2. The subterraneous waters may occasion earthquakes, by their overflowing, cutting out new courses, &c. Add, that the water being heated; and rarified by the subterraneous fires, may emit fumes, blasts, &c. which by their action, either on the water, or immediately on the earth it self, may occasion great succussions.

3. The air may be the cause of earthquakes: for air, being a collection of fumes, and vapours raised from the earth and water; if it be pent up in the too narrow viscera of the earth, the subterraneous, or its own active heat, rarifying and

expanding it, the force wherewith it endeavours to escape, may shake the earth: hence there will arise diverse species of earthquakes, according to the different position, quantity, &c. of the imprisoned aura.

Lastly, Fire is a principal cause of earthquakes; both as it produces the aforesaid subterranean aura, or vapour; and as this aura, or spirit, from the different matter and composition whereof arise sulphur, bitumen, and other inflammable matters, is kindled either from some other fire it meets withal, or from its collision against hard bodies, or its intermixture with other fluids; by which means bursting out into a greater compass, the place becomes too narrow for it; so that pressing against it on all sides, the adjoining parts are shaken; till having made itself a passage, it spends it self in a volcano, or burning mountain.

But to come nearer to the point: Dr. Lister, in *Philosoph. Transact.* N^o. 157. is of opinion, that the material cause of thunder, lightning, and earthquakes, is one and the same, viz. the inflammable breath of the pyrites, which is a substantial sulphur, and will take fire of it self.

The difference between these three terrible phenomena, he takes only to consist in this; that this sulphur, in the former, is fired in the air; and in the latter, under ground. Which is a notion that Pliny had long before him: *quid enim*, says he, *aliud est in terra tremor, quam in nube tonitru?* This he thinks abundantly indicated by the same sulphurous smell being found in any thing burnt with lightning, and in the waters, &c. cast up in earthquakes; and even in the air before and after them.

Add, that they agree in the manner of the noise; which is carried on as in a train, fired; the one rowling and rattling through the air, takes fire as the vapours chance to drive; as the other fired under ground, in like manner, moves with a defultory noise.

Thunder, which is the effect of the trembling of the air, caused by the same vapours dispersed through it, has force enough to shake our houses; and why may not there be thunder and lightning under ground, in some vast repositories there, I see no reason. Especially if we reflect, that the matter which composes the noisy vapour above us, is contained in much larger quantities under ground: *Philosophical Transactions*, N^o. 202.

That the earth abounds in cavities, every body allows; and that these subterranean cavities are, at certain times, and in certain seasons, full of inflammable vapours, the damps in our mines sufficiently witness, which fired, do every thing as in an earthquake, only in a lesser degree.

That the pyrites alone, of all the known minerals, yields this inflammable vapour, is highly probable: for that no mineral, or ore whatsoever, is sulphurous; but as it is wholly or in part, a pyrites; and there is but one species of brimstone, at least with us in England, which the pyrites naturally, and only yields. The sulphur vive, of natural brimstone, which is found in and about the burning mountains, is certainly the effect of sublimation; and those great quantities of it said to be found about the skirts of volcanos, is only an argument of the long duration and vehemence of those fires: Possibly, the pyrites of the volcanos, or burning mountains, may be more sulphurous than ours: And, indeed it is plain, that some of ours in England are very lean, and hold but little sulphur; others again very much: which may be one reason, why England is so little troubled with earthquakes; and Italy, and almost round the Mediterranean sea, so very much: though another reason is, the paucity of pyrites in England, in regard to those places.

Comparing our earthquakes, thunder and lightning, with theirs, it is observed, that there it lightens almost daily, especially in summer time, here seldom; there thunder and lightning is of long duration, here it is soon over; there the earthquakes are frequent, long, and terrible, with many paroxysms in a day, and that for many days; here they are very short, only of a few minutes, and scarce perceptible. To this purpose, the subterranean cavities in England are small, and few, compared to the vast vaults in those parts of the world; which is evident, from the sudden disappearance of whole mountains and islands.

Dr. Woodward gives us another theory of earthquakes. He endeavours to shew, that the subterranean heat, or fire (which is continually elevating water out of the abyss, to furnish the earth with rain, dew, springs, and rivers) being stopped in any part of the earth, and so diverted from its ordinary course, by some accidental glut, or obstruction, in the pores or passages, through which it used to ascend to the surface; becomes, by such means, preternaturally assembled, in a greater quantity than usual, into one place; and therefore causeth a great rarefaction, and intumescence of the water of the abyss; putting it into great commotions, and disorders, and at the same time making the like effort on the earth; which being expanded upon the face of the abyss, occasions that agitation and concussion which we call an earthquake.

This effort, in some earthquakes, he observes, is so vehement

that it splits and tears the earth, making cracks and chasms in it, some miles in length, which open at the instants of the shocks, and close again in the intervals betwixt them; nay, it is sometimes so violent, that it forces the upper-incumbent strata, breaks them all throughout, and thereby perfectly undermines, and ruins the foundation of them; so that these failing, the whole tract, as soon as the shock is over, sinks down into the abyss, and is swallowed up by it; the water thereof immediately rising up, and forming a lake in the place, where the said tract before was. That this effort being made in all directions indifferently, the fire dilating and expanding on all hands, and endeavouring to get room, and make its way through all obstacles, falls as foul on the water of the abyss beneath, as on the earth above, forcing it forth which way soever it can find vent, of passage, as well through its ordinary exits, wells, springs, and the outlets of rivers, as through the chasms then newly opened; through the camini, or spiracles of *Ætna*, or other neighbouring volcanos; and those hiatus's at the bottom of the sea, whereby the abyss below opens into it, and communicates with it. That as the water, resident in the abyss, is, in all parts of it, stored with a considerable quantity of heat, and more especially in those, where these extraordinary aggregations of this fire happen; so likewise is the water, which is thus forced out of it; inasmuch, that when thrown forth, and mixed with the waters of wells, or springs of rivers, and the sea, it renders them very sensibly hot.

He adds, that though the abyss be liable to these commotions in all parts; yet the effects are no where very remarkable, except in those countries, which are mountainous, and consequently stony and cavernous underneath; and especially where the disposition of the strata is such, that those caverns open into the abyss, and so freely admit, and entertain the fire; which assembling therein, is the cause of the shock; it naturally steering its course that way, where it finds the readiest reception, which is towards those caverns. Besides, that those parts of the earth, which abound with strata of stone, or marble, making the strongest opposition to this effort, are the most furiously shattered; and suffer much more by it, than those which consist of gravel, sand, and the like laxer matter, which more easily give way, and make not so great resistance; but above all, these countries which yield great store of sulphur, and nitre, are, by far, the most injured and incommoded by earthquakes; those minerals constituting in the earth a kind of natural gunpowder, which taking fire upon this assemblage, and approach of it, occasions that murmuring noise, or subterranean thunder, which is heard rumbling in the bowels of the earth during earthquakes, and by the assistance of its explosive power, renders the shock much greater; so as sometimes to make miserable havoc and destruction.

And it is for this reason, that Italy, Sicily, Anatolia, and some parts of Greece, have been so long, and so often alarmed and harrassed by earthquakes; these countries being all mountainous and cavernous, abounding with stone and marble, and affording sulphur, and nitre in great plenty.

Further, that *Ætna*, Vesuvius, Hecla, and the other volcanos, are only so many spiracles, serving for the discharge of this subterranean fire, when it is thus preternaturally assembled. That where there happens to be such a structure and conformation of the interior parts of the earth, as that the fire may pass freely, and without impediment from the caverns, wherein it assembles unto those spiracles; it then readily and easily gets out, from time to time, without shaking, or disturbing the earth: but where such communication is wanting, or the passage is not sufficiently large and open, so that it cannot come at the spiracles, it heaves up and shakes the earth, with greater or lesser impetuosity, according to the quantity of fire thus assembled, till it has made its way to the mouth of the volcano. That therefore there are scarce any countries much annoyed with earthquakes, but have one of these fiery vents; which are constantly in flames, when any earthquake happens; as disgorging that fire, which, whilst underneath, was the cause of the disaster. Lastly, that were it not for these diverticula, it would rage in the bowels of the earth much more furiously, and make greater havoc than it doth.

Thus we have seen what fire and water may do; and that either of them, in good hands, are proved sufficient for all the phenomena of earthquakes: If they should both fail, we have a third agent, scarce inferior to either of them. The reader must not be surprized when we tell him it is air.

M. Atmonons, in the *Mémoires de l'Acad. des sciences*, an. 1703, has an express discourse to prove, that on the foot of the new experiments of the weight and spring of the air, a moderate degree of heat may bring the air into a condition, capable of causing earthquakes. It is shewn, that at the depth of 43528 fathoms below the surface of the earth, air is only one fourth less heavy than mercury. Now, this depth of 43528 fathoms is only a 74th part of the semi-diameter of the earth. And the vast sphere beyond this depth, in diameter 6451538 fathoms,

fathoms, may probably be only filled with air; which will be here greatly condensed, and much heavier than the heaviest bodies we know of in nature. But it is found by experiment, that the more air is compressed, the more does the same degree of heat increase its spring, and the more capable does it render it of a violent effect: and that, for instance, the degree of heat of boiling water increases the spring of the air above what it has in its natural state, in our climate, by a quantity equal to a third of the weight wherewith it is pressed. Whence we may conclude, that a degree of heat, which on the surface of the earth will only have a moderate effect, may be capable of a very violent one below. And as we are assured, that there are in nature degrees of heat, much more considerable than that of boiling water: It is very possible there may be some, whose violence, further assisted by the exceeding weight of the air, may be more than sufficient to break and overturn this solid orb of 43528 fathoms; whose weight, compared to that of the included air, would be but a trifle.

Artificial EARTHQUAKES. Chemistry furnishes us a method of making artificial earthquakes which shall have all the great effects of natural ones: which, as it may illustrate the process of nature in the production of these terrible phenomena under ground, we shall here add.

To twenty pounds of iron filings, add as many of sulphur: mix, work, and temper the whole together with a little water, so as to form a mass, of the consistence of a firm paste. This being buried three or four foot under ground, in six or seven hours time, will have a prodigious effect: The earth will begin to tremble, crack and smother, and fire and flame will burst through.

Such is the effect even of two cold bodies, in the cold ground: And there only wants a sufficient quantity of this mixture to produce a true ætna. If it were supposed to burst out under the sea, it would produce a water-spout. And if it were in the clouds, the effect would be thunder and lightning.

EASE, in the sea-language, signifies as much as slacken, or let go slack.

Thus they say, *ease* the bowling, and *ease* the sheet, that is, let them go slack.

Chapel of EASE. See the article CHAPEL.

EASEL-PIECES, among painters, such smaller pieces, either portraits, or landscapes, as are painted on the *ease*, i. e. the frame whereon the canvas is laid.

They are thus called, to distinguish them from larger pictures drawn on walls, ceilings, &c.

EASEMENT, in law, a service, or convenience, which one neighbour has of another by charter, or prescription, without profit: as a way through his ground, a sink, or the like.

In the civil law, *ease*ments are called *servitus prædii*.

EAST *, in cosmography, one of the cardinal points of the horizon; being the point wherein the prime vertical intersects that quarter of the horizon which the sun rises in.

* The word *east* is Saxon: in Italy, and throughout the Mediterranean, the *east* wind is called the *levante*. In Greek, *ανατολη*, and *ανατολη*, because it comes from the side of the sun, *ανατολη*. In Latin, *orient*.

To find the *east* and west line, points, &c. See MERIDIAN Line.

EAST Wind, is that which blows from the *east* point. See WIND.

EAST Dials. See the article DIAL.

EAST-India Companies. See the article COMPANY.

EAST-India Silk. See the article SILK.

Mooring for EAST. See the article MOORING.

EASTERN. See the article ORIENTAL.

EASTER, a feast of the church, held in memory of our Saviour's resurrection.

The Greeks and Latins call it *Πασχα*, *pascha*, originally a Hebrew word, signifying *passage*; applied to the feast of the passover, which is held among the Jews, much about the same time. In English it is called *easter*, from the Saxon *Eastre*, a goddess worshipped with peculiar ceremony in the month of April.

Easter is one of the most considerable festivals in the christian calendar; being that which regulates and determines the times of all the other moveable feasts.

The rule for the celebration of *easter*, fixed by the council of Nice, in the year 325, is, that it be held on the Sunday which falls upon, or next after the full moon, next after the 21st of March; i. e. the Sunday which falls upon, or next after the first full moon after the vernal equinox.

The reason of which decree was, that the christians might avoid the celebrating their *easter*, at the same time with the Jewish passover, which, according to the institution of Moses, was held the very day of the full moon.

To find *easter*, agreeable to this rule, the method that obtained throughout the church, from the time of Dionysius Exiguus, to that of the reformation of the calendar under pope Gregory; and which still obtains in England, Sweden,

and among the Greeks, where the Gregorian correction is not admitted; is, by means of the golden numbers duly distributed throughout the Julian calendar.

The vernal equinox, at the time of the Nicene council happening on the 21st of March, has been, upon Dionysius's authority, affixed to the same day of the Julian year ever since; so that in the Julian way of computing, no full moon is paschal, but that immediately after the 21st of March. Therefore *easter* can never happen earlier than the 22d of March.—Now, by finding the full moons, next after the 21st of March, for the several golden numbers, or years of the lunar cycle, we shall have a table for the finding of *easter* for ever.

Such table being of considerable use in the Julian computation, we shall here subjoin.

Gold. Numb.	Full Moons next after Ver. Equin.	Gold. Numb.	Full Moons next after Ver. Equin.
I	5 April, D	XI	15 April, G
II	25 March, G	XII	4 April, C
III	13 April, E	XIII	24 March, F
IV	2 April, A	XIV	12 April, D
V	22 March, D	XV	1 April, G
VI	10 April, B	XVI	21 March, C
VII	30 March, E	XVII	9 April, A
VIII	18 April, C	XVIII	29 March, D
IX	7 April, F	XIX	17 April, B
X	27 March, B		

Now to find *easter*, for any given year, find the dominical letter, and the golden number of the given year, as directed under the articles DOMINICAL Letter, and GOLDEN Number.

Then, in the table, seeking the dominical letter, with the day of the paschal full moon, and the Sunday letter annexed thereto; compare this letter with the dominical letter of the given year; that it may appear how many days are to be added to the day of the paschal full moon, to give *easter* day.

E. gr. In the year 1715, the dominical letter is B, and the golden number VI; consequently, the paschal full moon, is fixed, by the table, to the 10th of April; whose Sunday letter being B, the dominical letter given, it self is a Sunday: and, therefore, *easter* will fall on the eighth day following, viz. on the 17th of April.

But in this computation, the vernal equinox is supposed affixed to the 21st of March; and the cycle of nineteen years, or golden numbers, is supposed to point out the places of the new and full moons exactly: both which suppositions are erroneous. Whence it follows, that the Julian *easter* never happens at its due time, unless by accident.

For an instance of the error, it may be observed, that in the year 1715, the vernal equinox falls on the 10th of March; 11 days before the rule supposes it: and the paschal full moon on the 7th of April, three days earlier than was supposed. *Easter*-day, therefore, which is held on the 17th of April, should be held on the 10th.

This error was grown to such a pitch, in course of time, that pope Gregory XIII. thought it necessary to correct it. And accordingly, in the year 1582, by the advice of Aloysius Lilius, he ordered 10 days to be thrown out of October; so to bring back the vernal equinox to its old place, viz. the 21st of March. And hence the Gregorian calendar, Gregorian year, &c.

In the new, or Gregorian computation, in lieu of golden numbers, the time of *easter* is found by means of epacts, contrived for that purpose. See EPACT.

The following table renders the finding of *easter* in the Gregorian year, from the year 1700, to the year 1900, very easy.

Epacts.	Paschal full Moons.	Epacts.	Paschal full Moons.
X	13 April, E	IX	4 April, C
XI	2 April, A	XX	24 March, F
XXII	22 March, D	I	12 April, D
III	10 April, B	XII	1 April, G
XIV	30 March, E	XXIII	21 March, C
XXV	18 April, C	IV	9 April, A
VI	7 April, F	XV	29 March, D
XVII	27 March, B	XXVI	17 April, E
XXVIII	15 April, G	VII	6 April, E
		XVIII	26 March, A

Now, to find *easter* for any given Gregorian year. Seek the dominical letter, and the Gregorian epact; as shewn under EPACT, &c. Find the epact in the table, and note the paschal full moon, with the weekly letter, corresponding to the same. The rest is performed, as already taught for the Julian *easter*.

E. gr.

E. gr. The dominical letter of the year 1715, is F, and the epact XXV; consequently, the paschal moon falls on the 18th of April, C: and therefore *easter-day* is the 21st of April.

Though the Gregorian calendar be, doubtless, preferable to the Julian; yet it also has its defects. It cannot, for instance, keep the equinox fixed on the 21st of March; but it will sometimes fall on the 19th, and sometimes on the 23d.

Add, that the full moon happening on the 20th of March, might sometimes be paschal; yet is it not allowed as such, in the Gregorian computation: as, on the contrary, the full moon of the 22d of March, may be allowed for paschal, which yet it is not. Scaliger and Calvisius have also proved other inaccuracies on this calendar. See CALENDAR.

EASTER Term.

EASTERN Amplitude.

EASTERN Church.

EASTERN Horizon.

EASTERN Ocean.

EAVES, the margin, or edge of the roof of a house; being the lowest tiles, slate, or the like, which hang over the walls, to throw off the waters to a distance from the wall.

EAVES-LEATH, a thick, feather-edged board, generally nailed round the eaves of a house, for the lowermost tiles, slate, or shingles to rest upon.

EBIONITES, ancient heretics, who rose in the church, in the very first age thereof; denying the divinity of Jesus Christ.

Origen takes them to have been so called from the Hebrew word, *ebion*, which in that language signifies *poor*; because, says he, they were poor in sense, and wanted understanding. Eusebius, with a view to the same etymology, is of opinion they were thus called, as having poor thoughts of Jesus Christ; taking him for no more than a mere man.

It is more probable, the Jews gave this appellation to the christians in general, out of contempt; because in the first times there were few but poor people, that embraced the christian religion. This opinion Origen himself seems to give into, in his book against Celsus; where he says, that they called *Ebionites*, such among the Jews, as believed that Jesus was truly the expected Messiah.

It might even be urged, with some probability, that the primitive christians assumed the name of themselves, in conformity to their profession. It is certain, Epiphanius observes, they valued themselves on being poor, in imitation of the Apostles. The same Epiphanius, however, is of opinion, that there had been a man of the name *Ebion*, the chief, and founder of the sect of *Ebionites*, contemporary with the Nazarenes, and Corinthians. He gives a long and exact account of the origin of the *Ebionites*, making them to have arisen after the destruction of Jerusalem; when the first christians, called *Nazarenes*, went out of the same to live at Pella.

The *Ebionites*, then, are little else than a branch of Nazarenes; only, that they altered and corrupted, in many things, the purity of the faith held among those first adherents to christianity. For this reason, Origen distinguishes two kinds of *Ebionites*, in his answer to Celsus; the one believed that Jesus Christ was born of a virgin; and the others, that he was born after the manner of other men.

The first were orthodox in every thing, except that to the christian doctrine, they joined the ceremonies of the Jewish law, with the Jews, Samaritans, and Nazarenes: they differed from the Nazarenes however, in several things, chiefly as to what regards the authority of the sacred writings: for the Nazarenes received all for scripture, contained in the Jewish canon; whereas the *Ebionites* rejected all the prophets; and held the very names of David, Solomon, Isaiah, Jeremiah, and Ezekiel, in abhorrence.

They received nothing of the Old Testament but the Pentateuch; which should intimate them to have defended rather from the Samaritans than from the Jews. They agreed with the Nazarenes in using the Hebrew gospel of St. Matthew, otherwise called the gospel of the twelve Apostles: But they had corrupted their copy in abundance of places. And, particularly, had left out the genealogy of our Saviour, which was preserved entire in that of the Nazarenes, and even in those used by the Cerinthians.

These last, whose sentiments, as to the birth of our Saviour, were the same with those of the *Ebionites*, built their error on this very genealogy.

Beside the Hebrew gospel of St. Matthew, the *Ebionites* had adopted several other books under the names of St. James, John, and the other Apostles. They also made use of the *travels* of St. Peter, which are supposed to have been written by S. Clement; but had altered them so, that there was scarce any thing of truth left in them. They even made that Saint tell a world of falsehoods, the better to authorize their own practices. See S. Epiphanius, who is very diffusive on the ancient heresy of the *Ebionites*, Her. 30.

EBONY, EBENUM, in natural history, a kind of wood,

VOL. I.

brought from the Indies, exceedingly hard and heavy, susceptible of a very fine polish, and on that account, used in Mosaic, and inlaid works, toys, &c.

There are diverse kinds of *ebony*; the most usual among us are black, red, and green; all of them the product of the island of Madagascar, where the natives call them indifferently, *bazon maintsi*, q. d. *black wood*. The island of St. Maurice, belonging to the Dutch, likewise furnishes part of the *ebonies* used in Europe.

Authors, and travellers, give very different accounts of the tree that yields the black *ebony*: by some of their descriptions it should be a sort of palm tree, by others a cytissus, &c. The most authentic of them, is that of M. Flacourt, who resided many years in Madagascar as governor thereof: He assures us that it grows very high, and big; its bark being black, and its leaves resembling those of our myrtle, of a deep, dusky, green colour.

Tavernier assures us, that the Islanders always take care to bury their trees when cut down, to make them the blacker. F. Plumier mentions another black *ebony* tree, discovered by him at St. Domingo, which he calls *spartium portulaca foliis aculeatum ebeni materie*. Candia also bears a little shrub, known to the botanists, under the name of *ebenus cretica*.

Pliny and Dioscorides say, the best *ebony* comes from Ethiopia, and the worst from India; but Theophrastus prefers that of India. Black *ebony* is much preferred to that of other colours. The best is a jet black, free of veins and find, very massive, astringent, and of an acrid pungent taste.

Its rind infused in water, is said to purge pituita, and cure venereal disorders; whence Matthiolus took guaiacum for a sort of *ebony*. It yields an agreeable perfume, when laid on burning coals: when green, it readily takes fire, from the abundance of its fat. If rubbed against a stone, it becomes brown. The Indians make statues of their gods, and scepters for their princes of this wood. It was first brought to Rome by Pompey, after his subduing Mithridates. It is now much less used among us, than anciently; since the discovery of so many ways of giving other hard woods a black colour.

As to green *ebony*, besides Madagascar, and St. Maurice, it likewise grows in the Antilles, and especially in the isle of Tobago. The tree that yields it is very bushy, its leaves are smooth, and of a fine green colour. Beneath its bark is a white blea about two inches thick; all beneath which, to the very heart, is a deep green, approaching towards a black; though sometimes, streaked with yellow veins. Its use is not confined to Mosaic work; It is likewise good in dying, as yielding a fine green tincture.

As to red *ebony*, called also *grenadilla*, we know little of it more than the name.

The cabinet-makers, inlayers, &c. make pear-tree, and other woods, pass for *ebony*, by ebonying, or giving them the black colour thereof. This, some do, by a few washes of a hot decoction of galls, and when dry, adding writing ink thereon, and polishing it with a stiff brush, and a little hot wax. And others heat, or burn their wood black. See DYING.

EBRUBARITES, a sect, or order of religious among the Mahometans; thus called from their founder *Ebrubard*, a disciple of Nacchibendi.

The *Ebrubarites*, notwithstanding the extraordinary sanctity they make profession of, with an absolute dereliction of all worldly things, are regarded by the Muselmans, as no better than heretics; by reason they do not esteem themselves obliged to go in pilgrimage to Mecca. To excuse themselves herefrom, they urge that the pureness of their souls, their sublime contemplations, extasies, &c. shew them Mecca and Mahomet's tomb, without stirring out of their cells.

EBULLITION, in physics, the act of emitting bubbles, by a vehement agitation of the parts of a fluid, produced by fire or otherwise.

Philosophers are disagreed about the cause, and manner of *ebullition*: some account for it from an attenuation of the particles of the fluid, at the bottom of the vessel; which, by being attenuated, become lighter, and heave upwards against the super-incumbent load: others, from the particles of fire mixing with, and dilating the particles of the fluid, and so rendering them specifically lighter: and others, not from any attenuation, nor even rarefaction of the particles of the fluid by the action of heat; but from a rarefaction of the air pent up, and intermixed with the fluid; which coming to expand, tend upwards against the pressure of the less heated, less rarified part of the fluid.

A more precise account of the process, see under the foregoing article BOILING.

EBULLITION, in chemistry, &c. is used for a violent intestine motion, or colludation of parts, occasioned by the mixture of salts of different natures.

Dr. Harris will have it properly, and immediately, to signify that particular struggle, or effervescence, arising upon the mingling together of an acid and alcalisate liquor.

Mr. Boyle has an experiment to shew, that a considerable ebullition may be produced by such a mixture, without the bodies acquiring any heat; nay, that a degree of cold may be produced with it greater than was in either of the bodies singly; though accompanied with a great struggle, tumult, noise, and froth. For having shook one part of oil of vitriol, into 12 parts of common water, the mixture was at first sensibly warm: then, the ball of a thermometer was placed in it, till the included spirit had gained the temperance of the mixture; but then a convenient quantity of volatile salt of sal armoniac, being gradually put in to facilitate the action of the spirits, the spirit in the thermometer descended above an inch.

ECARTELE, in heraldry. See **QUARTERLY**.
ECCANTHIS, or **ENCANTHIS**, in medicine. See **ENCANTHIS**.

ECCE-HOMO *, among painters, a name given to a picture, wherein our Saviour is represented in a purple robe, with a crown on his head, and a reed in his hand; such as he was presented before Pilate by the Jews.

* The phrase is Latin, borrowed from the words of the Jews themselves, *q. d.* this is the man.—Such a person has a *lioc ecce homo*.

ECCENTRIC. } See the articles } **ECCENTRIC**.
ECCENTRICITY. } **ECCENTRICITY**.
ECCHYMOSIS, **ΕΚΚΥΜΩΣΙΣ**, the effusion of blood from a rupture in some of the small veins near the skin; causing a lividity, or blueness thereof.

This is also called *ecchymoma*, **Εκχυμομα**, and stands distinguished from the *enchymosis*, where there is no extravasation. The *ecchymosis* is either *simple*, or *with abscess*. The former is a mere disease of the skin, wherein the blood extravasated by some blow or contusion, upon its arrival between the fleshy or muscular parts and the cutis, stops there and turns black or livid, without any appearance of a wound.—In the latter, the extravasated blood suppurates, and breeds an impetuous.

ECCLESIA, a Latin, or rather Greek term, signifying *church*. See **CHURCH**.

In our ancient law-books, Fitz Herbert observes, that **ECCLESIA**, **ΕΚΚΛΗΣΙΑ**, properly signifies a *parish*. Whence, if a presentation were made to a chapel, as to a church, by the name of *ecclesia*, it changed the name thereof, and it presently commenced a church.

When the question was, whether it were, *ecclesia*, *aut capella pertinetis ad ecclesiam*? the issue was, whether it had *baptisimum* & *sepulchrum*? for if it had the administration of the sacraments, and sepulture, it was in law judged a church. See **CHAPEL**.

Restitutio extracti ab ECCLESIA. } See **RESTITUTION**.
Recto de advocations ECCLESIAE. } See **RECTO**.
Warda ECCLESIAE. } See **WARDA**.

ECCLESIANI, **ECCLESIANI**, in church history.—Upon any falling out or misunderstanding, between the emperors and the church men, the adherents to the emperor called such as stuck to the interests of the church, and church men, *ecclesiani*, a term of reproach, answering to our high-churchmen.

ECCLESIASTES, one of the books of the Old Testament; thus called, by a Greek word, signifying *preacher*; in regard the author in it declaims, or *preaches*, against the vices and vanities of the world.

This is Mariana's judgment; Grotius thinks otherwise; taking the book to derive its appellation from its being a collection of fine sentences, and reflexions on the vanity of the things of our earth, &c. From the word **אסף**, which signifies to *amass*, or *collect*, *אסף*, *אסף*. Some Hebrew doctors supposing the same etymon, will have it to have been thus called on account of its *amassing* a great deal of wisdom: others because the author's aim is to *assemble*, and *call* together, all such as are willing to consult their safety, and avoid the dangers of the world; which is the opinion of Grotius: lastly, others, with Calovius, deduce it from his *assembling* them about him, as a preacher assembles his auditory.

There are different sentiments as to the author of this book: the most common is, that it is Solomon's, who is supposed to have wrote it towards the close of his life, to give tokens of his penitence to posterity.

Grotius, indeed, takes the work to be posterior to Solomon; and to have been wrote after his death by I know not what authors, six in number; who, to give their book the greater authority, put Solomon's name to it, and represented him as repentant. What he founds so many positive acts on, is, that we meet with words in this book, which are no where else seen, but in Daniel, Elisha, and the Chaldee paraphrases. But, it is certain, all, both Hebrews, Greeks, and Latins, have always spoke of it as a work of Solomon. Indeed, there are authors, who have attributed all the books of Solomon to Isaiah; but these are only to be understood, as if that prophet had collected them. If it be true, that there are Chaldee words in the *Ecclesiastes*, it is easier to suppose Solomon understood that language, than to deny him the author of the book.

If the book is not Solomon's, because Grotius has found four or five words, which are only to be explained by the Chaldee and Arabic; we are not sure of the author of any book in the Bible. Moses must not be the author of Genesis; for even in the very first verse of that book we meet with two or three words, that are only deducible from Arabic roots. And how many authors attribute to Solomon, or to Moses, the book of Job, which is that of all the books of the Old Testament, where there is the most Arabic, and Chaldee, or Syriac.

In fine, Calovius assures us, that the true reason why Grotius would not allow Solomon the author of the book of *Ecclesiastes*, is, that it speaks too clearly, and precisely for his time, of the universal judgment, eternal life, and the pains of hell, but these are truths established before Solomon, in the Psalms, the Pentateuch, and Job.

There appears no reason therefore, for denying this book to Solomon; but several for ascribing it to him. As, 1^o. The title of the book, which asserts its author to be the son of David, and king of Jerusalem. 2^o. Several passages in the book, which agree to no body but that prince, as c. i. v. 12. c. vii. v. 24. c. xii. v. 9, &c. and 3^o. The constant tradition of the ancient Jews and Christians.

The Talmudists, and other Rabbins, however, note that the book of *Ecclesiastes*, was some time ere it was put in the canon. See the *Gemara* on the Pirke Abboth, f. i. col. i. Masch Schabbath, c. 2. fol. 30. col. 2. Aben Ezra on the *Ecclesiastes* vii. 4. Maimonides, Moreh Nebochim, l. iii. c. 28. and Mercerus, Calovius, and Gejerus on this book.

ECCLESIASTIC, or **ECCLESIASTICAL**, something belonging to, or set apart for the church; in contradistinction to *civil*, or *secular*, which regard the world. See **CIVIL**, &c. There are *ecclesiastical* things and persons: *ecclesiastical law*, *jurisdiction*, *history*, *ceremonies*, *discipline*, *preferments*, &c. *Ecclesiastical* persons, are either *regular* or *secular*. See **REGULAR** and **SECULAR**.—In the empire there are three *ecclesiastical* electors, *viz.* the archbishops of Mentz, Treves, and Cologne.—In France, they have *ecclesiastical Peers*, &c. See **PEER**.

ECCLESIASTIC chambers. See **CHAMBER**.

ECCLESIASTIC community. } See the articles } **COMMUNITY**.
ECCLESIASTIC corporation. } **CORPORATION**.
ECCLESIASTIC faith. } See the articles } **FAITH**.
ECCLESIASTIC patronage. } **PATRONAGE**.
ECCLESIASTIC tradition. } **TRADITION**.

ECCLESIASTICAL courts, are the convocation, court of delegates, of arches, of audience, prerogative court, court of peculiars, bishops court, and archdeacons court. See each under its proper article, **CONVOCAATION**, **AUDIENCE**, **ARCHES**, &c. *Ecclesiastical* censures and punishments, are excommunication, penance, suspension, deprivation, and deposition, or degradation. See **EXCOMMUNICATION**, &c.

ECCLESIASTICO primo beneficio habendo. See the article **PRIMO**.

ECCLESIASTICUS, an apocryphal book, composed by Jesus the son of Sirach, and admitted by the Romish church, into the canon of the Old Testament.

It is frequently cited by the abbreviation, *Eccle*, to distinguish it from the *Ecclesiastes*, which is cited by *Eccle*. Isidore, l. vi. Etym. c. 2. and among the moderns Groeius, and Drusius, deny the author of the *Ecclesiasticus* to be Jesus the son of Sirach, grandson of the high priest Jesus, who returned from Babylon with Zorobabel. Gesebrand asserts, that Jesus the son of Sirach was of the race of Jesus son of Josedec. But this does not appear.

St. Jerome assures us, in his preface to the books of Solomon, that he had seen this book in Hebrew; and that the Hebrews intitled it *parables*: from which the jesuite Mariana concludes, that the high priest Jesus wrote this book in Hebrew; as it appears likewise from the prologue to the book itself; and that his grandson translated it into Greek, which likewise appears from the prologue: that he made this translation in Egypt, where the author lived in his 38th year; that it was done under the reign of Ptolemy Evergetes, successor of Ptolemy Philadelphus, who began to reign in the year of Rome 512, 240 years before Christ; that the grandfather had intitled it *parables*, which the grandson changed into *Ecclesiasticus*: lastly, that the book, however, is attributed to the translator by reason he changed, and added many things to the original.

Fa. Calmet takes the book of *Ecclesiasticus* to have been composed under the pontificate of Onias III. son of Simon, and the reign of Antiochus Epiphanes, king of Syria. He adds, that neither the author of the Latin translation, nor the time when it was made, is known; but being quoted regularly by all the ancient fathers, there is no doubt of its being very ancient. He takes it to have been done by the translator of the book of Wisdom.

ECCOPE *, **ΕΚΚΟΠΗ**, in chirurgery, the same with excision, or amputation.

The word is formed from the Greek *εκκοπειν*, *excindere*, to cut off.

ECCEPE, is likewise used for a kind of fracture, or solution of continuity of the skull, by a simple incision.

ECOPROTICS*, ΕΚΟΠΡΟΤΙΚΑ, in medicine; laxative, or loosening remedies, which purge gently, by softening the humours and excrements, and fitting them for expulsion.

* The word is composed of the Greek particle εκ, and κοπῆς, excrement.

ENCHARGE. See **BATTERY** *en Encharge*.

ECHEVIN. See the article **ECHEVIN**.

ECHINATE seeds, are such as are prickly and rough like the coat of a chestnut; or, as some say, like the skin of a hedge-hog.

ECHINUS, in architecture, a member, or ornament, near the bottom of the Ionic, Corinthian, and composite capitals; which, from its circular form or contour, is called by the French, *quart de rond*, and by the English, *quarter round*, or *boulton*; and from its being usually carved, or cut with figures of eggs, &c. is called also by the Latins, *ovum*, by the Italians, *ovolo*, the French, *œuf*, and the English, *eggs* and *anchors*.—See *Tab. Archit. fig. 28. lit. p.* Lastly, the eggs being encompassed with a cover, and thus bearing some resemblance to a chestnut cut open; the Greeks have called it *ἐχίνος*, *echinus*, a word which denotes the prickly cover of a chestnut.

ECHINUS, is also used by some botanists for the prickly head, or top of any plant; thus called from its likeness to an hedge-hog, or the cover of a chestnut.

ECHINUS, the hedge-hog, and **ECHINUS** marinus, the sea-urchin. See in the *Supplement*, articles **ECHINUS**, and **ECHINODERMA**.

ECHIQUETE, in heraldry. See **CHECKY**.

ECHO*, or **ECCHO**, a sound reflected, or reverberated, from a solid, concave body, and so repeated to the ear. See **SOUND** and **REFLECTION**.

* The word is formed of the Greek *ηχῶ*, *sound*, of the verb *ηχέω*, *to sound*.

The Peripatetics, who took sound for I know not what species, or image of the sonorous body, impressed on the adjoining air, account for *echo* from a reflection of that species, occasioned by its meeting some obstacle in the way. But the moderns, who know sound to consist in a certain tremor, or vibration in the sonorous body communicated to the contiguous air, and by that means to the ear, give a more consistent account of *echo*.

For a tremulous body, striking on another solid body, it is evident, may be repelled without destroying or diminishing its tremor; and consequently a sound may be redoubled by the reflection of the tremulous body, or air.

But a simple reflexion of the sonorous air, is not enough to solve the *echo*: for then every plain surface of a solid hard body, as being fit to reflect a voice or sound, would redouble it; which we find does not hold.

To produce an *echo*, therefore, it should seem that a kind of concameration, or vaulting were necessary, in order to collect, and by collecting, to heighten and increase, and afterwards reflect the sound; as we find is the case in reflecting the rays of light, where a concave mirror is used.

In effect, as often as a sound strikes perpendicularly on a wall, behind which is any thing of a vault, or arch, or even, another parallel wall; so oft will it be reverberated in the same line, or other adjacent ones.

For an *echo* to be heard, therefore, it is necessary the ear be in the line of reflection: for the person who made the sound to hear its *echo*, it is necessary he be perpendicular to the place which reflects it: and for a manifold or tautological *echo*, it is necessary there be a number of walls and vaults, or cavities, either placed behind each other, or fronting each other.

A single arch, or concavity, &c. can scarce ever stop and reflect all the sound; but if there be a convenient disposition behind it, part of the sound, propagated thither, being collected and reflected, as before, will present another *echo*: or if there be another concavity, opposed at a due distance to the former, the sound reflected from the one upon the other will be tossed back again by this latter, &c.

Many of the phenomena of *echo's*, are well considered by the bishop of Leigh, who remarks, that any sound, falling either directly or obliquely, on any dense body of a smooth, whether plain or arched, superficies, is reflected, or, in other words, it *echo's* more or less. The surface, says he, must be smooth, otherwise the air, by reverberation, will be put out of its regular motion, and the sound thereby broke and extinguished. He adds, that it *echo's* more or less, to shew, that when all things are, as before described, there is still an *echoing*, though it be not always heard; either because the direct sound is too weak to beat quite back again to him that made it, or that it does return to him, but so weak, that it cannot be discerned; or that he stands in a wrong place to receive the reflected sound, which passes over his head, under his feet, or on one side of him, and which therefore may be heard by a man standing in the place where the reflected sound does come, provided no interpolated body intercepts it; but not by him that originally made it.

Echo's may be produced with different circumstances; for,

1. A plane obstacle reflects the sound back in its due tone and loudness; allowance being made for the proportionable decrease of the sound, according to its distance.

2. A convex obstacle reflects the sound somewhat smaller, and somewhat quicker, though weaker, than it otherwise would be.

3. A concave obstacle; *echo's* back the sound, bigger, slower, and also inverted; but never according to the order of words.

Nor does it seem possible to contrive any single *echo*, that shall invert the sound, and repeat backwards; because, in such case, the word last spoken; that is, which last occurs to the obstacle, must be repelled first, which cannot be. For where in the mean time should the first words hang and be concealed; or how, after such a pause; should they be revived, and animated again into motion?

From the determinate concavity, or archedness of the reflecting bodies, it may happen that some of them shall only *echo* back one determinate note; and that only from one place.

4. The *echoing* body being removed farther off, it reflects more of the sound than when nearer; which is the reason why some *echo's* repeat but one syllable, some one word, and some many.

5. *Echoing* bodies may be so contrived; and placed, as that reflecting the sound from one to the other, either directly and mutually, or obliquely and by succession, out of one sound, shall a multiple *echo*, or many *echo's* arise.

Add, that a multiple *echo* may be made, by so placing the *echoing* bodies, at unequal distances, as that they may reflect all one way, and not one on the other; by which means, a manifold successive sound will be heard; one clap of the hands like many; one ha like a laughter; one single word like many of the same tone and accent; and so one musical instrument, like many of the same kind, imitating each other.

Lastly, *echoing* bodies may be so ordered, that from any one sound given, they shall produce many *echo's*, different both as to tone and intention. By which means a musical room may be so contrived, that not only one instrument playing therein, shall seem many of the same sort and size, but even a consort of different ones; this may be contrived by placing certain *echoing* bodies so, as that any note played, shall be returned by them in 3ds, 5ths, and 8ths.

ECHO, is also used for the place where the repetition of the sound is produced, or heard.

Echo's are distinguished into diverse kinds, viz.

1. *Single*, which return the voice but once; whereof some are *tonical*, which only return a voice when modulated into some particular musical tone. Others, *polysyllabical*, which return many syllables, words and sentences. Of this last kind, is that fine *echo* in Woodstock park, which Dr. Plott assures us, in the day-time, will return very distinctly seventeen syllables, and in the night twenty. See *Nat. Hist. Oxford*, c. 1. p. 7.

2. *Multiple*, or *tautological*, which return syllables and words the same oftentimes repeated.

In *echo's*, the place where the speaker stands, is called the *centrum phonicum*; and the object, or place, that returns the voice, the *centrum phonocaptivum*.

At the sepulchre of Metella, wife of Crassus, there was an *echo*, which repeated what a man said, five times. Authors mention a tower at Cyzicus, where the *echo* repeated seven times. One of the finest *echo's* we read of is that mentioned by Barthius, in his notes on Statius's *Thebais*, l. VI. v. 30. which repeated the words a man uttered seventeen times: this was on the banks of the Naba, between Coblents and Bingen. Barthius assures us, he had proved what he writes; and had counted seventeen repetitions. And whereas, in common *echo's*, the repetition is not heard till some time after hearing the word spoke, or the notes sung; in this, the person who speaks, or sings, is scarce heard at all; but the repetition very clearly, and always in surprising varieties; the *echo* seeming, sometimes to approach nearer, and sometimes to be further off. Sometimes the voice is heard very distinctly, and sometimes scarce at all. One person hears only one voice, and another several: one hears the *echo* on the right, and the other on the left, &c.

Addison, and other travellers into Italy, mention an *echo* in that country, still more extraordinary, which will return the sound of a pistol 56 times, even tho' the air be very foggy. See *Addis. Trav. edit. 1718*, p. 32. *Misson. Voyag. d'Ital. T. 2. p. 196. edit. 1691*.

ECHO, in architecture, is applied to certain vaults, and arches, most commonly of elliptical, or parabolical figures; used to redouble sounds, and produce artificial *echo's*.

The method of making an artificial *echo*, is taught by the jesuit Blancani, in his *Echometria*, at the end of his book on the *Sphere*.

Vitruvius tells us, that in diverse parts of Greece, and Italy, there were brazen vessels, artfully ranged under the seats of the theatres, to render the sound of the actors voices more clear, and make a kind of *echo*; by which means, of the prodigious multitude of persons present at those spectacles, every body might hear with ease and pleasure.

ECHO, in poetry, denotes a kind of composition, wherein the last words, or syllables, of each verse, contain some meaning, which being repeated a-part, answers to some question, or other matter, contained in the verse.

Such is that famous *echo* of Erasmus, *decem annos consumpsi in legendo Cicerone—one, i. e. ore, affine*.

The first *echo*, in verse, according to Pasquier, is that in the Sylve of Johannes secundus: but Pasquier is mistaken; for the ancient Greek and Latin poets have wrote *echo's*. This, Martial intimates plainly enough, when laughing at such sorts of baubles, he says, there is nothing like them among his poems. *Nusquam gracula quæ recantat echo*: by which, on the one side, he shews there were Latin poets in his time, who made *echo's*; and on the other, that the invention came from the Greeks.

Aristophanes, in his comedy, intitled *Σεμμοφορεῖα*, introduces Euripides in the person of *echo*. And Callimachus, in the epigram, *Ἐχθαίρω το ποίημα το κυκλικόν*, seems to have intended a kind of *echo*.

ECHOMETER *, in music, a kind of scale, or rule, with several lines divided thereon, serving to measure the duration, or length, of sounds, and to find their intervals, and ratio's.

* The word is formed of the Greek *ἠχῶ*, *sound*, and *μετρέω*, *measure*.

ECLECTIC *, **ECLECTICI**, a name given to some ancient philosophers, who without attaching themselves to any particular sect, took what they judged good, and solid from each.

* Hence their denomination; which, in the original Greek, signifies, that may be chosen, or that chooses, of the verb *ἐκλέγω*, *I choose*.

Laertius notes, that they were also, for the same reason, denominated *analogetici*, but that they called themselves *Philateltes*, i. e. lovers of truth.

The chief, or founder of the *eclecticis*, was one Potamon, of Alexandria, who lived under Augustus, and Tiberius; and who, weary of doubting of all things with the Sceptics and Pyrrhonians, formed the *eclectic* sect; which Vossius calls the *eclective*.

ECLEGMA *, or **ECLIGMA**, **ΕΚΛΕΙΜΑ**, in medicine, a pectoral remedy, of the consistence of a thick syrup; called also *lobsch*, *linctus*, and *lambative*.

* The word is Greek formed of *ἐλ*, and *λεγχω*, *to lick*; by reason the patient is to take it by licking it off the end of a liquorice stick dip't therein; in order that being taken thus by little and little, it may remain the longer in the passage, and moisten the breast the better.

There are *eclegma's* of the syrups of poppy, others of lentils, others of squills, &c. Their intention is to heal, or ease the lungs in coughs, peripneumonies, &c. they are usually composed of oils, incorporated with syrups.

ECLIPSE *, in astronomy, a privation of the light of one of the luminaries, by the interposition of some opaque body, either between it and the eye; or between it and the sun.

* The word is derived from the Greek, *ἐκλείψω*, of *ἐκλεπω*, *defectus*, I fail.

The ancients had frightful ideas of *eclipses*, supposing them pre-fages of the most dismal events: Plutarch assures us, that at Rome, it was not allowed to talk publicly of any natural causes of *eclipses*. They made a great noise with brazen instruments, and raised loud shouts, during *eclipses* of the moon, as thinking thereby to ease her in her labour: whence Juvenal, speaking of a talkative woman, says; *una laboranti poterit succurrere luna*. Others have attributed the *eclipse* of the moon to the arts of magicians, who by their enchantments, plucked her out of heaven, and made her skim over the grass. The natives of Mexico keep fast, during *eclipses*; and, particularly, their women, who beat and abuse themselves, drawing blood from their arms, &c. They imagine the moon has been wounded by the sun in some quarrel between them.

The duration of an *ECLIPSE*, is the time between the immersion, and emersion.

Immersion, or incidence of an *ECLIPSE*, is the moment when part of the sun planet, or moon's disk first begins to be hid. See **IMMERSION**.

Emersion, or expurgation of an *ECLIPSE*, is the time when the eclipsed luminary begins to re-appear, or emerge out of the shadow.

To determine the duration of *eclipses*, they usually divide the diameter of the luminary eclipsed, into 12 equal parts, called *digits*, or *digitis eclipsietis*.

Eclipses, are divided with respect to the luminary eclipsed, into *eclipses of the sun*, of the moon, and of the satellites: and with respect to the circumstances, into *total eclipses*, *partial*, *annual*, &c. *eclipses*.

ECLIPSE of the moon, is a deficiency of light in the moon, occasioned by a diametrical opposition of the earth between the sun and moon.

The manner of this *eclipse* is exhibited in *Tab. Astronom. fig. 34.* where A represents the earth, and B or C the moon. When all the light of the moon is intercepted, *i. e.* when her whole disk is covered, the *eclipse* is said to be *total*, when only part, *partial*. When the *total eclipse* lasts for some time, it is

said to be *totalis cum mora*, total with continuance; when only instantaneous, *totalis sine mora*, total without continuance.

Eclipses of the moon, only happen in the time of full moon; by reason it is only then the earth is between the sun and moon. Nor do they happen every full moon, by reason of the obliquity of the moon's way with respect to the sun's; but only in those full moon's, which happen either in the nodes, or very near them, where the aggregate of the apparent semi-diameters of the moon and the earth's shadow, is greater than the latitude of the moon, or the distance between their centres.

The most considerable circumstances in the *eclipses of the moon*, are, 1. That as the sum of the semi-diameters of the moon, and earth's shadow, is greater than the aggregate of the semi-diameters of the sun and moon, (that when least, being $5\frac{1}{2}$, and this, when greatest, scarce $3\frac{1}{2}$.) It is evident, *lunar eclipses* may happen in a greater latitude of the moon, and at a greater distance from the nodes, and consequently are more often observed in any one part of the earth, than *solar* ones; though with respect to the whole earth, the latter are as frequent as the former.

2. *Total eclipses*, and those of the longest duration, happen in the very nodes of the ecliptic: by reason the section of the earth's shadow then falling on the moon, is considerably greater than her disk. There may likewise be *total eclipses*, within a little distance of the nodes; but the further, the less their duration; further off still, there are only partial ones, and at length none at all: as the latitude and the semi-diameter of the moon together, are either less, equal, or greater than the semi-diameter of the shadow.

3. All *lunar eclipses* are universal, *i. e.* are visible in all parts of the globe which have the moon above their horizon; and are every where of the same magnitude, and begin and end together.

4. In all *lunar eclipses*, the eastern side is what first immerges and also emerges; so that though at first the moon be more westerly than the earth's shadow, yet her proper motion being swifter than the same, she overtakes and outgoes it.

5. The moon, even in the middle of an *eclipse*, has usually a faint appearance of light; which Gassendus, Ricciolus, Kepler, &c. attribute to the light of the earth's atmosphere transmitted thither.

Lastly, She grows sensibly paler, and dimmer, before ever she enters within the earth's shadow, which is attributed to the earth's penumbra.

Astronomy of lunar ECLIPSES, or the method of calculating their times, places, magnitudes, and other phenomena.—Preliminary

1. To find the length of the earth's shadowy cone. Find the sun's distance from the earth for the given time; see **SUN** and **DISTANCE**. Then, as the sun's diameter is known in semi-diameters of the earth, the length of the cone will be found from the rules given under **SHADOW**.

Suppose, *e. gr.* the sun's greatest distance from the earth, 34996 semi-diameters of the earth; and the sun's semi-diameter to be to that of the earth as 153 to 1. Then will the length of the shadowy cone be found $230\frac{1}{2}$. Hence, as the moon's least distance from the earth, is scarce 64 semi-diameters; the moon, when in opposition to the sun, in or near the nodes, will fall into the earth's shadow, though the sun and moon be in their apogees. And much more, if they be in or near their perigees, by reason the shadow is then longer; and the moon nearer the base of the cone.

2. To find the apparent semi-diameter of the earth's shadow, in the place of the moon's passage, for any given time. Find the sun and moon's distance from the earth; and thence, their horizontal parallaxes: add the parallaxes together, and from the sum, subtract the apparent semi-diameter of the sun. The remainder is the apparent semi-diameter of the shadow.

Thus, suppose the moon's horizontal parallax $56' 48''$, the sun's $6'$: the sum is $56' 54''$: from which the sun's apparent semi-diameter $16' 5''$ subtracted, leaves $40' 49''$ for the semi-diameter of the shadow.

Note, M. de la Hire omits the sun's parallax, as of no consideration: but increases the apparent semi-diameter of the shadow by a whole minute, for the shadow of the atmosphere; which would give the semi-diameter of the shadow, in our instance, $41' 13''$.

3. The moon's latitude, *AL*, at the time of her opposition, together with the angle at the node B, being given; to find the arch between the centres *AI*, and the arch *IL*. (*Fig. 35.*) Since in the spherical triangle *AIL*, rectangular at *I*; the side *AL* is given, as also the angle *ALI*, as being the complement of *LAI*, or *B*, to a right angle; the arch between the centres *AI*, is found by spherical trigonometry: and since the angle *LAI*, is equal to *B*, each of them, with *IAB*, making a right angle; and the moon's latitude *AL* is given; the arch *LI* will likewise be found by spherical trigonometry. See **SPHERICAL triangle**.

To determine the bounds of an *ECLIPSE of the moon*.—Since there is no *eclipse* possible, but when the aggregate of the semi-diameters of the shadow and the moon, is greater than the moon's latitude, (for without this, the moon will not come in

ECL

the shadow) add the apparent semi-diameters of the moon in perigæo, and of the shadow, supposing the sun in apogæo; by which you will have the side MO, fig. 36. Then, in the spherical triangle MNO, having given the angle at the node, whose quantity is the moon's greatest latitude in the conjunctions; the right angle E; and the leg MO; find the moon's distance from the node NO: which is the utmost bound, beyond which the eclipse cannot reach. After the same manner, adding the apparent semi-diameters of the moon in apogæo, and of the shadow of the sun in perigæo, for the sake of having the LH, in the triangle NLH; the distance of the moon, from the ascending node HN, will be found by spherical trigonometry; which is the bound within which the moon will necessarily be eclipsed.

Thus, e. gr. the semi-diameter of the shadow, when the sun is in apogæo, and the moon in perigæo, according to Kepler, is $49' 40''$. And the apparent semi-diameter of the moon in perigæo $16' 22''$. Consequently MO is $66'$, or $1^\circ 6'$; and therefore there will be no eclipse at all, if the moon's latitude be greater than $1^\circ 6'$. Now, as the same angle N is supposed by Kepler to be $5^\circ 18'$.

Log. Sin. N 8965537
Sin. MO 82832433
Whole Sine 100000000

Log. of Sine ON 93177996. The number corresponding to which in the tables is $11^\circ 59' 50''$. If, therefore, the moon's distance from the ascending node be greater than 12° ; no eclipse can happen. And, in like manner, the semi-diameter of the shadow in the sun's perigæo, and the moon's apogæo is $43' 50''$, and the moon's semi-diameter in her apogæo $15'$. Consequently, LH is $58' 50''$. And, therefore, there will be an eclipse, if the moon's latitude do not exceed $58' 50''$. But here, as before, the argument of the latitude is found $1^\circ 40'$.

To determine the quantity of an eclipse, or the number of digits eclipsed.—Add the moon's semi-diameter IC, (fig. 35.) to the semi-diameter of the shadow AM; then will $AM + IK = AI + IM + IK = AI + MK$. From this sum, therefore subtract the arch between the centres AI, the remainder gives the scruples, or parts of the diameter eclipsed MK. Say, therefore, as the moon's diameter KH, is to the scruples, or parts thereof eclipsed MK; so is 12, to the digits eclipsed.

Thus, supposing KH, $30' 44''$, and consequently IK, $15' 22''$; AM, $41' 13''$; and AI , $43' 14''$: the moon's semi-diameter will be $15' 22''$, and that of the shadow $41' 13''$; the sum whereof, is $56' 35''$. From which the arch between the centres $43' 14''$, being subtracted, leaves $13' 21''$ scruples, or 801 scruples. Then as $1844 : 801 :: 12 : 5 \frac{2}{3}$ dig. or 5 dig. $13'$.

To find the scruples of half duration of an eclipse, or the arch of the lunar orbit, which her centre describes from the beginning of the eclipse to the middle thereof.—Add the semi-diameters of the shadow AP, and the moon PN together; the sum gives AN. From the square of AN, subtract the square of AI; the remainder is the square of IN. And the square root of this residue is the arch IN required.

To find the scruples of half duration of total darkness, in a total eclipse.—Subtract the moon's semi-diameter SV, from the semi-diameter of the shadow AV; the remainder is AS: in the triangle AIS, which is rectangular at I, therefore, we have the arch AS given by the last method; and the arch between the centres AI: where the arch IS is found, as in the last problem.

To find the beginning, middle, and end of a lunar eclipse.—Say, as the moon's horary motion from the sun, is to 3600 horary seconds; so are the seconds of the arch LI, fig. 35. to the horary seconds equivalent thereto. Subtract these scruples, or seconds, in the first and third quadrant of the anomaly, from the time of full moon, and add it to the same in the second and fourth; the result is the time of the middle of the eclipse. Then say, as the moon's horary motion from the sun is to 3600 scruples, or seconds, so are the seconds of half duration IN, to the time of half duration: the double of which gives the whole duration. Lastly, subtract the time of half duration, from the time of the middle of the eclipse, the remainder will be the beginning of the eclipse. And add the same to the same, the sum will be its end.

Suppose, e. gr. $LI = 4' 5'' = 245''$, IN $2530''$, time of full moon $9^h 23' 49''$, horary motion of the moon from the sun, $30' 12''$, or $1812''$, then will

Log. IN 33404934

68967959

Log. of half duration 36386378; the number corresponding to which, in the tables, is $4351''$, or;

$1^h 12' 31''$

Duration of eclipse $2^h 25' 21''$
Time of middle eclipse $9^h 15' 43''$
Half duration subtract. $1^h 12' 31''$

Beginning of eclipse $8^h 3' 12''$
Time of middle eclipse $9^h 15' 43''$
Half a duration added $1^h 12' 31''$

End of eclipse $10^h 28' 14''$

To calculate an eclipse of the moon.—1. For the given time of the mean full moon, compute the moon's distance from the node; to find whether there be an eclipse or not: as taught in the first problem.

2. Compute the time of the true full moon, with the sun and moon's true place reduced to the ecliptic.

3. For the time of the true full moon, compute the moon's true latitude, and the distance of each luminary from the earth, with the horizontal parallaxes, and apparent semi-diameters.

4. For the same time, find the sun and moon's true horary motion.

5. Find the apparent semi-diameter of the shadow.

And 6. The arch between the centres A I, with the arch LI.

7. Compute the scruples of half duration IN.

And thence, 8. Determine the beginning, middle, and end of the eclipse.

Lastly, Find the scruples eclipsed, and thence the quantity of the eclipse: as taught under the preceding problems.

E. gr. anno 1708, the mean full moon fell on the 29th day of September, at $3^h 45' 4''$ afternoon: and then the moon's distance from the ascending node, was $5^\circ 22' 36''$. Consequently the full moon was eclipsed. Now, for that time we find

True full moon $9^h 23' 49''$
True place of the sun $6^\circ 43' 47''$
Moon's place in the ecliptic $6^\circ 43' 47''$
Moon's true latit. north $43' 25''$
Horizont. parallax. of O 6
of D 56 18
Apparent semi-diam. of O 16 5
of D 15 22
True horar. mot. of D from O 30 12
Semi diam. of shadow 41 13
Arch between the centers 43 14
Arch LI 4 5
Scruples of half duration 36 30
Scruples eclipsed 13 21
Duration of eclipse $2^h 25' 21''$
Beginning $8^h 3' 12''$
Middle $9^h 15' 43''$
End $10^h 28' 14''$
Quantity 5 dig. $13'$.

To draw a type, or figure of a lunar eclipse on a plane.—1. Let CD, (fig. 38.) represent the ecliptic; and let the centre of the shadow be in A: through which draw a right line GQ, perpendicular to DC: and suppose D the east, C the west, A the fourth, and G the north.

2. From A, with the interval of the aggregate AN, of the semi-diameter of the shadow AP, and of the moon PN, describe a circle DGCC; and with the interval of the semi-diameter of the shadow AP, draw another concentric circle EMFR, which will exhibit the section of the shadow in the passage of the moon.

3. Let AL be equal to the latitude of the moon at the beginning of the eclipse; and in L erect a perpendicular LN, meeting the greater circle in N, towards the west. Then will the centre of the moon, at the beginning of the eclipse, be in N.

4. After like manner, make AS equal to the latitude of the moon at the end of the eclipse; and in S, erect a perpendicular OS, parallel to DC: then will the centre of the moon be in O, at the end of the eclipse.

5. Connect the points O and N by a right line: ON will be the arch of the orbit, which the centre of the moon describes during the eclipse.

6. From O and N, with the interval of the moon's semi-diameter, F f.

diameter, describe circles PV and TX, which will exhibit the moon at the beginning and end of the eclipse.

7. Then, from A, letting fall a perpendicular AI to ON; the centre of the moon will be in I, in the middle of the darkness.

Wherefore, lastly from I, with the interval of the moon's semi-diameter, describe a circle HK: this will represent the moon in the greatest darkness, and at the same time the quantity of the eclipse.

Eclipse of the sun, is an occultation of the sun's body, occasioned by a diametrical interposition of the moon between the sun and the earth.

It is distinguished, like that of the moon, into *total* and *partial*, &c. to which must be added a third species called *annular*.

Eclipses of the sun, some authors observe, should in propriety be called *eclipses of the earth*.

As the moon is found to have a parallax of latitude; eclipses of the sun only happen when the latitude of the moon, viewed from the sun, is less than the aggregate of the apparent semi diameter of the sun and moon. *Solar eclipses*, therefore, happen when the moon is in conjunction with the sun, in, or near the nodes, i. e. at the new moons. Consequently, the memorable eclipses of the sun, at our Saviour's passion, happening at the time of full moon, when the sun and moon are in opposition, was preternatural.

Though the new moon cover the sun from the earth, yet is not there an eclipse every new moon; by reason the moon's way is not precisely under the ecliptic, but is placed obliquely thereto; only intersecting it twice in every period. So that eclipses can only be occasioned in such new moons, as happen in these intersections or nodes, or very near them.

In the nodes, when the moon has no visible latitude, the occultation is total; and with some continuance, when the disk of the moon, in perigee, appears greater than that of the sun in apogee, and its shadow is extended beyond the surface of the earth; and, without continuance, at moderate distances, when the cup, or point of the moon's shadow, barely touches the earth. Lastly, out of the nodes, but near them, the eclipses are partial.

The other circumstances of *solar eclipses*, are, 1. That none of them are universal; that is, none of them are seen throughout the whole hemisphere, which the sun is then above; the moon's disk being much too little, and much too near the earth, to hide the sun from the disk of the earth, which is fifteen times bigger than it.

2. Nor does the eclipse appear the same in all parts of the earth, where it is seen; but when in one place it is total, in another it is only partial.

Further, when the moon, being in her apogee, appears much less than the sun; as happens most sensibly, when he is in perigee: the cup of the lunar shadow not reaching the earth, he becomes in a central conjunction with the sun, yet not able to cover his disk; but lets his whole limb appear like a lucid ring or bracelet: this is hence called an *annular eclipse*.

3. It does not happen at the same time, in all places where it is seen; but appears more early to the western parts, and later to the eastern.

4. Its beginning is always on the western side the sun, and on the same side it ends.

5. In most *solar eclipses*, the moon's darkened disk is covered with a faint, dawning light; which is attributed to the reflexion of the light, from the illuminated part of the earth.

Lastly, In total eclipses of the sun, the moon's limb is seen surrounded by a pale circle of light; which the late astronomers take for a manifest indication of a lunar atmosphere. See ATMOSPHERE.

The astronomy of ECLIPSES of the sun.—To determine the bounds of a solar eclipse.

If the moon's parallax were insensible, the bounds of a solar eclipse would be determined after the same manner as those of a lunar: but by reason here is a sensible parallax, we must alter our measures a little, viz.

1. Add the apparent semi-diameters of the luminaries both in apogee and perigee together.

2. Since the parallax diminishes the northern latitude; to the former sum, add the greatest parallax of latitude possible: and since the parallax augments the southern latitude, from the same sum, subtract the greatest parallax of latitude. Thus, in each case, will you have the true latitude, beyond which there can be no eclipse.

This latitude given, the moon's distance from the nodes, beyond which eclipses cannot happen, is found, as already directed for *lunar eclipses*.

As different authors follow very different hypotheses, with regard to the apparent diameters of the luminaries, and the greatest parallax of latitude; they differ much in assigning the bounds at which *solar eclipses* happen. Ptolemy makes the utmost bound of eclipses at $19^{\circ} 25'$ distance from the node; Copernicus, at $19^{\circ} 12'$; Tycho, at $18^{\circ} 25'$; Kepler, at $17^{\circ} 16'$; Ricciolus, at $18^{\circ} 49'$. Though Ptolemy,

in other places, judges $16^{\circ} 42'$ minutes distance from the node, necessary; Copernicus, $16^{\circ} 25'$; Tycho, $17^{\circ} 9'$; Kepler, $15^{\circ} 55'$; and Ricciolus, $15^{\circ} 58'$.

To find the digits eclipsed.—Add the apparent semi-diameters of the luminaries into one sum; from which subtract the moon's apparent latitude, the remainder is the scruples, or parts of the diameter eclipsed. Then say, as the semi-diameter of the sun is to the scruples eclipsed; so are 6 digits reduced into scruples, or 360 scruples, to the digits eclipsed.

To find the scruples of half duration, or the line of immersion.—The method is the same as that delivered for *lunar eclipses*.

To determine the duration of a solar eclipse.—Find the horary motion of the moon from the sun, for one hour before the conjunction, and another hour after: then say, as the former horary motion is to the seconds in an hour, so are the scruples of half duration to the time of immersion: and as the latter horary motion is to the same seconds, so are the same scruples of half duration to the time of immersion. Lastly, adding the time of immersion to that of emersion; the aggregate is the total duration.

To determine the beginning, middle, and end of a solar eclipse.—From the moon's latitude, for the time of conjunction; find the arch IL, (fig. 35.) or the distance of the greatest obscurity. Then say, as the horary motion of the moon from the sun, before the conjunction, is to 3600 seconds of an hour; so is the distance of the greatest darkness, to the interval of time between the greatest darkness and the conjunction.

Subtract this interval, in the first and third quarter of the anomaly, from the time of the conjunction; and in the other quarters, add it to the same; the result is the time of the greatest darkness. Lastly, from the time of the greatest darkness, subtract the time of incidence, and add it to the time of emersion; the difference, in the first case, will be the beginning; and the sum, in the latter case, the end of the eclipse.

Indeed, as the interval between the conjunction, and the greatest obscurity is very small, and exceedingly precarious; it is scarce worth while to be so very precise; and accordingly, many authors use the time of the apparent conjunction for that of the greatest darkness.

E. gr. in our case,	
Time of conjunction	21 ^h 36 ^m 59 ^s
Time of incidence	1 2 36

Beginning of eclipse	20 34 23
Or 8 ^m morn.	34 23
Time of conjunction	21 36 59
Time of emergence	1 5 47

End of eclipse	22 ^h 42 46
Or 10 morn.	42 46

Or if you would determine it with more accuracy, subtract about two minutes for the distance between the conjunction seen, and the time of the greatest obscurity.

To find the moon's apparent latitude at the beginning and end of an eclipse.—From the argument of the moon's latitude, computed for the time of the apparent conjunction, subtract the scruples of half duration, together with the motion of the sun, answering to the time of incidence: the remainder, is the argument of latitude, at the beginning of the eclipse.

To the same sum add the same scruples, together with the sun's motion answering to the time of emergence: the aggregate is the argument of latitude, at the end of the eclipse.

The argument of the latitude given; the moon's true latitude is found after the common manner.—(See LATITUDE.) And from the true latitude, is soon found the apparent one.

The apparent latitude of the moon, at the beginning and end of a solar eclipse, given; to draw a type or figure thereof.—This is performed, as already taught for eclipses of the moon.

To calculate an ECLIPSE of the sun.—1. Find the mean new moon, and thence the true one; together with the place of the luminaries for the apparent time of the true one.

2. For the apparent time of the true new moon, compute the apparent time of the new moon observed.

3. For the apparent time of the new moon seen, compute the latitude seen.

4. Thence determine the digits eclipsed.

5. Find the times of the greatest darkness, immersion, and emersion.

6. Thence determine the beginning, and ending of the eclipse.

From the preceding problems, it is evident, that all the trouble, and fatigue of the calculus, arises from the parallaxes of longitude and latitude; without which, the calculation of *solar eclipses* would be the same with that of *lunar ones*.

ECLIPSES of the satellites. See SATELLITES of Jupiter.

The chief circumstances here observed are, 1. That the satellites of Jupiter undergo two or three kinds of eclipses; where-

of,

of, the first are proper, being such as happen when Jupiter's body is directly interposed between them and the sun; these happen almost every day. Mr. Flamsteed and Cassini, give us tables, wherein their immersions into Jupiter's shadow; and emersions again, are computed to hours and minutes.

The 2d are occultations, rather than obstructions; wherein the same satellites, coming too near to Jupiter's body, are lost in his light: which Ricciolus calls *occidere azuface*, sitting jovially. In which case, Jupiter's nearest satellite exhibits a third kind of *eclipse*; being observed like a macula, or dark round spot, transiting Jupiter's disk, with a motion contrary to that of the satellite: just as the moon's shadow projected on the earth, will appear to do, to the lunar inhabitants.

The *eclipses* of Jupiter's satellites furnish the best means of finding the longitude at sea. Those, particularly, of the first satellite, are much surer than the *eclipses* of the moon; and withal they happen much oftener: beside that, the manner of applying them is very easy. See LONGITUDE.

ECLIPTIC, ECLIPTICAL, something belonging to eclipses.

All new and full moons are not *ecliptic*, i. e. eclipses do not happen every new and full moon, though there be then an interposition, either of the earth between the sun and moon, or of the moon between the sun and earth. The reason is, that the interposition is only as to longitude, and not as to latitude. The sun is always in the *ecliptic*, but the moon is not; she deviates from it about five degrees, sometimes on the north side, and sometimes on the south. But every five months, or thereabouts, she cuts the *ecliptic*; and it is only about those times, that there can be eclipses either of the moon or sun.

The places, wherein she cuts the *ecliptic*, are called the *nodes* of the moon.

ECLIPTIC bounds, or terms, termini ecliptici, denotes the space of about 15 degrees from the nodes of the *ecliptic*; within which, if the moon be, at the time of a conjunction or opposition with the sun, there may be an eclipse of the sun, or moon, though she be not precisely in the nodes.

ECLIPTIC digit, digiti ecliptici. See DIGITS.

ECLIPTIC, is more particularly used for a line, or circle, on the surface of the sphere of the world, under which the center of the sun proceeds in its proper motion: or a line, which the sun's center describes in his annual progress.

It has its name *ecliptic*, by reason all eclipses happen when the two planets are in or near the nodes, or intersections of the *ecliptic*.

It is also called the *sun's orbit*, and *sun's way*, by reason that the sun never deviates from it, in his annual motion from east to west.

The north, or ascending node of the *ecliptic*, is called the *dragon's head*, and the south, or descending node, the *dragon's tail*.

The *ecliptic* is placed obliquely with respect to the equator, and cuts it into two points, viz. the beginning of aries and libra, or into two equal parts; and, accordingly, we find the sun twice every year in the equator: and all the rest of the year, either on the north or south side thereof.

The *ecliptic* is a great circle of the sphere, bisected by the horizon; consequently, the arch of the *ecliptic*, intercepted between the horizon and the meridian, is a quadrant. And again, the solstitial points of the *ecliptic*, i. e. those most remote from the equator, are a quadrant distant from the equinoctial ones. Lastly, as the greatest declination of the *ecliptic*, from the equator, is an arch of a great circle distant by a quadrant from the equinoctial points; it will be the measure, or quantity of the obliquity of the *ecliptic*, i. e. of the angle formed by the intersection of the equator with the *ecliptic*.

The obliquity of the *ecliptic*, or the angle wherein it cuts the equator, is usually fixed at $23^{\circ} 29'$; which, therefore, is the greatest declination of the *ecliptic* from the equator: the points of which greatest declination on each side, are called the *solstitial points*; through which are drawn the two tropics.

The method of observing the greatest declination of the *ecliptic* is thus: about the time of one of the solstices observe the sun's meridian altitude with the utmost care, for several days successively: from the greatest altitude observed, subtract the height of the equator. And the remainder is the greatest declination in the solstitial point.

Ricciolus, *c. gr.* at Bologna, in the year 1646, observed the sun's meridian altitude, on the 20th of June, to be $68^{\circ} 50' 55''$; on the 21st, $69^{\circ} 4' 10''$; and on the 22d, $68^{\circ} 50' 55''$. The greatest then was, $69^{\circ} 50' 10''$; from which the altitude of the equator $45^{\circ} 29' 50''$, being subtracted, left $23^{\circ} 30' 20''$ for the greatest declination.

It has been matter of great dispute among the late astronomers, whether the obliquity of the *ecliptic* be fixed or moveable? It is certain, the observations of the ancient astronomers represent it considerably greater, than those of the moderns; whence Purbachius, Reinholdus, Regiomontanus, Copernicus,

Rheticus, Longomontanus, Tycho, Snellius, Lansbergius; Bullialdus, and others, have concluded it variable.

To determine the point, the observations of the astronomers of all ages, have been collected together; the chief of which are: that of Pytheas, in the year before Christ 324, which makes it $23^{\circ} 52' 41''$; that of Eratosthenes, in 230, $23^{\circ} 51' 20''$; and that of Hipparchus, in the year before Christ 140, $23^{\circ} 51' 20''$; that of Ptolemy, in the year after Christ 140, $23^{\circ} 51' 20''$; of Albategnius in 880, $23^{\circ} 35'$; Regiomontanus, in 1460, $23^{\circ} 30'$; Waltherus, in 1476, $23^{\circ} 30'$; Copernicus, in 1525, $23^{\circ} 28' 24''$; Rothmannus and Byrgius, in 1570, $23^{\circ} 30' 20''$; Tycho, in 1587, $23^{\circ} 30' 22''$; Kepler, in 1627, $23^{\circ} 30' 30''$; Gassendus, in 1636, $23^{\circ} 31'$; Ricciolus, in 1646, $23^{\circ} 30' 20''$; Hevelius, $23^{\circ} 30' 21''$; Moisson, $23^{\circ} 30'$; and De la Hire, in 1702, $23^{\circ} 29'$.

Upon the whole, though the oldest observations make the obliquity the greatest, yet it appears to be immutable: for it was by mistake that Eratosthenes concluded, from his observations, the greatest declination to be $23^{\circ} 51' 20''$: from the same observations he should only have made it $23^{\circ} 31' 5'$; as is shewn by Ricciolus. And the like oversight has been found by Gassendus and Peirescius in the observation of Pythias; which mistakes of Eratosthenes and Pythias were retained by Hipparchus and Ptolemy; and gave occasion to the forementioned authors to conclude that the obliquity was continually decreasing.

Yet the Chevalier de Louville, who has examined the merits of the cause with great attention, is of another opinion: the result of his researches, he gives us in the memoirs of the Royal Academy, for the year 1716, viz. that the obliquity of the *ecliptic* diminishes at the rate of a minute in 100 years. The ancients, we know, had no regard to any refractions in their observations; and besides, they made the sun's horizontal parallax $9'$; whereas the modern astronomers scarce make it $10''$. These two inaccuracies have a very ill effect in their observations; which M. de Louville is obliged to free them of, before he can build on them.

According to an ancient tradition of the Egyptians, mentioned by Herodotus, the *ecliptic* had anciently been perpendicular to the equator: this notion they were led into, by observing, for a long series of years, that the obliquity was continually diminishing; of which amounts to the fame, that the *ecliptic* was continually approaching to the equator. For hence they took occasion to suspect that those two circles, in the beginning, had been as far off each other as possible. Diod. Siculus relates, that the Chaldeans reckoned 403000 years from their first observations to the time of Alexander's entering Babylon. This enormous account, may have some foundation, supposing the Chaldeans to have built on the diminution of the obliquity of the *ecliptic* of a minute in 100 years. M. de Louville, taking the obliquity such as it must have been at the time of Alexander's entrance into Babylon; and going back to the time when the *ecliptic*, at that rate, must have been perpendicular to the equator, actually finds 402942 Egyptian, or Chaldean years, which is only 58 years short of the former epocha. In the general, there is no way of accounting for the fabulous antiquity of the Egyptians, Chaldeans, &c. so probable, as from the supposition of long periods of very slow celestial motions, whereof they had observed a little part, and thence calculated the beginning of the period; making the world and their own nation to commence together. If M. de Louville's system be true, in 140000 years more, the *ecliptic* and equator must coincide and mix in one. The *ecliptic* is divided into twelve parts, called *signs*. See SIGN.

Poles of the ECLIPTIC. See the article POLE.

Reduction of the ECLIPTIC. See REDUCTION.

ECLIPTIC, in geography, &c. is a great circle of the globe, cutting the equator under an angle of $23^{\circ} 29'$. See GLOBE. The *terrestrial ecliptic*, therefore, is in the plane of the *celestial ecliptic*; like which it has its equinoctial and solstitial points, and is bounded by tropics.

ECLOGUE, ΕΚΛΟΓΗ, in poetry; a kind of pastoral composition, wherein shepherds are introduced conversing together. The *eclogue* is properly an image of the pastoral life: nor do we see what fineness it was that determined Sannazarus to put fishermen in lieu of shepherds, who had been time out of mind in possession of the *eclogue*.

The beauty of the *eclogue*, M. Fontenelle observes, is not attached to what is rural, but rather to what is calm, and easy in the rural life. Shepherds being agreeable personages, the poets abuse them; and provided they do but talk a little about reeds, and herbage, they conclude of course it is an *eclogue*.

There are *eclogues* in Theocritus of a lofty character; and Virgil has some in the sublime style; the *eclogue*, therefore, occasionally raises its voice. Yet M. Fontenelle esteems it a fault in some modern poets, to have put matters of high concern in their *eclogues*; and to have made their shepherds sing the praises of kings and heroes. Ronsard, in particular,

has made himself ridiculous, by giving the *eclogues* of Budaus and Varable in his first *eclogue*, from the shepherd Margot. Such folks should have been above the knowledge of the simple Margot. The sentiments, in *eclogues*, the same author observes, should be finer, and more delicate than those of real shepherds; only, their form should be as simple, and country-like as can be. But this simplicity excludes none but glaring, and excessive ornaments.

Since the establishment of the academy, or assembly of Arcadians at Rome, about the year 1690; the taste for *eclogues* has been greatly improved among the Italians. Those gentlemen, who are the flower of the wits of Italy, take the name of the shepherds of Arcadia, and will not allow their assembly to be treated as an academy. They have each of them a poetical name, which is always that of some shepherd; and apply themselves particularly to *eclogues*, as pieces most proper to their profession.

The learned Sig. Creffimbini, one of the founders of the assembly, who had long been custos, i. e. president thereof, and bore the name of Alpheibeo Cario, has wrote the laws and establishment of the society, with the names of all who had been admitted thereof, at the end of his book, entitled, *la Bellezza de la Volgar Poesie*.

The word *eclogue*, is formed from the Greek *ελογον*, choice. So that according to the etymology of the word, *eclogue* should be no more than a select or choice piece; but custom has determined it to a farther signification, viz. a little elegant composition in a simple, natural style and manner.

Idyllion and *eclogue*, in their primary intention are the same thing: thus, the idyllia, *ιδυλλια* of Theocritus, are pieces wrote perfectly in the same vein with the *eclogues* of Virgil. But custom has made a difference between them, and appropriated the name *eclogue*, to pieces wherein shepherds are introduced speaking; idyllion, to those wrote like the *eclogues*, in a simple, natural style, but without any shepherds in them. Some imagine the name *eclogue*, to have been originally attributed to such poems, as were wrote in imitation of others; such as the *eclogues* of Virgil, which are only imitations of Theocritus.

Others are of opinion, the word was first formed from *αἴ, αἴγες*, goat, and *λογος*, discourse, q. d. a conversation or discourse of goats, or goat-herds. But Ruzeus, in his notes on Virgil, thinks, they would then have made it *Αἰγολογια*, *ægology*, rather than *eclogue*; or, at least, the word would have been wrote in Greek with *αι*, and in Latin by *a*, not *e*. Barthius advances another opinion, viz. that the name *eclogue*, was given to all poetical compositions that were of a moderate length, though too short to give them the name of books; and that hence it is, that Statius, in the epistle at the head of the 11th book of his *Sylvæ*, and in the preface to his fourth book, calls his poems, *eclogues*; though he had not called them so in the title.

Ausonius, in the preface to his *Cupid crucified*, calls also his idylls, *eclogues*. Add, that Cruquius, in his comment on Horace, declares to have seen very ancient manuscripts, wherein the satyrs of the poet are called *eclogues*; in which he is seconded by our learned countryman Mr. Baxter.

ECLOGUE, is also applied to certain compositions in prose. Thus, we read of the *eclogues* of Diodorus, of Polybius, of Ctesias, Theophrastus, Strabo, &c. In which sense the word only signifies *extracts*, or *collection*.

ECPHORA, *Projeſture*, in architecture, usually denotes the line, or distance, between the extremity of a member, or moulding, and the naked of the column, or other part it projects from.

Some authors, however, account the *ecphora*, or *projeſture*, from the axis of the column; and define it to be the right line intercepted between the axis and the outermost surface of a member or moulding.

ECPHRACTICS *, *ΕΚΦΡΑΚΤΙΚΑ*, in medicine, such remedies as have a faculty of opening, and unstopping the vessels, through which the humours are to pass; or which incise, and attenuate tough, viscid humours, and thereby promote their discharge.—They are the same with *aperients* and *deobstruents*.

* The word is formed from the Greek *εκαφρακταις*, to free from obstructions; of *εκ* and *φρακταις*, *abstrao*, *sepio*.

The chief simple *ecphractics*, are the little centaury, wormwood, agrimony, hyssop, chamædrys, bark of tamarisk, roots of capers, scolopendrium, &c.

ECPIESMA, *ΕΚΠΙΕΣΜΑ*, in chirurgery, a kind of fracture of the skull, &c. wherein there are several splinters, that press and disorder the inner membranes. See **FRACTURE**.

ECTHESIS *, in church history, a name which the emperor Heraclius gave to a confession of faith published by him in 639.

* The word is Greek, *εκθεσις*, and signifies *exposition*.

The *Ecthesis* favoured the error of the Monothelites, and established only one will in Jesus Christ. Heraclius published it at the instigation of Athanasius, chief of the Jacobites, Cyrus patriarch of Alexandria, and Sergius patriarch of Con-

stantinople: but finding that the Roman church esteemed it heretical, he disowned it, and declared by another edict, which he spread throughout the east and west, that Sergius was the author of *Ecthesis*.

ECTHLIPSIS *, in the Latin prosody, a figure whereby an *m* is retrenched, or cut off, chiefly at the end of a word, when the following word begins with a vowel or an *h*.

* The word is Greek *εκθλιψις*, which signifies *elision*.

Thus in, *multum ille*, &c. In scanning the verse, we drop the *m* at the end of *multum*, and only make three syllables in the two words, *mult-il-le*.

Some account the *ecthipsis*, a poetical licence in the Latin verification, but in reality, the elision of an *m* final, when the following word in the same verse begins with a vowel, is a matter of necessity, not of licence.

Anciently, the *s* was likewise retrenched before a consonant; as *facundus* *juoque*, for *facundus*, &c. In effect, the *m* and *s*, were peculiarly rough and harsh in the Latin pronunciation; as appears from Quintilian: and it was this that led the poets to retrench them at the ends of their words; as the like cause did the French, to drop their *r* feminine before a word beginning with a vowel, to avoid the hiatus, or concurrence of vowels.

ECTHYMOSIS *, in medicine, a vehement agitation and dilatation of the blood and spirits; such as happens in extraordinary emotions of joy.

* The word is formed of *εκ*, *ex*, and *θυμος*, *animus*, mind.

ECTROPION, *ΕΚΤΡΟΠΙΟΝ*, in medicine, a disease of the eyes, consisting in a sort of inversion of the lower eye-lid, which disables it from covering its part of the eye.

ECTYLOTICS *, *ΕΚΤΥΛΟΤΙΚΑ*, remedies proper to consume, and eat of callus's, warts, and other excrescences formed on the flesh.

* The word is formed of *εκ*, and *τυλος*, *callus*.

ECTYPE *, *ΕΚΤΥΠΟΣ*, among medals, an imbossed figure, or impression of a seal, ring, or medal; or a figured copy of an inscription, or other ancient monument.

* The word is Greek: *εκτυπος*, denotes the original, or model: *εκτυπων*, the copy, or image, moulded or struck in brass: and *εκτυπον*, *ectypum*, the image in relief, or embossed.

In books of travels, we find abundance of *ectypes* of ancient inscriptions, of the Trajan column, of Chilmimar, &c.

ECU, or **ESCU**, the French crown. See the articles **CROWN**, and **ESCU**.

ECURY. See the article **EQUERY**.

ECUSSON, in heraldry, an inescutcheon, or little escutcheon. See **ESCUTCHEON**.

EDDISH, or **EADISH**, the latter pasture, or grass, which comes after mowing, or reaping: otherwise called *egrass*, *earsh*, and *etch*.

EDDY, in natural history, is when the water, at any place, runs back, contrary to the tide, or stream, and so falls into the current again.

The sea-men call that *eddy water* which falls back, as it were, on the rudder of a ship under fail, the *dead water*.

An *eddy wind*, is that which returns, or is beat back from any fail, &c.

EDELING. See **EDHLING**, and **ATHELING**.

EDGINGS, in gardening, rows of shrubs, herbs, or flowers, placed by way of borders, around beds, compartments, &c. For the *edgings* of compartments, box seems the most proper. They are frequently also made of aromatic plants, sage, sweet marjoram, thyme, lavender, hyssop, &c.

EDHLING, **EDHLINGS**, an ancient appellation of the nobility among the Anglo-Saxons.

The Saxon nation, says Nithard, *Hist.* l. IV. is divided into three orders, or classes of people; the *edlings*, the *frilingi*, and the *lazzi*: which signify the nobility, the freemen, and the vassals or slaves.

Instead of *edling*, we sometimes meet with *atheling*, or *ætheling*; which appellation was likewise given to the king's son, and the presumptive heir of the crown. See **ATHELING**.

EDICT, an instrument signed, and sealed by a prince, to serve as a law to his subjects.

Edicts have no room in England, where the enacting of laws is not lodged in the king, but in the parliament.

In the Roman law, we find frequent mention of the *edict* of the *prætor*, *quod prætor edixit*, which was a phrase consecrated to the ordinances of the *prætor*; though it was sometimes also used on other occasions.

In the French law, *edicts*, make a great figure: they are of various kinds: some importing a new law, or regulation, as the *edict* of duels, that of second marriages, &c. Others the creation of new offices, establishment of duties, rents, &c. Sometimes articles of pacification, as the *edict* of Nantz, &c.—*Edicts* are all sealed with green wax, to shew that they are perpetual and irrevocable.

Edicts with them, are much the same as proclamations with us, but with this difference, that the former have the authority of a law in themselves, from the power which issues

issues forth; whereas the latter are only declarations of a law, to which they refer, and have no power in themselves.

Chamber of the EDICT. See the article **CHAMBER**.

EDIFICE *, **EDIFICIUM**, a building. See **BUILDING**.

* The word is formed of the Latin, *ædus*, and *facio*, I make.

EDILE, or rather **EDILE**. See the article **EDILE**.

EDITOR, in the common-wealth of learning, a person who takes care of publishing the work of another author; usually, an ancient author: for *editor* is neither properly applied to a working printer, nor to an author who prints his own works.

Erasmus was a great *editor* of ancient writings: the Lovain doctors, Scaliger, Petavius, Fa. Sirmond, bishop Walton, Mr. Hearn, &c. are learned *editors*.

EDUCATION, the art of bringing up, forming, and instructing children.

The follies of a too delicate *education*, are well expressed in that device of an ape, which by over caressing and hugging its young ones, strangles them; with this motto, *completando necat*. Oclavius Ferrarius, has a very good Latin treatise on the subject of *education*, entitled *Chiron*; the name of the centaur, who was Achilles's tutor.

Mr. Locke's excellent treatise of *education*, is known to every body. Quintilian employs the second chapter of his first book, in enquiring whether a domestic, or a college *education*, be preferable, i. e. whether it be better to bring up ones children at home, or to send them to the colleges, and public schools. After urging all that can be said on either side, he concludes for a college, or school *education*.

EDULCORATION, in pharmacy, is the dulcifying, or sweetening of any food, or remedy, by means of honey, sugar, or syrups.

EDULCORATION, in chemistry, denotes the freshning, or purging any thing of its salts, by repeated lotions, or washings in cold water.

Such is the dulcifying of the precipitates of mercury, metals, &c. by washing away those sharp salts, by whose means they had been dissolved, or which had been mingled with them, to effect a dissolution. See **ABLUTION**.

EEL Fishing. See the article **FISHING**.

EFFARE, or **EFFRAYE**, in heraldry, a term applied to a beast, when rearing on its hind legs, as if it were affrighted.

EFFECT, the result, or consequence, of the application of a cause, or agent, on some subject.

It is one of the great axioms of philosophy, that full or adequate *effects*, are always proportionable to the powers of their causes.

EFFECT is also of some further import in the arts: As when we say, in painting and architecture, that such a contralt, or such a drapery, or such an attitude, draw him backwards, and shifting it out of the right hand into the left, or *vice versa*, i. e. are beautiful, or noble, &c. Too many breaks, and little enrichments in a building, have a pitiful *effect*, i. e. they give it a mean aspect.

EFFECT, in the manage, is applied to the motions of the hand, which direct the horse.

They distinguish four *effects* of the hand, viz. in using the bridle to put a horse forwards, draw him backwards, and shifting it out of the right hand into the left, or *vice versa*.

EFFECTS, in commerce, &c. the goods possessed by any person, whether moveable, or immovable: particularly those which merchants and dealers acquire by trade.

The *effects* of merchants are usually distinguished into three classes, good, bad, and doubtful: by an ordinance of the French court in 1673, every merchant is obliged to take an inventory, or review every year, of all his *effects* of every kind.

Vacant EFFECTS. See the article **VACANT**.

EFFECTIONS, in geometry, the geometrical constructions of propositions.

The term is also used in reference to problems and practices; when they are deducible from, or founded upon, some general propositions, are called the *geometrical effections* thereof.

EFFERVESCENCE, is popularly used for a light ebullition; or a brisk intestine motion, produced in a liquor, by the first action of heat, without any notable separation of its parts.

EFFERVESCENCE, in chemistry, is not applied to all ebullition, or motions produced by fire; but only to those resulting from the mixture of bodies of different natures, which by their acting on one another, occasion a heat, resembling the ebullition, or boiling produced by fire.

Acids, mixed with alkalies, e. gr. oil of tartar, and spirit of vitriol, produce an *effervescence*, &c.

Chauvin defines *effervescence* more scientifically, to be a violent expulsion of the air, out of the pores of the particles of one body, by the intrusion of the particles of another body mixed therewith, into those pores before possessed by air.

VOL. I.

In order for *effervescence* to take place, the particles of the latter body must be supposed conformable, both in bulk and figure, to the pores of the other; so that they may enter, and fill the same, like wedges: And beside there must be a strong degree of attraction between the particles of the two bodies, stronger than the attraction, or force of cohesion, between the particles of either of the bodies alone.

Hence 't should seem, that *effervescence* only differs from fermentation, in the degree of explosion; which in *effervescence*, by reason of the greater purity and freedom of the acid and alkali, is greater than in fermentations.

Of *effervescences*, some are hot, and others cold. Of the first kind, are those produced by mixture of oil of tartar per deliquium, with spirit of vitriol; quicklime with cold water; all acid spirits, with alkaline, or earthy bodies; aqua fortis, spirit of vitriol, spirit of nitre, aqua regia, &c. with metallic bodies, marcasites, and minerals; coral, with lemon, or orange juice; marble with spirit of salt; chalk, grasses, mother of pearl, and all shells with acids. In all which, the *effervescences* are attended with a more or less intense heat. Oil of vitriol, and oil of turpentine, particularly mixed together, produce such a vehement heat, that unless they be mixed drop by drop, they are apt to burst forth into a flame, and break the vessel.

Powdered coral, mixed with distilled vinegar, produces a cold *effervescence*, which the same philosophers account for hence, that the pores of the coral being very great, it may be easily dissolved in the acid spirit, without any great friction, or collision of the parts, such as would be necessary to generate any considerable heat.

An *effervescence* may also be produced by the mixture of many other cold liquors: See **DISSOLUTION**.

EFFICACIOUS, **EFFECTUAL**, in theology. Within these 150 years there have been great disputes on the subject of *efficacious* grace. Grace is usually divided into sufficient, and *efficacious*; though the Janesists hold, that there is no grace sufficient, but what is *efficacious*, i. e. but what effectually determines the will to act.

Efficacious grace, is that which enlightens the mind, and touches the heart, in such manner, as always to produce its effect, however it be opposed, or resisted by the will. See **GRACE**.

Some divines maintain, that *efficacious* grace is *efficacious* of it self. *Efficacious* grace of it self, if there be any such thing, is that which produces its effect merely of it self, and not in virtue of any consent of the will. Calvin, is the first that used the term *gratia efficax per se*, grace *efficacious* of it self.

A late divine holds the *efficacy* of grace in it self to consist in this, that *efficacious* grace is always joyned with a moral necessity of doing the thing it inclines to; and sufficient grace, joyned with a moral impotence of doing it.

The Arminian and Popish way of conceiving the necessity of *efficacious* grace, is to hold that this grace is never wanting, at least to the righteous, except through their own default; that they always stand in need of other inner graces, truly and properly sufficient, in order to draw down this *efficacious* grace; and that these do infallibly draw it down, when they are not rejected, though they often remain without effect, by reason men resist, instead of yielding their consent thereto.

F. Malebranche maintains, that the mutual commerce between soul and body, i. e. life, has no other vinculum, or principle, but the *efficacy* of God's decrees: And that second causes have no proper *efficacy*, &c.

EFFICIENT, in philosophy. An *EFFICIENT* cause is that which produces an effect. See **CAUSE**, and **EFFECT**. Philosophers usually distinguish four kinds of causes in nature: the efficient, final, formal, and material. See each under its proper article.

The school philosophers are exceedingly divided as to the nature and essence of an *efficient* cause. Aristotle defines it, *id unde*, that from which; or, the first principle of changes, and rest, i. e. of production and conservation.

The *efficient* is called *id unde*, that from which; as the end or final cause, is that *propter quod*, for which; the exemplar, *ad quod*, that to which; the matter, *ex quo*, that out of which; and the form, *per quod*, that by which.

It is called the first principle, not in respect of priority of time, for the end exerts its causality before the *efficient*, but of dignity; the *efficient* being a physically active principle; and the end only acting objectively.

Others of the schoolmen define *efficient* to be *principium per se influens in aliud sine mutatione sui*. The Ramists, after Plato and Cicero, define an *efficient* to be that, a *qua res est*, from which a thing is: To which a great author, objecting that a thing may also be from its end, adds, that an *efficient* is that, a *qua res vera causalitate proficiscitur*.

Others define *efficient* to be, *quæ per actionem causat*, that which causes by acting: for to effect, every body knows, is

EFF

to act; and hence neither a procatartic, nor an exemplary cause, are properly *efficient*, though usually ranked among them.

Lastly, others define an *efficient* to be a cause, *a qua aliud producat*, from which something is produced; consequently, what arises from such a cause, is called an *effect*: and thus God is the *efficient* cause of the world; and the world the effect of God. To which definition of an *efficient*, all the former definitions are reducible.

An *efficient cause* then, is either physical, as fire is the *efficient* cause of heat; or moral, as an adviser is the cause of a murder; or universal, which in various circumstances produces various effects, as God and the sun; or particular, as a horse, which produces a horse; or univocal, which produces an effect like itself, as a horse begets a horse; or equivocal, according to the old doctrine, as the sun producing a frog; or natural, which acts not only without precept, in opposition to artificial, but also from within, and according to its own inclination, in opposition to violent, as fire acts when it warms; or spontaneous, as a dog eating; or voluntary and free.

Others consider *efficient* causes, either as principal, or as instrumental. Others, either as next, or remote; or as mediate or immediate. Others, in fine, divide *efficient* causes, among all the kinds of beings, natural and super-natural; spiritual and corporeal; substantial and accidental; vital and not vital, &c.

But the most celebrated division of *efficient*, is that into *first* and *second*.

A *first efficient* cause, is that between which and the effect there is some necessary connection. Of which kind there is none but God alone.

A *second efficient* cause is that from which an effect follows in consequence of the will, or constitution of the creator; and which the Cartesians call an *occasional cause*.

But these precarious, or occasional causes are, in reality, no causes at all, but only antecedent effects.—This is easily shewn: For, 1. All action, at least all corporeal action, is contained in motion; but motion can only result from the first cause: it being an allowed principle, that body of it self is inert and inactive. The true cause of motion, therefore, is a spiritual not a corporeal nature. But neither can a finite, spiritual nature, be the chief cause of motion; for there is no necessary connection between the will, *e. gr.* of an angel, and the motion of a body, nor between that of any other being except God. Thus, when an angel wills, a stone moves; by reason God has constituted such a law between the will of the angel, and the motion of the stone: And thus we move our hands when we please. Not that the soul is the principal cause of such motion, but only the occasional cause.

EFFICIENTS, in arithmetic, the numbers given for an operation of multiplication; called also the *factores*. See **FACTOR**, **COEFFICIENT**.

The *efficient* are the multiplicand and multiplier.

EFFIGY, **EFFIGIES**, a portrait, or representation of a person to the life. See **PORTRAIT**.

Kings are shewn in *effigy* in their state beds.

EFFIGY, is also used for the print, or impression of a coin, representing the prince's head who struck it.

To execute or degrade in **EFFIGY**, denotes the execution, or degradation of a condemned, contumacious criminal, who cannot be apprehended, or seized.

In France they hang a picture on a gallows, or gibbet, wherein is represented the criminal, with the quality, or manner of the punishment: at bottom is wrote the sentence, or condemnation.—It is only sentences to death, that are executed in *effigy*.

EFFLORESCENCE, a breaking out of humours in the skin: as in the measles, or the like. See **EXANTHEMA**.

EFFLUVIUM, a flux, or exhalation of minute particles from any body: or an emanation of subtle corpuscles, from a mixed, sensible body, by a kind of motion of transpiration.

That there are such *effluvia*, continually emitted from all bodies, is pretty certain: Thus, if a body be immersed in water, or any other humid matter, little bubbles are continually transmitted therefrom to the surface of the water; which are supposed to be nothing else but little particles, detached from the solid body; and which, when they arrive at the surface, emerge in form of bubbles. And thus a body, placed in the receiver of an air pump, is seen, as it were, in a kind of effervescence, by reason of the external particles continually flowing from the same.

Odoriferous bodies, every one knows, are continually emitting substantial *effluvia*; by means whereof it is, that they excite in us the sense of smelling. These minute *effluvia* are sometimes perceived by the eye, in form of fumes and vapours.

The school philosophers hold these *effluvia* to be intentional qualities, as they call them, and nothing substantial; but the moderns laugh at the notion, as finding that these *effluvia* refresh and nourish both the animal and vital spirits.

EGG

Some bodies are found to emit *effluvia* for a great number of years, without any considerable loss, either as to bulk or weight; as magnets, electrical bodies, ambers, and diverse odorous bodies, the tenuity of whose emanant corpuscles is incredible: not but that the loss they sustain by the continual emission of *effluvia*, may be made up to them by the reception of other similar *effluvia* of the same kinds of bodies, diffused through the air.

It is added, that these *effluvia* are emitted in manner of *radii*, rays, *in orbem*, and that the circumference or bound of the activity of the radiation, exhibits the same figure as is that of the radiant. This the astronomers sufficiently prove, from the ratio of the refraction of the atmosphere. For the law of the emission of these *effluvia*. See **QUALITY**.

That *effluvia* may considerably operate upon, and have great effects on bodies within the sphere of their activity, is proved by Mr. Boyle, in an express treatise on the *subtlety* of *effluvia*; where he shews, 1. That the number of corpuscles, emitted by way of *effluvia*, is immensely great. 2. That they are of a very penetrating nature. 3. That they move with vast celerity, and in all manner of directions. 4. That there is frequently a very wonderful congruity, or incongruity in the bulk and shape of these *effluvia*, with the pores of the bodies they penetrate into and act upon. 5. That in animal and organic bodies, particularly, these *effluvia* may excite great motions of one part of the frame upon another, and thereby produce very considerable changes in the economy. Lastly, That they have sometimes a power of procuring assistance in their operations from the more catholic agents of the universe, such as gravity, light, magnetism, the pressure of the atmosphere, &c.

That *effluvia* are emitted to very great distances, we have a notable proof in this: That our wines grow turbid in the hogheads and bottles, precisely at the same time when the grapes are at their maturity in other remote countries, whence the wine was imported. Beside, that odoriferous *effluvia* are, in many cases, perceived at the distance of many leagues. Again, that the generality of *effluvia* retain the proper colour, smell, taste, and other properties, and effects of the bodies whence they proceeded, and this even after they have passed through the pores of other solid bodies, we have abundant proof: Thus, magnetical *effluvia* penetrate all, even the most solid bodies, without any change of their nature, or loss of force. And the same we see confirmed in sympathetic inks, and powders, and in the sagacity of blood-hounds, &c.

EFFLUXION, a flowing out, from *ex*, out of; and *fluere*, to flow.

EFFUSION, the pouring out of any liquid thing with some degree of force.

In the ancient heathen sacrifices, there were diverse *effusions* of wine, and other liquors; called *libations*. When our princes conclude a treaty of peace, they usually pretend it is to prevent the *effusion* of christian blood.

EFFUSION, or **FUSION**, in astronomy, denotes that part of the sign Aquarius, represented on celestial globes and planispheres, by the water issuing out of the urn of the water-bearer. See **AQUARIUS**.

EGG, in natural history, a part formed in the females of certain animals; which, under a shell or cortex, includes an embryo or fetus, of the same species; the parts whereof are afterwards displayed and dilated, either by incubation or by the accession of a nutritious juice.

The species of animals that lay *eggs*, are particularly denominated *oviparous*; and the part wherein the *egg* is formed, the *ovary*.

Of the various kinds of *eggs*, those of hens, or pullets, being the most usual, and which have been the most observed, we shall say somewhat of the structure thereof, and the generation of the chick therein.

The exterior part, then, of a hen's *egg* is the shell; a white, thin, friable cortex, including all the other parts, and defending them from injuries. Immediately under the shell lies the *membrana communis*, which lines the whole cavity of the shell, adhering pretty closely to it, except at the bigger end, where a little cavity is left between them, which with age grows bigger. Under this membrane are contained two albumina, or whites, each wrapped up in its own membrane. In the middle of the inner white, is the vitellus, or yolk inclosed likewise, in its separate involucre, or cover. The outer albumen is oblong or oval, accommodated to the figure of the shell: The inner is spherical, and of a more crasis, and viscid substance; and the yolk is of the same figure.

At each end is a chalaza, which are, as it were, the poles of this microcosm: these are white, dense bodies, consisting each of three little globules like hail joined together: by these not only the several membranes are connected, or knit together, by which means the several liquors are kept in their proper place and position to each other; but they serve also to keep one and the same part of the yolk uppermost, let the *egg* be turned which way it will.

About

About the middle, between the chalazæ, on the side of the yolk, and in the membrane thereof, is a little vesicle or bladder, not unlike a vetch, or lentil, called the *ciatricula*, and by some the eye of the egg. In this vesicle is contained a humour, in, and of which the chick is generated.

All these parts of a pullet's egg, are found in all other eggs, to which the definition of an egg properly and strictly agrees: such egg being that, of a part whereof the animal is formed, the rest serving for its food. Accordingly, the first feed, or flamen of the chick, is in the *ciatricula*.

The albumen is the nutritious juice, whereby it is distended and nourished till it become big; and the yolk serves it for food after it is well grown, and partly also after it is hatched. For, a good part of the yolk remains after exclusion; being received into the chicken's belly, as a store-house, and conveyed thence by the appendicula, or ductus intestinalis, as by a funnel, into the guts, serving instead of milk.

An Egg, improperly so called, is that of the whole whereof the animal is formed: such are the eggs of flies, butterflies, &c. which Aristotle calls *vermiculi*.

The two have this further difference, that whereas the former, after they are excluded from the female, need no external nutriment, nor any thing but warmth and incubation, to bring the fœtus to perfection: the latter, after they are fallen out of the ovary into the uterus, require the nutritious juices of the uterus to distend and enlarge them; whence they remain much longer in the uterus than the other.

The principal differences among eggs properly so called, are, that some are *perfect*, i. e. have all the parts above described, while in the ovary, or uterus; and others, *imperfect*, as not having all those parts till after they are excreted or laid; such are the eggs of fishes, which after they are brought forth, assume an albumen to themselves in the water.

Another difference is, that some are *fœcundated*, and others not: the first are those which contain a sperm, injected by coition of the male, to dispose them for conception: the rest, not impregnated with this sperm, never breed young by any incubation, but always putrify.

An egg fœcundated, contains the rudiments of the chick, before ever the hen have fate upon it. By the microscope we see, in the middle of the *ciatricula*, the plain carina of the chick, swimming in the liquor or humour; it consists of fine white zones, or threads, which the warmth of future incubation enlarges, by rarifying and liquifying the matter first of the albumen, and then of the vitellus, and pressing them into the vessels of the *ciatricula*, for a further preparation, digestion, assimilation, and accretion; till the chick, too big for its coverle, breaks the shell, and is delivered.

It was anciently thought, that none but birds and fishes, with some other animals, were produced, *ab ovo*, from eggs; but the generality of the moderns incline to think, that all animals, even man himself, is generated the same way. Harvey, de Graaf, Kerckringius, and several other great anatomists, have so strenuously asserted this opinion, that it now generally obtains.

In the testes of women, are found little vesicles, about the size of green peas, which are accounted as eggs; for which reason, these parts, which the ancients called *testicles*, the moderns call *ovaries*. These eggs, fœcundated by the most volatile and spirituous part of the seed of the male, are detached from the ovary, and fall down the fallopian tubes into the uterus, where they grow and increase.

This system is countenanced and confirmed by abundance of observations and experiments. M. de S. Maurice, upon opening a woman at Paris; in 1682, found a fœtus perfectly formed in the testicle.

M. Olivier, a physician at Brest, attests, that in the year 1684, a woman, pregnant seven months, was brought to bed of a whole plate full of eggs, fastened together like a bunch of grapes, and of various sizes, from that of a lentil, to that of a pigeon's egg. Wormius assures us, that he had himself seen a woman who had laid an egg. And Bartholin confirms him, Cent. I. Hist. Anatom. IV. p. 11. The same author tells us, he knew a woman at Copenhagen, who, after twelve weeks conception, was delivered of an egg wrapped up in a soft shell. Lanzoſus, Dec. II. An. ix. Obf. 38. p. 73. of the *Curiosi Nature*, relates the same thing of another woman seven weeks gone: the egg she brought forth was of a size between that of a hen and a pigeon; and he adds, was covered with membranes instead of a shell. The outer membrane, or chorion, was thick and bloody; and the inner, or amnios, thin and transparent, including a whitish humour wherein the embryo swam fastened by umbilical vessels, like threads of silk.

Bonetus, in a letter to Zuingerus, published in the ephemerides of the *Curiosi Nature*, Dec. II. An. 2. Obf. 186, p. 417. relates that a young maid had cast forth a great number of

little eggs. Con. Virdungius observes, that in distilling a woman who had a rupture, he found eggs of diverse sizes in the cornua of the womb. Lastly, we meet with diverse instances of the same thing in Rhodius, Cent. III. Obf. 57. and in several places of the memoirs of the *Curiosi Nature*. Inſomuch that Berger in his treatise de *Natura humanæ*, L. II. C. I. p. 461. makes no scruple to give it as his opinion, that the only difference between animals, called *oviparus*, and those denominated *viviparus*, consists in this; that the former cast their eggs out of the body, and lay them in nests; and that their eggs contain all the nourishment requisite for the fruit, or fœtus: whereas in the latter, the eggs are only layed from the ovary into the uterus; that they have but little juice; and that the mother furnishes the rest.

There is not so much as a plant, whose generation according to the sentiment of Empedocles, and since him of Malpighi, Rallius, Fabric. de Aquapendente, Grew, and others, is not effected by the way of eggs.

On the other hand, we have numerous instances of *oviparus* animals sometimes producing their young absolutely alive, and without eggs. Such instances we have of a crow, a hen, serpents, fishes, eels, &c. See Librod. ab Amelancxen, *Breviar. Memorabil.* N. 28. in *Append. Ephem. Curios. Nat. Dec. II. An. 4. p. 201.* Lyserus, *Obf. VI. Aldrovand. Hist. Serp. & Dracon.* p. 309. Seb. Nuremberg, *De Mirac. Naturæ in Europ.* C. 41. Franc. Paulin de Anguilla, S. I. C. 2. &c.

But this is not all: Naturalists tell us of instances of males, and even men, casting out eggs by the fundamen. The thing will look too odd to an English reader, that we might be censured, were we to relate the various accounts of this kind in form. We shall therefore, content ourselves to refer the reader, who has curiosity enough that way, to the authors and places where he may meet with them, viz. Chiff. Paulin. *Cynograph. Curios.* Sect. I. L. 3. §. 56. *Ephem. Nat. Curios.* Dec. II. A. 8. Obf. 117. p. 261. and Dec. I. An. 2. Obf. 250. and Dec. II. An. 4. *Append. p. 199.* Schenck. *Hist. Monst.* p. 129, &c.

M. Stollerfoht is of opinion, that at least, in some of these cases, what was taken for eggs might be no more than certain aliments ill digested, and coagulated; an instance of which he himself had seen. As to those of women, Wormius and Fromann, L. III. de *Fœcundat. P. VI. C. 20. §. 9. p. 882.* take it for the effect of the devil: but Bartholin and Stollerfoht treat this notion, as it deserves, with derision.

Gouffet, de *Causis Lingue Hebræicæ*, explodes the modern system of generation *ab ovo*, as contrary to scripture: and others imagine they have seen the animal alive, and formed in the seed of the male.

Malpighi, has made very curious observations with the microscope, of all the changes that happen in the egg, every half hour of incubation. Vossius, and diverse other authors, are very solicitous about settling the question, which was formed first, the egg or the pullet? de *Idol.* L. III. C. 78.

In Egypt, they hatch their eggs by the heat of a furnace, or oven; and frequently have seven or eight thousand chickens come forth at a time. An account of the method hereof we have in the *Philosophical Transactions*.

At Tonquin, they are said to keep eggs entire for the space of three years, by covering them up in a paste made of ashes and brine. The tortoise is said to lay no less than fifteen hundred eggs, which she covers in the sand, and leaves the sun to hatch them; and the eggs of the ostrich are hatched after the same manner. Willugh. *Ornithol.* L. II. C. 8. §. 1.

In the *Acta Erudit. Lips.* An. 1683. p. 221. mention is made of a hen's egg, in all respects like the common ones, in the middle whereof was found another, of the size of a pigeon's egg.

Eggs with double shells, are no unusual phenomenon. Harvey is very large on the rationale of these appearances, in his treatise de *Generation. Animal.*

Among the ancients, the egg was the symbol of the world; it being a tradition among them, that the world was made of an egg; whence eggs became of singular importance, in the sacrifices of Cybele, the mother of the Gods. Some of their deities they said were likewise produced from eggs.

Wind Egg, See the article *WIND Egg*.

Cow Egg, is a name which some authors give to a kind of bezoard, found in the stomachs of the cow kind.

Egg, in architecture, an ornament of an oval form, cut in the echinus, or quarter-round, of the Ionic and composite capitals. The profile, or contour of the echinus, is enriched with eggs and anchors, alternately placed.—See *Tab. Archit.* fig. 10.

Philosophical Egg in chemistry. See *PHILOSOPHICAL. EGUISCE*.

EGUISCE'. See the article ARGUISCE'.

EGYPTIANS, in our statutes, a counterfeit kind of rogues, who, being English, or Welsh people, disguise themselves in uncouth habits, sneering their faces and bodies, and framing to themselves an unknown, canting language, wander up and down; and under pretence of telling fortunes, curing diseases, &c. abuse the common people, trick them of their money, and steal all that is not too hot, or too heavy for them.—See several statutes made against them, 28 Henry VIII. c. 10. 1 and 2 Phil. & Mar. C. 4. 5 Eliz. C. 20.

The origin of this tribe of vagabonds called *Egyptians*, and popularly *Gipsies*, is somewhat obscure; at least the reason of the denomination is so. It is certain, the ancient Egyptians had the character of great cheats, and were famous for the subtilty of their impostures; whence the name might afterwards pass proverbially into other languages; as it is pretty certain it did into the Greek, and Latin. Or else, the ancient Egyptians, being much versed in astronomy, which in those days was little else but astrology, the name was on that score assumed by these *disseurs de bonne aventure*, as the French call them, or tellers of good fortune.

Be this as it will, there is scarce any country of Europe but has its *Egyptians*, though not all of them under that denomination: the Latins call them *Aegyptii*; the Italians, *Cingari* and *Gingari*; the Germans, *Zigeuner*; the French, *Bohemians*; others, *Saracens*; and others, *Tartars*, &c.

Munster, *Geogr. L. III. c. 5.* relates, that they made their first appearance in Germany, in 1417, exceedingly tawny and sun-burnt, and in pitiful array; though they affected quality, and travelled with a train of hunting dogs after them, like nobles. He adds, that they had passports from king Sigismund of Bohemia, and other princes. Ten years afterwards they came into France, and thence passed into England. Pasquier, in his *Recherch. L. IV. c. 19.* relates the origin of the Gipsies, thus: on the 17th of April 1427, there came to Paris twelve penitents, or persons, as they said, assigned to penance, viz. one duke, one count, and ten cavaliers, or persons on horseback: they took on themselves the character of *christians of the lower Egypt*, expelled by the Saracens, who having made application to the pope, and confessed their sins, received for penance, that they should travel through the world for seven years, without ever lying in a bed. Their train consisted of 120 persons, men, women and children, which were all that were left of 1200, who came together out of Egypt. They had lodgings assigned them in the chapel, and people went in crowds to see them. Their ears were perforated, and silver buckles hung to them. Their hair was exceedingly black and frizzled; their women were richly, thievishly, and pretenders to telling of fortunes. The bishop soon afterwards obliged them to retire; and excommunicated such as had shewn them their hands.

By an ordonnance of the estates of Orleans, in the year 1560, it was enjoined all these impostors, under the name of *Bohemians* and *Egyptians*, to quit the kingdom on penalty of the galleys. Upon this they dispersed into lesser companies, and spread themselves over Europe. The first time we hear of them in England, was three years afterwards, viz. anno 1563. Raph. Volaterranus making mention of them, affirms that they first proceeded or strolled from among the Uxii, a people of Persis, or Persia.

EGYPTIAN-year. See the article YEAR.

EJACULATION, in medicine, the act of emitting seed; from the Latin *ejaculari*, to cast outwards. See EMISSION. To evince a man's virility, in a court of justice, where he is accused of impotency, it is required he give evidence of erection, intromission, and ejaculation.

EJACULATOR, in anatomy, a name applied to two muscles of the genitals, from their office in the ejaculation of the seed.

The *ejaculatores* arise from the sphincter of the anus, and advance along the urethra, as far as the middle thereof; where they are inserted laterally.

The same denomination is likewise given two muscles of the clitoris, which arising from the sphincter ani, advance laterally along the labia, and are inserted aside of the clitoris.

EJACULATORY, in anatomy, is a term applied to two little ducts, or canals, arising from the vesiculae seminales. The *ejaculatory* ducts are about an inch in length: towards the vesiculae, they are pretty wide; but they contract themselves as they approach towards the urethra, which they penetrate together.

Some authors also apply the name *ejaculatory* to the vasa deferentia.

EICETÆ, called also HEICETÆ, and HICETÆ, heretics of the VIIth century, who made profession of the monastic life. From that passage in Exodus, where Moses and the children of Israel are said to have sung a song in praise of the Lord, after they had passed the Red Sea wherein their enemies had perished; the *eiectæ* concluded, that they must sing and dance, to praise God aright: and as Mary the prophetess, sister of Moses and Aaron, took a drum in her hand, on the same occasion;

and all the women did the like, to testify their Joy, by playing, beating, and dancing, the *eiectæ*, the better to imitate their conduct herein, endeavoured to draw women to them to make profession of the monastic life, and assist in their mirth.

EJECIT *infra terminum*. See QUARE *ejecit*.

EJECTION, the act of throwing out, or discharging any thing at some of the excretories; as by stool, vomiting, or the like.

EJECTIONE *firmæ*, a writ which lies for the lessee for years who is ejected before the expiration of his term, either by the lessor, or a stranger.

FIGHT, *piece of*. See PIECE of eight.

EIGHT pair of nerves. See the article NERVE.

FIRE, in law. See the article EYRE.

ELABORATION, the act of finishing, or perfecting any thing with labour, and time.

The term is chiefly used in medicine, where the chyle, blood and semen, are said to be *well elaborated*, when they are well conditioned, have undergone all the secretions, mixions, impregnations and circulations necessary to bring them to perfection.

If the chyle went directly from its receptaculum to the breasts, it would not be sufficiently *elaborated* to afford good milk. See MILK.

ELABORATORY. See the article LABORATORY.

ELASTIC * *body* is that, which by being struck, or stretched, has its figure altered; but endeavours, by its own force, to resume the same.—Or, it is a springy body, which when compressed, condensed, or the like, makes an effort to set it self at liberty; and to repel the body that constrained it.—Such is a sword-blade, a bow, &c. which are easily bent, but presently return to their former figure and extension.

* The word is formed from the Greek, *elastis*, *impulsor*, of *elastum*, to impell, push, &c. See SPRING.

Elastic bodies are either *natural*, or *artificial*: those most eminent for their elastic power among *artificial* bodies, are steel, brass, ivory, and marble balls; leathers, skins, membranes; brass, silver, iron, and steel chords or wires; nerves, guts, hemp and flax strings, &c.

Amongst *natural bodies*, the principal are air, sponges, the branches of green trees, wool, cotton, feathers, &c.—It is disputed, whether or no water have any *elastic* force: the most common opinion is, that it has none of it self; and that if it shew any, it is owing to the air contained therein.

The principal phenomena observed to obtain in *elastic bodies*, are, 1. That an *elastic body*, (i. e. a *body perfectly elastic*, if any such there be) endeavours to restore it self with the same force wherewith it is pressed or bent. Thus, whatever force is applied to bend a bow, with the same force it strives to unbend it self, or return to its natural state. For the force, wherewith the string is drawn, is the same with that which resists the draught; the bow being bent so long, till the force applied, and that which resists it, are in equilibrio.

2. An *elastic* body exerts its force equally towards all sides; though the effect is found chiefly on that side where the resistance is weakest: as is evident in the case of a bow shooting out an arrow; a gun exploding a ball, &c.

3. *Elastic bodies*, in what manner soever struck, or impelled, are inflected, and rebound after the same manner. Thus a bell yields the same found in what manner, or on what side soever it be struck.

4. A body perfectly fluid, if any such there be, cannot be *elastic*; by reason its parts cannot be compressed. See FLUID.

5. A body perfectly solid, if any such there be, cannot be *elastic*; in that having no pores, it is capable of being compressed. See SOLID.

6. Hard, long, flexible bodies, apt to acquire *elasticity*, do it chiefly in three manners; either by being extended, by being contracted, or by being bent.

7. Bodies, in dilating themselves by their *elastic* power, exert a greater force at the beginning of their dilatation, than towards the end thereof. By reason the bodies are more compressed at first; and the renitency is always equal to the compression.

8. The motion, whereby compressed bodies restore themselves, is usually an accelerated motion.

For the laws of motion and percussion in *ELASTIC* bodies, see MOTION, and PERCUSSION.

ELASTICITY, or *ELASTIC force*, in physics, a property or power, in natural bodies, which denominates them *elastic*; and by which they are restored to the figure, and extension they had lost from any external cause. See *ELASTIC body*.

The cause, or principle, of this important property *elasticity*, or springiness, is variously assigned: the Cartesians account for it from the materia subtilis making an effort to pass through pores that are too narrow for it. Thus, say they, in bending, or compressing, a hard, elastic body, *e. gr.* a bow, its parts recede from each other on the convex side, and approach on the concave: consequently the pores are contracted or streightened on the concave side; and if they were before round,

round, are now, for instance, oval: so that the materia subtilis, or matter of the second element, endeavouring to pass out at those pores, thus frightened, must make an effort, at the same time, to restore the body to the state it was in when the pores were more patent and round, *i. e.* before the bow was bent: and in this consists its *elasticity*.

Other later, and more wary philosophers, account for *elasticity* much after the same manner as the Cartesians; with this only difference, that in lieu of the subtil matter of the Cartesians, these substitute æther, or a fine ethereal medium, that pervades all bodies.

Others, setting aside the precarious notion of a materia subtilis, account for *elasticity* from the great law of nature, attraction, or the cause of the cohesion of the parts of solid and firm bodies.

Thus, say they, when a hard body is struck or bent, so as the component parts are moved a little from each other, but are not quite disjoined, or broke off, or separated so far as to be out of the power of that attracting force whereby they cohere; they must certainly, on the cessation of the external violence, spring back to their former natural state.

Others resolve *elasticity* into the pressure of the atmosphere: for a violent tension, or compression, though not great enough to separate the constituent particles of bodies far enough to let in any foreign matter, must yet occasion many little vacuola between the separated surfaces; so that upon the removal of the force they will close again, by the pressure of the aerial fluid upon the external parts.

Lastly, others attribute the *elasticity* of all hard bodies to the power of resiliens in the air included within them. And so make the *elastic force* of the air, the principle of *elasticity* in all other bodies.

Laws of ELASTICITY.—To enquire a little more expressly into the nature and laws of *elasticity*, we shall consider the phenomena thereof. Let it be premised, then, that all the bodies wherein this power is observed, do consist, or may be conceived to consist, of small threads, or fibres, which, laid together, constitute such bodies. To examine *elasticity*, therefore, in its most simple case, we had best consider it in musical strings, or chords, and particularly in those of metal; for those of cat-gut, having a spiral twist, cannot be considered as the fibres whereof bodies are formed.

Now the *elasticity* of a fibre, or chord, consists in this, that it may be stretched or extended; and that upon removing the force whereby it was stretched, or lengthened, it returns again to its former dimensions. Fibres have no *elasticity*, unless they be extended with a certain force; as appears in lax chords, which may be moved a little out of their position, without endeavouring to recover it. Though what the degree of tension is, necessary for *elasticity* to commence, is not yet determined by experiment. Add, that when a fibre is too far stretched, it loses its *elasticity*; though here too, the degree of tension that destroys *elasticity* is unknown. But it is certain, *elasticity* depends on tension, and is confined within a certain sphere, or boundary thereof on either side.

This, if it do not give us the proper adequate cause of *elasticity*, yet shews us the difference between *elastic* and *inelastic* bodies; how it is that a body loses its *elasticity*; and how a body, destitute of any such force, comes to acquire it.—Thus, a plate of metal, by repeated blows of a hammer, becomes *elastic*; and being heated, again loses that property.

Between the limits of tension, wherewith *elasticity* is terminated, there are different forces required to give different degrees of tension, in order to stretch chords to certain lengths. What the proportion of these forces is, can only be determined by experiments made with chords of metal. But as the lengthenings of such chords are scarce sensible, the proportions cannot be directly measured; but a particular apparatus, and a kind of circuit, are necessary to arrive therat. Dr. s'Gravefande has taken a good deal of pains, in order to fix these laws, the result of whose experiments are as follow.

1. That the weight, whereby a fibre is increased a certain length, by stretching, is in different degrees of tension, as the tension itself: *i. e.* *gr.* there be three fibres of the same kind, length, and thickness, whose tensions are as 1, 2, and 3; any weights, in the same proportion, will stretch them equally.

2. That the least lengthening of the same fibres are to one another, nearly as the forces whereby the fibres are lengthened. Which property may likewise be applied to their inflexion.

3. In chords of the same kind, and thickness, and which are equally stretched, but of different lengths, the lengthenings produced by superadding equal weights, are to one another as the lengths of the chords. Which arises hence, that the chord is lengthened in all its parts: consequently the lengthening of a whole chord is double the lengthening of half of it, or a chord of half the length.

4. Fibres of the same kind, but of different thicknesses, may be compared together after the like manner; only considering them as consisting of a greater or less number of fine fibres of

the same thickness; the number whereof must be taken in the ratio of the solidity of those fibres, *i. e.* as the squares of the diameters, or as the weights of these fibres, when their lengths are equal. Such fibres, of consequence, will be equally stretched by forces that are in the same ratio of the squares of the diameters; which same ratio, is likewise required between the forces whereby the chords are inflected, that the sagittæ may be equal in the given fibres.

5. The motion of a stretched fibre agrees with the motion of a body vibrating in a cycloid; and how unequal soever the vibrations are, they are all regularly performed in the same time.

6. In two equal chords, unequally stretched, unequal forces are required to inflect them equally. Their motions may be compared to those of two pendulums, describing similar cycloids, by different forces. Consequently, the squares of the times of the vibrations of the fibres are to each other inversely, as the forces whereby they are equally inflected, which are as the weights by which the chords are stretched.

7. The motions of similar chords, equally stretched, but of different lengths, may be compared with that of pendulums after another manner; for as the times of the vibrations are to be considered, the celerities also, wherewith the chords are moved, must be considered. Now these celerities are to one another directly as the weights whereby the chords are inflected, and inversely as the quantities of matter in the chords; that is, inversely as their lengths. The celerities, therefore, are in an inverse duplicate ratio of those lengths; that is, they are inversely as the squares of the lengths: and the squares of the times of the vibrations, are likewise in the inverse ratio: Consequently, the lengths of the chords will be as the times of the vibrations.

Elastic laminæ, or plates may be considered as congeries's, or bundles of *elastic* chords. When the plate is inflected, some fibres are lengthened; and there are unequal lengthenings in several points of the same plate.

The curve formed by the inflected plate, is easily determined from what has been shewn concerning chords. In effect, in the vibrations of such plate, or spring, the motion thereof is accelerated, after the same manner as the motion of a chord, and of a pendulum in a cycloid, are accelerated. And the vibrations of such springs are all performed in the same time.

Elastic balls, spheres, &c. may be considered as consisting of several *elastic* plates, or springs; and the introcessions, or yieldings inward of any point thereof, are proportionable to the forces wherewith the body is compressed.

The *ELASTICITY of fluids* is accounted for, from their particles being all endowed with a centrifugal force; whence Sir Isaac Newton, prop. 23. lib. 2. demonstrates, that particles, which mutually avoid, or fly off from one another by such forces as are reciprocally proportional to the distances of their center, will always compose an *elastic fluid*, whose density shall be proportional to its compression; and *vice versa*, if any fluid be composed of particles, that fly off and avoid one another, and hath its density proportional to its compression; then the centrifugal forces of those particles will be reciprocally, as the distances of their centers.

ELASTICITY of the air, is the force wherewith that element dilates itself, upon removing the force whereby it was before compressed.

The *elasticity or spring of the air*, was first discovered by the great Galileo. Its existence is proved by this experiment of that philosopher: an extraordinary quantity of air, being intruded by means of a syringe into a glass or metal ball, till such time as the ball, with this accession of air, weigh considerably more in the balance than it did before; upon opening the mouth thereof, the air rushes out, till the ball sink to its former weight.

For hence we argue, that there is just so much air gone out, as compressed air had been crowded in. Air, therefore, returns to its former degree of expansion, upon removing the force that compressed, or resisted its expansion; and consequently it is endowed with an *elastic force*.

It must be added, that as the air is found to rush out, in every situation, or direction of the orifice; the *elastic force* of the air acts every way, or in every direction.

The *elasticity of the air* making a considerable article in the new pneumatics, we shall here give the principal laws thereof.

1. The *elasticity* of the lower air, is equal to the weight of all the upper incumbent air. For the upper air is easily proved to press on the lower.

And the *elasticity of the air*, has already been shewn equal to the compressing power; whence it follows, that the *elasticity of the air* is equal to the weight of the whole incumbent atmosphere.

Hence, as the weight of the upper air, incumbent on the lower, is equal to the weight of a column of water of the same diameter with the column of air, and the altitude of 31 feet; or to a column of mercury 28 inches high: the spring of the lower air is equal to the same column of water, or mercury.

Hence, again, the spring of the air, included in a vessel, &c. is likewise equal to the weight of the whole incumbent atmosphere. Consequently the air, included in a vessel, presses with the same force, as the weight of the atmosphere. And, therefore, the elasticity of the included air, is able to sustain mercury to the height of 28 inches, and water to the height of 31 feet, in an empty tube. See AIR-PUMP.

2. The elastic force of air compressed, is to that of the same air dilated; reciprocally, as the bulk of the dilated air to that of the compressed air.

For the elasticity of air more compressed, is to that of air less compressed; as the weight incumbent on that, to the weight incumbent on this. But the bulks of more, and less compressed air, are in the same reciprocal ratio of these weights.

Therefore the elastic force, &c.

Hence the elasticity of air more compressed, is stronger than that of air less compressed.

3. The elasticity of more compressed air, is to that of air less compressed, *ceteris paribus*, as the mass, or quantity of more compressed air, is to a mass of air less compressed of the same bulk.

4. The ratio of the space filled by air pressed only by the weight of the atmosphere, to the space it is reduced into by further compression, being given; to determine the elastic force of the compressed air.

Since the spring of the air, pressed only by the weight of the atmosphere, is equal to the weight of a column of mercury, of the same base with the column of air, and of the height of 28 inches; to the bulk of the compressed air, that of the air not compressed, and the weight of the column of mercury; seek a fourth proportional: this will express the quantity of the elastic force in the compressed air.

Hence, subtracting the weight of the column of mercury from the quantity of the elastic force thus determined, the remainder is the force of elasticity whereby it exceeds the resistance of the weight of the atmosphere.

5. Heat increases the elasticity of the air; and cold diminishes it. See HEAT, and COLD.

6. The elastic force of the air, whereby it is expanded, in rarefaction, is to the elasticity of the air condensed; as the bulk of rarefied air, to the bulk of condensed air.

ELATERIUM*, EAATHION, in pharmacy, a violently purgative medicine, prepared from the wild cucumber.

* The word is formed from the Greek, ελαυνω, I impel, agitate, &c.

Elaterium is made of the juice of the fruit, forced out with the finger, which suffered to stand some time lets fall a sediment, which carefully dried on chalk stones is the elaterium. Elaterium is a vigorous purge, and is sometimes used in lethargies, palsies and hypochondriacal melancholies.

ELBOW, the outer angle made by the flexure, or bend of the arm.

That eminence, whereon the arm rests, called by us elbow, is by the Latins called *cubitus*, and the Greeks *αγκων*, and by others, *ολεκτρον*.

ELBOW, is also used by architects, masons, &c. for an obtuse angle of a wall, building, or road, which diverts it from its right-line.

ELCESAITES, HELCESAITES, or ELCSAIANS, as Theodoret calls them, ancient heretics thus denominated from their great prophet *Elcsai*.

This *Elcsai*, by others called *Elxai*, who lived in the time of Trajan, gave into the sentiments of the Ebionites, touching Jesus Christ; though he altered and reformed them in some things, to denominate himself the author of a sect.

His fundamental doctrines were, that Jesus Christ, who was born from the beginning of the world, had appeared from time to time under diverse bodies; that he was a celestial power, or virtue, called the *Christ*, whereof the Holy Spirit was sister; (note the Hebrew word for spirit, is feminine) and that both of them had descended into Jesus the son of Mary.

The *Elcsaites*, according to St. Epiphanius, were by some also called *Sampsaians*, from the Hebrew word, *sames*, sun.

Scaliger was notoriously mistaken, in holding that *Elxai* was no more than *Essai*, or *Essene*; on which supposition he made the *Elcsaites* the same with the sect of *Essenes*, which is contrary to all antiquity.

Origen makes mention of the *Elcsaites*, in one of his homilies, as a heresy newly risen. The retainers hereto, says he, do not admit all the books of the canon, but only some of them. They allow some passages out of the Old Testament and the evangelists, but reject all the epistles of St. Paul.

Add, that they have produced a book, which they pretend descended to them from heaven; and maintain, that whoever perform what is enjoined therein, shall obtain pardon of all their sins. See Eusebius, *Hist. Lib. VI. c. 38.* who remarks, that this heresy became extinct almost as soon as it arose.

St. Epiphanius is very full on the subject of this sect, *Har. 19.* where he observes, that *Elxai* was a Jew by birth, and that not being able to live according to the law of Moses, he

invented new opinions, and got himself followers. He was a professed enemy of virginity, and obliged all who followed his doctrine to marry. He tutored them to hypocrisy in times of persecution; pretending it was lawful to adore idols, provided the heart had no share therein.

ELDERS, *Seniors*, in the Jewish history, were the most considerable persons for age, experience, and virtue, among that ancient people.—Moses, we read, assembled the elders of the people together, and acquainted them with what the Lord had commanded.

Long afterwards, those who held the first rank in the synagogues, were usually called *zekenim*, *elders*, in imitation of the 70 elders, whom Moses established for the judges of the Sanhedrin.

The president, or chief, had in a particular manner the appellation of *elder*, being, as it were, the *decanus seniorum*, dean of the elders.

In the assemblies of the primitive christians, those who held the first place, or rank, assumed the denomination of presbyters, or elders. For the word *presbyteri*, which occurs so frequently in the Old Testament, and which includes alike both bishops and priests, does properly signify elders. See M. Simon's observation thereon, in his *Supplement aux ceremonies des Juifs*.

The president, or bishop, as being the chief of the elders, did likewise assume the denomination of *elder*: whence it is, that in the New Testament the name *bishop* is frequently confounded with that of *presbyter*. See BISHOP and PRESBYTER.

For the like reason, the council of the first churches, was called *presbyterium*, or council of the elders, where the bishop presided in quality of first elder, being seated in the middle of the other elders. The priests, or elders, who sat by him, had each his judge's chair; for which reason they are called by the fathers, *assessores episcoporum*. Nothing of any importance was done, till it had first been examined, and resolved in this assembly, where the bishop only made one body with the other elders, or priests; the jurisdiction which we now call episcopal, not being then dependant on the bishop alone, but on all the elders, over whom he was only the president.

ELDERS, is also a denomination still retained in the presbyterian discipline.

The elders are officers, who, in conjunction with the pastors, or ministers, and deacons, compose the consistory, or kirk-sessions, meeting to consider, inspect and regulate matters of religion and discipline. They are chose from among the people, and are received publicly with somewhat of ceremony. In Scotland, there are an indefinite number of elders in each parish, generally about twelve.

Chamberlayne makes mention of a *ruling elder* in each parish, chose by the kirk-session; the congregation afterwards approving the choice, after a strict scrutiny into his life and manners. He adds, that the minister ordains him; and that his office is for life: his business being to assist the minister in overseeing and correcting the manners of the people; to attend him in visiting, catechising, praying for the sick, in private admonitions, and at the communion table.

But this we apprehend to be a mistake; what that author says of *ruling elders*, belonging properly to the *simple elders*. As to *ruling elders*, there are no such things, but in the general assemblies, where they appear as representatives of the rest. See KIRK-SESSIONS, SYNOD, and PRESBYTERY.

ELECAMPANE wine. See the article WINE.

ELECT, *chosen*, in theology, particularly in the scriptures, is applied to the saints, the predestinated.—In which sense, the *elect* are those persons whom God has chosen to bestow the glory of heaven upon.

The apostles also apply the word to the primitive christians.—In which sense, the *elect* are those chosen and admitted to the favour and blessing of christianity.

God, who has predestinated the *elect* to glory, has likewise predestinated them to sanctification.

ELECT, is likewise applied to archbishops, bishops, and other officers, who are chosen, but not yet consecrated, or actually invested with their office or jurisdiction.

The emperor is said to be *elect*, before he is inaugurated and crowned: a lord mayor is *elect*, before his predecessor's mayoralty is expired, or the sword is put in his hands.

Philip of Savoy was five years archbishop of Lyons, without ever being ordained or consecrated; after which he quitted his archbishopric to marry the countess of Burgundy. All that time he bore the title and quality of archbishop *elect* of Lyons, *electus Lugdunensis*.

ELECTION, a choice made of any thing, or person, whereby it is preferred to some other.

There seems this difference, however, between *choice* and *election*, that *election* has usually a regard to a company, or community, which makes the choice; whereas *choice* is seldom used, but when a single person makes it.

We say, the *election* of a bishop, a member of parliament, &c. See BISHOP, PARLIAMENT, &c.

The most solemn *election* is that of a pope; which is performed

formed by the cardinals, in four several manners.—The first, by the Holy Spirit, as they call it; when the first cardinal who speaks, having given his vote for any person, proceeds to the adoration, and proclaims him pope, as by a sudden inspiration of the Holy Ghost. In which case, he is deemed duly *elect*, if all, or at least two thirds of the assembly be consenting thereto.

The second, by Compromise, when the whole college pitches on three cardinals, to whom they give a power of nominating the pope; which power expires upon the burning out of a candle lighted on that occasion.

The third, by way of Poll or Scrutiny, which last is the most usual; the cardinals throwing sealed tickets, wherein their votes are wrote, into a chalice, or cup, placed on the altar. Two thirds of the votes are required to determine an *election* by scrutiny.

The fourth is by way of Acceffion; when, the votes being too much divided to *elect* any body, some of the cardinals, desist from their first suffrage, and accede, that is, give their votes to him, who has already the majority by scrutiny.

The way of acceffion, however, is always added to the scrutiny; it being the constant practice for all the cardinals, to give their voices, after the last scrutiny, to him whom they find to have the plurality already. So that all *elections* of popes are, with the unanimous consent of all the cardinals.

ELECTION, is also the state of a person who is left to his own free will, to take or do either one thing, or another, which he pleases. See **LIBERTY**.

ELECTION, in theology, signifies the choice which God, of his good pleasure, makes of angels or men, for the objects of mercy, and grace.

The *election* of the Jews, was the choice God made of that people to be more immediately attached to his worship and service, and for the Messiah to be born thereof.

ELECTION also, sometimes, signifies a predestination to grace and glory; and sometimes to glory only.

It is an article of faith, that predestination to grace is gratuitous, merely and simply so: *gratia quia gratis data*. But the divines are much divided as to the point, whether *election* to glory be gratuitous, or whether it suppose obedience and good works, *i. e.* whether it be before, or after the provision of our obedience?

Some hold that it is before, and after, at the same time: it is before the provision of our obedience, as glory is intended as antecedent to our obedience: And it is after, as this glory is intended us as a reward, and of consequence, as a sequel of our obedience. See **GRACE**, and **REPROBATION**.

ELECTION, is also used for a part of pharmacy; being that which teaches how to chuse the medicinal simples, drugs, &c. and to distinguish the good from the bad.

Some distinguish a general *election*, which gives the rules and marks for all medicines in general; and a particular one for each medicine in particular. Pomet, in his history of drugs, gives very good rules for this *election*.

ELECTIVE, something that is done, or passes by election.

The empire of Germany was hereditary in time of Charlemagne; and did not become *elective*, till after the death of Louis the III. the last of the race of Charlemagne in the empire. Indeed, it was not entirely *elective* till the time of Frederic II. in 1210.

Some benefices are *elective*, others collative. Municipal offices in England, are generally *elective*; in Spain, venal: Poland is an *elective* kingdom. All prelatures in France are *elective*, since the Concordat.

ELECTOR *, a person who has a right to *elect*, or choose another to an office, honour, &c.

* The word is formed of the Latin, *eligere*, to choose.

We say, the *electors* of a burghs, a knight of the shire, a grand master of an order, &c.

ELECTOR, is particularly, and by way of eminence, applied to certain princes of Germany, in whom lies the right of electing the emperor; being all sovereigns, and the principal members of the empire.

The origin of *electors* is not well known: some refer it to the time of Otho III. in the year 907; others to Frederic II. who died in 1250; and others, to Ralph of Hapsburg, founder of the house of Austria, in the year 1280.

Their number, however, was unfixed, at least till the time of Frederic II. in the 13th century. The golden bull, published by Charles IV. in 1356, fixed the number of *electors* to seven; three of them ecclesiastical, *viz.* the archbishops of Mentz, Treves, and Cologne; and four seculars, *viz.* the king of Bohemia, the count palatine of the Rhine, the duke of Saxony, and the marquis of Brandenburg. By the treaty of Munster, in 1648, this order was changed: the duke of Bavaria being put in the place of the count palatine, and an eighth electorate erected for the count palatine.

In the year 1692, a ninth electorate was created by the emperor Leopold, in favour of Ernest duke of Hanover, under

the title of *elector* of Brunswic. Some opposition was made to this election; and the princes of Germany stood out for some time, and refused to acknowledge it. But they afterwards acquiesced in it, and it has been since recognised by all the foreign princes. The king of France did it at last by the treaty of Rastad.

The several functions of the *electors* are as follow: the *elector* of Mentz, is chancellor of Germany; he convokes the states, and gives his vote before any of the rest. The *elector* of Cologne, is grand chancellor of Italy, and consecrates the emperor. The *elector* of Treves, is grand chancellor of the Gauls, and confers the imposition of hands on the emperor. The count palatine of the Rhine is grand master of the imperial palace, and presents the emperor with a globe at his coronation. The marquis of Brandenburg is grand chamberlain, and puts the ring on the emperor's finger. The duke of Saxony, now king of Poland, is grand marshal, and gives the sword to the emperor. The king of Bohemia, who was anciently only duke, is grand butler, and puts Charlemagne's crown on the emperor's head. Lastly, the *elector* of Hanover, now king of Great Britain, is arch-treasurer; though first erected under the title of standard-bearer of the empire.

ELECTORAL, something relating, or belonging to an *elector*.

The *electoral* prince is the eldest son of an *elector*, and the presumptive heir of his dignity.

Electors are always addressed under the title of *electoral highnesses*.

The *electoral* college, consisting of all the *electors* of the empire, is the most illustrious and august body in Europe. Belarmin and Baronius attribute the institution of the *electoral* college to pope Gregory V. and the emperor Otho III. in the Xth century. Of which opinion, are the generality of historians, and particularly the canonists. Wicquefort is of another sentiment; and endeavours to make it appear, from the elections of the succeeding princes, that the number of *electors* was not then fixed; nor the *electoral* dignity annexed to any particular principalities, exclusive of the other princes of Germany. He adds, that there was nothing settled with regard hereto before Charles IV. and that the publication of his golden bull, was only to prevent schisms, and secure the repose of the kingdom by a regulation in form.

It was the golden bull, therefore, published in 1356, that constituted the *electoral* college, and reduced the number of *electors* to seven.

ELECTORAL Crown, or **Coronet**, is a scarlet cap, turned up with ermine, and clofed with a semi-circle of gold, all covered with pearls. On the top of it there is a globe with a cross thereon.

ELECTORATE, the dignity of an *elector*, with the territory, or dominions, to which that quality is annexed. See **ELECTOR**.

We say, the *electorate* of Saxony, of Bavaria, &c. The emperor, of his own special authority, in the year 1692, erected a ninth *electorate*, in favour of the house of Brunswic-Lunenburgh. The princes, who disputed the validity of this election, were called the *opposers* of the ninth *electorate*.

Though the custom ordinarily be, in Germany, for the sons of princes to share their father's lands, and territories among them; those whereto the *electorate* is annexed, are not used to be divided; but pass entire to the eldest son, who succeeds to the *electorate*.

ELECTRICITY, or **ELECTRICAL Force**, is that power, or property, whereby amber, jet, sealing-wax, agate, glass, and most kinds of precious stones, attract straws, paper, and other light bodies to themselves.

Electricity differs from *magnetism* in this, that the latter only attracts iron, whereas the former indifferently attracts most kinds of bodies; though the effect is principally sensible in light ones.

The Peripatetics hold this power to consist in I know not what secret quality, or sympathetic power, subsisting between the amber, *e. gr.* and the straw, and resulting from the substantial form of each.

But the later philosophers generally agree to make it the effect of a corporeal effluvia, emitted from, and returning to, the electrical body. Though as to the nature of these effluvia, and the manner of their acting, they are hitherto greatly divided. Some, with Cæcilius, suppose actual steams to issue out of the *electrical* body, when agitated by attrition; and that these disperse and repel the ambient air, which, after it has been driven off a little way, makes as it were a little vortex, by the resistance it meets withal in the remoter air, to which these *electrical* steams did not reach: and that these steams shrinking quickly back again to the attracting body, do, in their return, attract and bring along with them such light and small bodies as they meet in their way.

Others, with Dr. Gilbert, Gaslendus, Sir Kenelm Digby, &c. hold, that on rubbing, or chafing, the *electrical* body is made to emit rays, or fibres, of an unctuous nature; which coming to be condensed and cooled by the ambient air, do lose their agitation, and so shrink back again into the body from which

which they fallied; and by that means carry along with them such light and small bodies, as happen to be fastened, or sticking to their further ends. Gassendus adds, that these unctuous effluvia being emitted all manner of ways, do frequently decussate, or cross each other; and by that means take the better hold of straw, &c.

The Cartesianes, not being able to imagine how so hard and brittle a body as glass should emit effluvia, attribute *electricity* to the globules of the first element; which breaking out through the pores, or chinks of the body, like little darts or swords, and not meeting with proper meats, or passages in the air, return whence they came, and carry the little bodies, whose pores they happen to enter, and be entangled in, along with them.

Mr. Boyle, Mr. Hauksbee, &c. have made a number of experiments, to ascertain the nature, and laws of *electricity*; the result whereof may be summed up under the following articles.

1. That *electrical* bodies do not at all, or very rarely attract, except when warmed, and thereby sollicit to emit effluvia more copiously.

Mr. Hauksbee, having heated a glass tube, of about an inch diameter, and 30 inches long, by rubbing it vehemently on paper, and then applying it to several pieces of leaf brass, found that they were no sooner within the sphere of activity of the effluvia emitted by the tube, than they began to be put into very brisk and surprizing motions; would leap towards the tube, even at the distance of 12 or 14 inches; would sometimes adhere, and fasten to the tube, settle on its surface, and there remain quiet: and sometimes be thrown off from it with a great force. And thus would they alternately attracted and repelled, for several times successively. Sometimes, again, they would move slowly toward the tube; sometimes, they would remain suspended between the tube and the table they were first laid on; and sometimes would slide along in the direction of the side of the tube, without touching it.

2. That bodies, warmed by fire, do not attract so forcibly, as when heated by rubbing; though if they be first heated, and then rubbed, they will attract the more strongly.

Mr. Hauksbee assures us, that the hotter he made the tube by rubbing, to the greater distance did the attractive force extend itself: but that this would answer in proportion, to any degree of heat excited, he will not undertake. When the tube was rendered the hottest by the strongest attrition, the force of the effluvia was rendered manifest to another sense, namely that of feeling, being plainly perceived on the face, or any other tender part, making strokes or impulses on the skin, much like those made by pushing a number of limber hairs against it.

3. That tension or wiping, is almost universally necessary, as well as attrition or rubbing, to produce *electricity*; by reason the effluvia can more readily escape, when there is nothing to stop up, or choke the pores.

4. That the interposition of the finest linnen, as muslin, gauze, or the like, will totally hinder the operation of *electrical* bodies.

5. The effect is less sensible in thick and cloudy weather. For the air being clogged with vapours and exhalations raised from below, the resistance the *electrical* effluvia meet withal, must be greater than when the air is free of any such impediments. Hence, also, in all probability, arises the necessity of tension; the watry particles being apt to run together, and condense on the surface of the body, and so to obstruct the passage of the effluvia.

6. *Electrical* bodies are more forcible, *ceteris paribus*, in hot weather than in cold, in summer than in winter; by reason the more vigorous action of the solar rays, does more effectually shake the parts of bodies, and unlock the pores, and so make room for a more plentiful emission of effluvia. Beside, that in warmer weather, the medium being rarer, makes less opposition to the passage of the effluvia.

7. The air being exhausted out of the tube, it loses almost all its *electricity*: so that though rubbed, and heated more vehemently, and leaf-gold applied nearer than usual, it scarce attracts at all. And what little attraction remains, Mr. Hauksbee conjectures, may arise from the little portion of air remaining in the tube: and so the attraction may continue in proportion to the quantity of air. When the air is let into the tube again, the attractive power is immediately restored; and that before any new attrition can be given the tube, or before it be removed from the distance and position it was in when exhausted. Mr. Boyle, however, found that a piece of amber did sensibly attract when the air was pumped out of the receiver.

8. *Electrical* bodies attract all things indifferently, whereas the magnet draws only iron and steel.

9. A large piece of very *electrical* amber being suspended by a silken thread, and one end of it rubbed strongly on a little cushion; the cushion being brought nearer, towards the amber at rest, will plainly make the amber tend towards it, and follow it. Whence it appears that the *electrical* body is attracted by the other bodies, as well as it attracts them. And that it is only by accident that the small attracted bodies approach to the *electrical* ones.

10. After an *electrical* body has been well rubbed, there is a certain nick of time in which the light body, instead of being attracted, will be actually repelled, or driven away from the *electrical* one, by the effluvia going briskly out, and not returning again.

Mr. Hauksbee assures us, that two pieces of leaf gold would be sometimes thrown off from his tube with a great force, even to the distance of six or seven inches. And thus, not only when they adhered to the surface of the tube, would they be suddenly and precipitantly driven from it; but also in their motion of ascent towards it.

11. A glass globe, being contrived to be whirled round, with its axis parallel to the horizon, and a semi-circle of wire fitted round the upper hemisphere thereof, at the distance of four or five inches, with several pieces of woollen thread hung thereon, of such lengths, as that when extended in a direction towards the centre of the glass, they would reach within an inch of the circumference thereof; but when left at liberty, hung down in a parallel position: upon applying the hand, and so adding an attrition to the former rotation, the threads presently began to change their direction, and all harmoniously pointed to the centre of the globe; and to put it past doubt, that this effect depended on the attrition, the experimenter, by shifting the place of the attrition hither and thither, could draw the threads towards this or that end of the globe, though they all still went uniformly converging towards some centre, in the axis thereof; and so formed a kind of conical surface.

The same phenomena followed upon shifting the wire, and putting it on the lower hemisphere. Add, that upon suspending the motion and attrition, the threads would continue in their strait direct posture for the space of four or five minutes. And in the mean time, if the finger, or any other body, were applied near the extremity, or points of the threads, they would avoid and fly from the same: but if applied about an inch distance from the end of such thread, the thread would usually be attracted towards it. Since these a multitude of other curious experiments have been made. See *Supplement*, article *ELECTRICITY*.

ELECTRUM, is sometimes used for *amber*. See the article *AMBER*.

ELECTRUM more frequently signifies a mix'd metal of great value amongst the ancients. See *Gottlieb Rink de vet. Num. Pot. & Qualitate*, cap. IX.

ELECTUARY *, in pharmacy, a form of medicine, composed of powders and other ingredients, incorporated with some conserve, honey, or syrup; to be divided into doses, like bolus's, when taken.

* Some will have it thus called, by reason all the parts, or ingredients it consists of, should be well chosen; from the Latin verb *eligere*, to choose, whence *electus*, chosen. Others derive it from *lac*; and accordingly the Greeks, under the Eastern empire, called it *λακταριον*. Scaliger derives it from *λεγεω*, I lick, and calls it in Latin, *electum*. Vossius observes, that all the remedies prescribed for the sick, as well as the confusions taken by way of regale, were called by the Greeks, *ελεκταρια*, and *ελεκτηρια*, of the verb *λεγω*, I lick: whence, says he, was formed the Latin *electarium*, and afterwards *electuarius*. This conjecture he supports from the laws of Sicily, where it is ordained, that *electuaries*, syrups, and other remedies, be prepared after the legal manner. The Bollandists, who relate this etymology, seem to confirm it. *Ad. Sand Mart. T. II. p. 131.*

Electuaries are either soft, or solid; and of each kind, some are alterative, others corroborative, others purgative, &c.—The *soft* are of the confistence of honey, and may consist of three ounces of powder to a pound of honey or conserve and syrup.

The purgatives are usually of the soft kind: but the corroborative only admit of 1 or 1½ ounce of powders to five or six ounces of conserve, with a proper quantity of syrup.

Among the soft *electuaries* of the shops, are reckoned Venice treacle, mithridate, the confection of hamech, that of alkermes, the catholicon, diaprunum, diaphoenicum, Galen's hiera picra, &c. which see explained under their respective articles.

Among the solid *electuaries*, are reckoned those of carthamum, rose juice, violet juice, &c. M. Lemery reckons up about 120 sorts of *electuaries*, and beside these there is an infinite variety in extemporaneous prescriptions.

ELEEMOSYNA Carnuarum, or *pro Avatriis*, or *Avatri*, in our ancient customs, a penny which king Ethelred ordered to be paid for every plough in England, towards the support of the poor.—Sometimes it is also called *eleemosyna regis*, because first appointed by the king.

ELEEMOSYNA, is also used for the possessions belonging to churches. See *ALMS*, and *FRANK ALMOIGN*.

ELEEMOSYNARIA. See the article *AMBER*.

ELEGANCE, ELEGANCY, denotes a manner of doing, or saying things politely, agreeably, and with choice.

With choice, so as to rise above the common manners; politely, so as to strike people of a delicate taste; and agreeably, so as to diffuse a relish which hits every body.

Poetical

Poetical *elegancies*, *elegantie poetice*, are of service to scholars in making their verses: by being too regular in the grammatical construction, we lose certain licences, wherein the *elegance* of language consists. *Elegance*, though irregular, is better than regularity without *elegance*.

The *elegance* of a painting is not founded on the correctness of the design, as appears in Raphael and the Antique. It is most felt in works otherwise careless and inaccurate; as in Correggio, where, spite of all the defects as to justness of design, there is an *elegance* even in the manner of the design itself, as well as in the turn of the attitudes, &c.

The *elegance* of a design, is a manner which embellishes, and heightens objects either as to their form, or colour, or both; without destroying or perverting the truth.

ELEGIAIC, in the Latin poetry, something that belongs to *elegy*.

Elegiac verses, *Elegiacæ*, are alternately hexameter, and pentameter.

Quintilian esteems Tibullus the top of the *elegiac* poets: but the younger Pliny gives the preference to Propertius. They have each of them reason on their side; and one might make a third choice, as just as either of them.

ELEGIT, in law, a judicial writ, which lies for him who has recovered debt or damages, or upon a recognizance in any court, against one not able in his goods to satisfy; and directed to the sheriff, commanding him to make delivery of half the party's lands, and all his goods, oxen and beasts for the plough excepted.

The creditor shall hold the moiety of the said land so delivered to him, till his whole debt and damages are satisfied; and during that time, he is tenant by *elegit*. See **TENANT**.

ELEGY, *Elegia*, a mournful, and plaintive kind of poem. The first inventor of the *elegy* is not known: some say it was one Theocles of Naxos, or, according to others, of Eretria, who, in the heat of his phrenzy, first produced this kind of composition. But, no wonder we at this time are in the dark as to the matter: Horace assures us, it was a point not settled among the grammarians even in his time, who the author was.

*Quis tamen exiguis elegos emisit auctor
Grammatici certant & adhuc sub judice lis est.*

The chief writers of *elegy* among the Greeks, are Callimachus, Parthenius, and Euphorion: And among the Latins, Ovid, Catullus, Tibullus, and Propertius.

The Flemish have distinguished themselves among the moderns for this kind of Latin verse: The *elegies* of Bidermann, Grotius, and especially Sedronius and Vallius, seem worthy of the purest antiquity. The countess de la Suze, has distinguished her self for *elegies* in the French tongue.

In the English, we have nothing considerable of the *elegiac* kind, but what we have in Milton. The English and French *elegies* are chiefly in Alexandrine verses.

In process of time, *elegy* degenerated from its original intention; and not only matters of grief, but also joy, wishes, prayers, expostulations, reproaches, and almost every subject, were admitted into *elegy*.

The office of *elegy* is well delivered by M. Boileau:

*La plaintive elegie en longs habits de deuil,
Scail, les cheveux epars, gemir sur un cercueil:
Elle peint des amans la joye, & la tristesse;
Flotte, menace, irrite, apaise une maitresse.*

In mourning weeds *lad elegy* appears,
Her hair dishevel'd, and her eyes in tears:
Her theme, the lover's joys, but more his pains;
By turns she sings, soothes, threatens, and complains.

The diction of *elegy* ought to be clean, easy, perspicuous, expressive of the manners, tender, and pathetic; not oppressed with sentences, points, &c. No apostrophe's are allowed; and the sense ought to be generally closed in every distich, or two lines. At least in Latin compositions.

ELEMENTARY, something that relates to the principles or elements of bodies.

The elements of a body are also called the *elementary principles* thereof. See **PRINCIPLE**.

The whole space, included within the concave, or orbit of the moon, is also called the *elementary region*, as being the seat, or sphere of the four vulgar elements, and the bodies compounded thereof.

The author, of the *Comte de gabalis*, gives the name *elementary people* to a kind of beings who are supposed to inhabit the elements, and are only known by what they call the *philosophers*, or *sages*. According to these folks, the element of fire is inhabited by Salamanders; water, that is, the sea and rivers, by Nymphs, or Orilians; earth by Gnomes and Gnomides; and air, by Sylphs and Sylphides.

ELEMENTARY Air.

ELEMENTARY Fire.

ELEMENTARY Geometry.

ELEMENTARY Music.

VOL. I.

MUSIC.

ELEMENTS, in physics, the first principles, or ingredients of things, whereof all bodies are compounded; and into which they are all resolvable.

Elements are conceived as the most simple, homogeneous parts, or corpuscles; of an assemblage, and mixture whereof, all the bodies we see, consist.

Authors generally talk wildly and inconsistently of the elements, and confound them with the principles of things: yet is there a great deal of difference. As we find, by experience, that all things cannot indifferently be made of all; that stone, for instance, and marble, are not convertible into flesh, nor are fit to nourish or augment an animal body: it seems to follow, that all the variety of bodies could never arise from the first simple combination of the two principles, matter and form; but only some infinitely simple being, or corpuscles, which being variously intermixed, might constitute all other bodies.

Now those most simple of all beings, thus formed of the first determination and concretion of principles, are what the philosophers properly call elements: so that elements and principles have this difference between them; that a principle, as matter, is a kind of incomplete nature; but an element, is a perfect or complete one.

Hence it follows, that there must, of necessity, be more elements than one: since otherwise all things would be equally simple, and there would be no such thing as a compound in nature. Most of the ancients, not aware of this, confound element with principle: by which means the elements are sometimes represented as corruptible, and sometimes as incorruptible. The retainers to incorruptible elements, mean precisely by element what we mean by the first matter. In effect, their elements are their atoms, or corpuscles, which are supposed indivisible, incorruptible, &c.

Democritus is held to have been the first author of this tenet; which accordingly is adhered to by Epicurus, and many of their descendants, the Epicurean and corpuscular philosophers. Among those who hold the elements corruptible, some will only have one, and some several. Of the former, the principal are Heraclitus, who held fire; Anaximenes, air; Thales Milesius, water; and Hesiod, earth; as the only element. Hesiod is followed by Bernardin, Telephus; and Thales, by many of the chemists.

Among those who admit several corruptible elements, the principal are the Peripatetics; who, after their master Aristotle, contend for four elements, viz. fire, air, water, and earth. Aristotle took the notion from Hippocrates; Hippocrates from Pythagoras; and Pythagoras from Ocellus Lucanus, who seems to be the first author of the dogma.

But there is a still further variety of elements: for the philosophers, not considering matter in it self, or in the general, but only some of the sensations it excites in us; some of them refer all to the sense of sight, and assert lucid and obscure, or pellucid and opaque, to be the elements of all things: and others, regarding only the sense of touch, make hard and liquid, or hot and cold, the elements of things.

In this latter class we are to reckon Aristotle; though his way of proceeding was somewhat different from the rest. For, considering the four principal qualities that fall under the sense of touching, heat, cold, dryness or hardness, and humidity or liquidity: and observing that two of these qualities might be one and the same thing taken in two different relations; and that they might be combined four ways; he made four elements; the first, cold and dry; the second, cold and moist; the third, hot and moist; and the fourth, hot and dry.

Then, to give proper names to these elements, he enquired in what things these several elements seemed chiefly to prevail? Accordingly, taking the earth to be the coldest, and, at the same time, driest of all things, he called the first element, earth.

And water, being the coldest and moistest of all things, he called his second element, water.

Again, judging air the moistest and at the same time hottest of all things, his third element he called air.

Lastly, fire being the hottest and driest of all things, his fourth element he denominated fire.

These denominations gave occasion to some, impertinently enough, to mistake his meaning; and to take this habitable earth, this potable water, this air we breathe, and this fire we burn on our hearths, to be the four elements; notwithstanding that the word element denotes a most simple thing; whereas the bodies just mentioned, are all exceedingly compound.

The Cartesians only admit three elements; which they pretend are all that could arise from the first division of matter: to explain their origin, they suppose the whole mass of matter in the universe, divided into an infinite number of particles of unequal magnitudes, and of any figure at pleasure. These several particles they suppose further, to have been revolved, or whirled, in various manners, each round its centre; so as to become truly separate and apart.

Thus much supposed, it is impossible but the angular, eminent, and implicated parts of the several particles must be

broke off; and thus, though little before, they must be made continually to grow less till they arrive at a perfect rotundity: By this means we get two kinds of determinate matter for the two first elements: the first, a fine dust rubbed, or broke off from the angles of the particles, till they are turned round; which is the matter of the *first element*, or the *materia subtilis*. The other, the parts themselves thus turned round, and smooth, which makes the *second element*.

And, as it is probable some particles of matter may either separately, or conjunctly, still retain irregular, hooked, and intricate forms; these constitute the *third element*.

It is added, that the elements are convertible into each other: for the third element, by becoming round, may become the second; and the second, by a continual comminution and subtilizing, may become the first.

Our great Sir Isaac Newton, considers the primary elements of bodies on the atomical system, thus: all things considered, it seems probable, that God in the beginning formed matter in solid, massive, hard, impenetrable, moveable particles of such sizes, and figures, and with such other properties, and in such proportion to space, as most conduced to the end for which he formed them; and that these primitive particles, being solids, are incomparably harder than any porous bodies compounded of them; even so very hard as never to wear out: no ordinary power being able to divide what God made one in the first creation. While the particles remain entire, they may compose bodies of one and the same nature and texture in all ages: but should they wear away, or break in pieces, the nature of things depending on them, would be changed. Water and earth, composed of old worn particles, and fragments of particles, would not be of the same nature and texture now, with water and earth composed of entire particles in the beginning. And, therefore, that things may be lasting, the change of corporeal things are to be placed only in the various separations, and new associations and motions of those permanent particles: compound bodies being apt to break not in the midst of solid particles, but where those particles are laid together, and only touch in a few points. It seems to him likewise, that these particles have not only a *vis inertiae*, with the passive laws of motion resulting therefrom, but are also moved by certain active principles; such as is gravity, and that which causes fermentation and the cohesion of bodies. See GRAVITY, FERMENTATION, and COHESION.

ELEMENTS, in chemistry, are the principles, or component parts of natural bodies, into which they are resolvable by fire, &c.

The effect of chemistry is to analyse or resolve bodies into their elements.

The chemical elements are divided into *active* and *passive*.

The chemists are somewhat divided as to their elements: the generality of them, to the vulgar peripatetic elements, water, which they call phlegm; and earth, which they call *caput mortuum*; add three more, viz. salt, sulphur, and mercury. Salt, they hold, the principle of taste; and sulphur, of smell and inflammability: as to mercury, which they also call spirit, some hold it the principal of colours, but others deny this; and, in effect, they agree in nothing, but that it is the most subtle and spirituous part.

The elements of fossils are, 1. Mercury, as the base; 2. Sulphur, as the coagulator, or binder; 3. Salt; 4. Earth. The elements of metals, are sulphur and mercury alone; mercury as the base, or matter, and sulphur as the binder, or cement. The elements of fossil salts, are an acid spirit and insipid earth. The elements of earths, are an oil, a little acid salt, and a calx. The elements of sulphurs, are an acid spirit, an oil, and an earthy or metallic matter. Boerhaave.

But, after all, it must be added, that there is no assigning any precise number of chemical elements; some bodies yielding more, and others less. And even these very elements themselves are reducible, by a further process, into other elements. Thus, by repeated distillations of wine, we successively get a spirit of wine, a vapour water, a subacid water, a more acid water, oil, bitter yellow spirit, and a caput mortuum, which is resolvable into earth, oil, &c. Now, are these so many several elements? Add, that what they account an element, now that it is separated, is very different from what it was when it existed in the mixt; as appears hence, that upon remixing all the elements a body is resolved into, the mixture will bear no resemblance to the first body.

In effect, these elements seem rather to be produced by the fire, than separated by it. Beside, that they are convertible, or at least resolvable, into one another.—Thus spirit of wine is found to yield an acid, an oil, and a water: and salts yield either an acid, or an alkali, with phlegm.

What makes the notion of the chemical elements still more precarious, is, that a pot-herb, and a poisonous herb, shall sometimes yield elements perfectly alike; more so, that the same plant analysed at two different times. M. Homberg has considered the difficulties charged on elements, with great attention.

The result of numerous experiments made to ascertain the matter is: that the four principles, salt, oil, water, and earth,

are always found in all plants, in what manner soever analysed: that these principles are more or less volatile, or fixed according to the different manners of analysing: that this difference arises, not only from the different force of fire, but also from the fermentation of the mixed, preceding the analysis: that a vehement fire, rendering different elements equally volatile, confounds them in the analysis: that the fire evaporates, and absolutely loses several parts: and that to have the elements as pure as may be, only fermentation and a gentle fire must be used.

ELEMENTS, is also used figuratively, for the grounds and principles of arts, and sciences.

Thus we say, letters are the elements of speech: he does not know the first elements of grammar.

The ELEMENTS of mathematics have been delivered by several authors in their courses, systems, &c.—The first work of this kind, is that of Peter Herigon, in Latin and French, published in 1664, in ten tomes; wherein are contained the elements of Euclid, Euclid's data, Apollonius Pergaeus, &c. with the elements of arithmetic, algebra, trigonometry, architecture, geography, navigation, optics, spherics, astronomy, music, perspective, &c. The work is remarkable for this, that throughout, a kind of real and universal characters are used; so that the demonstrations may be understood by such as only remember the characters, without any dependance on language or words at all.

Since Herigon, the elements of the several parts of mathematics have been laid down by others, particularly the Jesuit Schottus, in his *cursum mathematicum*, in 1674; Sir Jonas Moor, in his *new system of mathematics*, in 1681; De Chales, in 1674; Ozanam, in his *cours de mathématique*, in 1699. And above all, Christ. Wolfius, in his *elementa mathematicae universae*, in two vols. 4to. The first published in 1713, and the second in 1715; a work never enough to be commended.

The elements of Euclid, are the first and best system of geometry. We have abundance of editions, and comments on the XV books of Euclid's elements. Orontius Fineus, first published the first VI books in 1530; with notes to explain Euclid's sense. The like did Peletarius in 1557. Nic. Tartaglia made a comment on all the XV books, about the same time, with the addition of some things of his own: and the like did Fran. Fluffates Candalla, a noble Frenchman, in the year 1578, with considerable additions as to the comparison, and inscription of solid bodies; which work was afterwards re-published with a prolix comment by Clavius, whose edition has since been reprinted, at various places and times.

De Chales, Herigon, and Commandinus, have likewise done well upon Euclid's elements; so has Dr. Barrow, who is remarkable for the conciseness and strictness of his demonstrations. But as the whole XV books do not seem necessary, especially for young mathematicians, some authors have chose only the first fix, with the eleventh and twelfth at most; it would be endless to relate the several editions hereof: the two best are the French one of De Chales, and the Latin one of And. Tacquet: the best edition of the former of which is that of Paris in 1709, by Ozanam; and of the latter, that of Cambridge in 1703, by Mr. Whiston.

Herlinus, and Dalypodius, have thrown all Euclid's demonstrations into syllogisms; to shew how by a concatenation of syllogisms, a complete demonstration arises. Pet. Ramus disliked Euclid's order, as appears from his *discourse on the XV books of Euclid*; and therefore compiled 23 new books of elements, in the order of the schools; but unhappily: though his example was afterwards followed by others, particularly the Jesuit Gaston Pardies, in 1680; Arnaud, in 1667; and Fa. Lamy, in 1685; Polynier, a French physician, in 1704, digested Euclid into a new method: the like did Angelus de Marchettis of Pisa, in 1709, in his *Euclides reformatus*.

ELEMENT of an area, called also its differential, is the rectangle, PMR p (Tab. Analysis, fig. 18.) of the semi-ordinate PM, into the differential of the absciss, Pp. See DIFFERENTIAL.

ELEMI, or ELEMV, in pharmacy, a pellucid resin, of a whitish colour, intermixed with yellowish particles, and often much of the colour and consistence of wax; of a pretty brisk bitter, though not disagreeable taste; and a smell somewhat like that of fenel.

It is usually called *gum elemi*, though very improperly, inasmuch as it takes fire readily enough, and dissolves it in oleaginous liquors, which are the characters of a resin, not a gum. It flows from incisions made in the trunk, and large branches of a large and tall tree, growing in Æthiopia, and Arabia Felix. It is also found in Apulia, a province of the kingdom of Naples.

Pomet, in his history, and Lemery in his dictionary of drugs, describe elemi as a white resin, bordering on green, odoriferous, and brought from Æthiopia, in cakes of two or three pounds a-piece, and usually wrapped up in the leaves of the Indian cane.

It is excellent in diseases of the head; and is proper to digest, relieve

resolve and suppurate. It is held a kind of natural balsam; and is sovereign in the cure of all sorts of wounds.

The true gum elemi is that above described; but there are several spurious sorts, some natural, and others factitious; frequently sold for it.

The factitious, or counterfeit, is usually made of rosin washed in oil of spike: though the ill smell, and white colour of this, might easily discover the fraud. The natural gums, obtruded for elemi, are,

1^o. A gum brought from the American islands, in cags of different weights, covered up with the leaves of a plant unknown in Europe.

The 2d might be taken for common rosin, but for its smell, which is somewhat sweeter, and more aromatic.

The 3d is of an ash-colour, bordering on brown, brought over in large pieces, and very dry and friable.

Pomet does not take any of these for different genuine gums; but rather supposes them to be originally elemi, only impure, and coarse, since melted down, and made up by the fire.

ELENCHUS, ΕΛΕΥΘΟΣ, in logic, by the Latins called *argumentum*, and *inquisitio*, is a virtuous, or fallacious argument, which deceives under the appearance of a truth; the same with what is otherwise called *sophism*.

ELEOSACCHARUM, rather ΕΛΕΟΣΑΚΚΑΡΟΝ, ΕΑΙΟ-ΣΑΚΧΑΡΟΝ, in pharmacy, a mixture of sugar with a distilled oil; in order to bring it to mix with some aqueous fluid for present use.

ELEPHANT*, ELEPHAS, gives the denomination to an ancient and honourable military order, conferred by the kings of Denmark, on none but persons of the highest quality, and extraordinary merit.

* It is called the *order of the elephant*, from its badge, which is an elephant, with a castle on its back, set with diamonds, and hung on a water'd sky-colour'd ribbon, like the George in England.

There are different sentiments as to the origin and institution of this order: the first is that of Menenius and Hoepingius, who attribute it to Christian IV. who was elected king in 1584. The second, that of Selden and Imhof, who derive it from Frederic II. elected in 1542. Gregorio Leti goes back as far as Frederic I. who reigned about the year 1530. Bernard Rebolledus, will have king John to be the author, who began to reign in 1478. Anselmus, Roslerus, and Loelcher, hold it to have had its rise under Christian I. father of Frederic I. Lastly, Voigtius, Becman, and Bircherodius, maintain Canutus VI. to have been the first institutor; and the occasion thereof to have been the croifades. This prince, according to the chronology of Swaning, reigned towards the close of the XIIIth century, from the years 1163, to 1191.

This, at least, we are certain of, that the order was subsisting in the year 1494; that there being a painting still extant, done that year by count Reinden, a knight of this order. And we have even authentic evidences of the marquis of Mantua's being created knight of the same order by Christian I. in 1474. There are bulls of pope Pius II. and Sixtus IV. confirming the statutes of the order, authorizing the holding of assemblies, or chapters, in the chapel of Roefchild, and settling the privileges of the knights.

The order was at first called the *order of St. Mary*, *ordo S. Mariæ*: though it seems to have had the appellation of the *elephant*, as early as Christian I. Witness the figure of an elephant, so often struck on his coins, medals, &c.

The manner of its institution is thus related: king Canutus having sent a fleet against the Saracens, in 1189, which took Siluma and Ptolemais; a gentleman among the Danish croifces, killed an elephant; in memory of which extraordinary accident, the order was erected. This account is rendered the more probably by this; that it is referred to an æra, when nothing was more common than to take the spoils of a vanquished enemy for armories, or cognizances: and accordingly some of the principal arms of the like kind now on foot, e. gr. the lions of the low countries, had their rise at the time of the croifades; as is shewn by Heuterius and Hoepingius. Which circumstances greatly corroborate the opinion of those, who ascribe the order to king Canutus.

Besslarion brought with him a very ancient and rare coin from the east to Rome; whereon was seen the image of the Holy Virgin, with an elephant. Du Puis takes this to have been the badge, or symbol of the Dances, engaged in the croifades against the Saracens; and supposes it to relate to the order of the elephant. The chancellor Pritichius, had another coin of the like kind, whereon was the image of the Holy Virgin, an elephant, and a crescent, which was anciently a bearing in the arms of this order. Boisseau relates another ancient figure of the arms of this order, being the image of the Holy Virgin with four elephants, charged with towers. And Petra Sancta, a fourth, wherein was the Virgin with three keys, and four elephants, and spurs; whence it appears, that the order was under the protection of the Holy Virgin. Accordingly, it is still denominated the *order of St. Mary*.

To the collar of the order hangs an elephant, with a silver turret on its back, and underneath the elephant, an image

of the Holy Virgin, encircled with rays. See the abbot Justiniani, *Hist. de tutti gli Ord. Milit. e Caval. T. 2. c. 72.*

The chapel of Roefchild, was founded by Christian I. for the assemblies, or chapters of this order to be held in. It was at first called the *chapel of the three kings*, *capella trium regum*.

afterwards Frederic I. gave it the name of the *royal chapel*. The order was reformed by Frederic II. who created abundance of knights at the ceremony of his coronation, which is the only time when the Danish kings make any knights of the elephant. Christian V. augmented and enriched it very considerably. In the year 1694, a grand chapter of the order was held at Fredericburg, in the chapel of the knights, wherein six German princes were admitted into the order.

We have a multitude of writings on the subject of this order: whereof that of Janus Bircherodius may serve for all the rest: it is the latest, most ample, and learned. It was published at Copenhagen, in 1705, under the title of *Breviarium equestre; seu de illustissimo, & inchyssimo ordine elephantino, &c.*

ELEPHANTIASIS, in medicine, a kind of leprosy, called also *lepra arabum*, in contradistinction to the *lepra græcorum*, which is another disease.

The elephantiasis, is thus denominated, by reason those seized therewith, have their arms, and legs, big, swollen, and tumorous; the skin bloated, yet rough to the touch, and all wrinkled and rugose like the skin of an elephant.

The elephantiasis, is a disease unknown in our parts of the world, at least in these days. Some authors call it *leontiasis*, and others *satyriasis*. The Greeks call it *ελεφαντίασις*; and sometimes *εσπασ*, elephant, also *εσπασία*, and *εσπασίασμος*.

The elephantiasis græcorum, or *lepra arabum*, is described by Deodatus, as a contagious disease, infecting the body with a cloud of evils in it. The skin of the face, knees, elbows, thighs, hands, and feet is beset with moveable, indolent tubercles of a livid colour, tending to redness: in the mouth, palate, and jaws, likewise, arise tubercles, sometimes yellow, and sometimes livid: in the intervals between the toes, and on the soles of the feet, especially the hard callous parts thereof, as also in other parts of the limbs, break out ulcers, which penetrate the cutis, are very broad, and keep spreading, with callous, and tumid lips: these, upon a little violence, yield blood, and yet are indolent. Add, that ulcers eat the nose; tumours rise about the ears; and the lips thicken, and the feet and hands are wonderfully bloated.

Et Muller, Haly Abbas, and others, speak of the elephantiasis as a ruddy livid swelling chiefly of the feet and legs; with varices, and ulcers; which distend and make the feet appear like those of elephants.

ELEPHANTINE, something that relates to, or partakes of the qualities of elephants.

The term is chiefly applied to certain books of the ancient Romans, wherein were recorded the transactions of the emperors, and the proceedings, acts, &c. of the senate. This we learn from Pollio, and Vopiscus in the life of the emperor Tacitus, where he observes that in the 6th press of the Ulpian library, was kept one of these *libri elephantini*; wherein, for a long course of time, were wrote down the decrees, and edicts of the senate.

In some of these books, were registred all the acts and proceedings of the senate, and the magistrates of Rome; in others, the proceedings and events in the provinces, the armies, &c. There were above thirty-five large volumes of them, as many as there were tribes.—In them were likewise contained the births, and classes of the citizens; with the musters and all things belonging to the census. They were renewed every five years with the censors; and were all anciently kept in the ærarium, or public treasury, in the temple of Saturn.

Vigenere, and several others, believe these books to have been called *elephantine*, by reason of their enormous bulk, q. d. as big as elephants, or bullocks. But Loisel on the XVIIth chapter of the XIth book of Aulus Gellius, gives us a different etymology; and assures us they were called *elephantine*, because composed of ivory leaves, or tablets, which every body knows is a production of the elephant. And, accordingly, Ulpian, L. 52. ff. de Legat. 3. makes mention of an ivory book.—Scaliger and Gerard Vossius, say they were written on the intestines of elephants.

Vossius does not deny, indeed, but that they might have been made of ivory; but being there were several other books, and tablets, made of that matter, as appears from Martial, L. XIV. epigr. 3. and a hundred other ancient authors, and from what we have shewn under the term ΔΙΕΡΥΧΟ: it does not appear, why the name *elephantine* should be peculiarly appropriated to these.

Martial does not give the name *elephantinus*, but eboreus, of ivory, to the tablets mentioned in the place last quoted, eborei pugillares: Alexander ab Alexandro Genii. Dier. L. II. c. 2. makes mention of the *libri elephantini*: so also does Salmains on the passage in Vopiscus, just quoted; where he relates Scaliger, maintains that these books were of ivory, and shews that the ancients used the word *elephas*, for ivory; witness Virgil *Æneid*. L. III. v. 464. and Servius on the same: and *elephantinus*, for what was of ivory; witness Martianus

Capella, and Isidore in his glosses. He shews further, that it was no impossible thing to write on ivory, as Scaliger had suggested; that they did not make use of a goose quill as we do, nor of ink like ours: but of rufes, or reeds, formed after a different manner from our pens, and of ink fit to take upon ivory. The matter of fact, in fine, he asserts, is clear from Martial, and Plautus in his *Mossellaria*.

ELEVATION *, the altitude, or height, of any thing. See ALTITUDE.

* The word is formed from *elevare*, to raise, or lift up.

ELEVATION of a star, or other point, in the sphere, is an arch of the verticle circle, intercepted between such star, or other point, and the horizon.

Hence, as the meridian is a verticle circle; a meridian altitude, or elevation, i. e. the elevation of a point in the meridian, is an arch of the meridian, intercepted between that point, and the horizon.

ELEVATION of the pole, denotes the altitude of the pole above the horizon of any place; or an arch of the meridian, intercepted between the pole, and the horizon.

Thus, in *Tab. Astronomy*, fig. 4. A Q being supposed the equator, H R the horizon, H Z P N the meridian, and P the pole; P R is the elevation of the pole.

In which sense elevation stands opposed to depression or depth. See DEPRESSION.

The elevation of the pole, is always equal to the latitude of the place; that is, the arch of the meridian intercepted between the pole, and the horizon, is always equal to the arch of the same meridian, intercepted between the equator and the zenith.

Thus the north pole is elevated $51^{\circ} 32'$ above the horizon of London: and there is the same distance, or number of degrees between London and the equator; so that London is likewise in $51^{\circ} 32'$ of northern latitude.

To observe the elevation of the pole of any place. See POLE, and LATITUDE.

ELEVATION of the equator, is an arch of the meridian, less than a quadrant, intercepted between the equator, and the horizon of the place.

Thus A Q, as before, representing the equator, H R the horizon, P the pole, and H Z P N the meridian; H A is the elevation of the equator. See EQUATOR.

The elevations of the equator, and of the pole, together, are always equal to a quadrant: consequently, the greater the elevation of the pole, the less the elevation of the equator; and vice versa.

Thus in the figure just cited P A, is supposed by the construction a quadrant; and H A + A P + P R a semi-circle: consequently H A + P R is a quadrant.

To find the ELEVATION of the equator.—Find the elevation of the pole, after the manner hereafter directed under the article POLE.

Subtract the elevation found, from a quadrant, or 90° , what remains is the elevation of the equator. Thus, the elevation of the pole $51^{\circ} 32'$, being subtracted from 90° , leaves the elevation of the equator $38^{\circ} 28'$.

ELEVATION, in architecture, denotes a draught, or description of the principal face, or side of a building; called also its upright, or orthography. See ORTHOGRAPHY.

ELEVATION, we also find used in some writers of perspective, for the scenography, or perspective representation of the whole body, or building. See SCENOGRAPHY.

ELEVATION, in the Romish religion, is applied to that part of the mass, wherein the priest hoists, or raises the host, with the cup, above his head, for the people to adore it; after having first consecrated, and adored it himself.

The priest, who officiates at mass, rings a bell at the elevation; to apprise the people to cast their eyes upon their new formed favour, and adore him.

St. Louis decreed, that they should fall on their knees at the elevation, in imitation of certain religious whom he does not name. The Chartreux, and the religious de la Trappe, still observe this ceremony of prostrating themselves at the elevation.

Angle of ELEVATION, in mechanics, is the angle A R B, (*Tab. Mechanics*, fig. 47.) comprehended between the line of direction of a projectile A R, and the horizontal line A B. See PROJECTILE, and ANGLE.

ELEVATION of a canon or mortar piece, is the angle, which the chafe of the piece, or the axis of the hollow cylinder, makes with the plane of the horizon.

ELEVATOR, **ELEVATORIUM**, in chirurgery, an instrument used to raise up bones, as those in fractures of the skull, when beaten, or crushed in, with blows, or the like.

There are dented elevators, and elevators with three feet, called *elevatores triploides*.—The elevator made lever wise, is a new invention: its use is in drawing teeth. One extremity of it is flat, to rest on the gum, at the bottom of the tooth, and the other hooked, like one of the branches of a pelican, to fasten hold of the tooth.

ELEVATOR, in anatomy, is a name common to several muscles, which do the office of raising or lifting up the parts they belong to; of equal import with *Attollens* and *Levator*. See LEVATOR, and ATTOLLENS. Such are the

ELEVATOR *ala nasi*, a muscle, or pair of muscles of the nose, of a pyramidal figure, very narrow, though fleshy at its origin on the fourth bone of the upper jaw; and very broad and thin at its termination on the side of the ala nasi.—Its action is to pull the ala upwards, and turn it outwards. See *Tab. Anat.* (Myol.) fig. 1. lit. o.

ELEVATOR *auris*, or *attollens auriculam*, is in reality no more than a part of the muscle of the scalp, with some flesh fibres in it, as it descends over the temporal muscles to the upper part of the concha.—Its action is scarce visible; the auricles being hardly perceived in men to have ordinarily any motion at all.—See *Tab. Anat.* (Myol.) fig. 6. n. 3. fig. 1. n. 13.

ELEVATOR *labiorum communis*, a muscle of the lips, arising from the fourth bone of the upper jaw, and terminating at the angle of the lips, under the zygomaticus. See *Tab. Anat.* (Myol.) fig. 1. n. 4.

ELEVATOR *labii inferioris*, is a muscle that arises from the second bone of the under jaw, below the incisores. It descends, and passes under the zygomaticus, and is inserted into the under lip.

This, assisted by a small, but strong pair of muscles, arising from the gum of the dentes incisivi, and descending directly, is inserted into the lower part of the skin of the chin; and serves to pull the skin of the chin upwards, and consequently to thrust up the lip.

ELEVATOR *labii superioris*, arises from the upper part of the second bone of the upper jaw; and descending obliquely, is inserted into the upper lip, above the dentes incisivi.—It draws up the lip. See *Tab. Anat.* (Myol.) fig. 1. n. 3. and n. 5.

ELEVATOR *oculi*, one of the muscoli recti of the eye, serving to draw it upwards. See RECTUS, and EYE.

ELEVE, a term purely French; though of late used also in our language. Literally it signifies a disciple, or scholar, bred up under any one; being formed from the Italian, *allievo*, an apprentice or novice.

It was first used by the French writers in speaking of painters: such a painter was an *eleve* of da Vinci, of Raphael, &c. From painting, it came to be applied to such as studied, or learned any other art under a master. In the Royal Academy of sciences, there were 20 *elevés*: and in that of inscriptions, 10 *elevés*. The *elevés* are to act in concert with the pensionaries. See ACADEMY.

We are not afraid, says M. Fontenelle, to compare a simple *eleve*, such as M. Amontons was, to one of the greatest members the academy ever had. [M. Mariotte] The name *eleve*, with us, implies no difference as to merit; it only signifies somewhat of less seniority, and servitude.

The denomination *eleve*, however, has been since suppressed, and that of *adjoint* substituted in its room; by reason every body did not know the sense affixed to it by the academy. And now the pensionary academists have not, as formerly, each of them an *eleve*: but the *elevés* are become *adjoints*, or associates of the academy.

ELEUSINIA *, in antiquity, the mysteries of the goddess Ceres; or the religious ceremonies performed in her honour: thus called from *Eleusis*, a maritime town of the Athenians, wherein was a temple of that goddess, famous for the celebration of these mysteries.

* Some writers call the city, where the *eleusinia* were celebrated, *Eleusina*, not *Eleusis*: Harpocration confirms this orthography, in deriving its name from *Eleusinus*, a son of Mercury: to which opinion, Pausanias likewise adheres in his *Attica*. Others, who write it *Eleusis*, *advēnt*, suppose it thus called, by reason Ceres, after running over the world in search of her daughter, stopped here, and put an end to her pursuit. Diodorus Siculus, L. V. will have the name *Eleusis* to have been given this city, as a monument to posterity, that corn, and the art of cultivating it, were brought from abroad into Attica.

The *eleusinia* were the most solemn and sacred ceremonies in use among the Greeks; for which reason they were called *mysteria* by way of eminence. They are said to have been instituted by Ceres herself, at *Eleusis*, in memory of the zeal and affection wherewith the Athenians received her.

This is the account Iocates gives in his panegyric; but Diodorus Siculus assures us, L. VI. that the *eleusinia* were instituted by the Athenians, in gratitude to Ceres, for having instructed them to lead a less barbarous, and rustic life. Yet the same author, in the first book of his *Bibliotheca*, relates the thing in another manner.

A great drought, says he, having occasioned a miserable famine throughout all Greece; Egypt, which had that year reaped a most plentiful harvest, bestowed part of the fruits thereof upon the Athenians. It was Erichtheus that brought this extraordinary supply of corn; in commemoration of which beneficence, Erichtheus was created king of Athens, who instructed the Athenians in these mysteries, and the manner of celebrating them.

This account comes near to what we are told by Herodotus and Pausanias, viz. that the Greeks learned their gods, and their religion from the Egyptians.

Theodore, L. I. *Græcæ Affæ*, writes that it was Orpheus, not Erichtheus, who made this establishment; and who instituted for Ceres, what the Egyptians practised for Isis: which sentiment

sentiment is confirmed by the scholiast on the Alceſtis of Euripides.

Eleuſis, the city where theſe myſteries were celebrated, was ſo jealous of the glory thereof, that when reduced to the laſt extremities by the Athenians, it would not ſurrender but on this condition, that the *eleuſinia* ſhould not be taken away; though theſe were no religious ceremonies peculiar to the town, but were held common to all Greece.

The matter of theſe myſteries, as related by Arnobius and Lactantius, was an imitation, or representation of what mythologiſts teach of Ceres. They laſted ſeveral days; during which, the people run about with burning torches in their hands; ſacrificed abundance of victims, not only to Ceres, but alſo to Jupiter; made libations, from two veſſels, one of them to the eaſt; and the other to the weſt; marched in pomp to *Eleuſis*, making pauses from time to time, wherein they ſung hymns, and ſacrificed victims: and theſe they performed, not only in going to *Eleuſis*, but in returning back to Athens. For the reſt, they were obliged to keep it an inviolable ſecret; and the law condemned to death any one who ſhould dare to divulge their myſteries. Tertullian in his book againſt the Valentinians, relates that the figure ſhewn in the *eleuſinia*, and which was ſo expreſſly prohibited to be made public, was that of a man's privy parts: Theodoret, Arnobius, and Clemens Alexandrinus, likewiſe make mention of it; but he ſays it was the figure of a woman's privities.

The day after the feaſt, the ſenate aſſembled at *Eleuſis*, apparently to examine whether every thing had been managed according to order.

There were two kinds of *eleuſinia*, the *great* and the *leſſer*: thoſe we have been hitherto ſpeaking of were the greater.

The *leſſer* were inſtituted in favour of Hercules: for that hero deſiring to be initiated into the former; and the Athenians not being able to gratify him therein, by reaſon the law prohibited any ſtranger being admitted; being both however to give him an abſolute denial, they inſtituted new *eleuſinia* whereat he aſſiſted. The greater were held in the month Boedromion, which answered to our Auguſt; and the leſſer in the month Antheſterion, which happened in our January. People were only brought to partake of theſe ceremonies by degrees: at firſt, they were to be purified; then admitted to the leſſer *eleuſinia*; and at laſt initiated in the greater. Thoſe who were yet only at the leſſer, were called *myſta*; and thoſe admitted to the greater, *epoptæ*, or *aphorî*, i. e. inſpectors. They were uſually to undergo a probation of five years, ere they paſſed from the leſſer to the greater. Sometimes, indeed, they were contented with a ſingle year; immediately after which, they were admitted to the moſt ſecret religious parts of the ceremony.—Meurſius has an expreſs treatiſe on the *eleuſinia*, where moſt of theſe points are proved.

ELEUTHERIUS *, ΕΛΕΥΘΕΡΙΟΣ, in antiquity, a Greek word ſignifying, *liberator*, or *deliverer*; it was uſed by the Greeks as a ſurname, or epithet of Jupiter, given him on occaſion of his having gained them the victory over Mardonius, general of the Perſians, and killed as they ſay 300000 men of his army, and by that means deliver'd them from the danger where in of being brought under the Perſian yoke.

* The word is formed from, ελευθερος, free. There were alſo feaſts ſolemnized on this occaſion, in honour of Jupiter *Eleutherius*, and called *Eleutheria*. They were held every five years, with races of armed chariots, &c.—The ſcholiſt on Pindar, *Olymp. Od. 7*, ſays, they were celebrated at Platea, the place where the victory was obtained.

ELICIT, or **ELICITE**, in ethics, is applied to an act of the will, immediately produced by, and of the will, and received within the ſame.

Such are willing, nilling, loving, hating, &c. Theſe acts are denominated *elicit*, by reaſon being before in the power of the will, they are now brought forth into act. But they are ſo far intrinsic, that ſome authors conſider them as the will it ſelf; and deny they ought to be diſtinguiſhed from it, any more than light is to be diſtinguiſhed from the ſun.

ELIGENDO Viridario. See the article **VIDUARDO**.

ELIGIBILITY *, in the Romiſh canon law. A bull of **ELIGIBILITY**, is a bull granted by the pope, to certain perſons, to qualify them to be choſen, or inveſted with an office, or dignity, whereof they were before incapable, by reaſon of want of age, birth, or the like.

* The word is formed of the Latin, *eligere*, to chuſe; whence the word *eligibilitas*, &c.

In ſeveral churches in Germany, a perſon who is not of the chapter, cannot be elected biſhop, without a bull of *eligibility*.

ELIRE. See the article **CONSEIL de elire**.

ELISION, in grammar, the cutting off, or ſuppreſſing a vowel, at the end of a word, for the ſake of ſound, or meaſure.

Elisions are but little known in Engliſh: in Latin, French, &c. they are frequent; and conſiſt moſtly in ſuppreſſions of the final *a*, *e*, and *i*.—As in *Phyllida amo ante alias*.—*Si ad vitulum ſpectes*, &c.

In writing, *elisions* are often marked by an apoſtrophe; as *egon' quem quæram*, for *egone*. *Emin' ego?* for *emine*. *Penſin' for venſine*, &c. *Cat' ſperance*, for *cette*. *L' homme*, for *le homme*.

VOL. I.

In the pronunciation we make frequent *elisions*, but do not mark them in writing, thus we write *riſque* it, but pronounce *riſſ' it*. So the French pronounce *un' ame*, but write *une ame*. In effect, they never mark any *elisions* but at the end of the monosyllables, *je, ne, le, te, ce, que, and la*. They never elide the *o*, nor *u*, nor *i*, but in the conjunction *ſi* before *il*; nor *a* but in *la*.

In poetry, the ſyllable where there is a vowel *elided*, is never reckoned; and great care is taken to avoid the clashing of ſyllables, where there is no *elision*; this making what they call a *hiatus*, or *choſm*.

Some reduce the *elisions* under the head of *elisions*: as in *monſtrum, horrendum, ingens*, &c. See **ECTHIPSIS**.

ELIXATION *, in pharmacy, &c. the infuſing, ſteeping, or boiling of any medicine in a proper liquor, gently, and for a conſiderable time: amounting to what, in the dreſſing of meats, we call *ſtewing*.

* The word is formed from the Latine, *lixare*, to boil, or boil in water.

The liquor ordinarily uſed in *elixations*, is ſpring or river water: though on ſome occaſions they uſe ſpirit, milk, whey, beer, or the like.

The ordinary purpoſe of *elixation*, is to extract the virtue out of the medicine, and impart it to the liquor. Though it is ſometimes alſo uſed to free the parts of animals, plants, &c. of their crudities; as well as to ſoften, and make them tender; to take away from foods, or medicaments, any diſagreeable taſte, or other ill quality; to ſeparate the earthy or groſſer parts, and for other intentions.

Decoction is alſo a ſort of *elixation*. See **DECOCTION**.

ELIXIR *, in medicine, a compound tincture, or eſſence, drawn from a mixture of ſeveral ingredients, by infuſing them in a proper menſtruum.

* Menage derives the word from the Arabic, *el-ſſir*, properly ſignifying *fraction*, by reaſon *elixirs* have the force of breaking diſcates: others, more naturally derive it from the Arabic *aleſſiro*, an artificial extraction of ſome eſſence: others from the Greek, ελαιον, oil, and σφρα, I draw, q. d. an extract of the oil, which is the eſſential part of mixts. Others from the Greek verb, αλεξω, I help, or aſſiſt, by reaſon of the great ſuccours we receive from *elixirs*.

An *elixir* is properly a ſtrong, ſpirituſ liquor, or juice, to be taken inwardly; containing the pureſt, and moſt efficacious parts of ſeveral mixed bodies, communicated to it by infuſion and maceration.

Quincy defines it a ſtrong infuſion in ſome menſtruum, whereby the ingredients themſelves are almoſt diſſolved, and a Liquor thus acquired of a thicker conſiſtence than an ordinary tincture.

Boerhaave conſiders an *elixir* as a compound magiſtery, i. e. a compound of various bodies, changed after the ſame manner as a ſingle body is in a magiſtery.

Spirits drawn from vegetables, i. e. the ſtrong, or ſpirituſ waters of vegetables, are uſually the baſis of *elixirs*, and the menſtruum, or diſſolvent, whereby the eſſence of the other ingredients is drawn or ſeparated. Spirit of wine is the beſt and moſt commodious menſtruum of all.

The Charietans abuſe the term *elixir*, and apply it to abundance of ſimple extracts, or tinctures; only to put them off at the higher price.—Some authors, for *elixir*, uſe the word *quinteſſence*.

ELIXIR Proprietatis, is a remedy firſt invented by Paracelſus; compoſed of aloes, myrrh, and ſaffron; the tincture, or eſſence whereof, is drawn by putting them to diſſolve, or digeſt with ſpirit of ſulphur.—Some add ſpirit of wine to the ſpirit of ſulphur.

Crollius takes this *elixir* to be the balm, or baſam of the ancients; adding, that it contains all the virtues of the natural balm. It comforts and fortifies the heart and ſtomach, aſſiſts digeſtion, purifies the blood, and promotes ſweat.

ELIXIA, among the alchymiſts, is uſed for the philoſopher's ſtone, or the powder of projection.—And ſometimes, for an univerſal medicine, which will cure all diſeaſes, called by way of excellence the *grand elixir*.

Thoſe two things, moſt alchymiſts take to coincide; ſo that what will make gold, they think will cure all diſeaſes. See **PHILOSOOPHER'S Stone**.

The notion of a *grand elixir* is of a long ſtanding. Kircher aſſures us, that the ancient Egyptians had a method of drawing an *elixir* from the hardeſt and moſt precious ſubſtances, which on account of its ſubtility and perfection, they called *heaven*. And this he takes to be that admirable, and celeſtial water, capable of removing all diſcates; called alſo the *ſtone*, and the *philosopher's ſtone*; as being drawn from precious ſtones; and ſometimes, by the hermetical denominations, *agua vitæ*, *vegetable ſeed of nature*, *ſolar ſoul*, &c. *Oed. Egypt. Tom. II. p. 430*.

ELKS claws, in pharmacy, a drug, ſuppoſed to be good againſt the epilepsy; known in the ſhops by the name of *ungula alci*.

The animal that yields them, called by the Latins, *alce*; by the Germans, French, &c. *elend*; and by us, *elk*, is a wild beaſt, found in the forests of Maſcovy, Sweden; and Pruſſia; but

but more abundantly in Canada, and most parts of North America.

It is about the size and figure of a mule; only its snout bigger, its tail short, its feet cloven; and that it bears a large ramage, or horn, like that of a deer, weighing three, and sometimes four hundred weight. That anatomized in the royal academy of sciences, was five foot seven inches long. Its hair is brown, and about the length of that of a goat, its ears nine inches long, and four broad; and its tail not above two inches: its neck short and thick: its skin strong and hard, though thin; its flesh very delicate, especially that of the female: and the ligaments of its joints exceeding strong; which has occasioned some authors to say, that its legs had no joints at all; and that it was this made it so ready at sliding on the ice, to save itself from the wolves.—It neither runs, nor bounds; but its trot is almost equal to the swiftest running of a deer.—Pausanias says, that the male has horns: and Cæsar, that the female hath none: but we find that both have.

The hunting of the *elk*, is one of the principal and most agreeable employments of the savages of Canada, Accadie, &c. They chuse a time when the snow is on the ground; in which the beast is apt to sink and stick. When they have killed enough with their fire arms, to feast for several days; they flea them, and send the skins to the French, who dress them in oil, like the buffalo skin.

The savages likewise take care to cut off the left hind foot of each beast; especially if it be a female; the hoof of which foot is that applauded remedy for the falling sickness.

Ancient authors tell us, that to catch the *elk*, the northern people watch the occasion when it falls down of the epilepsy; which it frequently does; and that they lay hold of it ere it can recover strength enough to put its left foot in its ear, which cures it immediately.

And hence it is, that the notion of its virtue, in the cure of that disease, had its rise. The Germans call it *elend*, that is, misery, by reason of the misery it is reduced to in falling so often into the epilepsy; though it has its remedy always about it; which has given people reason to suspect, that the virtue attributed to it is fabulous.

Accordingly, Olaus Magnus says, it is the outer hoof of the right foot, that the *elk* thus puts in its ear to cure the epilepsy; which being impossible, it should seem as if Olaus only spoke of it by way of sneer.

He adds, that the blows which the *elk* deals are so strong, that with its hind feet it will even break the trees; and with its fore feet pierce the hunters through and through.

Pomet gives us the marks to distinguish the genuine *elks* claws; but as their virtue is very equivocal, not to say absolutely false, there is no great harm in being deceived: the opinion alone may serve for the reality.

ELL, *Uba*, a measure, which obtains under different denominations, in most countries.

The *ell* is the standard, or measure, whereby cloths, stuffs, linnens, silks, &c. are usually measured, or estimated; answering, in good measure, to the yard of England, the canna of Italy, the vara of Spain, the palm of Sicily, &c.

Servius will have the *ell* to be the space contained between the two hands when stretched forth: but Suetonius makes it only the cubit.

The *ells* which occur most frequently in England, are *English* and *Flemish*: the *ell English* contains three feet nine inches; or one yard one quarter English measure: the *ell Flemish*, contains 27 inches, or three quarters of a yard; so that the *ell English* is to the *Flemish ell* as five to three.

M. Ricard, in his treatise of commerce, reduces the *ells* thus: an hundred *ells* of Amsterdam, are equal to ninety eight, three quarters of Brabant, Antwerp, and Brussels; to fifty eight and an half of England and France: to an hundred and twenty of Hambourg, Francfort, Leipzig and Cologne: an hundred twenty five of Breslaw: an hundred and ten of Bergen and Dronheim: and an hundred and seventeen of Stockholm.

ELLIPSE*, in geometry, one of the conic sections; popularly called an *oval*.

* The word is formed from the Greek, ελλειψις, deficiency, a denomination which the ancient Greek geometers gave this figure, by reason, among other properties, this is one, that the squares of the ordinates are less than, or defective of, the rectangles under the parameters and abscissas.

The *ellipse*, to define it from its form, is a regular, continued curve line, including a space that is longer than broad; wherein are two points equally distant from the two extremes of the length; from which, two right lines being drawn to any point, assumed at pleasure in the *ellipse*, their sum is equal to the length of the *ellipse*.

Thus, in the *ellipse* AEBMD, &c. (Tab. Conics, fig. 21.) the lines Fa and fa drawn from the two points F and f, equally distant from the two extremes A and B, are equal to AB.

Or, taking the *ellipse*, as geometers frequently do, for the space contained, or included within this curve line; it is defined a figure, contained under one single oblong line, and having two unequal axes, or diameters AB and DE.

The greater axis of the *ellipse*, or the right line representing the length of the *ellipse* AB, or of the space included by the *ellipse*, is called the *transverse axis*, or *diameter*: and the lesser axis, representing the breadth of the *ellipse* DE, the *conjugate*, or *second axis*.—The two axes always bisect each other at right angles. See **AXIS**.

The two axes are the two greatest diameters of the *ellipse*, but there are an infinity of other different diameters. See **DIAMETERS**, &c.

The centre of an *ELLIPSE*, is the point C, wherein the two axes intersect. See **CENTRE**.

The two points F and f, in the greater axis, equally distant from the extremes thereof A and B, are called the *foci*, or *umbilici* of the *ellipse*; from which two lines, drawn to the circumference of the *ellipse*, as already observed, are equal to the greater axis. See **FOCUS**.

The *ellipse*, considering it as a conic section, that is, as a curve arising from a section of the cone, is best defined from its genesis, or the manner of its production, thus: an *ellipse* is a curve line, produced by cutting the cone ABC, (fig. 21. n^o. 2.) by a plane, in such manner, as that the axis of the section DE, meets with the diameter of the base AB, produced to F.

Or, defining it from one of its known properties assumed; an *ellipse* is a curve line, wherein the square of the semi-ordinate PM, is to the rectangle of the segments of the axis AP and PB; as the parameter, is to the axis.

Thus, if AB=a, the parameter=b; PM=y; AP=x. then will b:a::y²:ax-x². Consequently ay²=abx-bx². See **CONIC SECTION**.

Hence, y²=bx-bx²:a. That is, the square of the semi-ordinate, is equal to the rectangle of the parameter into the absciss; abating another rectangle of the same absciss into a fourth proportional to the axis, parameter and absciss.

2^o. To find the axis, parameter, and semi-ordinate of an *ELLIPSE*. The parameter, absciss, and semi-ordinates, in an *ellipse* being given; the axis is found by making 1. b:y::y²:y². 2. x-y²= $\frac{(bx-y^2)}{b}$:x=x+a.

3^o. The axis AB, the absciss AP, (fig. 22.) and the semi-ordinate PM being given, the parameter AG is thus found: make AI=PM; and from A, through M, draw the right line AL. In I erect a perpendicular LI: then, since AP:PM::AN:LI; LI=y²:x. Produce PM to O, till PO=LI=y²:x and from B, through O, draw the right line BG. In A erect a perpendicular GA=ay²:(ax-x²): this will be the parameter AG.

4^o. The axis AB, and the parameter AG being given, we can assign every absciss, as BP, its semi-ordinate PN; by drawing a line GB to the parameter AG, which is perpendicular to the axis AB: then, erecting a perpendicular PN, make PL=PH. Lastly, on AL describe a semi-circle.

To find the foci, conjugate axis, ratio of the ordinates, &c. of an *ellipse*.—1^o. From B to L (fig. 19.) set off half the parameter; then will CL= $\frac{1}{2}a-\frac{1}{2}b$. In the centre C erect a perpendicular CK, meeting the semi-circle described on AL. Thus will CK= $\sqrt{(\frac{1}{2}a^2-\frac{1}{2}ab)}$. Therefore, making CF=CK; F will be the focus.—The latter equation furnishes us this theorem.

If the axis AB, be cut in the focus F, the rectangle under the segments of the axis AF, FB will be subquadruple of the rectangle under the parameter and the axis. See **FOCUS**.

5^o. The parameter, and axis AB given, the conjugate axis is easily found; as being a mean proportional, between the axis and parameter. Consequently, the parameter is a third proportional to the greater and lesser axis. Add, that the square of half the conjugate axis, is equal to the rectangle, under the distance of the focus from the vertex, and its complement to the axis.

6^o. In an *ellipse*, the squares of the semi-ordinates PM, pm, &c. are to each other as the rectangles under the segments of the axis. Hence DC²:PM=CB²:AP.PB. Consequently DC²:CB²=PM²:AP.PB. That is, the square of the less axis is to the square of the greater; as the square of the semi-ordinate, to the rectangle under the segments of the axis.

7^o. The right line FD (fig. 24.) drawn from the focus F, to the extremity of the conjugate semi-axis; is equal to half the transverse axis AC.

Hence, the conjugate axes being given, the foci are easily determined. For, bisecting the greater axis AB in C; from C erect a perpendicular CD, equal to the conjugate semi-axis. Then from D, with the interval CA, the foci F and f are determined.

8^o. To describe an *ellipse*.—The sum of two right lines FM, and fm drawn from each focus of an *ellipse*, F and f to the same point of the periphery M, being equal to the greater axis AB: the conjugate axes of an *ellipse* being given; the *ellipse* is easily described. For, determining the foci F and f, already directed; and fixing two nails therein, and about these nails, tying a thread F M f, equal to the length of the greater axis AB.

AB: the thread being stretched, and a style, or pin, applied at its extent, the duct or sweep of the style or thread about the nails will describe an *ellipse*.

9°. The rectangle under the segments of the conjugate axis, is to the square of its semi-ordinate, as the square of the conjugate axis, to the square of the greater axis. Hence, the co-ordinates to the conjugate-axis, have the same relation, as there is between the co-ordinates to the greater axis. Consequently, the parameter of the conjugate axis, is a third proportional to the conjugate axis, and the greater axis.

10°. To determine the subtangent PT (fig. 25.) and subnormal PR in an *ellipse*.—As the first axis, is to the parameter; so is the distance of the semi-ordinate from the centre, to the subnormal.

11°. The rectangle under the segments of the axis, is equal to the rectangle, under the distance of the semi-ordinate from the centre, into the subtangent. See SUBTANGENT.

12°. As the distance of the semi-ordinate from the centre, is to half of the axis; so is the absciss to the portion of the subtangent intercepted between the vertex of the *ellipse* and the tangent.

13°. The rectangle under the subtangent PT, into the absciss PC, is equal to the rectangle under the segments of the axis. Hence, the square of the semi-axis AC, is equal to the rectangle of CT, into PC.

14°. The rectangle under the subtangent, and the distance of the ordinate from the centre, is equal to the difference of this distance, and the square of the transverse semi-axis.

15°. In an *ellipse*, the square of the semi-ordinate is to the square of the conjugate semi-diameter, as the rectangle under the segments of the diameter, is to the square of the semi-diameter. Consequently, the relation of the semi-ordinates to the diameters, is the same as to the axes: and the parameter of the diameter, is a third proportional to the diameters.

Infinite ellipse, are those defined by the equation $ay^m + n = bx^m (a-x^2)$ which some call *elliptoides*, if m be greater than 1, or n greater than 1.

In respect of these curves, the *ellipse* of the former kind is called the *Apollonian ellipse*.

QUADRATURE OF THE ELLIPSIS. See QUADRATURE.

ELLIPSIS, in grammar, and rhetoric, is a figurative way of speaking, wherein something is suppressed, or left out in a discourse, and supposed or understood.

This chiefly happens, when, being under the transport of a violent passion, a man is not at leisure to speak every thing out at length; the tongue being too slow to keep pace with the rapid motions of the mind. So that on these occasions we only bring forth broken, interrupted words and expressions; which represent the violence of a passion, better than any consistent discourse.

F. Bosiu considers the *ellipse*, as a way of disguising sentences; by suppressing the word which should make the particular application, and leaving the whole in a kind of ingenious ambiguity.

Thus, the Trojans, in Virgil, being reduced by Turnus to the last extremity, and ready to be destroyed, spy Æneas coming to assist them: upon which the poet says, *spes addita suscitât iras*. Which expression signifies either, in particular, that the hope they conceive retrieves and augments their courage: or in general, that the hope of assistance at hand naturally raises courage, and gives people new strength.

If the poet had added a word, and said, *illis spes addita suscitât iras*, the passage had been expressly restrained to the first sense; and had ceased to be a sentence, and commenced only the application of a sentence. The suppression of that word makes it a sentence in form.

This, that excellent critic looks on as one of the finesses of the Latin tongue: wherein it had vastly the advantage of the modern tongues. *Trait. du Poëme Epique.* Page 466, &c.

ELLIPTIC, or ELLIPTICAL, something that belongs to an *ellipse*.

Kepler first maintained, that the orbits of the planets are not circular, but *elliptical*; which hypothesis was afterwards adhered to by M. Boullaud; Mr. Flamsteed, Sir Isaac Newton, M. Cassini, and others, of the later astronomers, have confirmed the same: so that this, which was once by way of contempt called the *elliptic hypothesis*, is now the prevailing doctrine.

Sir Isaac Newton demonstrates, that if any body revolve round another in an *elliptic* orbit, its centrifugal forces, or gravities, will be in a duplicate ratio; or as the squares of its distances from the umbilicus, or focus.

Serlio, Hartman, &c. endeavour to demonstrate that the best form for arches, or vaults, is the *elliptical*. See ARCH. See also CATENARIA.

ELLIPTIC SPACE, is the area, contained within the circumference, or curve of the *ellipse*. See ELLIPSIS.

It is demonstrated, 1°. That the *elliptic space* is to a circle described on the transverse axis; as the conjugate diameter is to the transverse axis.

2°. That the *elliptic space* is a mean proportional between two circles described on the transverse and conjugate axes.

ELLIPTIC CONOID, is the same with the *spheroid*. See SPHEROID.

ELLIPTIC SPECULA, or Mirrors. See MIRRORS.

ELLIPTIC WINDING-STAIRS. } See the articles } STAIRS.

ELLIPTIC WIND-MILL. } See the articles } WINDMILL.

ELLIPTIC COMPASSES, an instrument, made usually in brass; for the drawing any *ellipse*, or oval, by one revolution of an index.

ELLIPTIC DIAL, is an instrument, usually of brass, with a joint to fold together, and the Gnomon to fall flat; for the sake of the pocket.

By it are found the meridian, hour of the day, rising and setting of the sun, &c. See DIAL.

ELLIPTOIDES, an infinite *ellipse*; i. e. an *ellipse* defined by the equation $ay^m + n = bx^m (a-x^2)$, wherein $m > 1$ or $n > 1$. See ELLIPSIS.

Of this there are several kinds or degrees: as the cubical *ellipsoid*, wherein $ay^3 = bx^3 (a-x)$. A biquadratic or tersed-folial *ellipsoid*, or that of the third order, wherein $ay^4 = bx^4 (a-x)^2$.

If any other ordinate be called v , and the correspondent absciss z ; there will be $ay^m + n = bx^m (a-x)^2$. Consequently, $ay^m + n : av^m + n :: bx^m (a-x)^2 : bz^m (a-z)^2$ that is, $y^m + n : v^m + n :: x^m (a-x)^2 : z^m (a-z)^2$.

ELOCUTION, is defined by Tully; the choosing and adapting of words, and sentences, to the things, or sentiments, to be expressed.—To the *elocution* then properly belongs the diction verborum, or choice of words.

The beauties of *elocution* consist chiefly in the use of figures, and figurative dictions or expressions in the periods, and the style. See FIGURE, PERIOD, and STYLE.

ELOGIUM, *ELOGE*, a praise, or panegyric, bestowed on any person, or thing; in consideration of its merit.

* The word is Latin, but formed of the Greek *eulogia*, commendation; which is compounded of *eu*, well; and *logos*, to say, or speak.

In that fine discourse of Isocrates, entitled *panegyris*, there is an historical *eloge*, of the city Athens: Fa. Labbe, has composed an historical *eloge* of the city Bourges; Fa. Menestrier, of the city of Lions; and M. Martignac, of the bishops, and archbishops of Paris, for about a century.

The secretary of the royal academy of sciences at Paris, composes the *eloges* of such members as die; and delivers them at the next public meeting of the company.—Funeral orations are only *eloges* of eminent persons deceased.—Some authors have wrote *eloges* on despicable, and even pernicious things.

Extravagant and improbable *eloges* are of the greatest difference to their own design; and do, in effect, diminish the person, whom they pretend to magnify. Any worthy man may pass through the world, unquestioned and safe, with a moderate recommendation: but, when he is set-off and bedawbed with rhetoric, and embroidered so thick that you cannot discern the ground; it awakens naturally (and not altogether unjustly) interest, curiosity, and envy: for, all men pretend a share in reputation, and love not to see it engross'd, or monopoliz'd; and are therefore apt to enquire (as of great estates suddenly got) whether the person (so commended, came honestly by it, and of what credit the person is, that tells the story.

ELONGATION, in astronomy, the digression, or recess of a planet from the sun, with respect to an eye placed on our earth.

The greatest distance of the planet, &c. from the sun, is called the *greatest elongation*: which varies on two accounts, viz. in that both the earth, and the planet revolve, not in circles, but in *ellipses*.

The *elongation* is chiefly considered in Venus and Mercury: the *greatest elongation* of Venus is 45 degrees, and that of Mercury 30 degrees: that is, the former never recedes from the sun, or is seen distant from him, above 45°; nor the latter above 30°. Whence it is that Mercury is so rarely visible; as being usually lost in the light of the sun. See MERCURY, and VENUS.

ELONGATION, is also used, by some authors, for the difference in motion, between the swiftest and the slowest of two planets; or the quantity of space, whereby the one has overgone the other: called also *superation*.

The swiftest motion of the moon, with regard to the sun, is called the *elongation* of the moon from the sun.—We also say diurnal *elongation*, binary *elongation*, &c.

Angle of ELONGATION, or *angle at the Earth*, the difference between the sun's true place, and the geocentric place of a planet.—Such is the angle ETR (Tab. Astronom. fig. 25.) between the place of the sun E, and that of the planet R.

ELONGATION, in chirurgery, is an imperfect luxation; when the ligament of any joint is so extended, or relaxed, as to lengthen

ELY

lengthen the limb, but yet not to let the bone go quite out of its place. See LUXATION.

ELOPEMENT *, in law, is when a married woman, of her own accord, departs from her husband, and dwells with an adulterer; for which, without voluntary reconciliation to the husband, she shall lose her dowry; nor shall the husband, in such case, be compelled to allow her any alimony.

Sponte virum mulier fugiens, & adultera fœdit.

Dote sua caret, nisi sponte retracta.

* The word is formed from the Belgic, *Eel*, matrimony, and *Loopen*, to run away.

ELOQUENCE, the art of speaking, or writing well; so as to move, and persuade. See RHETORIC, and ORATORY.

Demosthenes, and Cicero, are the two princes of ancient eloquence; the one among the Greeks; the other among the Romans. Their manner, however, was exceedingly different; the first being close, strong, nervous, concise, and severe, so that a word could not be spared; the latter copious, florid and rich, so that a word could not be added.

It was objected to Cicero, that his eloquence was Asiatic, that is, redundant, or stuffed with superfluous words, and thoughts.

Pericles was called a *torrent of eloquence*, a *thunderbolt of eloquence*. Pedants do not distinguish eloquence from the heaping up of figures, the use of big words, and the roundness of periods.

True eloquence depends principally on the vivacity of the imagination. In strictness, it is not that which gives grace and ornament, but life and motion, to discourse. Its mien is that of an Amazon, not that of a Coquette.

The authors of the *Art of thinking* remark, that the rules of eloquence are observed in the conversations of people naturally eloquent, though they never think of them, while they practise them. They practise those rules because they are eloquent; not in order to be eloquent.

The eloquence of the chair, and pulpit, is much more difficult than that of the bar. Sir George Mackenzie has a treatise of the eloquence of the bar. *Idea Eloquentiæ forensis*, &c.

ELUDING, the act of evading, or rendering a thing vain, and of no effect; a dextrous getting clear, or escaping out of an affair, difficulty, embarrass, or the like.

We say to *elude* a proposition, &c.—The design of chicanery is to *elude* the force of the laws: this doctor has resolved the difficulty, but *eluded* it. Alexander, says the historian, in cutting the Gordian knot, either *eluded* the oracle, or fulfilled it: *Ille nequiquam luctatus cum latentibus nodis, nihil, inquit, interst, quomodo solvatur; gladioque ruptis omnibus loris, oraculi sortem vel elusit vel implevit.* Q. Curt.

ELYSIUM, ΕΛΥΣΙΟΣ, in the ancient theology, or rather mythology, a place in the inferi, *i. e.* in the lower world, or as we sometimes render it, in hell; furnished with fields, meads, agreeable woods, groves, shades, rivers, &c. whither the souls of good people were supposed to go after this life. Orpheus, Hercules, and Æneas, are held to have descended into *elysium*, in their life-time, and to have returned again. Virgil, lib. VI. v. 638, &c. Tibullus, lib. I. eleg. 3. give us fine descriptions of the *elysian fields*.

Virgil, opposes *elysium* to *tartara*; which was the place where the wicked underwent their punishment.

Hæc locus est, partes ubi se via findit in ambas:

Dextera, quæ ditis magni sub mœnia tendit:

Hæc iter elysium nobis: at læva malorum

Exercet pœnas, & ad impia tartara mittit.

Some authors take the fable of *elysium* to have been borrowed from the Phenicians; as imagining the name *elysium* formed from the Phenician *ely alaz*, or *ely alats*, or *ely alaz*, to rejoice, or to be in joy; the letter *a* being only changed into *e*, as we find done in many other names; as in Enakim, for Anakim, &c. On which footing *elysian fields* should signify the same thing as a place of pleasure; or,

—*Locos lætos & amœna virentia*

Fortunatorum nemorum, sedesque beatas. Virg.

Others, derive the word from the Greek, *λυω*, *solvō*, I deliver, I let loose, or *disengage*; (by reason here men's souls are freed, or disencumbered from the fetters of the body. Beroaldus and Hornius, *Hist. Philosoph.* l. III. c. 2. take the place to have derived its name from Eliza, one of the first persons who came into Greece after the deluge, and the author and father of the Ætolians. Ol. Rudbecks contends, that it was in Sweden the *elysian fields* were placed.

ELYTROIDES *, ΕΛΥΤΡΟΙΔΗΣ, in anatomy, one of the proper coats, or tunics of the testicles. See TESTICLE.

* The word is formed of the Greek, *ελυσιν*, *vagina*, a sheath, and *ειδ*, *form*.

The *elytroides* is the second proper coat of the testes: it resembles a sheath, or vagina, whence some have also called it *vaginalis*.

EMA

It is formed of a dilatation, of the production of the peritonæum: its inner surface is smooth and equable; and the outer rough and unequal; which makes it adhere the more strongly to the first of the proper coats, called *erythroides*.

EMANATION *, the act of flowing, or proceeding, from some source, or origin.—Such is the *emanation* of light from the sun; or that of effluvia from odorous, &c. bodies; of wisdom, from God, &c.

* The word is formed of the Latin *e*, out of, and *manare*, to flow, or stream.

EMANATION is also used for the thing that proceeds, as well as the act of proceeding.—The power given a judge, is an *emanation* from the regal power: The reasonable soul is an *emanation* from the divinity: The Holy Spirit is an *emanation* from the Father and the Son, &c.

EMANATION is also used among the schoolmen for the production of a lesser thing, in order to the production of a greater, by virtue of some natural connection, or dependance between them.

For, as when several moveables are joyned together, the same power that moves the first moves all the rest (as in pulling up the trunk of a tree, you pull up the roots, branches, &c. or in drawing one link, of a chain, you bring forward all the rest.) The same is to be understood in all conjunct natural effects, viz. that the same power whereby the first is produced, does also produce all the rest naturally connected to it: in that by means of the connection, the action of the agent is conveyed from one to the other; so that the first determines the agent to the production of all the rest.

And hence that is called an *emanative cause*, (in contradistinction to an efficient cause) which produces an effect by its mere presence, without the intervention of any action; as a rose doth a smell, &c.—Others, and with good reason, deny, that there is any such thing as an *emanative cause*, to produce an effect without any action. See CAUSE.

EMANCIPATION *, in the Roman law, was the act of setting a son free from the power, and subjection of his father.

* The word is formed from the Latin, *ex*, of, and *mancipium*, a slave.

Emancipation differs from *manumission*; as the latter was the act of a master in favour of his slave; the former that of a father in favour of his son.

The effect of *emancipation* was, that the goods, and moveable effects, which the son should thenceforth acquire, should be his sole property, and not the property of his father; as they were before *emancipation*. Beside, that *emancipation* put the son in a capacity of managing his own affairs, and of marrying without his father's consent, though a minor, or pupil, and under 25 years of age.

There were two kinds of *emancipation*: the one *tacit*, which was by the son's being promoted to some dignity, or by his coming of age, or by marriage: in all which cases, the son became his own master of course.

The other *express*, where the father declared before the judge, that he *emancipated* his son. This was not performed without some formality: the father was first to sell his son imaginarily, to another man, whom the lawyers call *pater fiduciarius*, father in trust; of whom being bought back again by the natural father, he manumitted, or set him free by a declaration before the judge.—This imaginary sale was called *mancipatio*; and the manumission, consequent thereon, *emancipatio*.

Emancipation still obtains in France, chiefly, with regard to minors, or pupils, who are hereby set at liberty to manage their effects, without the advice, or direction, of their fathers or tutors. It must be observed, however, that *emancipation* only extends to the selling of moveables, and letting of leases, &c. of immoveables; not to the selling or mortgaging of immoveables: which are only done with the consent of a curator, ordinarily appointed a person when *emancipated*.

Formerly, *emancipation* was performed in the ordinary courts of justice, when desired by the child; but if he were a minor, the king's letter was also required. Though there were other ways of *emancipation*, as by marriage; arriving at the age of 20 years; and in some provinces, by the death of the mother, by reason the children were there under the power of the father and mother jointly, so that the death of either of them *emancipated* the child.

Emancipation by marriage, in France, gives a power of marrying again, without the father's consent, though under age: but among the Romans, Cujas tells us, a widow, under 25 years of age, though *emancipated* by her former marriage, returned into the power of her father, and might not marry a second time without his consent.

Du Cange observes, that the word *emancipation* was also used in the monasteries, in speaking of monks, promoted to any dignity, or removed from under the power of their superiors: as also in speaking of monasteries, chapels, &c. themselves, when exempted by the pope, from the jurisdiction of the ordinary.

EMASCULATION, the act of taking from a male those parts which are characteristic of his sex. See **CASTRATION**.

EMAUX de l'Escu, in heraldry, the metals and colours of a shield, or scutcheon.

EMBALMING *, the opening a dead body, taking out the intestines, and filling their place with odoriferous, and delicate drugs, and spices, to prevent its putrefying.

* The word is formed from *balm*, which was a principal ingredient in the embalmings of the ancient Egyptians.

The body of Jacob was 40 days in *embalming* in Egypt. See Genesis i. v. 3. Mary Magdalen, and Mary the mother of James, bought perfumes to *embalm* Jesus. See Matthew, &c. John king of France, dying at London in 1364, his body was *embalmed*, and sent to France, and there interred at St. Dennis. Du Tillet. For the manner of *embalming* among the Egyptians, see Thevenot's *Collection*, tome I.

Dr. Grew, in his *Museum Regalis Societatis*, is of opinion, that the Egyptians boiled their bodies in a large cauldron, with a certain kind of liquid balsam: his reason is, that in the mummies preserved in the collection of the royal society, the balsam had penetrated not only the fleshy and soft parts, but even the very bones; so, that they are all as black as if they had been burnt.

The Peruvians had an effectual method of preserving the bodies of their yncas, or kings, *embalmed*.—Garcilasso de la Vega takes their main secret to have been the burying of the corps in the snow, to harden them; and afterwards applying a certain bitumen, mentioned by Acosta, which kept them as entire, as if they had been still alive.

EMBARCADERO, in commerce, a Spanish term, much used along the coasts of America, particularly those on the side of the fourth sea.

It signifies a place which serves some other considerable city further within land, for a port, or place of shipping, i. e. of *embarking*, and *disembarking* commodities.

Thus Calao, is the *embarcadero* of Lima, the capital of Peru: and Arica, the *embarcadero* of Potofí. There are some *embarcaderos* 40, 50, and even 60 leagues off the city which they serve in that capacity.

EMBARGO, a restraint or prohibition, laid by a sovereign, on merchant vessels; to prevent their going out of port; sometimes to prevent their coming in; and sometimes both, for a limited time.

Embargo's are usual in time of war; in apprehensions of invasions, &c.—One great occasion of *embargo's* is, that the government may make use of the merchant vessels, with their equipage, &c. in armaments, expeditions, transporting of soldiers, &c. *Embargo's* are of very mischievous consequence in commerce.

EMBARRAS, a French term, though now naturalized; denoting a difficulty, or obstacle, which perplexes, or confounds a person, &c.

The *embarras* was very great in the road, by reason of the army which defiled therein. A man lives more in two days of leisure, and feels more of life therein, than in two years of hurry and *embarras*. Chev. de M.—It discovers a decay of passion, when lovers are under an *embarras* at finding themselves alone. La Bruyere.

EMBASSADOUR *, or **AMBASSADOUR**, a public minister, sent from one sovereign prince, as a representative of his person to another.

* The word is derived from the corrupt Latin *ambasciator*, formed of *ambasius*, an old word borrowed from the Gaulish, signifying servant, client, domestic, or officer: such is the origin given by Borel, Menage, and Chifflet, after Salmastius and Spelman. But the Jesuits of Antwerp reject this opinion, in the *Alta Sancti Mart.* tom. II. p. 128. by reason the Gaulish *ambas* had been discontinued long enough before the Latin *ambascia* was ever thought of: which, however, is not strictly true; the word *ambascia* occurring in the Salic law, Tit. 19. and being formed of *ambasia*, by pronouncing the *t* as in *aditia*; and *ambasia* came from *ambasius*, *ambasch*, work; as signifying a person hired to perform a work, or legation: and Choriæ, meeting with the same word in the laws of the Bourguignons, gives into the same sentiment. Alb. Acharius in his Italian dictionary derives it from the Latin *ambulare*, to walk, or travel. Lastly, the Jesuits of Antwerp, in the place last cited, observing that the word *ambascia* occurs in the laws of the Bourguignons, derive thence the words *ambasciatore*, and *ambasciatore*, as signifying envoys, or agents, from one prince, or state to another. Their opinion is, that among the Barbarians, who overpassed Europe, *ambascia* signified the discourse of a person who floops, or humbles himself; being formed from the same root with *abassus*, viz. of *en*, or *em*, and *bas*.

In Latin, we usually call this kind of minister *legatus*, or *orator*; though it is certain, the word *ambasciadour*, with us, has a much more extensive signification, than that of *legatus* among the Romans: and, excepting that they are both under the protection of the law of nations, there is scarce any thing in common between them.

Embassadours are either *ordinary* or *extraordinary*.

EMBASSADOUR in ordinary, is he who resides stately in the court of another prince, to maintain a mutual good understanding, look to the interests of their masters, and transact such affairs as may occur.

Embassadours in ordinary, are but of modern invention: It is not above 200 years ago since they were first heard of: till then, all *embassadours* were *extraordinary*, and retired as soon as they had dispatched the affair they were sent upon.

EMBASSADOUR extraordinary, is he who is sent to a prince's court on some particular, and emergent occasion; as to conclude a peace, or marriage; make a compliment, or the like.

Indeed, there is no essential difference between *ordinary* and *extraordinary* *ambasciadours*; their errand is all: and they equally enjoy all the privileges and prerogatives which the law of nations decrees.

At Athens, the *ambasciadours* from foreign princes and states, always mounted the tribune, or pulpit, of the public orators, and there opened their commission, and acquainted the people with their business and errand: at Rome they were introduced to the senate, and delivered their commission to them: among us, they make their address immediately and solely to the king.

Athens and Sparta, says M. Tourneil, when in all their glory, were never so much delighted, as to see, and hear a number of *ambasciadours* in their assemblies, suing for the protection, or alliance of the one, or the other state. It seemed to them the noblest homage that could be paid them; and that state, which received the most *ambascies*, was judged to have the advantage over the other.

The name of *ambasciadour*, Cicero observes, is sacred and inviolable; *non modo inter facerum jura, sed etiam inter hostium tela incolume versatur*. In Vegg. Orat. VI.—David, we read, made war against the Ammonites, to revenge the injury done his *ambasciadours*. 2 King. X. Alexander put the inhabitants of Tyre to the sword, for having insulted his *ambasciadours*; and the youth of Rome for affronting the *ambasciadours* of Vallona, were delivered up into their hands, to be punished at discretion.

The *ambasciadours* of kings should never attend at any public assemblies, marriages, interments, or other solemnities, unless their masters have some interest therein; nor must they even go into mourning, or the like, on any occasions of their own, by reason they represent the persons of their princes, and must conform, and keep pace with them.

EMBASSY, or **AMBASSY**, *Legatio*, a mission from one sovereign prince, or state, to another, of some able experienced person, to negotiate some affair, in quality of *ambasciadour*.

Fa. Daniel observes, that under the ancient French kings, their *ambassies* consisted of a body, or number of persons, joined together in commission, and who composed a kind of council: something like which is still retained at treaties of peace. Thus the French *ambassy* at Nimeguen, for the peace, consisted of three plenipotentiaries; that of Utrecht of two, &c.

We likewise read of *ambasciadresses*: Madam the Marechale de Guebriant, Wicquefort observes, was the first, and perhaps the only woman, sent by any court in Europe, in quality of *ambasciadress*. Matth. L. IV. *Vie d'Henry IV.* tells us, that the king of Persia sent a lady of his court on an *ambassy* to the grand signior, during the troubles of the empire.

EMBATTLED, a term in heraldry, when the out-line of any ordinary is notched after the manner expressed in *Tab. Herald.* fig. 56. N^o. 2. representing the battlements of a wall, or castle. See **BATTLEMENT**.

EMBER-Weeks *, are those wherein the *ember* or *embring-days* fall.

* In the laws of king Alfred, and those of Canute, those days are called, *ymbren*, that is, circular days, from whence the word was probably corrupted into *ember-days*: by the canons they are called, *quatuor anni tempora*, the four cardinal seasons, on which the circle of the year turns: and hence Henfaw takes the word to have been formed, viz. by corruption from *temper*, of *tempora*.

The *ember-days* are the Wednesday, Friday, and Saturday, after Quadragesima Sunday, after Whitunday, after Holy-Rood day in September, and after St. Lucies day in December: which four times answer well enough to the four quarters of the year, Spring, Summer, Autumn, and Winter.

Mr. Somner thinks they were originally fasts, instituted to beg God's blessings on the fruits of the earth. Agreeably to which, Skinner supposes the word *ember* taken from the ashes, *embers*, then strewed on the head.

These *ember-weeks* are now chiefly taken notice of, on account of the ordination of priests, and deacons; because the canon appoints the Sundays, next succeeding the *ember-weeks*, for the solemn times of ordination. Though the bishops, if they please, may ordain on any Sunday, or holiday.

EMBLEM

EMBLEM *, **ΕΜΒΛΗΜΑ**, a kind of painted ænigma, which representing some obvious history, with reflections, underneath, instructs us in some moral truth, or other matter of knowledge.

* The word is pure Greek; formed of the verb, *εμβάλλειν*, to cast in, to insert: Suetonius relates, that Tiberius made the word be coined out of a decree of the Roman senate, because borrowed from another language.

Such is that very significant image of Scævola, holding his hand in the fire: with the words, *agere & pati fortia Romanum est*: to do and suffer courageously is Roman.

The emblem is somewhat plainer, and more obvious than the ænigma.—Gale defines *emblem* an ingenious picture, representing one thing to the eye, and another to the understanding.

The emblems of Alcibiades have been in as much reputation among the more learned, as those of Quarles among the vulgar.

The Greeks also frequently gave the name **ΕΜΒΛΗΜΑΤΑ**, *εμβλήματα*, to inlaid, or Mosaic works, and even to all kinds of ornaments of vases, moveables, garments, &c. And the Latins used *emblemata*, in the same sense: accordingly, Cicero reproaching Verres with the statues, and fine wrought works he had plundered from the Sicilians, calls the ornaments fixed thereto (and which on occasion might be separated from them) *emblemata*. Add, that Latin authors frequently compare the figures and ornaments of discourse to these *emblemata*: thus, an ancient Latin poet, praising an orator, says, that all his words were ranged like the pieces in Mosaic.

*Quam lepide dictos composuæ, ut tessellæ omnes,
Arte pavimenti, atque emblemate vermiculata.*

We do not use the English word, *emblem*, in this sense; though the ancient juris consulti, always retain the Latin *emblemata* to express such ornaments; by reason the Greek *εμβλήματα*, literally denotes any thing applied, or added to a body by way of enrichment.

With us, *emblem* ordinarily signifies no more than a painting, basso relievo, or other representation, intended to hold forth some moral, or political instruction.

What distinguishes an *emblem* from a *device*, is, that the words of an *emblem* have a full, compleat sense of themselves; nay, all the sense, and signification which they have together with the figure.

But there is a yet further difference between *emblem* and *device*: for a *device* is a symbol appropriated to some particular person, or that expresses something which concerns him particularly; whereas an *emblem* is a symbol that regards all the world alike.

These differences will be more apparent, from comparing the *emblem* above quoted, with the *device* of a candle lighted; and the words, *juvando consumor*, I waste myself in doing good.

EMBLEMATICAL Characters. See **CHARACTER**.

EMBLEMENTS, a term strictly signifying the profits of lands sown; though sometimes used more largely for any profits arising, and growing naturally from the ground: as grass, fruit, &c.

If a tenant, for life, sow the land, and die; his executor shall have the *emblemments*, and not he in reversion. But if the tenant for years, sow the land, and before severance the term expires, there the lessor, or he in reversion, shall have the *emblemments*, and not the lessee.

EMBOLISMIC, *Intercalary*, is chiefly used in speaking of the additional months, which chronologists insert to form the lunar cycle of 19 years.

The 19 solar years, consisting of 6939 days, and 18 hours; and the 19 lunar years, only making 6726 days: it was found necessary, in order to render the 19 lunar years equal to the 19 solar, which make the lunar cycle of 19 years, to intercalate or insert seven lunar months, containing 209 days; which, with the four biffextile days, happening in that interval, make 213 days, and the whole, 6939 days. See **CYCLE**.

By means of these seven *embolismic*, or additional months, the whole 6939 days and 18 hours of the solar years, are employed in the calendar.

In the course of 19 years, there are 228 common moons, and seven *embolismic* moons. Their distribution is thus: every 3d, 6th, 9th, 11th, 14th, 17th, and 19th years are *embolismic*, and consequently contain 384 days a-piece. And this was the method of computing time among the Greeks; when they used the enneadecæterides, or cycle of 19 years. But they did not keep regularly to it, as the Jews seem to have done.

The *embolismic* months, like other lunar months, are sometimes 30 days, and sometimes only 29. See **YEAR**.

The *embolismic epacts*, are those between XIX and XXIX; which are thus called, by reason with the addition of the epact XI, they exceed the number XXX: or rather, because the years, which have these epacts, are *embolismic*; having thirteen moons a-piece, whereof the 13th is the *embolismic*.

EMBOLISMUS

EMBOLISMUS *, **ΕΜΒΟΛΙΣΜΟΣ**, in chronology, signifies *intercalation*.

* The word is formed of *εμβαλλειν*, to insert. See **EMBOLISMIC**.

As the Greeks made use of the lunar year, which is only 354 days; in order to bring it to the solar, which is 365 days; they had every two or three years an *embolism*, i. e. they added a thirteenth lunar month every two or three years; which additional month they called *embolimus*, *εμβολιμιας*, because inserted, or intercalated.

EMBOLUS, the moveable part of a pump, or syringe; called also the *piston*, and popularly the *sucker*. See **PISTON**: See also **PUMP**, and **SYRINGE**.

The pipe, or barrel of a syringe, &c. being close shut, the *embolus* cannot be drawn up without a very considerable force; which force being removed, the *embolus* returns again with violence. This phenomenon the Aristotelians attribute to nature's abhorrence of a vacuum. See **VACUUM**.

But the modern philosophers finding that in an exhausted receiver, the *embolus* is easily drawn up, though the orifice be stopped; prove that it is the pressure of the atmosphere on the external parts of the *embolus*, that makes the difficulty of drawing it up. See **AIR**, **ATMOSPHERE**, and **SUCTION**.

EMBOSSING, or **IMBOSSING**, the act of forming, or fashioning works in relievo, whether they be cast, or moulded, or cut with the chisel, &c.

Embossing is one great part of sculpture; being that which has to do with figures raised, or prominent from the plain, or ground; the other part, which makes figures, &c. that are indented, or cut in below the ground, is called *engraving*.

EMBRACEOR, he who, when a matter is in trial between party and party, comes to the bar with one of the parties (having received some reward so to do) and speaks in the cause, or privately labours the jury, or stands there to over-look, awe, or put them in fear.—The penalty hereof is 20 pounds, and imprisonment at the justices discretion.

EMBRASURE, in architecture; an enlargement of the gap, or aperture of a door, or window, within-side the wall. See **DOOR**.

Its use is to give the greater play, for the opening of the door, wicket, casement, &c. or to take in the more light.

The *embrasure* coming sloping inwards, makes the inner angles obtuse. When the wall is very thick, they sometimes make *embrasures* on the out-side.

EMBRASURES, in fortification, denote the holes, or apertures, through which the cannons are pointed; whether in casemates, in batteries, or in the parapets of walls. See **CANNON**, **ORDNANCE**, **BATTERY**, &c.

The *embrasures* are generally about 12 foot a-part, from six to nine feet wide without, and from two or three within. Their height from the plat-form is usually three feet on the inside, and a foot and half on the outside: that is the muzzle, on occasion, may be sunk, and the piece brought to shoot low.

They are sometimes called *cannonieres*, when big enough to pass the mouth of a cannon through; and *meurtrieres*, when only big enough for muskets.

When the parapet is so low, that the cannon may shoot without *embrasures*, it is said to shoot *en barbe*.

EMBROCATION *, or rather **EMBROCHATION**, **EMBROCHA**, **ΕΜΒΡΟΧΗ**, in pharmacy, denotes the application of remedies, as oils, spirits, decoctions, and other liquids, by sprinkling, or even rubbing them on the part affected: this is called also *irrigation*.

* The word is formed from the Greek *βραχω*, *irrigo*, *made-facio*, I sprinkle, wet, macerate.

Embrocations are only a kind of lotions: They are now little used, except in diseases of the head. If the pain do not abate, make an *embrocation* of cows milk, lukewarm, on the head. Degori. Apply an *embrocation* on the part with unguent. Dialtheæ, or oil of lillies very hot. Dionis.—The pumping used in natural baths is properly an *embrocation*.

EMBROIDERY *, the enriching of a cloth, or stuff, by working diverse figures thereon, with the needle, and thread of gold, or silver.

* The word *embroidery* is derived from the French *broderie*, of *broder*, to embroider; which some deduce, by transposition from *bordure*, by reason they formerly embroidered only the borders of stuffs; whence the Latins also call the embroiderers *limbularii*. Du Cange observes, that they anciently wrote *aus obrystus*, for embroidered with gold, or *brustus brudatus*, and *brodatus*; whence *broderie*.

That done with silk, flax, or the like, is not now called *embroidery*; though anciently, and properly, the word denoted all kind of figuring, or flourishing.

The chief use of *embroidery* is in church vestments, cloaths, housings, guidons, standards, &c. The invention of *embroidery* is attributed to the Phrygians; whence the Latins call embroiderers *phrygiones*.

There

There are diverse kinds of *embroidery*: as *embroidery on both sides*, that which appears on both sides; only practicable on thin slight stuffs, as taffetas, gauzes, mullins, &c. *Embroidery on the flap*, where the figures are very high, and prominent, being supported on wool, cotton, hair, &c. *Low embroidery*, where the figures are low, and without any enrichment between them.

EMBRYO *, in medicine, the first beginning, or rudiments of the body of an animal, in its mother's womb; before it have received all the disposition of parts, necessary to become animated: which is supposed to happen to a man on the forty-second day; at which time, the *embryo* commences a foetus.

* The word is derived from the Greek, *εμβρυον*, which signifies the same thing; formed of the proposition *εμ* and *βρυω*, *scaturio*, *pullulo*, I spring out; by reason of the manner of the first growth of the *embryo*, which resembles that of the first shoots of a plant, as being a kind of zoophyte, and having only a vegetative life.

The moderns have made abundance of fine discoveries on the formation, and growth of the *embryo*.

M. Dodart having an *embryo* of 21 days age put in his hands, made a nice examen thereof; to find the order nature observes in the formation of the parts, and the first rise of the parts themselves.

The placenta, he found more than half of the whole; and thence concludes, that the nearer the *embryo* is to the moment of its conception, the greater is the placenta with respect to the secundines, and the foetus. Which circumstance furnishes a reason why miscarriages are more dangerous than regular deliveries; notwithstanding that the foetus in the former case is much less than in the latter. For though the *embryo* have made a way sufficient for it self, it may not for so great a placenta, as is to follow it.

The *embryo* it self was only seven lines long, from the top of the head to the bottom of the spina dorsi, where it terminated. The thighs were not yet unfolded: they only appeared like two little warts at the bottom of the trunk: the arms made the same appearance on the shoulders. The head was just $\frac{1}{2}$ of the length of the whole seven lines: on this were seen two little black points, which would one day have been eyes. The mouth was very big; which M. Dodart takes for an indication that the foetus was fed by the mouth. There was no eminence for the nose; but two little, almost imperceptible, pits for the nostrils.

The painters usually make the head $\frac{1}{3}$ of the height of a well proportioned man; and $\frac{1}{4}$ of that of a young child: in the *embryo* we are speaking of, the head made $\frac{1}{3}$ part of the whole; whence it follows, that the younger the *embryo*, the bigger the head in proportion to the body. The parts nearer the head are also bigger in proportion to the rest; and the legs and feet the smallest.

The *embryo* was a little crooked forwards, and bore some resemblance to the maggot of a silk-worm: it weighed less than seven grains, which is an extraordinary lightness for a body seven lines long. It was so soft, that no part of it could be touched without making a change in its figure.

Upon opening it, M. Dodart discovered the heart, and the right auricle: all the other parts in the thorax, and lower venter, were only simple lineaments, or out-lines, and all vesicular, excepting a part on the left side, which may be supposed to be the spleen. There was no appearance of any thing on the right side for a liver. *Mem. de l'Acad.* See **FETUS** and **GENERATION**.

EMBRYO, is also used by naturalists, to express the grain, or seed of a plant; sometimes the germ, or first sprout appearing out of the seed; by reason the whole future plant is supposed to be contained therein. Just as the whole chick, is supposed contained in the cicatrix, or treddle of an egg.

EMBRYOTHLASTES, **EMBPTOΘAECTES**, an instrument wherewith to crush the bones of an *embryo*, or dead child; so as to make it easier of extraction, and prepare it for the *embryulus*; to draw it out of the womb.

EMBRYOTOMY *, **EMBPTOTOMIA**, in chirurgery, the operation of cutting off the funiculus umbilicalis, or navel string, of a child just born; and tying it up.

* The word is formed of the Greek, *εμβρυον*, and *τομω*, I cut.

EMBRYULKIA *, or **EMBRYOLKIÄ**, **EMBPTOTAXIA**, or **EMBPTOEAXIA**, in chirurgery, an operation of extracting the child out of the mother's womb. See **CÆSAREAN**.

* The word is formed of the Greek, *εμβρυον*, *scaturio*, and *ελευω*, to draw.

What the Greeks call *embryolkia*; the Latins call *cæsarean section*: which latter name M. Dionis observes; has taken place, and prevailed over the former; as being more easy of pronunciation.

EMENDALS, an old term still used in the accounts of the inner temple; where, so much in *emendals* at the foot of an account, signifies so much in the bank, or stock of the house, for reparation of losses, and other occasions.

EMENDATIO panis & cerevisiæ, the assize of bread and

beer; or the power of supervising and correcting the weights and measures belonging to them. See **ASSIZES**.

EMERALD *, a precious stone, when in its greatest perfection green and transparent; and as to hardness, nearly equal to the Ruby.

* The word is formed from the French *émeraude*, and that from the Latin *smaragdus*, which signifies the same. Others derive it from the Italian *sméraldo*, or the Arabic *zomrad*.

Pliny reckons up twelve kinds of *emeralds*; and denominates each from the provinces, or kingdoms, where he supposed them to be found; as *Scythian*, *Bactrian*, *Egyptian*, *Peruvian*, &c.

But the modern naturalists, and jewellers, only know of two fine kinds, *viz. oriental* and *peruvian*. And if we may credit Tavernier, in his treatise of coloured stones found in the Indies, inserted in the second volume of his voyages, these two should be further reduced to one, *viz. the peruvian*.

In effect, he pretends that there is not, nor ever was, any mine of *emeralds*, in the East Indies; and that all that are there found, were brought from Peru by the way of the South Sea; which was a method of commerce, carried on by the Peruvians before the discovery of America by the Spaniards. But as the point of such commerce is not sufficiently proved, we must keep to the ancient division.

The *oriental emerald* is harder, more brilliant, and transparent than the *peruvian*; which has generally clouds flow in it, and sparkles less. Beside, that there are such quantities brought from Peru, by the way of Carthage, that they are much sunk in value and reputation. There are also European *emeralds*, but they are little other than coloured crystal. Some authors say that *emeralds* are usually taken out of iron mines: and Pomet assures us, he had one to which the iron ore was still sticking. To which, all we have to say, is, that it could not be a *peruvian*, by reason there is no iron mine in the country.

The *emerald* is supposed to grow more and more perfect in the mine like the ruby; and to arrive at its greenness by flow degrees, as the fruit comes to maturity on trees. It is a common opinion, that the *emerald* grows in the jasper; and it is certain there are some jaspers so perfectly green and fine, that many have taken parts of them for *emeralds*.

But the proper matrix, or marcasite of this stone is the *preme d'Emeraud*, which is held among the coarser precious stones; being hard, semi-pellucid, and often intermixed with yellow, green, white and blue, &c.

The ancients made amulets of *emeralds* against all kinds of forcery; and supposed them effectual against a thousand different diseases: At present, that we have more experience, or less credulity, they are valued for their beauty, not their virtue; though there are still some who suppose, that when reduced into an impalpable powder, and mixed with rose water, they may be of some use in medicine.

We read in authors of several *emeralds* of incredible magnitude: Rodrigo de Tolédo tells us, that when the Saracens took that town, king Tarik had for his share of the plunder, a table 365 foot long, and all of a-piece, which he maintains to be an *emerald*. After this, the reader will not wonder at that pretended to have been seen by Theophrastus, in a temple in Egypt, four cubits long, and three broad; nor even at an obelisk of *emerald* 40 foot high. But these were not properly *emeralds* in our sense of the name, but only green marble or other such stones.

In the *Dictionnaire de Commerce*, we have a very curious and accurate estimate of the values of the different kinds of *peruvian emeralds*; which the reader will not be displeased to find transcribed here.

Rough EMERALDS. — Those of the first and coarsest sort, called *plafmet*, for grinding, are worth 27 shillings sterling the marc, or 8 ounces. The demi-morillons, 8 lib. sterl. per marc. Good morillons, which are only little pieces, but of fine colour, from 13l. to 15l. per marc. *Emeralds*, larger than morillons, and called of the third colour, or sort, are valued at from 50l. to 60l. the marc. *Emeralds*, called of the second sort, which are in larger and finer pieces than the preceding, are worth from 65l. to 75l. per marc. Lastly, those of the first colour, otherwise called *negres cartes*, are worth from 110l. to 115l.

EMERALDS ready cut, or polished and not cut, being of good stone, and a fine colour, are worth,

	Lib.	Sh.
Those weighing one caract, or four grains	0	10
Those of two caracts	1	7
Those of three caracts	2	5
Those of four caracts	3	10
Those of five caracts	4	10
Those of six caracts	7	10
Those of seven caracts	15	0
Those of eight caracts	19	0
Those of nine caracts	23	0
Those of ten caracts	33	0

See Supplement article **SMARAGDUS**.

E M E

EMERALD, or EMERAUD, in heraldry, is used in lieu of vert, or green, in blazoning the arms of dukes, earls, &c.

EMERGENT Year, in chronology, is the epocha, or date, whence we begin to account our time.

Our *emergent year* is sometimes the year of the creation: the Jews use that of the deluge, or the Exodus, &c. The *emergent year* of the Greeks, was the establishment, or at least restoration of the olympic games by Iphitus. The Romans accounted their years from the building of the city, AB U. C. That is, AB URBE CONDITA.

EMERSION, in physics, the rising of any solid above the surface of a fluid specifically lighter than it self, into which it had been violently immersed, or thrust.

It is one of the known laws of hydrostatics, that a lighter solid being forced down into a heavier fluid, immediately endeavours to emerge; and that with a force, or moment, equal to the excess of a weight of a quantity of the fluid, above that of an equal bulk of the solid.

Thus, if a solid be immersed in a fluid of double its specific gravity; it will emerge again, till half its bulk, or body, be above the surface of the fluid.

EMERSION, in astronomy, is when the sun, moon, or other planet, begins to re-appear, after its having been eclipsed, or hid by the interposition of the moon, earth, or other body.

The difference of longitude is sometimes found by observing the immersions and *emersions* of the first of Jupiter's satellites.

The immersions are observed from the time of Jupiter's being in conjunction with the sun, to his opposition; and the *emersions*, from the opposition to the conjunction. Which two intervals are usually six months a-piece, and divide the year between them.

But when Jupiter is in conjunction with the sun, and fifteen days before and afterwards; there is nothing to be observed: that planet, with his satellites, being then lost in the light of the sun.

EMERSION, is also used when a star, before hid by the sun, as being too near him, begins to re-appear, and to get out of his rays.

Scruples, or minutes of EMERSON, an arch of the moon's orbit, as TQ (Tab. Astron. fig. 46.) which the moon's centre passes over, from the time she begins to emerge out of the shadow of the earth to the end of the eclipse.

EMERY *, a sort of metallic stone, found in several mines of metals; but chiefly in those of iron, being properly an iron ore.

* The word comes from the French *emiril*, formed from the Latin *myril*, and that from the Greek *μυρίων*, which signifies the same thing; and which Lemery derives from the verb *μυράω*, I clean, scour.

We usually distinguish three kinds of *emery*; the *spanish*, red, and *common emery*.—The first is found in the gold mines of Peru, and other provinces of the Spanish America: it is judged a kind of ore of that rich metal; being streaked with little veins, and specks of gold. It is for this reason the king of Spain prohibits its being exported: which renders it exceeding rare among us; to the great regret of the seekers of the philosopher's stone, who build great hopes in the transmutation of this precious mineral. The *red emery* is found in copper mines; the little we have of it comes from Sweden and Denmark.

The *common emery* is taken out of iron mines; and is almost the only sort used among us. The consumption hereof is very considerable among the armorers, cutlers, locksmiths, glaziers, lapidaries, masons, &c. Some of whom use it to polish and burnish iron, and steel works; others, to cut and scollop glass, marble, and precious stones.

This *emery* is of a brownish colour, sometimes bordering a little on red; exceedingly hard, and of consequence difficult to pulverize. The English are the only people that have got the art of making it into powder; which they do chiefly by means of certain mills contrived for that purpose: and thus send it in powder to their neighbours.

Pounding it in mortars were in vain; it being so hard that it would pierce, or break the mortar ere it would break it self.

Of the powder, the most subtle and impalpable is the best: as to the stone, it should be chose of a high colour, and as free of the rock as possible.

Emery fused with lead, and iron, hardens them. It is also said to encrease and heightens the weight and colour of gold. It is usual to mix a little of it with the gold from Madagascar, which is naturally pale and soft. See **GOLD**.

Putty of EMERY, is a kind of a dirty matter, found on the lapidaries wheels; containing part of the powder of *emery* they use.

EMETIC *, in medicine, a remedy that excites vomiting; or that purges the stomach by the mouth.

* The word is from the Greek, *εμεω*, I vomit.

Of these there are a great variety; as *Ipecacuanba*, *Carduus*

E M I

Benedictus, &c.—The use of *emetics* is indicated by a foulness of the mouth in a morning, reaching, loathing, gnawing of the stomach, gradual loss of appetite, spontaneous vomiting &c.

Vomiting is raised by irritating the spirits with the presence of something loathed; by an unusual agitation, as falling, &c. by tickling the fibres of the fauces, and pharynx with a leather dipped in oil; by drinking quantities of warm water, &c. by any thing sharp and viscid; as the flowers and seeds of dill, leaves of groundel, &c. crocus and glass of antimony; the flowers and regulus thereof; mercurius vitae, mineral turbit, and mercury sharpened any way with acid.

The **EMETIC wine, vinum EMETICUM**, is only white wine, wherein is infused some crocus metallorum, or glass of antimony.

The **EMETIC powder**, called also *powder of Algaroth*, from the name of its author, is a precipitate of antimony; or butter of antimony sweetened and softened by repeated lotions.

EMETIC tartar, is prepared from equal parts of crocus metallorum, and cream of tartar, boiled together in water, afterwards filtrated and crystallized. See **CRYSTALL**.

The operation of *emetic* medicines is thus accounted for by Dr. Quincy: the particles of the *emetic* wedging themselves into the orifices of the emissaries of the glands, placed adjacent to the surface of the stomach, do dilate the same; (which by some extrinsic cause had been contracted) and after the same manner, do dissolve (at least in some degree) the cohesion of the stagnant morbid matter; rendering it more fluid, and consequently making its resistance less.

Now the natural and constant action of the glands being secretion; and the impediment, (by the dilatation of the orifice, and the attenuation of the fluid) being taken away, or at least made less than the natural momentum of the glands; the matter must naturally flow into the cavity of the stomach, till it be heaped up in such quantity (which not being to be done in an instant, must require some time) as is sufficient by its stimulus to vellicate, and force the fibres of the stomach, abdomen, and diaphragm, by communication of the first with the two last, into a violent contraction; and thereby throw all out by the oesophagus; and this makes all quiet for a time, till a new and sufficient quantity be excreted from these glands to produce the aforesaid contraction.

Thus there happen fits of vomiting and quiet alternately, till either all the morbid matter be thrown out, or the force of the *emetic* be so diluted, that it is no longer able to draw out the morbid matter from the glands.

And the strong contraction in so many muscles, and muscular canals, as are at work in the action of vomiting, and the violent concussion which is produced all over the whole body by a power, which, by just computation, is not inferior to 260000. weight, may, and often does, take away the obstruction in many other canals, besides those which are adjacent to the stomach and gullet; as we plainly see, by those vast sweats, which plentiful fits of vomiting occasion.

Emetic and purgative medicines differ only in this, that the particles of the latter do not immediately vellicate the fibres of the stomach, dilate the orifices, and attenuate the matter contained in the glands of the stomach; but act gently, and assist the natural motion of digestion, and so are carried down into the guts: and how they operate there, see **PURGATIVE**.

EMINENCE, in geography, a little hillock, or ascent, above the level of the adjoining campaign.

This feat is built on an *eminence*. The enemies have taken possession of such an *eminence*, such a height, from which they can cannonade our rear.

EMINENCE, is also a title of honour given to cardinals.

It is his *eminence* the cardinal de— The decree of the pope, whereby it was appointed; that the cardinals should be addressed under the quality of *eminence*, bears date the 10th of January, 1630. They then laid aside the titles of *illustrissimi*, and *reverendissimi*, which they had born before.

The grand master of Malta, is likewise addressed under the quality of *eminence*.

The popes John VIII. and Gregory VII. gave the same title to the kings of France. The emperors have likewise born it.

Eminentissimus, the superlative of *eminent*, has of late been attributed to the cardinals, *L'eminetissime cardinal de Richelieu*.

EMINENTIAL equation, is used by some algebraists in the investigation of the areas of curvilinear figures; for a sort of artificial equation, containing another equation *eminently*.

Hayes Flux. p. 97.

EMINENTLY, *EMINENTER*, in the schools, is used in contradistinction to *formally*, and in the same sense with *virtually, viz.* to denote that a thing possesses, or contains any other in a more perfect or higher manner than is required to a formal possession thereof.

Thus an angel is said to have prudence *eminently*; as he has it in a higher and more perfect degree than it is in man, in whom it is formally.

For

For one thing to contain another *eminently*, there are usually required two conditions, 1. That the containing be of a more excellent nature than the contained. 2. That the less excellent be some way contained in the more excellent, viz. either as in its productive cause: or by some similitude: or as to the manner, and order of acting, &c.

EMIR *, a title of dignity, or quality, among the Turks, and Saracens; attributed to such as are relations, or descendants of their great prophet Mahomet.

* The word is Arabic, where it literally signifies *prince*. It is formed of the verb *amar*, which is originally Hebrew, and in both these languages signifies to say, and to command.

The *emirs* are held in high veneration; and have alone the privilege of wearing a green turban.—On the borders of the Holy Land there are several *emirs*, sovereign princes; as the *emir* of Gaza, and the *emir* Terabaa, over whom the grand feignior has but little authority.—The *emir* Hagge, or prince conductor of the pilgrims of Egypt to Mecha, is Bafhaw of Jerusalem, &c.

The title *emir*, at first, was only given to the caliphs: in Persia they were also called *emir zadeh*, q. d. prince's son: whence, by abbreviation of *emir*, they loined *mir*, and of *emir zadeh*, *mürza*. In after-times, when the Caliphs had assumed the title of Sultans; that of *emir* remained to their children, as that of Cæsar did among the Romans.

At length, the same title of *emir* came to be attributed to all, who were judged to descend from Mahomet by his daughter Fatimah, and who wear the green turban.

EMIR, is also a title, which being joined to some other word, frequently denotes an office, or employ.—As the *emir al omera*, commander of commanders; who, in the time of the Caliphs, was chief of the councils and armies.

The appellation **EMIR** is also applied, by the Turks, to all viziers, and bafhaws, or governors of provinces. See **BASHAW**, &c.—Add, that *emir Akhor*, vulgarly *Imrabor*, is master of the horse to the grand feignior.

Emir Alem, vulgarly *Miyalem*, standard-bearer, and director of all the standards of the empire.

Emir Bazar, the provost, or superintendent of the markets, who regulate the prices of provisions.

Emir al Moflemis, or *emir al Moumenin*, i. e. commander of the faithful, or the believers, was a title assumed by the Almohades and Almohades, who reigned in Africa and Spain.

EMISSARY *, a trusty, dextrous, able person sent, underhand, to sound the sentiments, and views of another; to make him some proposal, or overture; or to spread reports, watch the actions, motions, and countenance of a contrary party, or person, in order to make advantages of them all. See **SPY**.

* The word is formed of the Latin *e*, and *mitto*, q. d. I send out.

The leaders of parties have abundance of *emissaries* employed in their service, who inform them of what passes every where, that they may take their measures accordingly. The pope and the chevalier have commonly their *emissaries* in England.

EMISSARY of a gland, the same with *excretory duct*, being the common canal, or pelvis, in which all the little secretory tubes of a gland do terminate.

EMISSION, the act of throwing, or driving a thing, particularly a fluid, from within, outwards.—The ancients took vision to be performed by the *emission* of visual rays from the eye.

But, the term *emission* is chiefly applied among us to the expulsion, or ejaculation of the seed. See **EJACULATION**.

EMMENAGOGUES *, **EMMHNAGOGA**, in medicine, such remedies as promote the menses.

* They are thus called from *ev*, in, *menstru*, month, and *agō*, ducis, I lead; by reason their natural periods of flowing are once a month.

Emmenagogues either act by giving a greater force to the blood in its circulation, whereby its momentum against the vessels is increased; or by making it thinner, whereby it will more easily pass through any outlets.

The former intention is helped by chalybeats, which give a greater weight and momentum to a languid heavy blood, and all other substances of the like gravity and elasticity. And such is the case of a leuco-phlegmatic habit, or, as it is commonly called, the green-sickness, and its cure.

But in the latter case, where the blood is florid, and too high; attenuating alteratives and detergents are the only remedies, because fittest to render the blood more thin, and give it such a property, as will better carry it through those little apertures, destined for its discharge into the uterus.

EMOLLIENTS, in medicine, and pharmacy, remedies used to soften, and loosen indurations, or contractions of the belly, or those of tumors, and swellings.—Such are mallows, mercurialis, lily roots, linseed, butter, wax, gum ammoniac, &c.

The term *emollient* is applied to external as well as internal remedies.—We say, a laxative, anodyne, and *emollient* clyster, an *emollient* emplaster, an *emollient* cataplasm, &c. Fresh cherries are an *emollient* food; though, when dry, they rather

constrict than relax; as wanting a great part of the phlegm, which rendered them *emollient*. Ripe grapes, of astringent, which they were before, become laxative, and *emollient*. Hog's lard, applied externally, is resolutive, and *emollient*.

Quincy defines *emollients* to be such things as sheath and soften the appetites of the humours, and relax and supple the solids at the same time. For it is easy to conceive how these should be both effected by the same medicine; thus,—By what means soever, (whether in the stomach, or any other parts) the juices have obtained a sharpness, or astringency, so as to vellicate and render uneasy the fibres, and nervous parts; which often happens; those things which are smooth, soft, and yielding, cannot but wrap up their points, and render them imperceptible; whereby they may gradually, by the proper course of circulation; be brought to some convenient emunctory, without doing any injury by the way.

Such sharpness of parts, likewise, draws the fibres into spasms, keeps them too tense, and frequently thereby occasions obstructions of the worst kind.

In all such cases, therefore *emollients* lubricate, and moisten the fibres, so as to relax them into their proper dimensions; whereupon such disorders cease.

EMOLUMENT *, is properly applied to the profits arising daily from an office, or employ.

* The word is formed of the Latin *emolumentum*, which, according to some, primarily signifies the profits redounding to the miller from his mill; of *mola*, miller, to grind.—

The patent, or other instrument, whereby a person is preferred to an office, gives him a right to enjoy all the dues, honours, profits, and *emoluments* belonging thereto.

In our law books, *emolument* is used in a somewhat greater latitude, for profit or advantage in the general.

EMPALEMENT *, or **IMPALEMENT**, a cruel kind of punishment, wherein a sharp *pale*, or stake, is thrust up the fundament and through the body.

* The word comes from the French *empaler*, or the Italian *impalare*; or rather they come all alike, from the Latin *palus*, a stake, and the preposition *in*, in, into.

We find mention of *empaling* in Juvenal: It was frequently practised in the time of Nero; and continues to be so in Turkey.

EMPALEMENT, in botany, denotes the cup, or outmost part of the flower of a plant, or that encompassing the foliation of the attire.

It is compounded of the three general parts of all plants, the skin, the cortical, and the woody bodies, each *empaler* being (whether consisting of one or more pieces) as another leaf, and designed to be a guard, and a band to the flower, where it is weak and tender: so that such plants as have flowers, with a firm and strong basis, as tulips, &c. have no *empalement*, nor need any.

EMPALELLING, or **IMPALELLING**, in law, signifies the writing, and entering into a parchment schedule, or roll of paper, by the sheriff, the names of a jury summoned by him to appear for the performance of such public service, as juries are employed in.

EMPARLANCE, or **IMPARLANCE**, in law, a desire, or petition in court, of a day to consider, or advise what answer the defendant shall make to the action of the plaintiff.

The civilians call it *petitio induciarum*. Kitchen mentions *imparlance general*, and *special*: the first seems to be only that made in one word, or in general terms: *imparlance special*, is where the party requires a day to deliberate, adding these words, *salvis omnibus adiunctis tam ad jurisdictionem curie, quam ad breve et narrationem*.

Briton also uses *emparlance* for the conference of a jury upon a cause committed to them. See **IMPARLANCE**.

EMPASMA, **EMPAZMA**, in pharmacy, a powder thrown, or sprinkled, over the body, to correct some ill smell thereof, or to prevent unnecessary sweats.

* The word is formed from the Greek, *επαρσσω*; I sprinkle.

EMPASTING *, or **IMPASTING**, a term used in painting; for the laying on of colours, thick, and bold, or applying several lays of colours, so as they may appear thick. See **COLOURING**.

* It is formed of the French *empâster*, which has the same signification, of *paste*, or *pâte*, paste.

A painting is said to be well *empasted* with colours, when the colours are bestowed plentifully, or it is well soaked, and saturated with colours.

The term is also used, when the colours are laid distinct and asunder; and not softened, or lost in each other.—This head is not painted: it is only *empasted*.

EMPERESS, *Imperatrix*, the feminine of emperor; applied either to an emperor's wife, or to a woman who rules singly over an empire, with all the authority of an emperor: as, at this time, the *emperess* of Russia: See **EMPEROR**, **QUEEN**, &c.

EMPERESS, is also used in the ancient French poetry, for a particular kind of rhyme, thus denominated by way of excellence.

The rhyme *Emperiere* was a sort of crowned rhyme, wherein the syllable that made the rhyme, was immediately preceded

by two other like syllables, of the same termination; which made a kind of echo, called the *triple crown*; and which, to the shame of the nation, (as some of their late authors express it) their best ancient poets took for a wonderful beauty and excellence.

Fa. Mourgues, in his treatise of French poetry, gives us an instance very proper to raise contempt of the miserable taste of that age, which knew no way of expressing, that the world is impure, and subject to change, so excellent, as by saying,

Qu' es tu qu' un immonde, monde, onde,

EMPEROR, *Imperator*, among the ancient Romans, signified a general of an army, who for some extraordinary success had been complimented with this appellation.

Afterwards, it came to denominate an absolute monarch, of a supreme commander of an empire; a Roman *emperor*, &c. In strictness, the title *emperor* does not, cannot, add any thing to the rights of sovereignty: its effect is, only to give precedence, and prebeminence above other sovereigns; and as such, it raises those invested with it, to the top of all human greatness.

The *emperors*, however, pretend, that the imperial dignity is more eminent than the regal; but the foundation of such prerogative does not appear: it is certain the greatest, most ancient, and absolute monarchs, as those of Babylon, Persia, Assyria, Egypt, Macedonia, &c. were called by the name of *kings* in all languages both ancient and modern. See **KING**. It is disputed whether, or no *emperors* have the power of disposing of the regal title? it is true, they have sometimes taken upon them to erect kingdoms; and thus it is, that Bohemia and Poland are said to have been raised to the dignity: thus, also, the *emperor* Charles the Bald, in the year 877, gave Provence to Boson, putting the diadem on his head, and decreeing him to be called *king*; *ut more priscorum imperatorum regibus videretur dominari*.

Add, that the late *emperor* Leopold, erected the ducal Prussia into a kingdom, in favour of the elector of Brandenburg; and though several of the kings of Europe refused, for some time to acknowledge him in that capacity: yet by the treaty of Utrecht, in 1712, they all came in.

In the east, the title, and quality of *emperor* are more frequent than they are among us: thus the sovereign princes of China, Japon, Mogol, Persia, &c. are all *emperors* of China, Japon, &c. In the west, the title has been a long time restrained to the *emperors* of Germany. The first who bore it was Charlemagne, who had the title *emperor* conferred on him by pope Leo III, though he had all the power before.

In the year 1723, the czar of Muscovy assumed the title of *emperor of all Russia*; and procured himself to be recognized as such by most of the princes and states of Europe.

The authority of the *emperor* of Germany, over the states of the empire, consists, 1^o. In presiding at the imperial dyets, and in having a negative voice therein: so that his vote alone can prevent all the resolutions of the dyet. 2^o. In that all the princes, and states of Germany, are obliged to do him homage, and swear fidelity to him. 3^o. That he, or his generals, have a right to command the forces of all the princes of the empire, when united together. 4^o. That he receives a kind of tribute from all the princes and states of the empire, called the *Roman month*.—For the rest, there is not a foot of land, or territory, annexed to his title.

The kings of France were anciently also called *emperors* at the time when they reigned with their sons, whom they associated to the crown: thus, Hugh Capet, having associated his son, Robert, took the title, of *emperor*; and Robert, that of *king*. Under which titles they are mentioned in the history of the council of Rheims, by Gerbert, &c. King Robert is also called *emperor* of the French by Helgau of Fleury. Louis le Gros, upon associating his son, did the same. In the first register of the king's charters, fol. 166, are found letters of Louis le Gros, dated in 1116, in favour of Raymond bishop of Maguelonne, wherein he styles himself, *Ludovicus, Dei ordinante providentia, Francorum imperator augustus*.

The kings of England had likewise, anciently, the title of *emperors*; as appears from a charter of king Edgar: *Ego Edgarus Anglorum basileus, omniumque regum insularum oceanique Britanniam circumjacent, &c. imperator & dominus*.

Add, that we say, the king of England, *omnem habet potestatem in regno suo quam imperator vendicat in imperio*: whence the crown of England has been long ago declared in parliament to be an imperial crown.

EMPEROR elect. See the article **ELECT**.

EMPHASIS, in rhetoric, a force, stress, or energy, in expression, action, gesture, or the like. See **ENERGY**.

* The word is Greek, *εμφασις*, which signifies the same.

This orator speaks with a world of *emphasis*; all his words have an *emphasis*: what greater punishment, says de la Bruyere, than to hear sorry verses rehearsed with all the *emphasis* of an ill poet?

Some consider *emphasis* as a figure, whereby a thing is represented in the finest, and strongest terms;—such, e. g. is that of Augustus, *Forum alcatorum calefactum*: which is much

more energetic, than if he had said, *studiosè multumque lasimus alea*.

EMPHATICAL is used by the ancient philosophers, to express those apparent colours, which are often seen in clouds before the rising, or after the setting of the sun, or those in the rainbow, &c.

These, because they are not permanent and lasting, they will not allow to be true colours. But, since these *emphatical* colours are light modified chiefly by refraction, and with a concurrence of reflections, and some other accidental variations; and since they are the proper objects of fight, and capable as truly to affect it, as other permanent colours are: there is no reason for excluding them from the number of true and genuine colours; since all other colours are only modifications of light as these are.

EMPHRACTIC *, in pharmacy, the same with *emphastic*.

* The word is formed from the Greek, *εμψρακτω*, 1. *ψω*.

EMPHYSEMA, ΕΜΦΥΣΗΜΑ, in medicine, a windy swelling, or bloating of the whole outer habit of the body; like that in the parts of diverse animals, when blown up, after they are killed.

The wind, or air, which is the matter of the *emphysema*, is lodged under the cutis, and principally in the cellular adipose. Hence the seat of the *emphysema*, or the place wherein the wind is chiefly lodged, is in the adipose cells, under the skin covering the thorax: the ordinary occasion is some wound in the thorax.

Mr. Littre accounts for it thus: when a person is wounded in the breast, there enters air in at the wound: now, it may happen, either from the narrowness of the wound, or the flesh's closing again readily, or some other cause, that the air thus admitted, cannot readily get out again, at least not all of it: and thus air comes to be inclosed in the capacity of the breast.

Now, at every inspiration, the lungs are to fill this capacity, by their swelling with the air which is naturally received. But here they cannot swell without pressing upon the other extraneous air: the consequence of which is, that this latter is made to slip between the interstices of the fleshy fibres, and perhaps to enter the little oscula of the minute veins or lymphatics. Immediately, another force comes to take place, contrary to that of inspiration; viz. expiration: in this, the breast contracting itself, presses the extraneous air still more than the lungs had done in their dilatation: and the two opposite moments or actions conspire to the same effect.

The air, thus continually impelled, will be propagated along the passages it first opened itself, till at length it meets and becomes collected in some place. Now this place must be the cellules of the fat, rather than any where else, by reason of the thinness and flexibility of their membranes; and as the air came from within the cavity of the breast, it will be in the fat that covers the breast, under the skin, rather than elsewhere, that the windy tumor, or *emphysema* will lie.

Now, such tumor cannot be very considerable, when only formed by the air received in at a wound: but if we suppose the wound to have pierced the substance of the lungs, then beside the air taken in by the wound, there will be part of that taken by inspiration; so much as was contained in the bronchiae, or vascular, thus perforated, or opened, escaping into the cavity of the breast, and driven along with the former, into the flesh. And as a fresh quantity of this is supplied every moment, there will be a continual accession, so long as the wound of the lungs remains open.

Hence, an *emphysema* from a wound in the lungs, sometimes possesses the whole habit; the air being carried to all the parts of the body.

EMPHYTEUSIS *, in the civil and canon law, the letting out of poor barren lands for ever, or at least for a long term of years, on condition of the tenants cultivating, meliorating, or mending them; and paying a certain yearly consideration.

* The word is formed of the Greeks, *εμψυτευσις*, which signifies an *engraftment*, and by metaphor, a *melioration*, or amendment: for as we only graft trees to mend them; so a man only alienates his land by *emphyteusis*, on condition of having it amended.

Emphyteusis are a kind of alienations, differing from sales, in that they only transfer the dominum utile, the benefits of the ground; not the property, or fee-simple.—Among the Romans they were at first temporary; afterwards perpetual.

The 20th canon of the council of Carthage, prohibits the bishop's seizing the church's *emphyteusis*, out of the hands of private persons, unless they have been three years without paying rent.

EMPIRE, the territory, or extent of land under the command, and jurisdiction of an emperor. See **EMPEROR**.

We say the Roman *empire*, the *empire* of the east, the *empire* of the west, or the western *empire*, the *empire* of the great mogul, &c.

Tacitus observes of Galba, that all the world would have thought him worthy the *empire*, had he never been emperor. Antiquaries distinguish between the medals of the *upper* and *lower*, or *bas empire*.—The curious only value those of the

upper

upper *empire*, which commences with Cæsar, or Augustus, and ends in the year of Christ 260.

The lower *empire* comprehends near 1200 years, reckoning as low as the destruction of Constantinople, in 1453.—They usually distinguish two ages, or periods, of the lower *empire*: the first beginning where the upper ends, viz. with Aurelian, and ending with Anastasius, including 200 years: the second beginning with Anastasius, and ending with the Palæologi, which includes 1000 years. See MEDAL.

EMPIRE, or the **EMPIRE**, used absolutely, and without any addition, signifies the *empire* of Germany, called also, in juridical acts and laws, the *holy Roman empire*, S R I, q. d. *sacrum imperium Romanum*; which constitutes what we otherwise call the *Germanic body*.

The empire had its beginning with the IXth century; Charlemain being created first emperor by pope Leo III. who put the crown on his head in St. Peter's church on Christmas-day in the year 800.

Authors are at a loss under what form of government to range the *empire*: some of them will have it a monarchical state, by reason all the members thereof are obliged to ask the investiture of their states of the emperor, and to take an oath of fidelity to him.

Others maintain it a republic, or aristocratic state, by reason the emperor cannot resolve, or determine any thing, without the concurring suffrages of the princes: it is added, that if they require investiture from, and swear fealty to him, it is only as head of the republic, and in the name of the republic, and not in his own: just as at Venice, every thing is transacted in the name of the doge. See DOGE.

Lastly, others will have the *empire* to be a monarcho-aristocratic state, i. e. a mixture of monarchy and aristocracy; for that though the emperor in many cases, seems to act sovereignly, yet his decrees and resolves have no force, in case the states refuse to confirm them.

In fine, we should rather chuse to call it an aristo-democratic state; by reason the dyet, wherein the sovereignty is lodged, is composed of princes, and the deputies of cities; and is divided into three orders, or bodies, called *colleges*, viz. the colleges of electors, the college of princes, and the college of cities.

We say, diet of the *empire*, circles of the *empire*, fiefs of the *empire*, princes of the *empire*, estates of the *empire*, members of the *empire*, capitulations of the *empire*, recessus of the *empire*, &c. See DIET, CIRCLE, FIEF, BAN, PRINCE, CAPITULATION, and RECESSUS.

The states or estates of the *empire* are of two kinds, *mediate* and *immediate*.—The *immediate* states or those who hold immediately of the *empire*; whereof, again, there are two kinds: the first, such as have seats, and voices in the imperial diet; the second, such as have none.—The *mediate* states are those who hold of the *immediate*.

The states which now compose the *empire*, are the princes of the *empire*, the counts of the *empire*, the free barons of the *empire*, the prelates of the *empire*, the princebishops, or abbesses of the *empire*, the nobles of the *empire*, and the imperial cities.

EMPIRIC *, a name given by antiquity, to such physicians as formed themselves rules, and methods, on their own practice, and experience; and not on any knowledge of natural causes, or the study of good authors; and who prescribed, without enquiring into the nature of the disease, or the properties and virtues of their medicines: depending wholly on the authority of some general experienced remedies.

* The word is formed of the Greek, *εμπειρικος*, and that of *εμπειρος*, knowing, able; but, particularly, knowing and learned by experience; the root being *πειρα*, essay, trial, experiment.

Medicine was almost altogether in the hands of *empirics*, till the time of Hippocrates; who first introduced reason and the use of theory therein: and hence there arose a new sect, called *theoretici*.

Pliny, and Celsus, make mention of the *empirics*, and their profession, which the Greeks, and the Latins after them, call *empirice*; as attributing all to experience, and nothing to the authority of the matters of the art, or the deductions of reason.

Pliny relates, that the sect of *empirics* had its rise in Sicily: the first who professed it, he says, were Apollonius and Glaucias; others say, Acron Argentinus. They, and their followers, made great opposition to the dissecting of human bodies; and particularly to that practised by Herophilus, and Erasistratus on living bodies, of criminals who were condemned to death. But the word *empiric* is now more odious than ever; being confounded with that of *charlatan*, or *quack*, and applied to persons who practise physic at random, without a proper education, or understanding any thing of the principles of the art.

Indeed, it is possible, the word may be abused even on this side of the question; for those of the physicians servilely attached to the train, and method of the schools, the reasonings of Hippocrates, and Galen, and the statutes of the faculty,

we all know, have been ever forward to treat those who think more freely, and are less stiffly devoted to antiquity, custom, and the reigning practice, or mode, as *empirics*, charlatans, and quacks. See MEDICINE.

EMPLASTER *, *ΕΜΠΛΑΣΤΡΟΝ*, popularly called *PLASTER*, a medicine of a stiff, glutinous consistence, composed of diverse simple ingredients, spread on leather, or linnen; and applied externally.

* The word is formed from the Greek, *εμπλαστρον*, *to put in a mass*, or *to smear over*: by reason the *emplaster* is made of diverse kinds of simple drugs, worked up into a thick tenacious mass; or because it covers over the piece of leather, or linnen, to be applied on the part affected.

Emplasters are made up in a strong solid body, that by remaining a long time on the part, the medicinal ingredients, they are chiefly composed of, may have time enough to produce their effect.

The drugs, used to give a body and consistence to *emplasters* are usually, wax, pitch, gums, fats, litharge, and other preparations of lead.

There are *emplasters* of diverse kinds, and used with diverse intentions: stomachic *emplasters*; cephalic, styptic, hepatic, diaphoretic, resolutive, detensive, emollient, incarnative, astrigent, conglutivative, &c. *emplasters*.

The most usual *emplasters*, are those of diapalma, and diachylon: the *emplastrum polychrestum*, the divinum, the manus dei, the magnetic, the plaster of saffron, de ranis, &c.

EMPLASTICS *, in pharmacy, are salves, or medicines, which stop up, and coagulate the pores of the parts they are applied on: otherwise called *emphragm*.

* The word is formed from the Greek, *εμπλαστικον*, *to stop up*.

Such are fats, mucilages, wax, the whites of eggs, &c.—The plaster is covered over with a very *emplastic* unguent, that it may stick the stronger to the skin. Dionis.

EMPLASTRA Amyntica. See the article AMYNTICA.

EMPORETICA Charta. See CHARTA, and PAPER.

EMPROSTHOTONOS *, *ΕΜΠΡΟΣΘΟΤΟΝΟΣ*, in medicine, a kind of tonic convulsion, wherein the head is drawn forwards, till the chin touch the breast.

* The word is Greek; composed of *εμπροσθεν*, before, and *τονος*, tension, stiffness, of the verb *τεινω*, I stretch.

Sometimes too, it is so general, that the whole body is bent forward; and makes a kind of bow; and even sometimes, a kind of circle, the knees meeting the head.

The cause of this disorder is a contraction of the anterior muscles, particularly those of the head called *myloides*.

EMPYEMA *, *ΕΜΠΥΗΜΑ*, in medicine, a collection of pus, or purulent matter, in the cavity of the breast; discharged thither upon the bursting of some abscess, or ulcer, in the lungs, or membranes, that inclose the breast.

* The word is formed of the Greek, *εμ*, in, and *πυον*, pus; the letter *π*, being here changed into *μ*: a thing often done; when the *π* happens to come, in composition, before the labials *b* and *p*. As in the words *emblemma*, *emblemma*, *empyrium*, &c.

The *empyema* sometimes succeeds a quincy, sometimes a peripneumony, but more usually than either, a pleurisy; as being ordinarily the effect of a peripneumonic or pleuritic abscess.

It usually comes 15 or 20 days after those diseases. Sometimes, also, it is generated of extravasated blood, issued out of a bursten, broken, or putrified vein: it is distinguished by a difficulty of breathing, a dry cough, a heaviness about the diaphragm, a noise, and fluctuating of the matter upon moving; a slow fever, ruddy cheeks, hollow eyes, the tips of the fingers hot, and a swelling of the abdomen.

The cure is difficult, from the difficulty of absorbing, or evacuating such extravasated matter: if nature shews any endeavour to throw it off by vomiting, or urine, or the like, she must be seconded, and assisted therein. Thus, if the urine be purulent, administer diuretics; if the stools, laxatives; if the spitting, expectorants, or even emetics; otherwise, recourse must necessarily be had to a paracentesis, or tapping.

In order to this, an aperture must be made in the thorax, by a proper instrument, on the side affected, between the 4th and 5th, or the 5th and 6th ribs, reckoning from the lowest; and through this, the pus must be slowly drawn.

There is also a kind of *spurious*, or *bastard empyema*, proceeding from a pituitous, or serous humour, brought by some duct, or passage, into the thorax: where corrupting, it degenerates into a matter like pus.

An *empyema*, in course of time, breeds a phthisis, and death often is the consequence.

EMPYREUM *, among divines, denotes the highest of the heavens, wherein the blessed enjoy the beatific vision: called also *empyrean heaven*, and *paradise*.

* The word is formed of *εμ*, and *πυρ*, fire, by reason of its splendour.

Some of the fathers take the *empyreum* to have been created before the heavens we see: St. Basil, and Eustathius of Antioch,

fioc, maintain this in exprefs terms. Being the abode of God, they fuppofe it muft be luminous in the higheft degree; and are in pain to account for the darknefs, which our part of the world was in, before the creation of the fun, &c. As judging that the infinitely vivid luftre of the *empyreum*, muft diffufe it felf to the greateft depths of this lower world.

They have, therefore, recourfe to an hypothefis; our vifible heavens, according to them, did the office of a fcreen, or curtain, and fheltered the earth and waters from the light of the *empyreum*. See Fa. Souciet, *Differt.* p. 171.

EMPYREUMA *, ΕΜΠΥΡΕΥΜΑ, in chemistry, &c. a fmell or tafte of burning; a quality, or change in bodies that have been burnt, or much fcorched with fire, fenfible to the tafte and fmell; or perhaps, it may be fome extraneous matter impreffed, or added by the fire, and remaining on the burnt or fcorched part, that gives the new offensive fmell and flavour.

* The word is formed of the Greek, *εμπυρνεω*, to inflame, kindle.

The term is chiefly ufed when in boiling, or diftilling any thing, it flicks and burns to the bottom of the vefel, or alambique; the offensive fmell and tafte whereof are expreffed by the word *empyreuma*.

EMPYREUMA is alfo ufed for the heat remaining upon the decenfion of a fever.

EMRODS, or rather *Hæmorrhoids*. See the article **HÆMORRHOIDS**.

EMULATION *, a noble jealousy, between perfons of virtue, or learning, contending for the fuperiority therein.

* The word comes originally from the Greek, *αμιλλα*, difpute, conteft; whence the Latin *emulus*, and thence our *emulation*.

Plato obferves of *emulation*, that it is the daughter of envy; if fo, there is a deal of difference between the mother and the offspring: the one is a virtue, and the other a vice. *Emulation* admires great actions, and ftrives to imitate them; envy refufes them the praifes that are their due: *emulation* is generous, and only thinks of furpaffing a rival; envy is low, and only feeks to leffen him.

EMULGENT, in anatomy, an epithet, beftowed on thofe arteries, which bring the blood to the kidneys; and thofe veins, which carry back what is fuperfluous thereof to the cava.—See *Tab. Anat. (Splanchn.) fig. 1. lit. k.* (Angiol.) *fig. 1. n. 49. fig. 6. lit. s. s.*

The *emulgent* arteries fpring from the defcending trunk of the aorta; and the *emulgent* veins terminate in the afcending trunk of the cava.

EMULSION *, in medicine, a foft, liquid remedy, of a colour, and confiftence, refembling milk.—It is compofed of oleaginous feeds, kernels, or fruits, pounded in a mortar, and diffolved in diffilled waters, or light decoctions, and afterwards, expreffed, or ftrained and fweetened with fugar, or fyrup.

* The word is formed from the Latin *emulgere*, to milk.

Emulfions ferve to temper, dilute, and foften acrimonies of the breaft; to moderate the heat of the kidneys; foften the fharpnefs of the urine, and give the patient reft and eafe. The feed of the melon is one of the four greater cold feeds, much ufed in *emulfions*: the feed of the great gourd is alfo ufed in *emulfions*, broths, and decoctions.

EMUNCTORY *, in medicine and anatomy, a part of the body deftined for the feparation of fome humour judged ufelefs, or even hurtful to the animal; after its having circulated fome time with the blood.

* The word is formed from the Latin verb, *emungere*, to wipe away.

The term *emunctory* alfo implies a cavity, adjoining to the part that feparates; wherein the excrementitious humour is collected, and preferved in readinefs for evacuation.

The kidneys, urinary bladder, and milliary glands of the fkin, are *emunctories*: the parotides are not properly *emunctories*, becaufe deftined to feparate the faliva, which is no ufelefs, or excrementitious humour, but neceffary for the digeftion of the food.

Some, without much propriety, confine *emunctory* to the receptacle into which the fecreted excrement is difcharged; as, the pituitous humour of the brain into the noftrils; the cerumen into the ears, the excrements into the inteftines, &c. Though thefe laft indeed have not undergone any circulation.

ENÆMON, ΕΝΑΙΜΩΝ, an external medicine which ftops, or flanches the blood: or which, by binding, cooling, or drying, closes the paffages of the vefels before open; or diminifhes the fluidity and motion of the blood. See **STRYPTIC**.

ENÆOREMA, ΕΝΑΙΩΡΗΜΑ, expreffes fuch contents of the urine, as float about in the middle, refembling a cloud; and thence alfo called *nubecula*. See **NUBECULA**, and **URINE**.

ENALLAGE *, in rhetoric, a figure whereby we change, and invert the order of the terms in a dicourfe; againft the common rules of language.

* The word is derived from the Greek, *εναλλαγή*, formed of *εναλλατ[ε]σθαι*, which fignifies to change, as well as the fimple verb *αλλατ[ε]σθαι*.

The grammarians, too, have a kind of *enallage*, whereby one part of fpeech, or one accident of a word, is put for another. Such is the change of a pronoun, as when a poffeffive is put for a relative, *e. gr. fuus for ejus*; or of a verb, as when one mood or tenfe is put for another.

ENALURON, in heraldry, is ufed by Guillim, to exprefs a bordure charged with birds; as an *enaluron* of martlets, &c. —But Mackenzy charges this as a miftake arifing from ignorance of the French tongue; *enaluron* properly fignifying orle, or in manner of a bordure, and being applicable to a bearing of any thing in that form.

ENAMEL, popularly ΑΜΕΛ, a kind of metalline colour, by the Latins called *encaustum*; ufed in enamelling, and painting in enamel.

The bafis of *enamels* is the fineft crystal glafs, made of the beft kali from Alicant, and fand vitrified together. See **GLASS**.—To thefe are added tin and lead in equal quantities, calcined by a reverberatory fire.

Such is the fundamental compofition of *enamels*; to which are added other metallic or mineral matters, to give them the colour required.—As, æs ufum for green, crocus martis for yellow, &c.

We may diftinguifh three kinds of *enamel*: the firft intended for the counterfeiting and imitating of precious ftones: the fecond, for painting in enamel: and the third ufed by the enamellers, jewellers, and goldfmiths, on gold, fiver, and other metals; with which laft kind, particularly the white, it is that the makers of the Dutch ware, give the glafs to their works.

The *enamels* ufed in imitating precious ftones, and thofe for painting, are ufually prepared by the workmen themfelves, employed in thofe arts: the reft are brought from Venice and Holland. The compofition is the fame, in the main, in all the three kinds: all the difference confifts in giving the colour, or tranfparency.

ENAMELS for painting.—The white *enamel*, or colour ufed by the painters in enamel, is the fame with the common fort ufed by enamellers: only, it is to be prepared by grinding and cleaning it with aqua fortis. After which, wafhing it well in fair water, it is ground, or pounded afrefh in a flipt or agat mortar.

The ruddy brown, is made with faces of vitriol, and falt-petre, or with iron ruff, well ground on an agat, with oil of afpic. Black, is made of perigex well calcined, and ground with oil of afpic; to which is added equal quantity of the goldfmiths, or enamellers black.

Yellow, is the fame with the goldfmiths yellow, the compofition whereof will be given hereafter.

Blue is made of the lapis lazuli, ufed by the painters in oil, well purified and prepared with fpirit of wine, and expofed in a bottle five or fix days to the rays of the fun.

Vermillion red, is made with vitriol calcined between two crucibles, luted together; then wafhed in aqua fortis, and afterwards in fair water: the fire is to be moderate, and to remain about half an hour.

The lake red, is compofed of fine gold diffolved in aqua regia with fal armoniac, or common falt. The diffolution being completed, it is put in a cucurbit with fpring water and mercury, over hot fand for 24 hours. The powder remaining at the bottom of the cucurbit, when the water is poured off, is ground up with double its weight of flower of fulphur, and put in a crucible over a gentle fire. And when the fulphur, which takes fire, is exhale, the red powder remaining is ground with rocaile.

Laftly, white copperas calcined, makes a colour much like the amber colour ufed by limners.

Thefe feven or eight colours, or *enamels*, ferve for the compofition of all the reft, by a difcrete mixture and combination thereof.—Thus, blue and yellow make green; blue and red, violet; and fo of the reft.

ENAMELS, ufed by the jewellers, goldfmiths, and enamellers.—Thefe we have obferved, come chiefly from Venice and Holland: they are in little thin cakes of different fizes; ufually four inches in diameter, and $\frac{1}{2}$ an inch thick. Every cake has the maker's mark ftruck on it with a puncheon. The moft ufual marks are the name Jefus, a fyren, monkey, fun, &c. Thofe brought from Venice are chiefly white, flate-colour, fky blue, carnation, yellow, green, and a deep blue, called a *faife lapis*. Thefe feven are the principles of all the others, which arife out of the mixture of thefe. And the white, in particular, is, as it were, the bafis of all the other fix principal colours.

White is made, as already obferved, of crystal glafs, tin, and lead calcined by a reverberatory fire. And this *enamel* is ufed

not only by the jewellers and enamellers on metal, but also by the painters in enamel, the makers of dutch ware, &c. By adding azure thereto, it becomes a slate colour; by adding copper, and cyprus vitriol, it makes a sky blue. By perigueux, a flesh colour; and by iron-rust, a yellow. To make a green, they add copper-filings, &c.

ENAMELLING, by the ancients called *Εγκαυστική, encastice*, the art, or act of applying enamels of various colours, on metals, &c. either in the way of painting, or by the lamp.

Painting in ENAMEL, is a method of painting with enamels, or metalline colours, ground, reduced to powder, and used like other colours, with a pencil; then fused, baked again, and vitrified by force of fire.

The art of *painting in enamel* is very ancient; and appears to have been first practised on earthen vessels, or potters-ware. As early as in the age of Porfenna king of Tuscany, we hear of beautiful vases made in his territories, *enamelled* with various figures; though far short of those afterwards made at Faenza, and Castel Durante, in the dutchy of Urbino, in the time of Raphael, and Michael Angelo. There are still some of those vases extant in the cabinets of antiquaries; in all which the design, or drawing of the figures, is much better than the colouring. For they were, at that time, only acquainted with two colours, *viz.* black and white; either for earthen, or metal works: excepting a faint kind of carnation for the faces and other parts.

In the time of Francis I. of France, the art was retrieved in that country, particularly at Limoges; where there were produced abundance of very valuable pieces, in the manner of the ancients, that is, well performed as to the draught, and the clear-obscure, chiefly in two colours.

There are two ways of *painting in enamel*; the one with clear and transparent, and the other with thick, and opaque colours. —To use the first, they are only ground up with water: the second are ground with oil of aspic.

The first are laid on the metal flat, and bordered, or edged with a rim of metal, to keep the colours asunder. Though, we have seen pieces laid on contiguous, and without any partition; which is very difficult to practise, by reason the transparent colours, in melting are apt to run into each other; especially in the smaller works.

The invention of opaque colours, is much later, and is greatly preferable to that of transparent ones. —All metals, however, will not equally admit both kinds. Copper, for instance, which bears all the opaque colours, will not bear the transparent ones; but to employ these latter upon copper, they are forced, first, to cover it with a layer, or couch of black enamel, over which they lay a silver leaf, and on this apply the other suitable colours, that is, the colours or enamels proper for silver, which itself does not allow of all kinds.

Those which suit it best, are purple, green, azure, and aqua marina. But gold receives all the kinds, and colours, both opaque, and transparent, perfectly well. It must be added, however, that only the finest gold must be used herein. For the transparent colours being laid on a base gold, grow dim and livid; there being a kind of smoky that settles on it not unlike black lead.

Of transparent enamels, the hardest are always the best; though there is a difference even among these; some losing their colour in the fire, and others retaining it. As to the reds, they are only red by accident, being only yellow when made and applied on the gold; and becoming red in the furnace. The best transparent reds are those made of calcined copper, iron rust, orpiment, and calcined gold, melted with the due proportions of sand and salt of glass.

But it is the method of painting with opaque, or thick enamel, to which we owe all our fine modern pieces of enamel; particularly those curious ones on gold, representing portraits to as much perfection as the best painting in oil; and even some history pieces: with this great advantage, that their beauty and lustre never decay, being equally secure from injuries of time and weather.

This art we are indebted for to the French: nothing of the kind having been attempted before the year 1630; when James Toutin, a goldsmith of Chasteaudun, and a great master in the common way of painting with transparent enamel, first applied himself to find a way to use thick colours of different tints, which should melt with fire, and yet retain their lustre, purity, &c.

Toutin succeeded in his attempt, and having got the secret, communicated it to his fellow artists; who, in their turns, contributed to the bringing it to perfection: the first who distinguished himself was Dubie, a goldsmith, who wrought in the galleries of the Louvre. After him came Morliere, a native of Orleans, who applied himself chiefly to the painting on rings and watch cases. His disciple, Robert Vaquer of Blois, exceeded them all, both in his designs and his colours. After him Pierre Chartier of Blois, took himself to the painting of flowers, wherein he succeeded to admiration.

By this time, the English were fallen into the way; who, as

VOL. I.

is allowed by foreigners themselves, seem to have been the first that applied it with success to the painting of portraits, which was now become mightily in vogue, in lieu of those in miniature.

M. Felibien observes, that the first, and most finished portraits, and those in the finest colours were brought into France by Petitot, and Bordier from England: This occasioned Louis Hance, and Louis du Guernier, soon after, two good painters in miniature to attempt the like; in which the latter succeeded beyond every body. He likewise invented several new tints for the carnations; and had he lived, had probably merited the glory of carrying the art to its last perfection.

This kind of painting, to be in perfection, must be on plates of gold: for copper, beside that it emits a fume which tarnishes the colours, is apt to scale and crackle; and silver turns the whites yellow.

These plates are made a little hollow on one side, and raised on the other, either in a circular or oval manner, to prevent the gold's fretting by the fire, and making the colours crack and fly: nor must they be made too thick. It is sufficient they can bear the colours; though it is usual to strengthen them all around with a circle somewhat thicker.

The plate being hammered very evenly throughout, they apply a white enamel on both sides, though the design be only to paint on one of them. The intent of this is to prevent any swelling and warping by the fire: for otherwise, in large pieces, and especially if the colours be laid on any thing unequally, they are apt to rise up in puffs or blisters. Now, this first lay, which is white, remaining smooth and uniform, serves as a ground for all the other colours: The composition of the white enamel, with the other opaque colours, is already delivered under the article ENAMEL.

The gold plate thus *enamelled* in white; the draught, or design to be painted, must be chalked thereon; and, afterwards, the whole accurately drawn out in a ruddy brown. The draught, or out-line, thus finished, the piece is set to the fire, and then painted with the colours above prescribed.

The white ground they paint on, serves all the colours for white. The method being to spare the ground from first to last, in the places where the lights are to be, after the same manner as in miniature: though they have another white, to lay over the other colours, when there is occasion to raise them.

Add, that as the painters in oil re-touch their paintings several times, and let them dry; so in this sort of painting, they touch the piece as often as they please, setting it each time to a reverberatory fire, and taking it away again, as soon as they perceive that the enamel has got its full polish.

The reverberatory fire is made in a little furnace, wherein there is fire both a-top and all around; only a void place in the middle, where the piece is to be put for the enamels to Neal. The colours are laid on with the tip or point of the pencil, as in miniature; with this only difference, that they use oil of aspic to dilute them instead of gum-water. See MINATURE.

Method of ENAMELLING by the lamp.—The works of this kind are all performed by the flame of a lamp; wherein, in lieu of oil, is put horses grease, by some called *caballin oil*. The lamp is of copper, or tin, and consists of two parts, the box and the lamp: in the latter of these, which is a kind of flat oval, is put the oil, and out of this rises the wick. All the use of the box is to receive the oil, which the ebullition, occasioned by the intense heat, might throw abroad.

This lamp, or even where two or three artists work together, two or three more lamps, are placed on a table of a proper height, &c. under which, about the middle of its height, is a double bellows like those of an organ, which one of the workmen raises and falls with his foot, to increase and quicken the flame of the lamps, which is by such means excited to a degree of vehemence almost incredible.

The wind of the bellows is conveyed to the several lamps, though never so many, by means of grooves cut along the thickness of the table, and covered with parchment, extending from the bellows, to a tube or pipe placed before each lamp.

These tubes are of glass, and that the enamellers may not be incommoded with the heat of the lamp, each tube is covered at about six inches distance with a piece of tin, called a *fan*, which is fixed in a hole of the table. In works that do not take up much time, they content themselves with a glass blow-pipe, to heighten the flame of the lamp.

Applying their cake of enamel to the flame of this lamp, they draw it out into threads inconceivably fine. Those made use of in artificial plumes of feathers are so very slender, that they may be wound on a reel, like silk or thread.

The fastidious jets of diverse colours, sometimes used in embroideries, are also made of enamel; and that with so much art, that each piece has its hole to pass the silk through, wherewith it is sewed. These holes are made by blowing them in long pieces, which are afterwards cut off with a proper tool.—See the process of drawing out the enamel, illustrated under the article DUCTILITY of Glass.

ENDORSE, in heraldry, an ordinary, containing the eighth part of a pale.

This, Leigh says, is never used but when a pale is between two such: though others hold, that an *endorse* may be bore between birds, fishes, beasts, &c.—Sir J. Ferne adds, that it shews the same coat has been sometimes two coats, and afterwards conjoined within one escutcheon, for some mystery of arms.—He bares azure an *endorse* argent.—V. *Tab. Herald.* fig. 56. N^o 3.

ENDORSED, *Endosse'*, in heraldry, is where things are bore back, to back.

ENDORSEMENT, is particularly used in commerce for a writing on the back of a bill of exchange, by the proprietor, or bearer; either, thereby, to transfer it to some other, or to render it payable to the order of some other; or else to serve for an acquittance or receipt. See **EXCHANGE**.

The *endorsement* is only the name of the proprietor, or *endorser*. Note, when the *endorsement* of a bill of exchange is to render it payable to another, it is called an *order*.

To an order, it is necessary the *endorsement* be dated; and contain the name of him who paid the value thereof: in which case the bill belongs to the person with whose name the order is filled; without any other transfer: without these conditions, the bill is judged to belong to the person who *endorsed* it. The bearer of a bill of exchange protested, has a remedy against the *endorsers*, for the payment of the rechange of the places where the bill was negotiated by their order. In case a bill or note is refused to be paid, &c. the bearer has a remedy against any one of the *endorsers*, where there are several. See **BILL**.

ENDORING, or **INDORSING**, in law, implies the writing on the backside of a deed, instrument, &c. something relating to the matters contained therein.

ENDOWMENT, or **INDOWMENT**, the giving, or assigning of a dower to a woman.

The word is also used figuratively for the setting forth, or severing a sufficient portion for a vicar, towards his perpetual maintenance, when the benefice is appropriated: whence such a vicarage, is called a vicarage *endowed*. See **VICARAGE**.

ENEMA, in medicine, denotes a *clyster*. See the article **CLYSTER**.

ENEMY. See the articles **HOST**, and **ALIEN**.

ENERGICI, an appellation given to a religious sect, of the sixteenth century; by reason they held that the eucharist was the *energy*, and virtue of Jesus Christ, not his body, nor a representation thereof.

ENERGUMENUS*, **ENEPOMENOS**, a term sometimes used by divines, and schoolmen, to signify a person possessed with a devil, or an evil spirit.

* The word is formed from the Greek, *ενεργειστας*, to be agitated, worked, of *εν*, and *εργον*, opus.

Though, Papias says, the *energumeni* were such as counterfeited the actions of the devil, performing things which seemed supernatural. The council of Orange debars, or deprives, the *energumeni* of the functions of the priesthood.

ENERGY*, an uncommon force, or strength, in a discourse a sentence, or a word. See **EMPHASIS**.

* The word is Greek, *ενεργεια*, formed of the preposition *εν*, and *εργον*, work, labour.

ENERVATING, the act of destroying the force, use, or office of the nerves; either by cutting them, by weakening them with debauchery, or by some other violence.

Excess of wine, and other strong, hot, spirituous liquors, *enervate*, or weaken the nerves. When they would render a horse useless, they *enervate* him, or cut his nerves.

ENERVATING is particularly used in the manage for the cutting two tendons on the side of a horse's head, under the eyes, which meet on the tip of the nose: they thus *enervate* horses to make their head small and lean.

The word is also used figuratively.—It is no small artifice in disputing, to be able to *enervate*, and extenuate the allegations of one's antagonist. This author has a weak, *enervate* style. See **NERVE**.

ENERVATION, a term in the ancient anatomy, applied to the tendons of the recti, or freight muscles of the abdomen. The fibres of the recti of the abdomen, do not go from one extreme of the muscle to the other, but are intersected by several nervous places, called by the ancients *enervations*; though they be real tendons.

Their number is not alike in all: some having three, others four, &c.

ENFANS Perdus*, a French phrase, used in war, to signify the soldiers who march at the head of a body of forces appointed to sustain them; in order to begin an attack, make an assault, or force a post.

* The word literally imports *lost children*, on account of the imminent danger they are exposed to.

In English they are called the *forlorn*, or *forlorn hope*. At present it is the grenadiers that usually begin such attacks.

ENFILADE*, a French term, sometimes used in English; signifying a series, or continuation, of several things, disposed, as it were, in the same thread, or line.—As, an *enfilade* of rooms, of doors, of buildings, &c.

* The word is formed of the French verb *enfiler*, to string a thing, which is compounded of *en*, in, and *fil*, of *filum*, thread: *g. d. a thread*, or *string*, of any thing.

ENFILADE, in war, is applied to those trenches, and other lines which are ranged in a right line; and so may be scoured, or swept by the cannon lengthwise, or in the direction of the line, and rendered almost defenceless.

Care must be taken that the lines be not *enfilad*, or *enfiladed*: on the contrary, the covert line must be *enfiladed*, that the enemy may be driven out of it.—The last boyau, or gut of the trenches, is subject to be *enfiladed*, that is, to be scoured according to its length.

A *batterie d'enfilade*, is that where the cannon sweep a right line.

A *post*, or *command d'enfilade*, is a height from which one may sweep a whole line at once.

ENFRANCHISEMENT, the incorporating any man into a society, or body politic. See **FREEDOM**, and **FRANCHISE**.

Thus, he that by charter is made denizen of England, is said to be *enfranchised*.—The like is understood of a person made a citizen of London, or other city, or corporate town; by reason he is thereby made partaker of the liberties appertaining to the corporation whereof he is *enfranchised*.

ENGASTRIMYTHUS*, **ENGASTRIMYTHOTE**, or **ENGASTRIMANDER**, a person who speaks from, or with, the belly; without opening the mouth; or, if open, without stirring the lips.

* Thus called by the Greeks, from *εν*, *γαστρις*, belly, and *μυθον*, speech; and by the Latins *ventriloquenti*, *quasi ex ventre loquenti*.

The ancient philosophers, &c. are divided on the subject of the *engastrimythi*: Hippocrates mentions it as a disease.—Others will have it a kind of divination, and ascribe the origin, and first discipline thereof, to one Euryclus, whom no body knows any thing of.—Others attribute it to the operation, or possession of an evil spirit: and others to art, and mechanism.

The most eminent *engastrimythi*, were the Pythians, or priestesses of Apollo, who delivered oracles from within, without any action of the mouth or lips.

St. Chrysostom and Oecumenius, make express mention of a sort of divine men, called by the Greeks *engastrimandri*, whose prophetic bellies pronounced oracles.

M. Schottus, library-keeper to the king of Prussia, in a dissertation on the apotheosis of Homer, maintains, that the *engastrimythi* of the ancients, were only poets, who, when the priestesses could not speak in verse, supplied the defect, by explaining or delivering, in verse, what Apollo dictated in the cavity of the basin placed on the sacred tripod.

Leo Allatius has an express treatise on the *engastrimythi*, entitled,—*de Engastrimytho, syntagma*.

ENGENDERING, or **INGENDERING**, the act of begetting, or producing the kind, by way of generation.

The term is likewise applied to other productions of nature: thus, meteors are said to be *engendered* in the middle region of the air. Crude fruits *engender* worms. The ancients believed that insects were *engendered* of putrefaction.

ENGINE*, a compound instrument, consisting of several simple ones, as wheels, screws, levers, or the like, combined together; in order to lift, cast, or sustain a weight, or produce some other considerable effect, so as to save either time, or force.

* The word is formed of the French *engin*, of the Latin *ingenium*, wit; by reason of the ingenuity required in the contrivance of *engines*, to augment the effect of moving powers.

The kinds of *engines* are infinite: some for war, as the ballista, catapult, scorpion, aries, &c. Others for the arts of peace, as mills, cranes, presses, clocks, watches, *engines* to raise water, to extinguish fire, &c. which see under their respective articles, **MILL**, **CLOCK**, **WHEEL**, **PRESS**, and **HYDROCANISTERIUM**. See also **INSTRUMENT**.

ENGINEER, or **INGINEER**, in its general sense, is applied to a contriver, or maker, of any kind of useful engines, or machines.

In its more proper sense, it denotes an officer in an army, or fortified place, whose business is to contrive, and inspect attacks, defences, works, &c.

An *engineer* should be an able and expert mathematician, particularly versed in military architecture, and gunnery; being often sent to view and examine the places intended to be attacked, to chuse out and shew the general the weakest place, to draw the trenches, assign the places of arms, galleries, lodgements on the counterfarp, and half moons; conduct the works, saps, mines, &c. and appoint the workmen their nightly

nightly task: he is also to make the lines of contravallation, with the redoubts, &c.

Under the new establishment of the office of his majesty's ordnance, there are six engineers, and four sub-engineers. See ORDINANCE.

ENGISOMA, ΕΓΓΕΙΣΜΑ, a species of fracture of the skull, wherein one of the extremities of the fractured bone is thrust inwards upon the dura mater, and the other extremity raised outwards. *Dion. ap. Bibl. Anat. T. 1. p. 559.*

ENGLECHERIE, ENGLECHERIE, or ENGLSCHYRE, a term of great import among our ancestors, though now obsolete; properly signifying the quality of an *Englishman*.

If a man were privately slain, or murdered, he was, anciently, accounted *francigena*, (which comprehended every alien, especially Danes) till *englecherie* was proved: i. e. till it was made appear that he was an *Englishman*. *Bracton, lib. 3. See FRANCIGENA.*

The origin of the custom was thus: king Canutus having conquered England; at the request of the nobles, he sent back his army into Denmark; only reserving a guard of Danes for his person: and made a law, that if any *Englishman* killed a Dane, he should be tried for the murder; or, if he escaped, the village where the man was slain should be charged to pay 66 marks into the exchequer. After this law, whenever a murder was committed, it was necessary to prove the party slain an *Englishman*, that the penalty of 66 marks might not be charged on the village.

ENGLISH, in a general sense, something that relates to the country, or people of England.

We say, the *English* crown, *English* copperas, *English* names, *English* money, *English* measures, *English* weights, &c.

The sweating sickness is called by foreigners *sudor anglicanus*, the *English* sweat. Dr. Cheyne calls the vapours the *English* malady. See *SUDORANGLICUS*.

ENGLISH Drops, Guttae Anglicanae. See *DROP*.

ENGLISH, or the *ENGLISH* tongue, the language spoken by the people of England; and, with some variation, by those of Scotland, as well as part of Ireland.

The *English* is of Gothic, or Teutonic extraction: this was the root, or stock upon which several other dialects have been since grafted; particularly the Latin and French. See *TEUTONIC*, &c.

The language anciently spoken in our island was the British, or Welch, which was common to the Britons and Gauls; and which still subsists, in more or less purity, in the principality of Wales, the county of Cornwall, the islands and high lands of Scotland, part of Ireland, and some provinces of France, particularly Bretagne.

As the Roman empire, extending it self towards the western parts of Europe, came to take in Gaul and Britain, the Roman tongue became propagated therewith; all the edicts, &c. relating to the public affairs, being designedly wrote in that language.

The Latin, however, it is certain, never got so much ground, or prevailed so far in England, as in Lombardy, Spain, and the Gauls; partly on account of its great distance from Rome, and the small resort of Romans hither; and partly, for that the entire reduction of the kingdom was not effected, till so late as the empire of Claudius, when the empire was on the declining hand; and the new province was forced to be soon deserted by its conquerors, called to defend their territories nearer home.

Britain thus left naked, became an easy prey to the Angli, or Anglo-Saxons, a strolling nation from Jutland and Norway, who took an easy possession thereof; much about the time that the Franks, another German nation, entered Gaul. The Gauls and Franks, it seems, at length, came to terms; found means to unite into one nation: and thus the ancient Gaulish, with its mixture of Latin, continued the prevailing tongue, only further intermixed with the francic, or lingua franca, of their new inmates: but the Britons were more constant, and determined absolutely to refuse any such coalition; they had embraced Christianity, and their competitors were Heathens: rather than admit of such an union, therefore, they chose to be shut up, with their language, in the mountainous parts of Cambria, or Wales.

The *English* Saxons thus left absolute lords, changed every thing; their own language was now fully established, and the very name of the country was henceforth to be Anglo-Saxon. The new language remained, in good measure, pure and unmixed till the Norman invasion: the attempts of the Danes, and the neighbourhood of the Britons, indeed wrought some lesser innovations therein; but, in the main, it preserved it self; for, as to the Danes, their language was not much different therefrom. Edward the Confessor, however, who had lived long in France, might, possibly, bring in a little mixture of the dialect of that country.

But William I. and his Normans, having got possession of England, an alteration was soon attempted: the conquest was not complete, unless the conqueror's language, the French, or Franco-Gallic, were introduced; and accordingly all his acts,

diploma's, edicts, pleadings, and other judicial matters, were written, &c. in that tongue.

But his attempts proved unsuccessful; the number of Normans he brought over, being very small, in comparison of the *English* with whom they were incorporated, they lost or forgot their own language, sooner than they could make any change in the *English*. This, however, did not hinder, but by the endeavours of the conqueror, abundance of French words, though many of them of Latin original, crept into the *English*; and many *English* words by degrees grew out of use.

Hence, as to the origin and etymology of many of our words, Dr. Wallis lays it down, that such words of German original as we have in common with the French, are to be reckoned as our own, rather than as words borrowed from them; and that the old Gaulish words, common to the French and the Welch, which are found in our language, have been likewise taken from the Welch, rather than from the French.

Hence, also, the same author accounts, why the names of the diverse sorts of cattle are Saxon, as *ox*, *cow*, *calf*, *sheep*, *hog*, *boar*, *deer*, &c. And yet that their flesh, when prepared for food, is French, as *beef*, *veal*, *mutton*, *pork*, *brawn*, *venison*, &c. The Norman soldiers, forsooth, not concerning themselves with pastures, parks, and the like places, where such creatures are fed and kept; so much as with markets, kitchens, feasts, and entertainments, where the food was either prepared, sold, or eaten.

Under Henry II. Dr. Swift observes, the French made a still greater progress; by reason of the large territories he possessed on that continent, both from his father and his wife, which occasioned frequent journeys thither, with numerous retinues, &c. And for some centuries after, there was a constant intercourse between France and England, by the dominions we possessed there, and the conquests we made; so that the language two or three hundred years ago, seems to have had much more French than at present.

Besides this alteration from the conquerors, the language, in process of time, underwent diverse others; and at length came to have numerous words and phrases of foreign dialects, ingrafted into it; in lieu whereof the ancient Saxon ones gave way; particularly by means of negotiations, and commerce with other nations; by the marriages of royal families; by the affectation of many writers in most ages, who are fond of coining new words, and altering the usual forms of speech, for the greater delicacy; and by the necessity of framing or borrowing new words, according as new things and inventions turn up. And by such means was the old Anglo-Saxon converted into the present *English* tongue.

Having traced the rise and progress of our language historically; we think it may be no inconsiderable amusement to represent, by actual examples, the several successive changes and stages it has passed through, to arrive at its present perfection: in order to which we shall make use of the collections of the ingenious Mr. Greenwood.

From the Saxon invasion in 440, we have no memorial extant of the language for 250 years: the oldest Saxon writing in being, is a gloss on the evangelists, written in the year 700, by Eadfride, bishop of Holy island: in which the three first articles of the Lord's prayer run thus.

Uren Fader thic arth in heofnas, sic gehalgud
Our Father who art in heaven, be hallowed
thin nama, so cymeth thin ric. Sic thin willa
thy name, come thy kingdom, be thy will
sue is heofnas, and in eorthis, &c.
so as in heaven, and in earth.

Two hundred years after, in the year 900, the same was rendered thus:

Thu ure Fader the eart on heofenum, si thin nama
gehalgod; cume thin rice, si thin willa on eorthis
sua, swa on heofenum.

In the following age it was turned thus in the Saxon homilies, said to be translated by king Alfred.

Fæder ure thu the eart on heofenum, si thin
nama gehalgod, to be cume thin rice, gewurthe
thin willa on eorthis swa swa on heofnum, &c.

About the year 1160, under Henry II. it was thus rendered by pope Adrian, an *Englishman*, in rhyme.

Ure Fader in heaven rich,
Thy name be haled ever lich,
Thou bring us thy michell blisse:
Als hit in heaven y-doe
Evar in yearth beene it also, &c.

About 100 years after, in the time of Henry III. it was turned thus:

Fadir that art in heaven blisse,
Thin helge nam it wurth the blisse,
Cumen & mot thy kingdom,
Thin holy will be it all don,
In heaven and in erdh also, &c.

Two hundred years after, under Henry VI. it was rendered thus:

Our Fadir that art in hevenes, hawewid be thi name, thi kingdom come to thee, be thi will don in eerthe, as in hevene.

An extraordinary specimen of the English, as spoke in the year 1385. Dr. Hicks furnishes us withal, in his *Theobaur. Liber. Septem.* which we shall the rather entertain the reader withal, as it is on this very subject the English tongue, and contains not only the history, but the reasons, of the changes and differences therein.

As it is knowe how meny maner peple beeth in this lond; there beeth also so many dyvers longages and tonges. Notheles Walche men and Scots that beeth nought medled with other nations, holdeth wel nyh hir friste longage and speche; but yif the Scottes that were sometime confederat and woned with the Pictes drawe somewhat after hir speche; but the Fleminges that woneth in the weste side of Wales, haveth left hir strange spech, and spekeþ fexonliche now. Also Englishe men, they had from the bygynnyng three maner speche: northerne, fowtherne, and middel speche in the middel of the londe, as they come of three maner of peple of Germania: notheles by comynxion and melynge first with Danes, and afterwards with Normans, in meny the contrary longage is apayred [corrupted]. This appayryng of the burthe of the tunge is bycause of twie thynges, oon is for children in scole agensit the usage and maner of all other nations, beeth compelled for to leve hire own longage, and for to construe hir lessons and here thynges in French, and so they haveth sethe Normans come first into Engeland. Also gentlemen children beeth taught to speke Frenche from the tyme that they beeth rokked in here cradel, and kunneþ speke and play with a childes broche; and uplondische men will likne hymself to gentylmen, and sondeth with great belynelle for to speake Frenche to be told of.—Hit seemeth a greet wonder how Englishe men and her own longage and tonge, is so dyverse of fown in this oon ilond; and the langage of Normandie is comlynge of another land, and hath oon manner foun amonge alle men that spekeþ hit arigt in Engeland.—Also of the foresaid Saxon tonge that is deled [divided] a three, and is abide scarcely with few uplondische men is greet wonder. For men of the est, with men of the west, is, as it were, under the same partie of hevne acordeth more in fownynge of speche, than men of the north, with men of the south. Therefore it is that mercii, that beeth men of myddel Engeland, as it were partners of the endes, understondeþ bettre the side longages northerne and southerne, than northerne or southerne understondeþ either other.—All the longage of the Northumbers, and specialliche at York, is so fcharp, flitting and frotyng, and unschape, that we southerne men may that langage unneth underfonde. I trow that that is by cause that they beeth nyh to strange men and nations, that spekeþ froungliche, and also bycause that the kinges of Engeland wonneþ alwey fer from that cuntry, &c.

How the English ffood about the year 1400, may be seen in Chaucer, who refined and improved it very considerably; though he is charged with the affectation of mixing too many French, and Latin words with his English, and by that means with too much altering and corrupting the primitive language.

In the year 1537, the Lord's prayer was printed according to the following version:

Our Father which arte in heven, halowed be thy name: let thy kingdom come, thy will be fulfilled as well in erth as it is in heven, &c.

Where the reader will observe the diction almost brought to the present standard; the variations being principally in the orthography.

Spencer, who lived in the same age, contributed not a little to the improvement and refining of the tongue: he threw aside abundance of the outlandish ornaments, and wrote a purer English, yet with more elegance and variety, than had been known before. He was succeeded in order, by Shakespear, Ben Johnson, lord Bacon, Milton, Cowley, Waller, Tiltonson, and Dryden, whose works are in every body's hands; and by whom the language has been transmitted to us under all its present advantages.

The perfections ascribed to the English, and that in a degree superior to any of the other modern tongues, are,—1^o. That it is very strong and significant: to which our finely compounded words, formed on the model of the Greeks, do not a little contribute.

2^o. Copious: of which Mr. Greenwood gives us instances in the word striking: which we have above 30 different synonymous expressions for; as, to smite, bang, beat, baste, buffet, cuff, hit, thump, thwack, flap, rap, tap, kick, spurn, box, yerke, pummel, punch, &c. And the word anger, for which he enumerates above 40. So we say, to seeth or boil flesh, stew prunes, poche eggs, coddle apples, bake bread; for which expressions to seeth, stew, poche, coddle, and bake, the Latins, with all the boasted copia of the tongue, have only one word, *coquere*; and the French, as much as they abound with terms of cookery, not many

more; the word *cuire*, serving indifferently for seething, boiling, baking, stewing, and coddling.

3^o. Musical and harmonious; in which respect Mr. Dennis makes no scruple to assert it superior even to the French. This, which some may think strange, he proves hence, that we have blank verse which is harmonious by mere force of numbers, and quantity; whereas the French have long ago delisted from all pretensions to poetical numbers, without the assistance of rhyme.

It may be added on this last head, from Mr. Westhead, that the English has many measures, the Iambic and Trochee for instance, in common with the Greek and Latin; an advantage arising from the variation of the accent: and that rhyme is peculiarly natural to it, varying it self to the ear with excessive sweetness; not to mention the cæsuras, pauses, transpositions, and numberless other graces, which the English versification is capable of, probably beyond any other living language.

Some object to the English, that it consists too much of monosyllables; which others make a piece of merit, as it argues the greater antiquity, if what Salmalius says be true: *certain quippe est, linguas omnes quæ monosyllabis constant cæteris esse antiquiores*; he adds, that the ancient Greek abounded herein, as appears from the ancient poets, and such as affected antiquity. *De re hellenist.*

But we have a further advantage from our monosyllables, viz. *conciseness*; we being hereby enabled to express more matter in the same compass of letters, than any other modern tongue. The only thing we suffer by it, is, something in point of softness and numbers; and yet we have verses composed wholly of monosyllables, that do not want harmony; as that of Creech "Nor could the world have born to fierce a flame."

Others object to our language, that it does not come up to the softness, the delicacy of the more southern languages, France, Spain, and Italy. It seems, it retains somewhat of the Gothic roughness of the people who framed, and introduced it; the soil and the climate it was planted in, not tending much to mellow and refine it.

To this purpose does Dr. Swift speak, who accounts for the effect hence, that the Latin tongue was never in its purity in our island; and beside, such as it was, was called away ere it could have time to incorporate with the language of the country, and subdue, and soften it: as it did in the other provinces of France and Spain, &c.—But it is to be observed, that, upon the whole, this, supposing it true, does not fall as an objection against the language, but the people: our manners are also less polished, than some of our neighbours; we are not yet arrived, and may we never hereafter arrive, at that pitch of modesty, of delicateness, of softness, which we profess in them; and it is but just our language correspond with the rest of our character. We have somewhat more of the rough virtues of human nature unsoftened, unpolished away by art; and when these are gone, we may talk as softly, and as prettily, as the dissolute, enervate, effeminate, I would have said, but for the catachresis nations on the other side the alps, where we see politeness in its perfection.

But the reverend doctor ventures yet further: "Our language," he affirms, is extremely imperfect; its improvements are in no proportion to its corruptions; and in many instances it offends against every part of grammar."—What this ingenious author means by offending against grammar, we do not apprehend. Is it, that the English tongue offends against the grammar of the same tongue? that were absurd: a language is not to be judged of and regulated, by any preconceived forms or rules of grammar, but the grammar is to be taken from the language: it is the language directs the grammar, not vice versa; so that if there be any disagreement between them, the fault must be charged on the grammar, which is so far deficient.—Does he mean, that it offends against the grammar of the Latin, or Greek? that may well be, without any fault; for the grammars of all languages widely differ: and it would be unjust to censure any language for varying from the grammar-rules of another.—If he means that in the English, there are many anomalies or departures from the general rules: we know of no language without them: idiotisms are perhaps as numerous in Latin or Greek as in English.

Mr. Westhead is of opinion, that the English language is not capable of a much greater perfection, than it has already attained: we have trafficked, he observes, with every country for the enriching it: the ancients and moderns have both contributed to the giving it splendor and magnificence; the fairest cyons that could be had from the gardens of France and Italy, have been grafted on our old stocks, to refine the savageness of the breed; we have laid aside most of our harsh, antique words, and retained few but those of good sound and energy: the most beautiful polish is at length given our tongue that it will bear, without destroying, and altering the very basis and ground work of it: its teutonic rust is worn away; and little or nothing is wanting, either of copiousness, or harmony. He goes on to argue the maturity and per-

fection of the *English*, from another very extrinsic principle; viz. by comparing the time, and circumstances of the improvements, made since the first refiners of it; with those of the Greek, Latin, French, and other tongues, that confessedly have risen to their height.

Every civilized nation, that auctor thinks, has its classical age; and he suggests, that the *English* are not far from it. So that what remains to be done for the *English* tongue, should not be to advance, but to fix it where it is, and prevent its declining. There is in effect, a point of perfection, which when a language has once arrived at, it cannot exceed, though it may degenerate from it; and thus it happened to the two finest languages the world has known.

It may seem odd to talk of fixing so unstable a thing as language: the Greek literature of St. Basil, and St. Chrysostom, still used in that church, the one for solemn, the other for common days, have been a long time unintelligible to the people: so much is the vulgar Greek degenerated from its original purity! Polybius testifies, that the articles of truce between the Romans and Carthaginians, could scarce be understood by the most learned Roman antiquaries, 350 years after the time of their making. In effect, from the days of Romulus, to those of Julius Cæsar, the Latin was perpetually changing; and what was wrote three hundred years before Tully, was as unintelligible in his time, as the *English* and French of the same period are now: and these two have changed as much since William the Conqueror, in about 700 years, as the Latin appears to have done in the like term.

Whether our language will decline as fast as the Roman did, may admit of some doubt; there being many circumstances in the affairs of the nation, which contributed to that speedy corruption, that may not, in all probability, find place among us.—The French, for these 50 years past, has been polishing as much as it will bear; and it appears to be now declining, by the natural inconstancy of that people, and the affectation of some late authors, to introduce cant words, which is the most ruinous corruption in any language. But without some such consideration, there does not seem any absolute necessity, why a language should be perpetually changing.

We find examples to the contrary: from Homer to Plutarch, are above a thousand years; and so long, at least, Dr. Swift thinks, we may allow the purity of the Greek: the Grecians spread their colonies round all the coasts and islands of Asia minor, and the Egean sea, where the language was preserved entire for many ages after they themselves became provinces to Rome, and were over-run by the barbarous nations. The Chinese have books in their language above 2000 years old; neither have the frequent conquests of the Tartars been able to alter it. And the German, Spanish, and Italian, have admitted few or no changes for some ages past.

On such considerations, that authority, moved the then prime minister, the earl of Oxford, to establish a society, or academy, for the settling, and ascertaining, the purity of our tongue; to set a mark on the improprieties which custom has made familiar, to throw out vicious phrases and words, to correct others, and perhaps retrieve some others now grown obsolete, and to adjust the orthography, pointing, &c.

Without some such means, he complains, that the same any writer can expect will be so short and scanty, as by no means to be a sufficient motive to call forth, and engage a man to exert his genius. Our language is chiefly confined to these two islands; and it is hard our authors should be limited in time as well as place. Were it not for the Bible and Common-Prayer, we should hardly have been able to understand any thing written a hundred years ago.

It is a melancholy reflection, that Petrarch still speaks good Italian; whereas Chaucer, who lived an hundred years later, is not to be understood by an English reader without a Saxon and French glossary. And what security has Dryden himself, while things continue on their present footing, that he shall not in a like space of time become as obsolete as Chaucer is? Grammars, and dictionaries, with whatever care and judgment they are composed, will prove but a feeble stay to a fleeting language, unless they have some extraordinary sanction, and authority. And what is to be lamented, such writings have contributed to the corruption almost as much as the perfection of our tongue.

Dr. Gill, Ben Johnson, and Hexham, it is certain, by forcing the *English* tongue to the Latin method, have clogged and perplexed it with abundance of useless precepts concerning cases, genders, and declensions of nouns, tenses, moods, and conjugations of verbs, and other things which our language has nothing to do withal. Nor have even Dr. Wallis, Greenwood, &c. though sensible of the fault in those others, been able wholly to keep clear of it themselves.

Borough ENGLISH. See the article **Borough**.
ENGONASIS, ETONASIS, in astronomy, *Hercules*; one of the northern constellations. See **HERCULES**.

ENGRAFTING, GRAFTING, or GRAFFING, in agriculture and gardening, the art, or act, of inserting, or fixing, a cyon, shoot, or bud, of one tree, in the stock of another; in order to correct, and improve its fruit.

Engrafting is the art of applying a *graft*, or shoot, of one plant, to the stock of another; in such manner, as that the sap passing freely through both, the tree *grafted* on may produce the same kind of fruit with that whence the *graft* is taken.

Engrafting only differs from *inoculation*, in this, that the latter is performed when the sap is at the highest, in summer; and the former before it rises, at least, in any quantity.

Engrafting is one of the principal operations in gardening, and that whereon the goodness of great part of our fruit greatly depends.

It is very extraordinary that the seeds, or kernels, or stones of a fruit, as an apple, pear, peach, plum, cherry, &c. being sown, degenerate in the ground; so, that the tree arising from it is of another kind, a sort of wilding, hairier, sooner and coarser than that of the parent tree. To correct this, trees thus reared, must always be *grafted* from other better kinds. Apples are commonly raised by *engrafting* the intended kinds on crab stocks, procured by sowing the kernels: so are pears, procured by *grafting* on the wild pear stock: though for dwarf, or wall trees, they generally chuse to *engraft* on the quince stock.

They will also do if *grafted* on the white thorn. Peaches are produced by *grafting* on an almond or plum-stock. Indeed, in this fruit, it sometimes happens that the stone sown, produces better fruit than that from which it was taken: but this is not common; beside that the tree in such case, is long ere it comes to bear. Plumbs are raised by *engrafting* on a damson, or wild plum-stock: and cherries, on the black-cherry, or merry stock, raised from stones.

Our best gardeners, likewise, *engraft* their less kindly trees from other better of the same sort, to mend them; as also, the smaller and single flowers, as gilliflowers, &c. from the larger and finer.—To produce stocks for *engrafting* on; see **Stock**.

The curious furnish us with other extraordinary and anomalous instances of *engrafting*: as of apples on plane, elder, thorn, cabbage-stalk, &c. and the like of pears, &c. pears on apple-trees, on elms, &c. cherries on the lawrel; coral berries on the plum: beech on the chestnut, oak on the elm, gooseberry on the currant, the vine on the cherry-tree, &c.

*Inferiur lauro cerasus, partuque coacto
Tingit adoptivis virginis ora pudor.* Auson.

Even Daphne's coynefs thou dost mock,
And weeds the cherry to her stock. Cowli. to Evel.

— *Mutatunque insita mala*

Ferre pyrum, & prunis lapidea rubescere corna.

Virg. Geor. l. 2.

— *Steriles platani, malis gessere valentes;*

Cassianæ, fagos; ornusque incanuit albo

Flora pyri; glandemque suæ fregere sub ulmi. Id. ibid.

The origin, and invention of *engrafting*, is differently related by naturalists. Theophrastus tells us, that a bird having swallowed a fruit whole, chanced to cast it forth into a cleft, or cavity, of a rotten tree; where mixing with some of the putrid parts of the wood, and being washed with the rains, it budded, and produced within this tree, another tree of a different kind. This led the Husbandman to certain reflections, from which, soon afterwards, arose the art of *engrafting*.

Pliny sets the thing in a different light: a countryman having a mind to make a pallisade in his grounds: that it might endure the longer, he berought himself to fill up, and strengthen the bottom of the pallisade, by running, or wattleing it with the trunks of ivy. The effect of this was, that the stakes of the pallisades taking root, became *engrafted* into the trunks, and produced large trees; which suggested to the husbandman the art of *engrafting*.

The reason, or philosophy, of *engrafting*, is somewhat obscure; and had not hazard given the first hint, all our knowledge of nature would never have led us to it. The effect is ordinarily attributed to the diversity of the pores, or ducts, of the *graft*, from those of the stock, which change the figure of the particles of the juices in passing through them to the rest of the tree.

Mr. Bradley, on occasion of some observations of Agricola, suggests something new on this head: the stock *grafted* on, he thinks, is only to be considered as a fund of vegetable matter, which is to be filtered through the cyon, and digested, and brought to maturity, as the time of growth in the vessels of the cyon directs. A cyon, therefore, of one kind, *grafted* on a tree of another, may be more properly said to take root in the tree, it is *grafted* in, than to unite itself with it: for it is visible that the cyon preserves its natural purity and intent, though it be fed and nourished with a mere crab; which is, without doubt, occasioned by the difference of the vessels in the cyon from those

those of the stock: so that *grafting* may be justly compared to planting.

In prosecution of this view of that ingenious author, we add, that the natural juices of the earth, by their secretion and comminution, in passing through the roots, &c. before they arrive at the cyon, must doubtless arrive there half elaborated and concocted; and so disposed for a more easy, plentiful, and perfect assimilation and nutrition; whence the cyon must necessarily grow and thrive better and faster than if it were put immediately in the ground, there to live on coarse diet and harder of digestion: and the fruit produced, by this further preparation in the cyon, must be finer and further exalted, than if fed immediately from the more imperfectly prepared and altered juices of the stock.

The cyon, to say no more, is somewhat in the condition of the fetus in utero, fed from the mother's blood: or at least, it is in that of the infant after exclusion, fed with the mother's milk.

The methods, or kinds of *engrafting* are various; as *grafting* in the cleft, *grafting* in the rind, *whip grafting*, *grafting* by approach, *scutcheon grafting*, *root grafting*, re-iterated *grafting*, *grafting* on branches, &c.

The apparatus, or instruments used herein, are saws to cut off the heads of stocks; knives to make clefts; a chisel to pare away the wood; clay, mixed with horse-dung, to prevent freezing, and with tanners hair to prevent cracking; also bafs strings, or woollen yarn, to tie the *grafts* with, and *grafting* wax. See Wax.

GRAFTING in the cleft, or stock, called also *slit-GRAFTING*, is the most ancient, and ordinary way. We have a very beautiful description of it in Virgil, II. Georg. v. 78. it is chiefly used for middle sized stocks, from one to two inches diameter. Its season is the months of January, February, and March.—The method, as now practised, is thus:

The head of the stock being fawn, or cut off, smooth and clean; a perpendicular cleft is made therein, nearly two inches deep, with a strong knife, or chisel, as near the pith as may be to mis it. In this cleft, the *grafting* chisel, or wedge, is put to keep it open. The *graft*, or cyon, is prepared by cutting it a-slope, in form of a wedge, to suit the cleft; only leaving a small shoulder on each side: and, when cut, is to be placed exactly in the cleft, so, that the inner bark of the cyon may aptly, and closely, join to the inner part of the bark, or rind of the stock; in the dexterous performance of which, the chief secret consists. If the cleft pinch too tight, a small wedge may be left in it to bear the stress. And, lastly, the cleft is covered over with clay: or rather, as M. Gentil advises, with moss, or the fresh bark of a tree bound on with oser.

The reader, who would have this in more elegant terms, may be furnished with them from Virgil:

*Aur rursus enodes trunci refecantur, & altè
Fiditur in solidum cuneis via: deinde feraces
Plantæ immittuntur: nec longum tempus, & ingens
Exiit ad cælum ramis felicitibus arbori,
Miraturque novas frondeis, & non sua poma.*

GRAFTING in the rind, or shoulder-GRAFTING, called also *slicing*, and *packing*; is practised in the latter end of April, or beginning of May.—The method is as follows:

The top of the stock is cut off in a smooth, straight place: then the cyon, or *graft*, is prepared by cutting it on one side from the joint, or seam down slopewise, making the slope about an inch long; and observing its bent, that so, when the cyon is fixed to the stock, it may stand nearly upright. At the top of the slope, they make a shoulder, whereby it is to rest on the slope of the stock. The whole slope is to be plain and smooth, that it may lie even to the side of the stock. As to the length of the cyon, for a standard-tree, it may lie about four inches from the shoulder; but for a dwarf, or wall tree six inches. The cyon being prepared; the outside is applied to the west, or south west side of the stock, and its length and breadth measured thereon; which done, the bark of the stock is cut away to those dimensions, that the cut part of the cyon may fit it. Wherein, regard is to be had to the bigness of the stock, and the thickness of the bark, to proportion the length and breadth of the chip thereto; otherwise the passages of the juice in the stock and cyon will not meet. Lastly, laying the cut-part of the cyon on that of the stock, they bind them together with woollen yarn, and cover the whole with clay an inch above, and as far below the stock's head: working it round the cyon, till it become sharp at top, that the rain may run down it.

This method has several advantages over the former: as that the wound heals up sooner; and that, in the mean time, it is in less danger from the weather; that it does less injury to the stocks and *grafts*, as avoiding those severe splittings and pinchings: that the bark is more easily placed in the passage of the sap here, than in the cleft: that the *graft* thrives and shoots with greater vigour, and bears sooner in this way than in that: and that it is practicable on smaller stocks than the other, which must have a good body, and consistence, before they can bear cleaving.

GRAFTING in the bark, is performed thus:—Prepare the stock, and cyon, as in *grafting in the rind*; but, instead of cutting the bark of the stock, slit the same on the fourth west side, from the top, almost as long as the sloped part of the cyon, and at the top of the slit loosen the bark, with the top of your knife. Thrust an instrument, made of wory, silver, or the like, and forced at the end like the slope end of the cyon but much less, down, between the bark and wood, to make room for the cyon; which being put in, the bark is to be so managed, as that it may fall close to the stock; and edges of the cyon.

GRAFTING by approach, called also *inarching*, and *abscission*. See ABLACTATION.

Whip-GRAFTING, or *Tongue-GRAFTING*, is a sort of *grafting* in the rind, proper for small stocks; from an inch diameter to a quarter of an inch. Mr. London speaks of it as the most effectual way of any, and that most in use.

In this, the stock and cyon are always to be of the same bigness. The cyon to be sloped off a full inch, or more; and the like is to be done to the stock; and so the one to be tied to the other. Otherwise, the top of the stock being cut off, a shoulder is to be made in the *graft*: and the rest to be performed as already shewn under *grafting in the rind*.

This method is also improved by what they call *slipping*, or *tonguing*; which is, the making a slit with a knife in the bare part of the stock, downwards; and the like in the sloped face of the cyon, upwards: then joining them, by thrusting one slice into the other, till the bare place of the cyon cover that of the stock.

Side-GRAFTING. In this, the cyon is prepared as in *whip-grafting*, but the head of the stock is not cut off. Only, from a smooth part on the west side, so much of the bark is pared off as the cyon will cover; then slitting both cyon and stock, as in the last article, they bind the two together, and close them up with clay. At the year's end, the top of the stock is cut off at the grafted place; slopewise, and the place is covered with clay.

Scutcheon-GRAFTING, is another method of *grafting* in the rind, practised in June, July and August; when the bark will not part from the stock. It is performed, by slitting the bark of the stock in form of the capital letter T, loosening it with the point of a knife, and clapping in a cyon, prepared as above. See SCUTCHEON.

Crown-GRAFTING, is when four or more *grafts*, are placed round the stock, between the bark and the rind, somewhat in the manner of a crown.—This is only practised in the larger trees, which are capable of receiving a number of *grafts*, and are too big to be cloven.—The method is in all respects the same as that already delivered for *grafting in the rind*.

Root-GRAFTING, is a modern invention, treated on at large by Agricola: its intention is somewhat different from the former; being for the propagation, or multiplication of plants.

To perform this, take a *graft*, or sprig of a young tree, which you intend to propagate; and a small piece of the root of another tree of the same kind, or of a kind very like it; or else pieces of roots cut off of other trees, in transplanting; and *whip-graft* them together: observing, that the two but-ends of the *graft* and root be united, and that the rind of the root join that of the *graft*. These may, afterwards, be planted out at pleasure, and the piece of root will draw the sap, and feed the *graft*, as the stock does the other way.

This way of propagation is very easy and expeditious; roots being more plentiful than stocks: by this method the pieces of roots of one crab-stock, or apple-stock, will serve for 20 or 30 apple *grafts*, and the like of other trees. The same is also an excellent way for raising of tender trees, that will hardly bear being *grafted* in the stock. Add, that trees thus *grafted*, bear sooner, and are more easily dwarfed, than those done any other way.

Re-iterated GRAFTING, or *grafting by a double*, or *triple incision*, is another method mentioned by Agricola: to perform which, first *graft* a good cyon on a stock, and cut it away to one half, or a third part; then fix another *graft* to it, of a better kind; and a third to that: for still, the oftener a tree is *engrafted*, the finer fruit it produces.

By this method, that author assures us, he produced Muscat pears, that were admirable; making, at first, use of a stock *grafted* with a pound pear, on which he *grafted* a summer Bon Chretien; and when the branch of this latter had shot, he *grafted* on it a cyon of Bergamot; which he also cut, and *grafted* on it a cyon of a Muscat pear.

ENGRAFTING of branches, Agricola mentions as a very certain and profitable operation, best practised on large, full grown, and even old trees.

To do this, half or more of the branches must be lopped off, and *grafts* of three or four years old be applied to them; taking care to have stakes, or other things, to support them against the wind, &c.

He adds, that by this method, you will have, perhaps, the

the same year, at least, the second or third, such a quantity of fruit, as the youngest and foundest tree would hardly produce.

ENGRAFTING of the small-pox. See INOCULATION.

ENGRAILED, or INGRAILED, in heraldry (from the French *Irrele*, hail) is when a thing is represented with its edges ragged, or notched circularly, as if broke by something falling on it.—See *Tab. Herald*, fig. 56.

It differs from *indented*, in that the breaches there are all in straight lines; but here semi-circular: and from *invected*, in that the points of the little arches are turned inwards towards the middle of the field; which in *invected*, are turned outwards. See *INDENTED* and *INVECTED*.—Spelman expresses it in Latin by *imbricatus*, others by *ingrediatu*, and others by *striatus*.

ENGRAVING *, or GRAVING, the art, or act of cutting metals, and precious stones, and representing figures, letters, and other matters thereon.

* The word is a compound of the preposition *in*, and the Greek *yegeu*, I write. Though Menage after Salmatius, derives it from the Latin *cavare*, to hollow; others from the Latin, *graphiare*; and others from the German, *graben*, q. d. *effodere*, to dig out. In Latin it is called *sculptura* and *callatura*.

Engraving is properly a branch of sculpture; though with us it generally stands contra-distinct from sculpture; as the latter, popularly called *carving*, expresses the forming of figures, &c. embossed, or in relief; and the latter, those indented, or in creux.

Among the French, the term *engraving*, *graveure*, is of more extent. It includes all kind of sculpture, both that performed with the chisel and knife, on marbles and woods, in relief; and that in metals, stones, &c. with the graver, indented.

Engraving is divided into several branches, according to the matters it is practised on, and the manner of performing it. The original way of *engraving* on wood is now distinguished by the name of *cutting in wood*; that on metals with aqua fortis, is called *etching*; that by the knife, burnisher, punch, and scraper, *mezzotinto*; that on stones, for tombs, &c. *carving* or *stone cutting*; and lastly, that performed with the graver on metals, as copper, brass, steel, silver, &c. as also on precious stones, crystals, &c. retains alone the primitive denomination of *engraving*.

Engraving is an art, for the greatest part, of modern invention; having its rise no earlier than the 16th century. The ancients, it is true, practised *engraving* on precious stones and crystals, with very good success; and there are still many of their works remaining, equal to any production of the later ages. But the art of *engraving* on plates, and blocks of wood, to afford prints, or impressions, was not known till after the invention of painting in oil.

The discovery is ascribed to Mafo Finiguerra, a goldsmith of Florence; who having used to take impressions of every thing he cut, in clay; and to cast melted sulphur in this mould; at length hit on a way of taking the impressions thereof on paper, by linearly this figure of sulphur with oil and lamp-black. See PRINTING.

The secret soon got abroad, and coming to the hands of Albert Durer and Lucas, they greatly improved it, and began to engrave on wood and copper, in which they succeeded to admiration.

ENGRAVING in copper, is employed in representing diverse subjects, as portraits, histories, landscapes, foliage, figures, buildings, &c. either after paintings, or after designs made for the purpose.

It is performed either with the graver, or with aqua fortis.—For the first, there needs but little apparatus, and few instruments. The plate you work on being well polished, is covered over with a thin skin of virgin wax, and on this, the draught, or design, done in black lead, red chalk, or other unrummed matter is laid; and rubbed down for the wax to take off. The design thus transferred upon the wax, is traced through on the copper, with a point or needle: then heating the plate, and taking off the wax, the strokes remain; to be followed, heightened, &c. according to the tenor of the design, with the graver, which is to be very sharp, and well tempered.

In the conduct of the graver consists all the art; for which there are no rules to be given; all depending on the habitude, disposition, and genius of the artist.

The other instruments are, a cushion, or sand-bag, to lay the plate on, to give it the necessary turns and motions.—A burnisher, round at one end, and usually flattish at the other, to rub out slips and failures, and to soften the strokes, &c.—A scraper, to pare off the surface, on occasion. And a rubber of black cloth, or hat, to fill up the strokes, that it may appear how the work proceeds.

ENGRAVING in copper with aqua fortis. See the article ETCHING.

ENGRAVING on precious stones, is the representing of figures, or

devices, either in relief, or indented, on diverse kinds of hard, polished stones.

The art of *engraving* on precious stones, is one of those wherein the ancients excelled; there being diverse antique agats, cornelians, and onyx's, which surpass any thing of that kind the moderns have produced. Pyrgoteles among the Greeks, and Dioscorides under the first emperors of Rome, are the most eminent engravers we read of: the former was so esteemed by Alexander, that he forbade any body else to engrave his head: and Augustus's head, engraven by the latter, was found so beautiful, that the succeeding emperors chose it for their seal.

All the polite arts having been buried under the ruins of the Roman empire, the art of *engraving* on stones met the same fate. It was retrieved in Italy, at the beginning of the 15th century; when one John of Florence, and after him Dominic of Milan, performed works of this kind no way to be depised.

From that time, such sculptures became common enough in Europe, and particularly in Germany, whence great numbers were sent into other countries; but they came short of the beauty of those of the ancients; especially those on precious stones; for as to those on crystal, the Germans, and after their example, the French, &c. have succeeded well enough in them.

In this branch of *engraving*, they make use either of the diamond or emery.—The diamond, which is the hardest, and most perfect of all precious stones, is only cut by it self, or with its own matter.

The first thing is to cement two rough diamonds to the ends of two sticks, big enough to hold them steady by, in the hands; and to rub or grind them against each other, till they be brought to the figure desired. The dust, or powder rubbed off, serves afterwards to polish them; which is performed with a kind of mill, that turns a wheel of lead, pewter or copper.

The diamond is fixed in a brass dish, and thus applied to the wheel, which is covered with a diamond dust, mixed up with oil of olives: and when the diamond is to be cut facet-wise, they apply first one face, then another, to the wheel.

Rubies, Sapphires, and Topazes, are cut and formed the same way, on a copper wheel; and polished with tripoli, diluted in water.

As to rubies, emeralds, hyacinths, amethysts, garnets, agats, and other of the softer stones, they are cut on a leaden wheel, moistened with emery and water; and polished with tripoli, on a pewter-wheel. Lapis lazuli, opal, &c. are polished on a wooden wheel.

To fashion and engrave vases of agat, crystal, lapis lazuli, or the like, they have a kind of lathe, like that of the pewterers; excepting, that whereas the latter is to hold the vessels, which are to be wrought with proper tools; the former generally holds the tools, which are turned by a wheel, and the vessel is held to them to be cut and engraved; either in relief, or otherwise: remembering from time to time, to moisten the tools with diamond-dust and oil; or, at least, with emery and water.

To engrave figures or devices or any of these stones, when polished; such as medals, or seals, &c. they use a little iron wheel, the two ends of whose axis are received within two pieces of iron placed upright, as in the turners lathe; and to be brought closer, or set further apart, at pleasure. At one end of one of the axes, are fitted the proper tools, being kept tight by a screw. Lastly, the wheel is turned by the foot; and the stone applied by the hand to the tool; and thus shifted and conducted as occasion requires.

The tools are generally of iron, sometimes of brass. As to their form, it is various, but it generally bears some resemblance to chisels, gouges, &c. some have small round heads like buttons; others, like ferrels, to take the pieces out; others flat, &c. These tools are not applied directly against the stones; but, as it were, sideways; thus wearing, and as it were, grinding off the substance. And still, whether it be figures, or letters, or characters, the manner of application is the same. The tools, as above observed, are to be frequently moistened with diamond-dust, and oil of olives. When the stone is engraven, they polish it on a wheel of brushes, made of hogs-bristles, with tripoli. For the larger, and less delicate works, they have copper, or pewter tools, on purpose to polish the ground, or plain parts, with tripoli, &c. which they apply after the same manner, as those wherewith the graving is performed.

ENGRAVING on Steel, is chiefly employed in cutting punches, matrices, and dies, proper for striking coins, medals, and counters.

The method of *engraving*, with the instruments, &c. are the same for coins, as for medals and counters: all the difference consists in their greater, or less relief; the relief of coins being much less considerable than that of medals; and that of counters still less than that of coins.

The engraver in steel usually begins with punches, or punchions, which are in relief, and serve for making the creux, or cavities of the matrices, and dies. Though, sometimes, he begins immediately with the creux; but it is only when the intended work is to be cut very shallow. The first thing is to design his figures; then he moulds them in white wax, of the size and depth required: and from this wax he graves his punch.

This punch is a piece of steel, or at least of iron and steel mixed; on which, before they temper, or harden it, the intended figure, whether a head, or a reverse, is cut, or carved in relief. The instruments used in this *graving* in relief, which are much the same as those wherewith the finishing of the work in creux, is effected, are of steel. The principal are gravers of diverse kinds, chisels, flatters, &c. when the punch is finished, they give it a very high temper; that it may the better bear the blows of the hammer, wherewith it is struck, to give the impression to the matrix.

What they call *matrice*, or *matrix*, is a piece of good steel of a cubic form, called also the *die*; whereon, the relief of the punch is struck in creux. It is called *matrice*, because in the cavities or indentures thereof, the coins, or medals, seem formed, or generated, as animals are in the matrix of their mother. To fatten this steel, that it may more easily take the impressions of the punch, they make it red-hot; and after striking the punch thereon in this state, they proceed to touch up, or finish the strokes and lines, where, by reason of their fineness, or the too great relief, they are any thing defective; with some of the tools abovementioned.

The figure thus finished, they proceed to engrave the rest of the medal, as the mouldings of the border, the ungrained ring, letters, &c. All which, particularly the letters, and graining, or engrainment, are performed with little steel punches, well tempered, and very sharp. Add, that as they sometimes make use of punchions, to engrave the creux of the matrix; so on some occasions, they make use of the creux of the matrix, to engrave the relief of the punch.

To see, and judge of the *engraving* in creux; diverse means have been devised to take the impressions therefrom, as the work proceeds. Sometimes they make use of a composition of common wax, turpentine, and lamp black; which always retaining its softness, easily takes the impression of the part of the *graving* it is applied to. But this only serving to shew the work piece-meal, they have had recourse to other ways, to shew the whole figure. The first, by pouring melted lead on a piece of paper, and clapping the matrix thereon: the second, with melted sulphur, managed the same way: and the third, proper only where the *graving* is shallow, by laying a piece of soft paper on the *graving*, and over the paper a leaf of lead; when, giving two or three blows with a hammer on the lead, the paper takes the impression of the work.

When the matrix is quite finished, they temper it, rub it well with a pumice-stone, and clean out the stone again with a hair-brush; and lastly, polish it with oil and emery. In this condition it is fit for the mill, to be used to strike coins, medals, &c.

After the like manner, are the matrices for casting of printing letters engraved. See *Letter Foundry*.

ENGRAVING of seals, stamps, punchions, marking irons, gilding irons, and other matters, for goldsmiths, pewterers, bookbinders, &c. either in relief, or indenture, is performed after the manner last described.

ENGRAVING in wood. See *Cutting in wood*.

ENGROSSING, the writing a deed over fair, and in proper legible characters. See *Copy*, *Calligraphus*, &c.

ENGROSSING, in matters of trade, signifies the buying up any commodity in the gross; or forestalling the market. See *FORESTAL*.

ENGUICHE, in heraldry, is applied to the great mouth of a hunting horn, when it has a rim of a different colour from the horn itself.

ENGYSCOPE, a machine, better known under the name of *microscope*. See *MICROSCOPE*.

ENHARMONIC, the last of the three genera, or kinds of music.

The *enharmonic* genus, is said to have been thus called by reason of its superior excellence; though wherein that consists, says, Mr. Malcolm, we do not see. It was by all acknowledged so difficult, that few could practise it.

The several genera are divided into diatemes, upon which the differences depend: those of the *enharmonic* are the *diests* and *ditonum*: those of the *chromatic*, the *hemitonium* and *tri-hemitonium*; and in the *diatonic*, the *hemitonium*, or *limma*, and the *tonus*.

But under these general names, which distinguish the genera, there are several different intervals, or ratios, which constitute the *chraai*, or *colores generum*, or species of *enharmonic*, *chromatic*, and *diatonic*. See *DIATONIC*, and *CHROMATIC*.

ENHARMONIC Diests. See the article *DIESTS*.

ENHERITANCE. See the article *INHERITANCE*.

ENIGMA. See the article *ENIGMA*.

VOL. I.

ENIXUM *Sal*, among many of the chemists, a neutral salt, neither acid nor alkaline, but participating of both.

Such are common salt, nitre, alum, vitriol, &c. See *SALT*, *NITRE*, *ALLUM*, *VITRIOL*, &c. others apply it to peculiar salts of this general kind.

ENMANCHE, in heraldry, is when a chief has two lines drawn from the middle of the upper edge, to the sides, the depth of half the chief; the two lines including an obtuse angle, whose vertex is the centre of the top of the chief. See *Tab. Herald. fig. 49*.

The heralds conceive this, as bearing some resemblance to *sleeves*; whence the etymology of the word, from the French *manche*, sleeve. It differs from *chappe*, where the lines come from the top to the bottom of the chief.

ENNEADECAETERIS *, in chronology, a cycle, or period of nineteen solar years.

* The word is Greek, *enneadecaseter*, formed of *ennea*, nine, *deka*, ten, and *eter*, year.

Such is the lunar cycle invented by Meton, at the end whereof the moon returns to the same point, from which it departed. Whence the Jews, Athenians, and other nations, who were minded to accommodate the lunar months to the solar year, made use of the *enneadecasteris*; allowing to seven of the years thirteen months a-piece, and to the rest twelve.

The Jewish *ENNEADECAETERIS* is properly a cycle of 19 lunar years, beginning from molad tohu, and returning again; and again; whereof, every 3^d, 6th, 8th, 11th, 14th, 17th, and 19th, are embolismic, or of 383 days, 21 hours a-piece; the rest common, or of 353 days, 8 hours a-piece. See *YEAR*.—Consequently, the Jewish *enneadecasteris* is 6939 days, 13 hours.

ENNEAGON *, in geometry, a figure of nine angles, and nine sides.

* The word is formed of *ennea*, nine, and *gonia*, angle.

In fortification, *ENNEAGON* denotes a place with nine bastions. See *FORTIFIED Place*.

ENNEATICAL Days, are every ninth day of a sickness; which some imagine naturally occasion a greater alteration, either for the better or worse.

ENNEATICAL Years, are every ninth year of a man's life. See *CLIMACTERIC*.

ENORMOUS *, something excessive, or monstrous, especially in bulk.—The Colossus of Rhodes was of an *enormous* stature.

* The word is formed of the privative *e*, and *norma*, rule, *q. d.* void of, or contrary to rule, or measure, *contra normam*. In the corrupt ages of Latinity, they used *inormis* and *inormis*.

In the French jurisprudence, *lesio enormis*, *enormous damage*, is that which exceeds half the value of the thing sold.

ENQUEST, or *INQUEST*, in law, denotes an inquisition of a jury by hearing of witnesses.

This is the most usual manner of trial, in all causes, both civil and criminal, within this realm.—In civil causes, after proof is made on either side, of so much as each party thinks good for himself; if the doubt be in the effect, it is referred to the discretion of twelve indifferent men, impanelled by the sheriff for that purpose; and as they bring in their verdict, so judgment passeth; for the judge saith, *the jury findeth the fact thus*.—For the *enquest* in criminal causes, see *JURY*.

ENRICHED Column. See the article *COLUMN*.

ENROLLMENT. See the article *INROLLMENT*.
Clerk of the INROLLMENT of Fines. See *CLERK of the Enrollments*.

ENS, *ENTITY*, *Being*, in metaphysics, is applied in a general sense, to every thing which the mind any way apprehends, and whereof it affirms, denies, proves, or disproves any thing.—This, other philosophers call *cogitable*, and *intelligible*; and the logicians, *thema*.

Ens, in a less general sense, signifies something that is, or exists some way further than by being conceived, or being capable of being conceived in the mind.—This is particularly called, *ens positivum* or *reale*, positive, or real being.—In opposition to which stands *non ens*.

Ens, in its proper, or restrained sense, is that to which there are real attributes belonging; or that which has a reality, not only out of the intellect, but in it self.—This is what is properly meant by *res*, thing; and what we otherwise call *ens reale*, and also *substantia*.

Ens rationis, is that which depends wholly on the mind; or which exists only in the imagination.—Of which they distinguish three kinds: *ens rationis obiectivum*, which is done, or produced by the mind; as knowledge: *ens rationis subiectivum*, which is received into the mind, as science; and *ens rationis obiectivum*, which is represented by the mind; as a chimæra, a golden mountain, or the like.

Which last, if it have no other manner of being, *i. e.* if it be represented so as it does not, or cannot be, it is what we most properly call *ens rationis*.—The generality of school philosophers, and the peripatetics among the rest, assert, that there are of these *entia rationis obiectiva*.—Others deny there are, or can be any such thing.

Ens, or **Ens primum**, among chemists, denotes the most efficacious part of any natural mixt body, whether animal, vegetable, or fossil; wherein, all the qualities or virtues of the ingredients of the mixt, are comprehended in a little compais.

Paracelsus pretends to have been able to separate the *ens primum* from bodies, and with it to effect prodigious things towards the renovation, and reformation of youth: but his processes are so obscurely delivered, that nobody has been induced to try them.

Mr. Boyle gives us a process from M. le Febvre, whereby the *ens primum*, or essence of bawm, is easily obtained; he adds, that the effects of an *ens* of bawm, thus drawn, are no ways inferior to those of Paracelsus; and instances in a special friend of his, who, upon taking it only for a fortnight, the nails of his hands and feet fell off, and were succeeded by a set of new ones; which convinced him so far of its efficacy, that he left off taking it himself: but giving some of it to an old woman of seventy years of age, who served in the house, it produced the menes again; and that so copiously, as wonderfully to startle the woman.

Upon giving a little of it to an old hen, her feathers began to moult on the sixth day, and she grew stark naked; but before a fortnight was over, she had others in their room, which were fairer, and better coloured than the former.

The relation is odd enough; yet considering the hand we have it from, and how easily the thing is tried, it is much no body, has yet attempted to prosecute it.—The process is thus:

Having gathered, *e. gr.* some bawm, or other fitting plant, at the proper season and time; beat it into a pulp in a marble mortar, and putting it into a bolt-head hermetically sealed, digest it forty days in a dunghill, or other analogous heat. This done, take out the matter which will now be more liquid than before, and separating from it the dregs, or grosser parts, digest it anew in a gentle bath; that the remaining grosser parts may also subside: filtrate it, and add to it the fixed salt, drawn from the former dregs, dried and calcined. To the liquor thus prepared, add equal parts of the liquor of good sea-salt well purified, and melted, and then let to run *per deliquium*. Lastly, seal up the mixture in a bolt-head; and expose it to the sun six weeks longer. At the end of which term, the *ens primum* of the plant will be found swimming on the liquor, in a liquid, transparent form, sometimes of a green, and sometimes a reddish colour, according to the plant used.

Ens Veneris, or *Flower of Venus*, a chemical preparation from vitriol, first published by Mr. Boyle; held a specific in the rickets, and much commended in nervous cases, obstinate cachexies, loss of appetite, and obstructions of all kinds.

It is prepared by subliming equal parts of the powder of Cyprus vitriol, (calcined till it is of a dark colour) and of sal ammoniac, into the form of yellow flowers.—It has its name from the particles of Venus, copper, therein, imparted by the vitriol.

ENSCONCED, in the military art. See the article **INSCONCED**.

ENSEMBLE, a French term, sometimes used in our language; literally signifying *together*, or *one with another*:—being formed from the Latin *in* and *simul*.

In architecture, we say the *ensemble*, or *tout ensemble* of a building, meaning the whole work, or composition, considered together, and not in parts; and sometimes also, the relative proportion of the parts to the whole.—All those pieces of building make a fine *ensemble*.

To judge well of a statue, or other work of sculpture, one must first examine, whether the *ensemble* be good.

The *tout ensemble* of a painting, is that harmony which results from the distribution of the several objects or figures, whereof the whole is composed.—This picture is good, taking the parts separately; but the *tout ensemble* is naught.

ENSIFORMIS Cartilago. See the article **XIPHOIDES**.

ENSIGN, in the military art, a banner, or colours, under which the soldiers are ranged, according to the different companies, or parties they belong to. See **FLAG**, **COLOURS**, and **STANDARD**.

The Turkish *ensigns*, are horses tails: those of the Europeans, are pieces of taffety, with diverse figures, colours, arms, and devices thereon. Xenophon tells us, that the *ensigns*, bore by the Persians, was a golden eagle on a white flag: the Corinthians bore the winged horse, or Pegasus, in theirs; the Athenians an owl: the Messenians, the Greek Letter M: the Lacedæmonians the A.

The Romans had a great diversity of *ensigns*; the wolf, minotaur, horse, boar, and at length the eagle, where they stopped: this was first assumed in the second year of the consulate of Marius.

A military *ensign* on a medal of a Roman colony, denotes it a colony peopled with old soldiers.

ENSIGN, is also used for an officer in the infantry, who bears the *ensign*, or colours; by the Latins called *signifer*, and *vexillifer*.

He has the charge of the *ensign* in battle; and if he be killed, the captain is to take it in his stead.—The *ensign* is under the command of the lieutenant, and in his absence supplies his post.

ENTABLATURE *, in architecture, is that part of an order of column which is over the capital; comprehending the architrave, frieze, and cornice. See **ARCHITRAVE**, **FRIZE**, and **CORNICHE**.

* The word seems formed of the Latin *tabulatum*, or *intabulamentum*.

The *entablature* is also called the *trabeation*; and by Vitruvius and Vignola, *ornament*: it is different in the different orders: Indeed it consists of the three grand parts, or divisions above-mentioned, in all; but those parts consist of a greater, or less number of particular members, or sub-divisions, as the orders are more or less rich.

Vignola makes the *entablature*, a quarter of the height of the whole column, in all the orders.

In the Tuscan and Doric, the architrave, frieze, and cornice, are all of the same height. In the Ionic, Corinthian, and Composite, the whole *entablature* being fifteen parts; five of them are allowed for the architrave, four for the frieze, and six for the cornice. See **IONIC**, **CORINTHIAN**, &c.

ENTABLATURE, or **ENTABLAMENT**, is sometimes also used for the last row of stones on the top of the wall of a building, whereon the timber and the covering rest.

As this is frequently made to project beyond the naked of the wall to carry off the rain, some authors call it in Latin *stillicidium*, or drip.—Such an *entablature* does not stand out far enough: it lets the water fall on the foot of the wall.

ENTAIL, in law, signifies *fee tail*, or *fee entailed*; that is, abridged, curtailed, or limited to certain conditions. See **FEU**, and **TAIL**.—For the docking of an entail. See **DOCKING**, and **RECOVERY**.

ENTE, in heraldry, literally implies *engrafted*; and is used by the foreign heralds to express a method of marshalling, little known among us.—Yet we have an instance of it in the fourth grand quarter of his Majesty's royal ensign; whose blazon is, Brunfwic and Lunenburgh impaled with ancient Saxony, *enté in pointe*.

ENTELECHIA, **ENTEAECHIA**, a Greek term, by which Aristotle defines the soul; and which not occurring in any other author, has given the critics and philosophers infinite perplexity to discover its true meaning. See **SOU**.

Hermolaus Barbarus, is even said to have consulted the devil about it; after which, in his paraphrase on Themistius, whether from the devil or himself we know not, he renders it by *perfecti habita*, which is not a whit the clearer.

Cicero, whose interpretation should be preferable to that of any modern, defines *entelechia* (*Tuscul. q. L. I. C. 1.*) to be *a certain, continued, and perpetual motion*: whence it should seem that Aristotle took the soul for the mode of the body; a *continuous motion* being doubtless a mode of body.

The common peripatetics hold *entelechia* to signify *act*; and under it, suppose the form of the compound, or animal, to be understood.—Accordingly, some define it any *act*, whether substantial or accidental, considered as capable of performing some operation in the body.—Others define it a substantial *act*, whereby a thing is, what it is, in substance. Lastly, other, and those the latest peripatetics agree that the *act* or *entelechia*, is whereby Aristotle meant to explain the nature of the soul, is either some mode of the body, as motion, or it is nothing at all.—And thus the peripatetic notion comes round to that of Cicero.

ENTENDEMENT, in law. See the article **INTENDMENT**.

ENTERFERING, in the manage. See the article **CUTTING**.

ENTEROCELE *, **ЕНТЕРОКХАН**, in medicine, a rupture, or descent of the intestines.

* The word is formed of the Greek, *enteros*, intestine; and *khana*, tumor.

The *enterocèle* is a kind of hernia, or rupture, wherein the intestines, and particularly the ilium, fall either into the groin, or the scrotum. See **HERNIA**.

There are two kinds of *enterocèle*; the *perfect*, which happens when the intestine falls into the scrotum; and the *imperfect*, when it only falls into the groin.

The next cause of the *enterocèle*, is the relaxation, or extension of the lower part of the peritonæum, wherein the intestines are contained.—The remote causes are great lifts, too violent exercises, great coughs, frequent vomiting, much crying, &c. whence it is that children are much subject thereto.—The remedy is chiefly by external applications, as trusses and boullsters.

ENTERO-EPIPOCELE, **ЕНТЕРОПНПЛОХХАН**, a kind of rupture, wherein the intestines, and epiploon, or caul, fall together into the scrotum. See **HERNIA**.—The causes are the same as those of the *enterocèle*. See **ENTEROCELE**.

ENTERO-

ENTERO-EPILOMPHALUS *, a kind of exomphalus, wherein the intestines, and epiploon, or caul, bunch out at the navel.

* The word is composed of *εντερον*, intestine, *επιπλον*, caul, and *ομφαλ*, umbilicus, navel.

ENTERO-HYDROMPHALUS *, in medicine, a kind of exomphalus, wherein, beside a displacing and bunching out of the intestine, there is a deal of watery humours collected along with it.

* The word is formed of the Greek, *εντερον*, intestine, *υδωρ*, water, and *ομφαλ*, navel.

ENTEROLOGY, (from *εντερον*, intestine, a gut, and *λογ*, *fermo*, discourse) is properly a treatise of the bowels. — Though the word is generally understood to include the contents of three cavities, head, breast, and all the viscera, or belly.

ENTEROMPHALUS *, *ΕΝΤΕΡΟΜΦΑΛΟΣ*, in medicine, a kind of exomphalus, wherein the intestines being fallen out of their place, occasion a tumor in the navel. See *EXOMPHALUS*.

* The word is formed of the Greek, *εντερον*, intestine, and *ομφαλ*, umbilicus.

ENTERPLEDER, in law, the discussing, or trying a point incidentally falling out, before the principal cause can be determined.

Thus, two persons being found heirs to land, by two several offices in one county; the king is brought in doubt, to which of them livery ought to be made. Before livery, therefore, they must *enterplede*, that is, formally try between themselves which is the right heir.

ENTERMENT, or **INTERMENT**. See **INTERMENT**.

ENTHUSIASM *, *ΕΝΘΟΥΣΙΑΣΜΟΣ*, a poetic or prophetic rage, or fury, which transports the mind, enflames and raises the imagination, and makes it conceive and express things extraordinary, and surprising.

* The word is derived from the Greek, *ενθου*, or *ενθες*, a man animated in an extraordinary manner with the spirit of God, in whom God is, or whom God animates. Whence, the verb *ενθουσιάζω*, or *ενθουσιάζομαι*, and the noun *ενθουσιασμός*, *ενθουσιάζω*, and *ενθουσιάζομαι*, *ενθουσιάζω*, a person subject to such transports.

M. de Piles defines *enthusiasme*, to be a transport of the mind, whereby it is led to think and imagine things in a sublime, surprising, yet probable manner.

The sublime, he thinks a necessary ingredient in the definition; as being the proper effect, and production of *enthusiasme*. — *Enthusiasme*, he adds, contains the sublime; as the trunk, the branches.

This is the *enthusiasme* felt in poetry, oratory, music, painting, sculpture, &c. But this *enthusiasme* which belongs to the works of art, is very different from that attributed to the sibyls and priestesses of the oracles, and heathen gods; which was little else but fanaticism, and consisted principally in grimace, and contortions of the body. See **ORACLE**, and **PYTHIAN**. See also the preface to this book.

There is a degree of assent, says Mr. Locke, which, with some men, has the same authority, as either faith or reason; and that is *enthusiasme*; which laying by reason, would set up revelation without it; whereby, in effect, it takes away both reason and revelation, and substitutes in the room of it, the ungrounded fancies of a man's own brain, and assumes them for a foundation both of opinion and conduct.

Immediate revelation being a much easier way for men to establish their opinions, and regulate their conduct by, than the tedious labour of strict reasoning; it is no wonder, that some have been very apt to pretend to it; especially in such of their actions and opinions, as they cannot account for by the ordinary methods of knowledge, and principles of reason. Hence we see, that in all ages, men, in whom melancholy has mixed with devotion, or whose conceit of themselves, has raised them into an opinion of a greater familiarity with God, than is allowed others; have often scattered themselves with the pervasion of an immediate intercourse with the deity, and frequent communications from the divine spirit.

Their minds being thus prepared, whatever groundless opinion comes to settle itself strongly upon their fancies, is an illumination from the spirit of God; and whatsoever odd action they find in themselves an inclination to do, that impulse is concluded to be a call, or direction, from heaven, and must be obeyed.

This we take to be properly *enthusiasme*, which, though rising from the conceit of a warm, or overweening brain, works, where it once gets footing more powerfully on the persuasions and actions of men, than either reason, or revelation, or both together; men being most forwardly obedient to the impulses they receive from themselves.

When men are once got into this way of immediate revelation, of illumination without search, and certainty without proof, reason is lost upon them; they are above it: they see the light infused into their understanding, and they cannot be mistaken; like the light of bright sun-shine, it shews it

self, and needs no other proof but its own evidence: they feel the hand of God moving them within, and the impulses of the spirit, and cannot be mistaken in what they feel. — But of this seeing and feeling, is it a perception of an inclination to do something, or of the spirit of God moving that inclination? these are two very different perceptions, and should be carefully distinguished.

If they know the thing to be a truth, they must do it, either by its own self-evidence, or by the rational proofs that make it out to be so: if they know it to be a truth, either of these two ways, they in vain suppose it to be a revelation: for thus all truths, of what kind soever, that men uninspired, are enlightened with, come into their minds. If they say, they know it to be true, because it is a revelation from God, the reason is good; but then it will be demanded, how they know it to be a revelation from God? if they say, by the light it brings with it; they should consider, whether this be saying any more, than that it is a revelation, because they believe it to be true; for all the light they speak of, is but a strong persuasion of their own minds, that it is a truth; which is a very unsafe ground to proceed on, either in our tenets or actions. True light in the mind, is nothing else but the evidence of the truth of any proposition; and, if it be not self-evident, all the light it can have, is from the clearness of those proofs upon which it is received. See **EVIDENCE**.

God, when he makes the prophet, doth not unmake the man: he leaves his faculties in the natural state, to enable him to judge of his inspirations, whether they be of divine original, or no. If he would have us assent to the truth of any proposition, he either evidences that truth by the usual methods of natural reason, or else makes it known to be a truth which he would have us assent to by his authority; and convinces us, that it is from him, by some marks, which reason cannot be mistaken in.

The holy men of old, who had revelations from God, had something else besides internal light of assurance in their own minds, to testify to them, that it was from God. They had outward signs to convince them, of the author of those revelations. And when they were to convince others, they had a power given them to justify the truth of their communion from heaven; and by visible signs to assert the divine authority of the message they were sent with. Moses saw the bush burn without being consumed, and heard a voice out of it. God, by another miracle, of his rod turned into a serpent, assured him likewise of a power to testify his mission, by the same miracle repeated before those to whom he was sent.

ENTHUSIAST, *ΕΝΘΟΥΣΙΑΣΤΗΣ*, a person possessed with *enthusiasme*. See **ENTHUSIASM**, **FANATIC**, &c.

The word is usually understood in an ill sense. — It was applied by the ancients, to a sect of heretics, called also *Massilians*, and *Euchites*; who, as Theodoret expresses it, were denominated *enthusiasts*, by reason that being possessed by the devil, they believed themselves divinely inspired. See **MASSALIANS**, and **EUCHITES**.

Among us, *enthusiast* is of like import with *fanatic*; and is applied to the quakers, the ancient anabaptists, and modern prophets, from their pretences to extraordinary lights, revelations, visions, impulses, &c. from heaven.

ENTHYME *, in logic, an argument consisting only of two propositions, — an antecedent, and a consequent deduced from it.

* The word is Greek, *ενθυμημα*, formed of the verb, *ενθυμειν*, to think, consider, a compound of *εν* and *θυμη*, mind.

Aristotle calls it, the *rhetorical*, or *probable argument*; the schools, the *imperfect syllogism*, in contradistinction to the perfect, which consists of three propositions, and is called the *dialectical argument*.

It must be observed, however, that the *enthymeme* is really a perfect syllogism in the mind, and only imperfect in the expression, by reason one of the premises is suppressed, as being sufficiently clear and obvious, and easily supplied by the understanding of those with whom we discourse.

Thus, in every right lined triangle, the three angles are equal to two right ones; and consequently, they are so in a isosceles triangle: is an *enthymeme*; the proposition that an isosceles is a right lined triangle, being omitted, as being sufficiently known and granted.

The *enthymeme* is the most simple and elegant of all arguments, being what a man, in arguing closely, commonly makes, without attending at all to the form thereof. Thus, that verse remaining of Ovid's tragedy, entitled, *Medea*, contains an *enthymeme*: *servare patris, perdere an possun rogare*? I was able to save you; consequently, to have destroyed you. All the beauty would have been lost, had all the propositions been expressed; the mind is displeased with a rehearsal of what is no ways necessary.

Sometimes also, the two propositions of an *enthymeme*, are both included in a single proposition; which Aristotle calls, an *enthymematical sentence*; and gives this instance thereof, *mortal*

do not bear an immortal hatred. The whole *entymeme* would be, *thou art mortal, let not, therefore, thy hatred be immortal.*
ENTIRE Tenancy, in law, is contra-distinquished to *several tenancy*; and signifies a sole possession in one man: whereas the other denotes a joint, or common one, in several. See **TENANT**, and **JOINTENANT**.

ENTIRE Arms. See the article **ARMS**.

ENTITATIVELY, **ENTITATIVE**, implies an abstraction, or separation, of all the circumstances, from a thing under consideration.

Thus, a thing is said to be taken, or considered, *entitatively*, or *secundum entitatem*, when considered nakedly, and precisely, according to what it is in itself, without any thing extrinsic.

—E. gr. Peter *entitatively* taken, is Peter, as a thing, a substance, a man, &c. without any regard to his being a lord, a husband, learned, &c.

ENTITY, in the school philosophy, a physical ens, or being, considered according to what it is in its natural capacity.

Some dealers in distinctions, give us several kinds of *entity*.—In its proper sense, they apply it to a compages of dissimilar parts: such as is the *entity* of a house, of the world, &c.—

In a more limited sense, they apply it to a congeries of similar parts: such as is the *entity* of water, heat, &c.—And, in its general sense, to any reality: such as the *entity* of God, of angels, &c.

But this is mere subtilty: perhaps *entity* were best defined the actual essence, or existence of any thinking thing.

ENTOYER, or **ENTOIRE**, in heraldry, is used to express a bordure, charged entirely with things without life. See **BORDURE**.

ENTRAILS*, the intestines, or guts, of an animal. See **INTESTINES**.

* Menage derive the word from the barbarous Latin, *interalia*; formed of the Greek *ε.ντερ. εντερων*.

In embalming they take out the *entrails*.

Poison leaves its chief marks in the *entrails*.

ENTRAILS, is also used, in a more extensive sense, for the viscera; or all the parts contained in the cavities of the bodies of animals. See **VISCERA**.

The aruspicina of the ancients, was employed in considering the *entrails* of victims, as the heart, lungs, liver, &c. See **ARUSPICES**, &c.

ENTRIES, amongst hunters, those places in thickets, through which deer are found lately to have passed; by means whereof their bigness, or size is guessed at; and at which the hounds, or beagles, are put to them for the view.

ENTRUSION, or **INTRUSION**, in law, denotes a violent, or unlawful entrance into lands, or tenements, void of a possessor; by a person who has no right to them.

Thus, when a man steps into lands, the owner whereof lately died, ere the right heir, either by himself, or any other, hath taken possession, it is *entruision*.

Entruision and *abatement*, are sometimes taken for the same thing: though there is a difference.

ENTRUSION, in the canon law. See **INTRUSION**.

ENTRY, or **ENTRANCE**, in its general sense, denotes a door, gate, passage, &c. through which to *enter*, or arrive within a place.

ENTRY, in book-keeping. See **BOOK-KEEPING**.

Bill of ENTRY. See the article **BILL**.

ENTRY, is sometimes also used to denote a duty, or impost, laid on commodities imported into a state, either by land or sea.

The duties of *entry*, or importation, are paid according to a tariff settled for that purpose. Where the duty of *entry* of any commodity, is not fixed by the tariff; it is paid by estimation, *i. e.* in proportion to what some other commodity, of nearly the same quality and value, uses to pay. See **IMPORTATION**, **EXPORTATION**.

ENTRY, also denotes a solemn reception; or a ceremony performed by kings, princes, ambassadors, legates, &c. upon their first *entering* a city, or their return in triumph from some expedition.

ENTRY, in law, signifies also the taking possession of lands, or tenements, in virtue of a title thereto. See **POSSESSION**.

Forcible ENTRY. See the article **FORCIBLE**.

ENTRY is also used for a writ which grants possession of lands or tenements to a person, on account of a legal right thereto.

Writs of entry, says Briton, favour much of the right of property: some, *e. gr.* are to recover customs, and services; and in these are contained the two words, *folet and debet*.—Such are the writs *quo jure, rationalibus divisis, rationabili estoverio*, &c. In the plea of *Entry* there are three degrees: the first, where a man demandeth lands or tenements, of his own seisin, after the term is expired.—The second, where one demandeth lands or tenements, let by another after the term is expired.—The third, where one demandeth lands or tenements of

that tenant, who had *entry* by one to whom some ancestor of the plaintiff did let for a term now expired: and according to these degrees, the writs for remedy are varied.—Beside which, there is a fourth form, without degrees, and in case of a more remote seisin; to which the other three degrees do not extend.

The writ in the second degree, is called a *writ of entry in le per*.—In the third, *in le per & cui*.—And in the fourth, without degrees, a *writ of entry in le poss*; that is, after disseisin, made by such a one to such a one.

If a *writ of entry* be conceived out of the right case, so that one form is brought for another, it is abatable.

A *writ of entry* differs from an *affize*, in that it lies, for the most part, against him who entered lawfully, but holdeth against law; whereas an *affize* lieth against him, who unlawfully disseized: yet, sometimes, a *writ of entry* lieth upon an entruision. See **ASSISE**.

ENVELOPE, in fortification, denotes a mound of earth, sometimes raised in the ditch of a place, and sometimes beyond it; being either in form of a simple parapet, or of a small rampart bordered with a parapet.

These *envelopes* are made, where weak places are only to be covered with single lines; without advancing towards the field; which cannot be done but by works which require a great deal of room; *such as horn-works, half moons, &c.—*Envelopes* are sometimes called *filans, contregards, conserovers, lunettes*, &c.

ENVIRONNE, in the French heraldry, is when a lion, or other figure, is *environed*, or encompassed round with other things.—*Environné* with so many bezants, &c. in orle.

ENUMERATION, the act of numbering, or counting.

God challenges Abraham in scripture, to *enumerate* the stars: at the time of our Saviour's birth, Augustus Cæsar had commanded an *enumeration* to be made of all the world, or rather of all the people under his empire. Though several able authors are of opinion that the census, tax, or *enumeration*, mentioned by St. Luke, did not extend to the whole empire, but only to the people of Judæa. See Perizonius *de Censu Judææ*: and Berger *de Viis Militaribus*.

At Rome, it was an usual thing to have an *enumeration* made of all the families: the first of these was under Servius Tullus, when the men amounted to 80 thousand. Pompey, and Crassus, made another when they reached to 400 thousand. That of Cæsar did not exceed 100 thousand: so that the civil wars must have destroyed 300 thousand Roman citizens. Under Augustus, in the year 725, the Roman citizens throughout the empire were numbered at 4 million 63 thousand. In the year of Rome 746, the citizens being numbered again, were found 4 millions, 2 hundred 33 thousand. In the year 766, being the last year of Augustus's reign, that prince, together with Tiberius, made another *enumeration* of the citizens of Rome, when they were found 4 millions 137 thousand persons. Claudius made a new computation, in the year of Christ 48, when, as Tacitus relates it, the Roman citizens throughout the whole empire, amounted to 6 millions 964 thousand; though others represent the number as considerably greater.—A very rare, yet indisputable medal of Claudius, never yet made public, expresses the precise number in this list made by Claudius, which was called *estensis*, to be 7 millions of people fit to bear arms, beside all the soldiers on foot in the armies, which amounted to 50 legions, 57 cohorts, and 60 soldiers.—After this *enumeration* we find no more till that of Vespasian, which was the last.

ENUMERATION, in rhetoric, denotes a part of the peroration, wherein the orator, collecting the scattered heads of what has been delivered throughout the whole, makes a brief and artful rehearsal, or recapitulation thereof.

ENUMERATION of the parts, in rhetoric, amounts to the same, with what we more usually call *distribution*. See **DISTRIBUTION**.

ENUNCIATION, a simple expression, or declaration, of a thing, in terms either of affirmation, or denial.

The schoolmen usually distinguish three operations of the understanding; apprehension, *enunciation*, and reasoning.

ENUNCIATION, among logicians, denotes the same as *proposition*. See **PROPOSITION**.

ENVOICE. See the article **INVOICE**.

ENVOY, a person deputed, or sent purposely to negotiate some particular affair with a foreign prince, or republic.

Those sent from the courts of England, France, &c. to Genoa, the princes of Germany, and other petty princes and states, do not go in quality of ambassadors, but of *envoys*. Add, that those sent from one great prince, or state, to another; as from the King of England to the emperor, &c. when the affair they go upon is not very solemn and important, have frequently no other character but that of *envoys*. See **EMBASSADOUR**.

Envoys are either ordinary, or extraordinary.

Both kinds are under the protection of the law of nations, and enjoy all the privileges of ambassadors; only differing from them in this, that the same ceremonies are not performed to them.

The quality of *envoy* extraordinary, Wicquefort observes, is very modern; more modern than that of resident: the ministers invested therewith, at first, took on them most of the airs of ambassadors; but they have since been taught otherwise.

In the year 1639, the court of France made a declaration, that the ceremonies of conducting *envoys* extraordinary to their audience in the king and queen's coaches, with diverse others, should no longer be practised to *envoys*.

S. Justiniani, the first *envoy* extraordinary from Venice, after that regulation offered to cover, in speaking to the king; but it was refused him. And the king of France himself declared, that he did not expect his *envoy* extraordinary at the court of Vienna, should be regarded any otherwise than as an ordinary resident. —Since this time, those two kinds of ministers have been treated alike. Wicquefort.

ENURNY, is the herald's term, for the bordure of a coat of arms being charged with any kind of beak.

EPOLIC, or rather **EPOLIC**. See **EPOLIC**.

EPON, or **EPON**. See the article **EPON**.

EPACTS, in chronology, the excesses of the solar month above the lunar synodical month; and of the solar year above the lunar year of 12 synodical months; or of several solar months, above as many synodical months; and several solar years above as many dozen of synodical months.

The *epacts*, then, are either *annual* or *menstrual*. *Menstrual EPACTS*, are the excesses of the civil, or calendar month, above the lunar month.

Suppose, e. g. it were new moon on the first day of January: since the lunar month is 29 days 12^h 44' 3"; and the month of January contains 31 days: the *menstrual epact* is 1 day 11^h 15' 57".

Annual EPACTS, are the excesses of the solar year above the lunar.

Hence, as the Julian year is 365 days 6 hours, and the Julian lunar year 354 days 8^h 48' 38"; the annual *epact* will be 10 days 21^h 11' 22"; that is, nearly 11 days. Consequently, the *epact* of 2 years, is 22 days; of 3 years, 33 days; or rather 3, since 30 days make an embolismic, or intercalary month.

Thus, the *epact* of 4 years is 14 days, and so of the rest: and thus, every 10th year, the *epact* becomes 30 or 0; consequently the 20th year the *epact* is 11 again: and so the cycle of *epacts*, expires with the golden number, or lunar cycle of 19 years, and begins again with the same, as in the following table.

Gold. Numb.	Epacts.	Gold. Numb.	Epacts.	Gold. Numb.	Epacts.
1	XI	7	XVII	13	XXIII
2	XXII	8	XXVIII	14	IV
3	III	9	XIX	15	XV
4	XIV	10	XX	16	XXVI
5	XXV	11	I	17	VIII
6	VI	12	XII	18	XIX
				19	XXX

Again, as the new moons are the same, that is, as they fall on the same day every 19 years, so the difference between the lunar and solar year, is the same every 19 years. And because the said difference is always to be added to the lunar year, in order to adjust, or make it equal to the solar year; hence the said difference respectively belonging to each year of the moon's cycle, is called the *epact* of the said year, that is, the number to be added to the said year to make it equal to the solar year; the word being formed from the Greek, *επαγω, induco, intercalo*.

Upon this mutual respect, between the cycle of the moon, and the cycle of the *epacts*, is founded this rule for finding the *epact* belonging to any year of the moon's cycle. Multiply the year given of the moon's cycle into 11; and if the product be less than 30, it is the *epact* sought: if the product be greater than 30, divide it by 30, and the remainder of the dividend is the *epact*. For instance, I would know the *epact* for the year 1712, which is the third year of the moon's cycle. Wherefore 3 is the *epact* for 1712: for $11 \times 3 = 33$, and 33 being divided by 30, there is left 3 of the dividend for the *epact*.

By the help of the *epact* may be found what day of any month in any year the new moon falls on, thus: to the number of the month, from March inclusively, add the *epact* of the year given; if the sum be less than 30, subtract it out of 30; if greater, subtract it out of 60; and the remainder will be the day, whereon the new moon will fall.

If the new moon be sought for in the month of January or March, then nothing is to be added to the *epact*; if for February or April, then only 1 is to be added.

For example: I would know what day of December the new

moon was on A. D. 1711; the *epact* whereof is 24. By the aforesaid rule, I find it will be December the 28th; for $22 + 10 = 32$, and $60 - 32 = 28$. See **MOON**.

The day whereon the new moon falls, being thus found it is easy to infer from thence what the age of the moon is on any day given. See **MOON**, and **AGE**.

However, there is a peculiar rule commonly made use of to this purpose, which is this: add the *epact* of the year, the number of the month, from March inclusively, and the given day of the month all into one sum, this if it be less than 30, shews the age of the moon; if it be greater than 30, divide it by 30, and the remainder of the dividend shews the age of the moon, or how many days it is from the last new moon: this method will never err a whole day.

For instance: what was the age of the moon on December 31st, A. D. 1711? by this rule, I find, that the Moon was then three days old; that is, it was then three days from the last new moon: For $22 + 10 + 31 = 63$, and 63 being divided by 30, there will remain of the dividend 3. And this exactly agrees to the other foregoing rule, whereby it was found that the new moon was on December 28, 1711.

It must be observed, that as the cycle of 19 years, anticipates the new moons by one day in 312 years; the same cycle of *epacts* will not always hold: the moon's anticipation lessening the several *epacts* by one, every 312 years.

To have the *epacts*, therefore, point out the new moons perpetually; that *epact* given in the calendar is not sufficient; but all the 30 *epacts* should be bestowed throughout the whole year, that the calendar may exhibit all the cycles of *epacts*.

And, again, as in 300 Gregorian years, there is one bissextile year dropped; the new moons are thus thrown on the following day. Consequently, by the moon's post-position there is one added to every *epact*.

EPANORTHOSIS *, in rhetoric, a figure, whereby the orator revokes, and corrects something before alleged, as too weak; and adds something stronger, and more conformable to the passion he is agitated by.

* The word is Greek *επανορθωσις*, formed of *επαο*, right, straight, whence *επαο*, I straighten, *αρθωσις*, correction, I correct, straighten, correct, and *επανορθωσις*, correction.

Accordingly, the Latins call it *correctio*, and *emendatio*. Such, e. g. is that of Cicero for Caelius: *O solum! solum! tunc dicam, an impudentiam singularem. Oh folly! folly did I call it, or rather intolerable impudence!—And in the first catilinarian; quamquam quid loquar! te ut ulla res frangat? tu ut unquam te corrigas? tu ut ulla fugam meditere? tu ut ulla exitum cogites? utinam tibi istam mentem Dii immortales donarent.*—Thus also Terence, in the *Heautontimorumenos*, introduces his old man Menedemus, saying,

Filius unicum adolescentulum habes. Ab! quid dixi habere me? imo habui; Cbrene, Nunc habeam necne, incertum est.

EPAULE *, or **ESPAULE**, in fortification, the shoulder of the bastion; or the angle made by the face and flank; otherwise called the *angle of the epaule*. See **BASTION**, and **ANGLE**.

* The word is pure French, and literally signifies *shoulder*.

EPAULEMENT; in fortification, a side-work hastily thrown up, to cover the canon, or the men.

It is made either of earth thrown up, of bags filled with sand or earth, or of gabions, fascines, &c. with earth: of which latter sort the *epaulements* of the places of arms, for the cavalry, behind the trenches, usually are.

EPAULEMENT, is also used for a demi-bastion, consisting of a face and flank, placed at the point of a horn or crown-work. —Also, for a little flank, added to the sides of a horn-work, to defend them when too long. —Also, for the redoubts made on a right line to fortify it. —And lastly, for an orillon, or mass of earth almost square, faced and lined with a wall, and designed to cover the canon of a casement. See **BASTION**, and **ORILLON**.

EPENTHESIS *, in grammar, the addition, or insertion of a letter or syllable, in the middle of a word. —As, *relligio* for *religio*, *maovers* for *maors*.

* The word is Greek, *επερθεσις*, formed of *επι*, in, and *θεσις*, q. d. *επερθεσις*, infers, immittit.

EPHA, a dry measure in use among the Hebrews. See **MEASURE**.

The *epha* was the most ordinary measure they used; and that whereby the rest were regulated. It is commonly supposed that the *epha*, reduced to the Roman modius contained four modii and a half. Now the Roman modius of grains, or flower, contained 20 librae, or pounds; consequently the *epha* weighed 90 pounds. Dr. Arbuthnot reduces the *epha* to three pecks, three pints, English measure.

The hospitality of Gideon is extolled for baking an *epha* of flower for a single angel; which might have served 45 men a whole day; the usual portion allowed the workmen being two pound of bread per diem.

EPHEMERA *, in medicine, an epithet applied to something that only lasts a day. —Particularly, to a sort of fever, which terminates in the compass of twenty four hours; called by

EPH

Galen, *ἐπιμὴρ* *ἡμερῶν*, *febris ephemera*, by the Latins *diaria*. See **FEVER**.

* The word, and the following one, *ephemerides*, are formed of the preposition *ἐπι*, *de*, *of*, and *ἡμέρα*, *day*.

EPHEMERON, or **EPHEMERA**, in natural history, denotes an animal, that only lives five hours: within the term whereof it is born, grows and extends its members, breeds eggs, propagates its species, grows and dies.

Aristotle, who gives the first account thereof, in his book *de Animal*, calls it by the name, *ἐπιμῆρ*, because its life is bounded within the day.—Aldrovandus, Johnston and Clusius, furnish us accounts of the *ephemeron*; and above all, Swammerdam, in an express work *de Ephem. Vita*.—He calls it *ephemera*, *hemerobios*, and in Latin, *diaria*.

The *ephemeron* is of the winged, or fly kind; and appears usually about St. John's tide. It is born about fix a clock in the evening, and dies about eleven.

It must be observed, however, that before it assumes this figure, it has lived three years under that of a worm, in a clay cell, or case.

It never eats from the time of its change to its death; nor is it furnished with the parts necessary for the reception and concoction of food. Its metamorphosis seems intended merely for the sake of generating and multiplying its kind.

The business of its life is summed up in a few words. In the beginning, it sheds its clay coat; which done, and the poor little animal thereby rendered light and agile, it spends the rest of its short and winged state in frisking over the waters. During which, the female drops her egg on the waters, and the male does his office to impregnate them. These eggs, thus impregnated, descend to the bottom of the water by their own gravity, and are hatched by the warmth of the sun into little worms, which make themselves cases in the clay, and feed on the same without any need of parental care: till the time of their change, or metamorphosis come.

EPHEMERA, is also applied among botanists, to a kind of flowers, which open, and expand themselves at sun-rising, and wither or close up again at his setting.—Such are the dent de lion, vulgarly dandelion, and diverse others.

Travellers into Arabia tell us of several *ephemeron trees*, which they say grow up every day, from morn to noon, and then disappear; though it is not known, whether they wither away entirely, or sink back into the sands among which they grow.

EPHEMERIDES, in astronomy, tables calculated by astronomers, shewing the present state of the heavens for every day, at noon; that is, the places wherein all the planets are found at that time.

It is from these tables, that the eclipses, conjunctions, and aspects of the planets, are determined; horoscopes, or celestial schemes constructed, &c.

We have *ephemerides* of Origan, Kepler, Argoli, Heckerus, Mezzaracchis, Wing, de la Hire, Parker, &c.—Sig. Cassini has calculated *ephemerides* of the sidera medicæ, or satellites of Jupiter, which are of good use in determining the longitude.

EPHETÆ, in antiquity, a sort of magistrates among the Athenians, instituted by king Demophon, to take cognizance of murders committed by accident.

Their number was 100, whereof 50 were Athenians, and 50 Argians: they were not admitted to the post till upwards of 60 years of age.—Draco extended their authority: Ubbö Emmius *de Rep. Athen.* says, he transferred to them part of the jurisdiction of the Areopagites.

EPHIALTES, *ἑπιάτης*, or *ΕΠΙΑΤΗΣ*, in medicine, a disease, by the English called the *night mare*, and by the Latins, *incubus*; chiefly affecting persons asleep, when laid on their back, and having the stomach loaded with food of difficult digestion.

In this state they are oppressed, as it were, with a great weight on the breast, and imagine some spectre, or demon, stopping their breath.

The disease does not arise, as was anciently imagined, from gross vapours filling the ventricles of the brain: but chiefly from a too great repletion of the stomach, which hinders the motion of the diaphragm, and of consequence, the dilatation of the breast necessary for inspiration.

The pressure of the cerebrum on the cerebellum, and that of the full stomach on the descending trunk of the aorta, seem also to be concerned in this manner: for neither of these can happen without affecting the nerves that pass to the muscles of respiration. Without supposing one or both of these, it will be hard to assign a reason, why persons should be rather affected when laid on the back, than in any other posture.

Etmuller observes, that they are but rarely affected with this disorder who use a laudable diet, and sup sparingly: lying on the side, with the head pretty high, generally prevents it.

The Arabs call it, the *nocturnal epilepsy*, because, when habitual, it usually degenerates into the epilepsy, being the usual forerunner thereof, especially in young people.—In old, it frequently terminates in an apoplexy.

EPI

Menjoitius accounts for its being most usual in boys, from their being too voracious, and eating more than they can digest.—Aurelianus assures us, it has killed several; adding from Symmachus, that there was a contagious, or epidemic *epibolæ* at Rome, which destroyed numbers, like a plague.

EPHIPPIUM, *ἑπιππίον*, in anatomy, a part of the sphenoide, called also *fella equina*, and *fella turcica*.

EPHOD *, a sacerdotal garment, in use among the ancient Jews, supposed to have been a kind of linnen alb, or surplice; the same with what the Latins call *super-bumale*.

* The word is Hebrew, *ἑφ*, *ephod*, derived from *ἑφ* *ephad*, signifying *to cloath*.

It is very hard to say precisely what the *ephod* was; and there is room enough for the interpreters to be divided about it. The only point they are agreed upon is, that it was an upper garment wore over all the rest, immediately under the pectoral, or breast-plate. Some hold it had sleeves; others deny it. The generality agree that it was very short, though some hold, that it hung down to the feet behind.

There were two kinds of *ephods*; the one, common to all who assisted in the temple; being only made of common linnen, mentioned in the 1st book of Samuel, ii. 18. The other, peculiar to the high-priest, mentioned Exod. xxviii. 6, 15, to be made of gold, of blue, and of purple, of scarlet, and fine twined linnen, with cunning work; having two shoulder pieces, with a curious girdle of the same matter, whereon were two onyx's, with the names of the children of Israel engraven thereon.

It is also expressed, in the 2d book of Samuel, vi. 14. that upon the removal of the ark of the covenant from the house of Obed Edom, David danced for joy, girt with a linnen *ephod*; whence some authors have concluded, that the *ephod* was also a regal garment worn on solemn occasions.

EPHORI *, *ἑφόροι*, magistrates established in ancient Sparta, to balance, and check the power, and authority of the kings: as, at Rome, there were tribunes created to controul the power of the consuls.

* The word is formed of the Greek, *ἐπορα*, *intueor*, formed of the preposition *ἐπι*, and the verb *ορα*, *to see*; whence *επορε*, q. d. *inspector*, *overseer*.

Lycurgus, being sensible that a perfect understanding between the prince and the people, was the basis and foundation of both their happiness; to maintain that good understanding, established *ephori*, or inspectors, as a kind of mediators, who should have an eye to the measures and conduct of both sides, and preserve so equal a balance between them, that the regal power should never decline into severity and tyranny; nor the liberty of the people run into license and rebellion.

The authority of the *ephori* was very great: on certain occasions, they expelled, and even put to death, the kings; and abolished, or suspended the power of the other magistrates; calling them to account at pleasure. Agesilaus, in the height of all his conquests, which even struck terror on the great king of Persia; stopped, and turned back, out of deference to the *ephori*, when they recalled him.

Some authors deny, that the *ephori* were established by Lycurgus; dating their origin 130 years after the time of that legislator.

EPIBATERION, a poetical composition, in use among the ancient Greeks.—When any person of condition, and quality, returned home after a long absence, or journey, into another country; he called together his friends, and fellow-citizens, and made them a speech, or rehearsed them a copy of verses, wherein he returned solemn thanks to the immortal gods, for his happy return, and ended with an address, by way of compliment, to his fellow-citizens.

These verses, made what the Greeks call *ἐπιβατήριον*, *epibaterium*, of *ἐπιβαίνω*, *I go aboard*.—At going away, they had another, called *epobaterium*.

EPIC POEM, an heroic poem; or a poem reciting some great, and signal transaction of a hero: called also *epopœia*.

Such are the *iliad* and *odysee* of Homer, the *æneid* of Virgil, the *gerusalemme* of Tasso, and the *paradise lost* of Milton; which are the principal poems of the *epic* kind.

An *Epic poem*, according to Sir R. Blackmore, is a probable, marvellous narration of an important enterprize, or great suffering of some illustrious person, related with dignity, in verse of the sublime style, to give delight and instruction.

The *epic* poem, is more accurately and scientifically defined, by Boſſu, a discourse invented with art, to form the manners, by instructions disguised under the allegory of an important action, related in verse, in a probable, entertaining, and surprising manner.

The *epic* poem is distinguished from comedy, in that the action of the latter is not important, nor is it related by the poet, but acted by the persons introduced for that purpose; which circumstance, likewise, distinguishes it from tragedy.

Nor is it a philosophical poem, as that of Lucætius, or the creation of Sir R. Blackmore; nor a treatise of agriculture, or the like; as the *georgics* of Virgil; those poems not being in-

intended to form the manners: beside, that the instructions they contain are naked, simple, and direct, without any disguise, or allegory. Which second circumstance likewise distinguishes it from a treatise of morality, wrote in verse: or a simple history in verse, as the paraphrase of Lucan; the punie war of Silius; or the civil wars of Sam. Daniel: add, that its being confined to one important action, distinguishes it from a poem which relates all the actions of a person's life; as the thesoid and achilleid of Statius, which are what we properly call *heroic poems*.

M. de la Motte, indeed, in his controversy with madam Dacier, on the subject of Homer, maintains, that the whole life of a hero, may justly be made the subject of an *epic poem*; and even, that the lutrin of M. Boileau, might pass for an *epic poem*: but he seemed, afterwards, to return to the common sentiment. In effect, the question is not as to the sense, which may be annexed to the words *epic poem*, but the sense which custom has actually annexed to them.

If we had only regard to the etymology of the word *epic*, (*ἐπικός*, *versé*, poetry, from *ἐπών*, *dicō*, I speak, relate) all poems wherein the poet speaks, or rehearses things himself, without making the persons of his poems speak, except at second hand, as he relates what they spoke on this or that occasion, would be properly *epic poems*; and so, there is not an epigram, sonnet, or madrigal, but would come under this denomination. But this were wild.

In effect, the term *epic poem*, is only attributed to a composition, whose subject is great, instructive, and serious; that only comprehends one single principal event, to which all the rest refer; which principal action is to be terminated in a certain space of time, ordinarily about a year. It is true, all this is arbitrary; but the sense of all words is so too: and in matters of language we must be guided by custom.

If M. de la Motte had only pretended, that one might make a fine, instructive poem, on the whole life of a hero; or an agreeable, and diverting poem, on some humorous adventure; all the world would have been of his side. But it is enough that custom has not thought good to apply the term *epic*, either to subjects of too much extent, and that are stuffed with too many incidents no wise connected together; nor to burlesque poems, as the batrachomyomachia of Homer; the scythia rapta of Tassoni; the deſaite de Dulot; the lutrin of Boileau; the Hudibras of Butler; the rape of the lock of Mr. Pope; or the dispensary of Dr. Garth.

The *epic poem*, then, as appears from what was above observed, bears a relation, or analogy, to four things; history, morality, fable, and poetry.—To *history*, as both of them relate one or more actions; but then, the actions of history are singular; so that the *epopœia* is no history, nor kind of history.

To *moral philosophy*, as both of them consist of instructions for forming the manners; but the action and allegories distinguish it herefrom.

But it relates entirely to poetry and fable; as being strictly a poem, and a fable.

The nature of the *epic poem*, is finely drawn by the great critic abovementioned: the *epic poets*, says fath. Boffu, have done that with regard to morality, which the ancient heathen divines did with regard to the divinity. The too great diversity of divine actions and perfections, so very disproportionate to our comprehension, obliged the latter to divide a single idea of a simple essence, God, into several persons; to whom they attributed several names, Jupiter, Juno, Neptune, &c. And, on the contrary, the nature of moral philosophy, which never prescribes rules for particular things, lead the poets to collect into one single idea; or into *one* and the same person; and one apparently singular action; whatever of that kind was found in different persons; and different actions.

Thus Aristotle, *Ὁν σὺν ἁλλήλοις ἡ πόλις ἀναμύχνηται*, &c. Poetry, says he, teaches moral philosophy, not by relating only, in manner of an historian, what Alcibiades, for instance, did or suffered; but by proposing what some person, named as the poet thinks fit, would, probably, or necessarily have done on the like occasion. And thus it is that he shews either the unhappy consequences usually attending imprudent schemes, or ill actions; or the reward of good actions, and the satisfaction resulting from a design laid in virtue, and conducted with prudence. So that in the *epic poem*, according to Aristotle's sentiment, the persons and actions, however named, are all to be feigned, allegorical, and universal, not historical and singular.

But the poets thus taking on them the office of moral philosophers, did not cease to be divines. On the contrary, their morality itself frequently obliges them to introduce the deity in their works; as the knowledge, fear, and love of God, are the first and most solid foundations of all morality. The presence of the divinity, and the share so august a personage was supposed to have in the action, obliged the poet to make the action great and important, and to have it transacted by kings and princes. The same likewise obliged them to think and speak, in a manner ele-

vated above the common pitch of men; and equal, in some measure, to the dignity of the divine persons introduced. To which end serves the poetical and figurative language, with the majesty of heroic verse. Add, that as so much of the divine and miraculous might ruin the probability, they were hereby obliged to have recourse to several rules to maintain the same.

Thus much the poets were driven to by the substance of the things they had chose for the matter of their poems and instructions. The manner of delivering them usefully and methodically, obliged them to several other necessary rules.

The *epic poem* is intended more for the manners and habits; than for the passions. These latter rise all at once, and their violence is but of short duration; but the habits are more calm, and impressed, or quitted more leisurely. Consequently, the *epic action* could not be included in the space of a day, as that of the theatrical. A longer time was necessary than is required for tragedy, which is altogether for the passions.

This distinction has introduced a world of difference between tragedy and *epic poetry*. The tragic violence requires a more lively and animated representation, than a mere recital. Accordingly, it is wholly thrown into action, and the poet never speaks at all, as he does in the *epopœia*, where there are no actors.—See further of the nature of the *epic poem* under FABLE.—For its matter, see ACTION. For its form, see NARRATION. See also MANNERS; CHARACTER, MACHINE, &c.

EPICARPIUM *, **ΕΠΙΚΑΡΠΙΟΝ**, in medicine, a kind of remedy, usually in form of a cataplasm, or plaster; consisting of sharp, penetrating ingredients, as garlic, or onion, spiders-webs, hellebore, camphor, Venice treacle, &c. applied round the wrist, at the beginning of the access of a fever, to prevent the growth of the same.

* The word is formed of the Greek *ἐπί*, *super*, on, and *καρπός*, *carpus*, wrist.

EPICEDION *, **ΕΠΙΚΗΔΙΟΝ**, in the Greek and Latin poetry, a poem, or poetical composition, on the death of a person.

* The word is Greek, formed of *ἐπί*, *upon*, and *κεῖνος*, *funeral*.

At the obsequies of any man of figure, there were three kinds of discourses usually made: that rehearsed at his bustum, or funeral pile, was called *nenia*; that engraven on his tomb, *epitaph*; and that spoke in the ceremony of his funeral, *epicedion*. We have two beautiful *epicedions* in Virgil; that of Euryalus, and that of Pallas.

EPICERASTICS *, **ΕΠΙΚΕΡΑΣΤΙΚΑ**, in medicine, remedies, which by their temperate moisture, soften the acrimony of an humour, and allwage the painful sensation of a part irritated or afflicted by it: such are the roots of althea, mallows, liquorice; leaves of lettuce, mallows, water-lilly, purslain; the seeds of flax, poppy, &c.

* The word is formed of *ἐπί* and *κεράσσω*, *tempero*, I moderate, correct.

EPICHIREMA, **ΕΠΙΧΙΡΗΜΑ**, in logic, an argumentation, consisting of four, or more propositions; some whereof are proofs of others.

Thus, that oration of Cicero for Milo, may be reduced to the *epichirema*: "Those who way-lay a man to kill him, it is lawful for him to kill; as is allowed by the laws of nature and nations, and by the practice of the best men: but Clodius way-laid Milo with that view; as appears from his forming an ambuscade before his country-house, and from his provision of weapons, soldiers, &c." Therefore it was lawful for Milo to kill Clodius.

EPICOENE, **ΕΠΙΚΟΙΝΟΝ**, in grammar, a term applied to nouns, which, under the same gender and termination, mark, indifferently, two kinds, or sexes. See **GENDEA**. Such, in Latin, is *aquila*, *vispertilis*, &c. which signify equally, a male or female eagle, or bat.

Grammarians distinguish between *epicene* and common.—A noun is said to be common of two kinds, when it may be joined either with a masculine, or a feminine article; and *epicene*, when it is always joined to some one of the two articles, and yet signifies both genders.

EPICOLIC Regions, (from *ἐπί*, *supra*, upon, and *colōn*, the gut so called) a name given by Dr. Glisson, to that space, on both sides, over the colon.

EPICUREANISM, or **EPICUREAN Philosophy**, the doctrine, or system of philosophy maintained by Epicurus, and his followers.

The noble poet Lucretius, who has given us a beautiful system of *epicureanism* in fine Latin verse, prefers its father Epicurus, to all other philosophers, whom; he makes no scruple to say, he obscured, as much as the sun does the other stars. It is said he first taught grammar; till upon reading Democritus's books, he began to apply himself to philosophy. From Democritus he learnt the doctrine of atoms, or corpules, which he afterwards made the basis of his physics. Clem. Alexand. *from*. 6. advances, that Epicurus stole his

chief doctrines from Democritus. But, it is certain, he greatly improved and illustrated them. Diag. Laertius assures us, he composed an infinite number of volumes.

This philosophy consisted of three parts: *canonical*, *natural*, *physical*, *ethical*, and *political*; which he explained briefly in three epistles.

The first, as Laertius relates, was about the canons, or rules of judging; wherein, rejecting the use of logic, he established the senses, passions, and anticipations, as the criterions, or judges of truth.

In the second, he laid down atoms, space and gravity, as the first principles of all things. The universe he taught, consisted of atoms or corpules, of various forms, magnitudes, and weights, which having been dispersed at random through the immense inane, or space, fortuitously concurred into innumerable systems, or worlds, which were thus formed, and afterwards, from time to time, increased, changed, and dissolved again, without any certain cause, or design; without the intervention of any deity, or the interdependence of any providence.

Not that he denied the existence of a God: on the contrary, he asserted it; but he thought it beneath the majesty of the deity to concern himself with human affairs: Laertius assures us, he held him, *το μακροῦ καὶ ἀθάνατου, ἐν αὐτοῖς πράγματι ὄντος, ἐπὶ οὐδὲν περὶ αὐτῶν, ἀλλὰ βέλτερος, ἀθάνατον, ἔχοντα καὶ ἀφ' ὧν αὐτὸν ἀπορρέει*, a blessed, immortal being, having no affairs of his own to take care of, and above taking care of those of others.

As to ethics; his first principle, or the supreme felicity of man, he held, was pleasure. Which some, as hereafter observed, understand of mental, and others of carnal pleasure.

EPICUREANS, a sect of ancient philosophers, who adhered to the doctrines, and opinions of Epicurus. See **EPICUREANISM**.

The *Epicureans* have, in all ages, been derided for their moral, and their attachment to the pleasures of sense: several authors, particularly, Cicero among the ancients, and Gassendus among the moderns, have endeavoured to vindicate them from this charge; by shewing that the pleasure wherein their master Epicurus places the summum bonum, or supreme happiness of this life, was not any sensual, or brutal pleasure, but a contentment, and tranquillity of mind, exempt from all tumultuary passions, &c.

This opinion seems just, and well-grounded; but, without entering into the question, which Gassendus, Du Rondel, and others have exhausted; it is certain, that in the common use of the word, *Epicurean* signifies, an indolent, effeminate and voluptuous person, who only consults his particular and private pleasure, without concerning himself with any thing serious.

In effect, there were always two kinds of *Epicureans*; the rigid, and remiss: the rigid *Epicureans*, were those strictly attached to the sentiments of Epicurus, who placed all their happiness in the pure pleasures of the mind, resulting from the practice of virtue. The loose or remiss *Epicureans*, taking the words of that philosopher in a more gross sense, placed all their happiness in pleasures of the body, in eating, drinking, loving, &c. The former kind, who were the genuine *Epicureans*, called the other the *sophists of their sect*.

The *Epicureans* take their name from the chief of their sect, Epicurus, whom, some, however, deny to be the author of the philosophy he taught; charging him with retailing for physics, the doctrine of Democritus; and for ethics, that of Aristippus.

Be this as it will, he was an Athenian, and the son of Neocles; born in the 109th olympiad, and consequently 342 years before Christ. He began to form his school at Mitylene and Lampachus, about the 32d of his life; though he afterwards removed to Athens, where he philosophized chiefly in his garden: he died of the stone at 72 years of age.

EPICYCLE*, in astronomy, a circle whose centre is on the circumference of another circle which bears it, and which for that reason is called its *Deferent*.

* The word is formed of the Greek, *ἐπι*, upon, and *κύκλος*, circle, q. d. a circle on a circle.

As astronomers invented an eccentric circle to solve the apparent irregularity of the planets, and their different distances from the earth; they likewise invented a little circle to solve the stations, and retrogradations of the planets: this circle which they call *epicycle*, has its centre in the circumference of another greater, which is the eccentric of a planet.

In this eccentric, the centre of the *epicycle* moves; carrying with it the planet fixed in its circumference, the centre of the planet, all the way, moving regularly along the circumference of the *epicycle*, when downwards, according to the order of the signs, and then upwards, contrary to it.

The highest point of the *epicycle* is called the *apogee*, and the lowest the *perigee*.

The great circle, in whose circumference the centre of the *epicycle* is placed, is also called the *deferent of the epicycle*, whose centre is in the orbit of the earth, according to the hypothesis of Copernicus: but in that of Ptolemy, who supposed the

heavens solid, the *epicycle* was a sphere, which revolved with the moon of the thickens allowed its heaven or orbit; and which, sometimes shewed it higher, and sometimes lower. See **Ptolemaic SYSTEM**.

The astronomers, who deny the motion of the earth; in order to render the phenomena of the motions of the planets more consistent with the motion of the sun, have affixed the orbit of the earth, as an *epicycle*, to the orbit of the planets: so that the planet should proceed in an *epicycle*, while it is carried through its orbit round the sun: but this is far from answering their expectations. Wolf. Elem. Math. T. 2. p. 501.

Ricciolus, though a zealous enemy of the motion of the earth, could not make any astronomical tables that should but tolerably agree with observation, without supposing the earth to move; not, though he called in all the foreign and forced affluences of changeable *epicycles*, liable to continual increase and decrease, and variously inclined to the ecliptic. De Chales Astron. Reform. lib. X. c. 1. f. 353. &c.

EPICYCLOID, in geometry, denotes a curve generated by the revolution of a point of the periphery of a circle, along the convex, or concave part of another circle.

A point of the circumference of a circle, proceeding along a plane, in a right line, and at the same time revolving on its centre, describes a *cycloid*.

And the generating circle, if in lieu of moving on a right line, it move along the circumference of another circle, whether equal or unequal, the curve described by any point in its circumference is called an *epicycloid*.

If the generating circle proceed along the convexity of the periphery, it is called an *upper*, or *exterior epicycloid*: if along the concavity, a *lower*, or *interior epicycloid*.

In an *epicycloid*, the part of the circle, the generating point moves along, is called the *base of the epicycloid*: thus in Tab. Geom. fig. 58. DB is the base of the *epicycloid*, V its vertex; VB its axis; DPV half of the *exterior epicycloid*, made by the revolution of the semi-circle VLB, (which is called the *generant*) along the convex side of the base, DB: as DPU is the *interior epicycloid*, formed by the generant's revolving along the concave side of the base.

The length of any part of the curve, which any given point in the revolving circle has described, from the time it touched the circle whereon it revolved, is to double the versed sine of half the arch which all that time touched the quiescent circle, as the sum of the diameters of the circles, to the semi-diameter of the quiescent circle: provided the revolving circle moves upon the convex side of the quiescent circle; but, if upon the concave side, as the difference of the diameters, to the semi-diameter.

Dr. Halley gives us a general proposition for the measuring of all *cycloids* and *epicycloids*; thus: the area of a *cycloid*, or *epicycloid*, either primary, or contracted, or prolate, is to the area of the generating circle; and also the area's of the parts, generated in those curves, to the area's of analogous segments of the circle: as the sum of double the velocity of the centre, and velocity of the circular motion, to the velocity of the circular motion. The demonstration hereof, see in Phil. Transact. N^o. 218.

EPIDEMIA, **ΕΠΙΔΗΜΙΑ**, in antiquity, feasts of Apollo at Delphos, and Miletus; and of Diana at Argos.

These feasts bore the name *epidemia*, (from *ἐπι*, in, and *δημος*, people) by reason those gods were imagined to be present on those days among the people. Accordingly, on the last day of the *epidemia*, they sang a hymn, called *ἐπιδημιακός* to bid them adieu, and set them forward on their journey.

As those gods could not be every where, and yet were honoured in abundance of different places; there were times allowed them to pass from one place to another to receive the vows of their adorers. See Scaliger, Poet. lib. III. c. 114.

EPIDEMIC*, **ΕΠΙΔΗΜΙΟΣ**, denotes a general, or spreading disorder, as a plague, arising from some corruption, or malignity in the air, which seizes great numbers of people in a little time.

* The word is Greek, formed of *ἐπι* and *δημος*, *populus*, people: such diseases running among all kinds of people, of whatever age, sex, quality, &c. as arising from a common or general cause.

The Latins call them *populares morbi*, popular diseases; in opposition to those called *sporadici*, which are only here and there, as arising from private, or particular causes. See **SPORADIC**.

EPIDERMIS*, in anatomy, the cuticle, or scarf-skin.

* The word is formed of the Greek, *ἐπι*, on, over, and *δερμα*, skin.

Some hold the *epidermis* to be formed of the excrements of the *derma*, or true skin: Hippocrates is of opinion, it is engendered by cold; as, on blood, broth, or the like, when cold, we see a pellicle formed.

But it is now past doubt, that it is produced at the same time, and after the same manner, with the other parts: it being found in foetus of all ages, in the womb: it has neither veins, arteries, nor nerves: whence it is insensible.

EPIDIDYMIS *, in anatomy, a little, round body, on the back of each testicle; called also *parastata*. See **PARASTATA**.

* The word is formed of the Greek, *επι, upon*, and *διδυμις, twin, testicle*.

EPIGASTRIC Region, is a name given to the upper part of the abdomen; reaching from the cartilago xiphoides, almost to the navel.

It is usually divided into three parts: the sides or lateral parts, called *hypocondria*; and the middle, the *epigastrium*.

There are also two *epigastric* veins, and as many arteries.

The arteries are branches of the iliac external arteries: the veins discharge themselves into the iliac external veins.—See *Tab. Anat. (Angeiol) fig. 1. n° 57. fig. 6. n° 3.*

EPIGASTRIUM *, **ΕΠΙΓΑΣΤΡΙΟΝ**, in anatomy, the middle part of the *epigastric* region.

* The word is formed of the Greek, *επι, upon*, and *γαστηρ, belly*.

EPIGLOTTIS *, **ΕΠΙΓΛΩΤΤΙΣ**, in anatomy, the cover, or lid of the larynx.

* The word is formed of *επι, upon*, and *γλωσσα, or γλωττις, tongue*.

The *epiglottis* is a thin, moveable cartilage, made in form of a leaf of ivy, or a little tongue, and therefore likewise called *Lingula*; serving to cover the cleft, or rima of the larynx, called *glottis*.

Galen takes the *epiglottis* to be the principal organ, or instrument, of voice; serving to vary, modulate, and render it harmonious.

Its base, which is pretty broad, is in the upper part of the cartilago scutiformis, and its point, or tip, turned towards the palate. It is only shut by the weight of the piece in swallowing; but not so exactly, but that a crum, or a drop, sometimes escapes through into the trachea.

EPIGRAM *, in poetry, a short poem, or composition in verse, treating of one only thing, and ending with some point, or lively, ingenious thought.

* The word is formed of the Greek, *επιγραμα, inscription*, of *επιγραφω, to inscribe*, or *write upon*.

Epigrams, then, originally signify *inscriptions*, and they derive their origin from those inscriptions placed by the ancients on their tombs, statues, temples, triumphal arches, &c. See **INSCRIPTION**.

These, at first, were only simple monograms; afterwards, increasing their length, they made them in verse, to be the more easily retained: Herodotus, and others, have preserved us several of them.

Such little poems retained the name of *epigrams*, even after the design of their first institution was varied, and people began to use them for the relating of little facts, and accidents, the characterizing of persons, &c.

The Greeks confine their *epigrams* to a very narrow compass: for though, in the anthology, we here and there meet with a very long one; yet ordinarily, they do not exceed six, or at most, eight verses. The Latins were not always so scrupulous, and the moderns much less, as to these bounds.

M. le Brun, in the preface to his *epigrams*, defines an *epigram* a little poem, susceptible of all kinds of subjects, and ending with a lively, just, and unexpected thought: which are three qualifications essential to the *epigram*; particularly the first and last of them, *viz.* brevity, and the point, or close of the *epigram*.

To attain brevity, only one thing is to be aimed at in the poem, and that to be pursued in the concise terms possible. Authors are much divided, as to the length the *epigram* is to be confined to: the ordinary limits are from two to twenty verses; though we have instances, both among the ancients, and moderns, where they extend to fifty. But still it is allowed that the shorter the better, and more perfect, as it partakes more of the nature and character of this kind of poem. The point or turn is a quality much insisted on by the critics, who require the *epigram* constantly to close with something poignant, and unexpected, to which all the rest of the composition is only preparatory. Others there are, who exclude the point, and require the thought to be equally diffused throughout the whole poem, without laying the whole stress on the close: the former is usually Martial's practice, and the latter that of Catullus. Which is the most beautiful and perfect manner, is disputed by a third class of critics.

The Greek *epigrams* have scarce any thing of the point, or briskness of the Latin ones: those collected in the anthology, have most of them a remarkable air of ease and simplicity, attended with something just and witty: such as we find in a sensible peasant, or a child that has wit. They have nothing that bites, but something that tickles. Though they want the salt of Martial, yet to a good taste they are not insipid; except a few of them, which are quite flat and spiritless. However, the general faintness, and delicacy of the pleantry in them, has given occasion for a *Greek epigram*, or *epigram a la Greque*, to denote among the French, an *epigram* void of salt or sharpness.

It is principally the point that characterizes the *epigram*, and distinguishes it from the madrigal. See **POINT**.

VOL. I.

In the modern versification, as observed by Fa. Mourgues, the *epigram* and madrigal, are distinguished by the number of verses, and the close. 1°. By the number of verses, which in the modern *epigram* does not go beyond eight, nor in the modern madrigal, comes short of six: and, 2°. In that the close, or period of the *epigram*, has always something more lively and studied than that of the madrigal.

The *epigram* is the lowest, and least considerable of all the productions of poetry; and it is in general rather an effect of good luck, than of art, to succeed therein. The fineness, and subtlety of the *epigram*, M. Boileau observes, should turn on the words, rather than the thought; which seems very little to the credit of this kind of composition, as it reduces it to the nature of the pun, or equivoque. Fa. Bohours confirms the hint, in adding, that the equivoque is what usually shines the most in the *epigram*.

One great beauty of the *epigram*, is to leave something for the reader to guess, or supply. Nothing pleases the mind so much, as to find something of it self in the objects presented it; nor does any thing disgust it more than to preclude it from shewing and exercising a faculty it values it self for. Segrais.

M. B. L. M. the author of a new collection of French *epigrams*, in the year 1720, has a deal of good observations on the nature of *epigram*. He defines it an ingenious thought delivered in a few verses; and conceives it as a general name, including under it diverse kinds of short, lively poeies, as the *sonnet, rondelay, madrigal*, and little *tales* which only turn on some merry thought. Epitaphs and inscriptions, he thinks, may be also reduced to the head of *epigrams*.

The *epigram* admits of great variety of subjects: some are made to praise, and others to satyryze, which last are much the easiest; ill nature serving instead of point and wit. Boileau's *epigrams*, are all satyrs on one or another. Those of des Reaux, are all made in honour of his friends. And those of Mad. Scudery, are so many eulogies. The *epigram* being only a single thought, it would be ridiculous to express it in a great number of verses; it must have its unity like the drama. The comedy has an action for its subject; and the *epigram* a thought.

EPIGRAPHE *, **ΕΠΙΓΡΑΦΗ**, an inscription on a building; to signify its use, occasion, the time when, and the persons by whom, it was built.

* The word is Greek, and signifies *supercription*.

EPILEPSY *, **ΕΠΙΛΗΨΙΑ**, in medicine, a convulsion, either of the whole body, or of some of its parts; attended with a deprivation of the senses and understanding; and returning from time to time in fits, or paroxysms.

* The word is formed of the Greek, *επιλαμβάνω, I surprize, seize hold of one*, by reason the disease seizes and overcomes the senses, so that the patient seems as if dead.

In English it is usually called the *falling sickness*, by reason people fall down when attacked therewith. The Latins call it *comitialis morbus*, by reason when any body was seized therewith in a comitia, or assembly of the Roman people, they presently broke up the assembly, as deeming it an unhappy preface.

Some call it the *morbus sacer*, as supposing it sent by way of immediate punishment from God. Others, *morbus caducus*, others *Herculeus, sonitus, lues deifica*, &c.

The patient seized herewith, falls instantly and suddenly down; or, rather, as it were throws and precipitates himself violently to the ground. When down, he grinds his teeth, foams at mouth, and frequently shakes his head; his arms, legs, neck, back, &c. either becoming rigid, or variously distorted. And as all the parts are in a violent contraction, there is frequently an involuntary flux of urine, feed, and fecal matter. After some time he returns to himself; only retaining a head-ach, heaviness, weariness of the limbs, &c.

Etmuller more accurately distinguishes the disease into three degrees: the first, or lowest, is much the same with the highest degree of a vertigo.

In the second, there arise various agitations and gesticulations; and the senses, both external and internal, either remaining, or being transported into a delirium, they dance, sing, laugh, weep, talk idly, shreek, and beat their breasts. Sometimes they remember all after the fit is over, and sometimes nothing at all of what has passed.

In the third degree, which alone is ordinarily called the *epilepsy*, they lose the use both of reason and sense; fall, or fling themselves down, foam, grind their teeth, and bite their lips, with the other circumstances above related. Those affected with the second degree, have been often supposed to be possessed by the devil.

The cause of this disease, Boerhaave attributes to too much action of the brain on the motory nerves, and none on the sensitive ones. Some are pleased to account for it, from the abundance of sharp humours mixing with the animal spirits, and giving them extraordinary and irregular motions, and directions; whence arises its distinction from a syncope, and apoplexy, which take away all motion as well as sense. See **SYNCOPE**, and **APOPLEXY**.

The *epilepsy* is either *idiopathic*, or *sympathetic*: it is *idiopathic*, when it arises merely from a disorder of the brain, or spirits: and *sympathetic*, when it is preceded by some other disease which brings it on.

The *epilepsy* sometimes hangs many years to a person, without much danger: though when its paroxysms return fast, it renders the patient more or less paralytic, delirious, or stupid. In young people there is hopes of its going off about the time of puberty. Hippocrates observes, that when it seizes a person after 25 years of age, it lasts for life; but this does not always hold.

The cure of a confirmed *epilepsy* is very difficult: the principal anti-epileptics are, the roots of peony, leaves of lily of the valley, seeds of rue, mistletoe of the oak, or hazle, box-wood, spirit of black cherries, spirit of human blood, human fecundines, human cranium, tooth of the sea-horse, castoreum, peacocks dung, camphor, and the salt, and oil of amber.

To recover a person in a fit, tobacco smoke, or that of burnt feathers, is recommended. Barbette above all things directs the flowers and spirits of sal ammoniac against this disease; Crato, native cinnabar. Sir John Colbatch has an express treatise on the mistletoe of the oak, to shew it a specific in this disease. Elks claws have long had the reputation of the same. See each remedy, its pretensions, &c. under its proper term, as *MISTLETOE*, *ELKS CLAWS*, &c.

M. Poupert, from a dissection of an *epileptic* person, wherein, immediately under the dura mater, was found a deal of white, thick, viscid, pituita, glued, and, as it were, incorporated with the membrane; thinks, that this might be the cause of the disease; the excessive quantity of such thick lymph, loading the brain, and obstructing its necessary motions. The first cause, he judges, might be the sponginess of the dura mater, which imbibed the ferocities of the brain.

He adds, that he knew an *epileptic* person, who, upon the first approach of his disorder, rub'd his forehead with his hand, and bent his head as far backward as he cou'd, resting it against a wall; and by that means secured himself against the convulsion. It is probable, that by this he gave a motion to the lymph, and drove it from the place which before it disturbed.

EPILOGUE *, *ΕΠΙΛΟΓΟΣ*, in oratory, &c. The peroration, or last part of a discourse, or treatise; containing ordinarily a recapitulation of the principal matters delivered.

* The word is Greek, *επιλογος*, formed of the verb *επιλογω*, I lay after, the *epilogue* being the end, or conclusion of a discourse.

EPILOGUE, in dramatic poetry, is a speech addressed to the audience, when the play is over, by one of the principal persons, or actors therein; containing usually some reflections on certain incidents in the play, particularly those of the part of the person who speaks it.

In the modern tragedy, the *epilogue* has usually somewhat of pleasantry in it; intended, we suppose, to compose the passions raised in the course of the representation, and send away the audience in good humour: though how far that design is good and laudable, will bear some dispute: an ingenious author in the Spectator, compares it to a merry jig on the organ, after a good sermon, to wipe away any impressions that might have been made thereby, and send the people away just as they came.

In effect, though the *epilogue*, in this sense, may seem an abuse; yet has it the countenance of antiquity: the Romans had something of the same nature, though under another name. Their exodium was a kind of farce, brought on the stage when the tragedy was over; *ut quicquid lacrymarum ac tristitiae cepissent ex tragicis affectibus, hujus speliaculi risus detergeret*, says the scholiast of Juvenal.

The *epilogue* is but of modern date, much later than the prologue. Many, indeed, have taken the exodium of the ancient Greek drama, for an *epilogue*; by reason Aristotle defines it, to be a part rehearsed after the chorus had sung for the last time; but in reality, it was of a quite different nature. The exodium was the last of the four parts of the tragedy; containing the unravelling and catastrophe of the plot, and answering to our last, or fifth act.

EPINICION *, *ΕΠΙΝΙΚΙΟΝ*, in the Greek and Latin poetry, denotes, 1^o. A feast, ceremony, or rejoicing, on occasion of a victory obtained. 2^o. A poem, or composition, on the same subject.—Scaliger treats expressly of the *epinician* in his poetics, l. I. c. 44.

* The word is formed from the Greek, *επι, on*, and *νικη, victory*.

EPIPHANY, in ecclesiastical antiquity, the feast of kings; A double festival, of the first rank, solemnized on the 6th of January, in honour of the appearance of Jesus Christ to the three kings, or Magi, who came to adore, and bring him presents.

The feast of *epiphany*, now held in honour of the adoration of the magi, had, its first institution among the Greeks, from a different object, viz. our Saviour's birth; and was called *theophany*, and *epiphany*, that is, appearance, and manifestation of God.

Pope Julius, who reigned from the year 337, to 352, was the first who taught the church to distinguish the feasts of the nativity, and *epiphany*. *Papbroch. paral. ad Const. p. 23. Act. SS. Maii. T. VII.*

The word in the original Greek, *επιφανεα*, signifies *appearance*, or *apparition*; and was applied, as some critics will have it, to this feast, on account of the star which appeared to the Magi.—St. Jerom. and St. Chrysostom, take the *epiphany* for the day of our Saviour's baptism, when he was declared to men by the voice, *hic est filius meus dilectus, in quo mihi complacuit*: this is my beloved Son, in whom I am well pleased. And accordingly it is still observed by the Coptics and Ethiopians in that view. See Ludolph. *Hist. Ethiop. Lib. XXI. c. 2.*—Others contend, that the feast of Christmas, or the nativity of our Saviour, was held in diverse churches on this day; which had the denomination *epiphany*, or *apparition*, by reason of our Saviour's first appearance on earth, as at that time. And it must be allowed, that the word is used among the ancient Greek fathers, not for the appearance of the star to the Magi, but for that of our Saviour to the world. In which sense, St. Paul uses the word *epiphania*, in his second epistle to Timothy, c. i. v. 10.

Add, that the Armenians, to this day, celebrate the feast of the nativity, on the day of *epiphany*, according to the practices of the ancient church; which some Romish missionaries have impudently censured them for, not knowing that the *epiphany*, originally, and properly, was the nativity of our Saviour. Ammianus Marcellinus makes mention of this feast, *Lib. XXI. c. 2.* and observes that it was held in January. Upon which passage, Valefius in his notes, endeavours to shew, that the historian meant by *epiphany*, the feast of the nativity.

The heathen writers used the word *epiphania* in the like sense, viz. to express the appearance of their Gods on earth. And the christians, after their example, applied it, in the general, to express any appearance, or manifestation of the deity.

EPIPHONEMA, *ΕΠΙΦΩΝΗΜΑ*, in rhetoric, a sententious sort of exclamation, which is frequently added after a narrative, or rehearsal of any thing remarkable; containing, usually, a lively, close reflection, on the subject there spoken of. Such is that of St. Paul, when, after discoursing of the rejection of the Jews, and the vocation of the Gentiles, he cries out.

Oh the depth of the wisdom and knowledge of God!

Such also is that of Lucretius, after relating the story of Agamemnon's sacrificing his daughter Iphigenia:

Tantum religio potuit suadere malorum!

Such, lastly, is that of Virgil, upon occasion of Juno's persecuting Æneas:

—Tantene animis cœlestibus ira!

Which M. Boileau has imitated in,

Tant de fiel entre t'il en l'ame des devots!

And Mr. Pope in,

And dwells such rage in softest bosoms then?

And lodge such daring souls in little men?

EPIPHORA *, *ΕΠΙΦΩΡΑ*, in medicine, a disease of the eyes; consisting in a preternatural distension of rheum, or the matter of tears; accompanied, frequently, with heat, redness, and twitching.

* The word is Greek, formed of *επιφωρεω, inferre*, to draw, or bring into; by reason of the pain it occasions.

Pitcairn calls it a *catarrh of the glands of the eye*. See *CATARH*.

The internal causes of the *epiphora*, or rheum in the eyes, are a relaxation of the glands of the eyes, and a too great acrimony, or sharpness of the serous humour separated thereby; which fretting and vellicating the eye, draws an unusual quantity of blood and lymph thereto; by which, at length, the cheek becomes excoriated, &c.—Children are most liable to it, from the frequent use and straining of the glands of the eye in crying.

The external causes of the *epiphora*, are sharp duffs, streams, &c. entering the eye, and irritating the same. Also a too cold and sharp air has frequently the like effect.—An inveterate *epiphora* often degenerates into a fistula lacrymalis.

The cure of the *epiphora*, is, 1^o. by causing a revulsion, or derivation of the peccant humour, to some other part, as by venæsection, cupping, blistering, or cathartics. 2^o. By correcting its acrimony by proper remedies. And, 3^o. By applying astringents externally. Lapis calaminaris is much commended.

EPIPHYSIS *, *ΕΠΙΦΥΣΙΣ*, in anatomy, a lesser bone adhering, or growing to another, by simple contiguity.

* The word is formed of the Greek, *επι, on*, upon, and *φυσις, to grow, adire*: The Latins call it *appendix, adiacentia, adhaescentia*, &c.

The substance of the *epiphyses* is rare and lax; in young children it is merely cartilaginous; but hardens as they grow in age, and, at length, becomes quite bony.

It is commonly laid down, that there is no regular articulation

tion between the *epiphyses* and the bone; though it is certain, that there is a reciprocal admission of the heads, or extremities of each, into the cavities of the other. See *ARTICULATION*.

There are some bones that have no *epiphyses* at all, as the lower jaw: others have no less than five, as the vertebrae. The design of adding *epiphyses* to bones, was, to supply their defects, and render them longer and bigger at the extremities.

EPIPHYSES *vermiformes*, are two eminences of the cerebellum, shaped like worms, which keep open the passage from the third, to the fourth ventricle.

In dilating the third ventricle of the brain, we perceive four eminences, two upper and bigger, called *orbicular protuberances*; and two lower and less, called *epiphyses* of the orbicular protuberances. *Dionis*.

EPIPLASMA, the same with *cataplasma*. See *CATAPLASM*.

EPIPOCELE, ΕΠΙΠΟΚΗΛΗ, in medicine, a kind of hernia, or tumor, occasioned by the descent of the epiploon, or caul, into the scrotum. See *HERNIA*, and *ENTERO-Epiplocele*.

EPIPOIC, or *EPIPOID*, a term applied to the arteries and veins, distributed through the substance of the *epiploon*, or caul.—See *Tab. Anat. Angiol.* fig. 1. n. 37. See also *EPIPOON*, and *GASTREPIPOON*.

EPIPOIS Dextra, is a branch of the celiac artery, which runs through the right side of the inner, or hinder leaf of the caul.

EPIPOIS Postica, is a branch of the celiac artery, springing out of the lower end of the spleen, and running to the hinder leaf of the caul.

EPIPOIS Sinistra, is a branch of the celiac artery, which is bestowed on the lower and left side of the caul.

EPIPLOMPHALUS *, or *EPIPLOMPHALON*, ΕΠΙΠΛΟΜΦΑΛΟΝ, in medicine, a species of exomphalus, or navel-rupture; being a tumor or swelling of the part, occasioned by the epiploon's falling into it. See *EXOMPHALUS*, and *ENTERO-EPIPLOMPHALUS*.

* The word is compounded of the Greek, *επιπλοον*, caul, and *μφαλ*, navel.

EPIPOON *, in anatomy, a fatty membrane, spread over the intestines, and entering even into the several sinuosities thereof; called also the *omentum*, and popularly the *caul*. See *OMENTUM*.

* The word is formed of the Greek, *επιπλων*, to swim upon, by reason it seems to float on the intestines.

EPIPOSARCOMPHALUS *, in medicine, a sort of tumor, of the exomphalus kind. It is formed of the epiploon, and the flesh. See *EXOMPHALUS*.

* The word is compounded of the three Greek words, *επιπλοον*, epiploon, *σαρξ*, flesh, and *μφαλ*, umbilicus, navel.

EPIPOCACY, the quality of episcopal government, or that form of church discipline, wherein diocesan bishops are established, distinct from and superior to, priests or presbyters. See *BISHOP*, *EPISCOPAL*, *EPISCOPALIAN*, and *HIERARCHY*.

Episcopacy and *presbytery*, have been alternately established and abolished in Scotland.

EPIPOCACIDE, the crime of murdering a bishop by one of his own clergy.—By the ancient laws of England, the same obedience is due from a clergyman to his bishop, as from a child to his father: and therefore the offences of *episcopicide* and parricide, are made equal, that is, they are both petty-treason.

EPIPOCAL *, something that belongs to a bishop.

* The word is formed of the Greek, *επισκοπος*, overseer, derived from *επισκοπεω*, *inspicio*, I inspect, or overlook.

Episcopal government, is the government of a diocese, wherein one single person, legally consecrated, presides over the clergy of a whole district, in quality of head, or superintendent thereof; conferring orders, and exercising a sort of jurisdiction.

The Presbyterians reject the *episcopal* establishment, and condemn the *episcopal* order as a human institution, the mere result of pride, and ambition.

Among the *episcopal* functions, the principal is that of holding frequent visitations of the diocese.

EPIPOCALIA, is sometimes used in the same sense with *pontificalia*. See *PONTIFICALIA*.

EPIPOCALIA, is also used to denote synodals, or customary payments, due to the bishops from the clergy of their diocese; called also *onus episcopale*.

EPIPOCALIANS, a name given to those who adhere to the church of England, and particularly to the ecclesiastical hierarchy, such as it was in the Romish church before the reformation; who affect the discipline of bishops, priests, canons, the office, or liturgy, &c. and retain the greatest part of the canon law, with the decretals of the popes, more closely than the catholics themselves of several countries. Though, as to matters of doctrine, or faith, they agree in most points with the calvinists, or reformed. In Scotland, the principal dissenters are the *episcopalian*s: lay

*episcopalian*s enjoy all the same civil privileges with those of the established church. They are under no restrictions; tied to no tests; but are employed in all places of trust, upon taking the oaths to the government. But the *episcopal* ministers are liable to several penal laws; the greatest part of them being nonjurors.

EPISCOPI multa. See the article *MULTA*.

EPISCOPUS puerorum, *bishop of the boys*; a ludicrous kind of office, formerly exercised in churches, in that called the *feast of fools*, or the feast of the kalends.

The custom was for some youth in the feast of epiphany to plait his hair, that he might seem to have the tonsure, and to put on episcopal garments; and then to exercise a shew of jurisdiction, and do several ludicrous actions: for which reason he was called the *bishop of the boys*. This custom obtained among us, long after several constitutions were made to abolish it. See *INNOCENTS-DAY*. See diverse curious particulars concerning this *episcopus puerorum*, in John Gregory's *Posthumous Works*; or, for want of that, in the *Antiquities of the Cathedral Church of Salisbury*, p. 71.

EPISODE *, ΕΠΙΕΣΟΔΙΟΝ, is commonly conceived to be a separate incident, story, or action, which an historian, or poet, inserts and connects with his principal action; to furnish out the work with a greater diversity of events: though, in strictness, all the particular incidents, whereof the action or narration is composed, are called *episodes*.

* The word is formed from the Greek, *επι*, upon, and *εσος*, entry, ingress, entry.

EPISODE, in dramatic poetry, was the second part of the ancient tragedy.

The origin and use of *episodes* is described by M. Hedelin, and F. Boffu. Tragedy, in its original, being only a hymn, sung in honour of Bacchus, by several persons, who made a kind of chorus, or concert of music, with dancing, and the like; to diversify the representation a little, and divert the audience, they bethought themselves at length to divide the singing of the chorus into several parts; and to have something rehearsed in the intervals.

At first, a single person, or actor, was introduced, then two, then more; and what the actors thus rehearsed, or entertained the audience withal, being something foreign, or additional to, or beside, the song of the chorus, and no necessary part thereof, was called *Επισοδιον*, *episode*.

And hence tragedy came to consist of four parts, the *prologue*, *episode*, *exode*, and *chorus*.

The *prologue* was all that preceded the first entrance of the chorus.

The *episode*, all that was interposed between the singings of the chorus.

The *exode*, all that was rehearsed after the chorus had done singing.

And the *chorus*, was the grex, or company that sung the hymn.

And as this recitation of the actors was in several parts, and inserted in several places; it might either be considered together, as a single *episode*, consisting of several parts; or each part might be called a distinct *episode*.

These several *episodes* in the same tragedy might either be taken from so many different subjects; or from the same subject divided into a proper number of recitations, or incidents.

To consider only the first occasion, and institution, of these foreign, or additional pieces; it appears no ways necessary that they should all be taken from one and the same subject; three or four recitations of different actions, no-wise related, or connected to each other, would ease the actors, and amuse the people, in the intervals of the chorus, as well as if they were all so many parts of the same action. By degrees, what was at first only an addition to the tragedy, became the principal part thereof. Then, the several pieces, or *episodes*, began to be considered as one single body, which was not to have parts, or members of different nature, and independent of each other.

The best poets took the thing in this light, and drew all their *episodes* from the same action; which practice was so fully established in Aristotle's time, that he lays it down as a rule. Those tragedies wherein this unity and connection was not observed, he calls *episodic pieces*.

EPISODE in epic poetry. The term *episode*, by being transplanted from the stage to the *epopeia*, did not change its nature. All the difference Aristotle makes between the tragic and epic *episodes*, is, that the latter are more ample than the former.

Aristotle uses the word in three different senses: the first taken from the enumeration already made, of the parts of the tragedy, viz. *prologue*, *chorus*, *episode*, and *exode*. Whence it follows, that in tragedy, every thing is *episode* that is none of the other parts: so that as among us, there are tragedies without either *prologue*, *chorus*, or *epilogue*, the *episode* includes the whole tragedy: consequently, the *episode* is the

must be the whole poem, in like manner. All there is to retrench from its being the proposition, and invocation, which stand in lieu of the prologue. In this sense, the *epopœia* and tragedy, have each only one *episode*; and if the parts or incidents, be ill connected together, the poem will be *episodic* and defective. But further, as all that was sung in the tragedy, was called the *chorus*, in the singular number; yet this singularity did by no means prevent every part or division of the same from being called a *chorus*, without making several *chorus's*: so it was with the *episode*: each incident, and part of the fable and action, is not only a part of the *episode*, but is an *episode* itself.

The term *episode*, therefore in this sense, signifies every part of the action expressed in the plan, or first draught of the fable; as the absence and wanderings of Ulysses, the disorders in his family, and his preference which retrieved and set all to rights again.

Aristotle furnishes us with a third kind of *episode*; in shewing, that what is contained and expressed in the first plan of the fable is proper, and that all the rest is *episode*.

By *proper*, he means what is absolutely necessary; and by *episode* what in one sense is necessary, and in another not; so that the poet is at liberty to use, or let it alone.

Thus, Homer, having made the first draught of the fable of his odyssey, was not at liberty either to make Ulysses absent from his country, or not. His absence was essential; and therefore Aristotle ranks it among the things he calls *proper*. But he does not bestow that appellation on the adventures of Antiphate, Circe, the Syrens, Scylla, Charybdis, &c. The poet was at liberty to have left these alone, and to have chosen others in their room; so that they are *episodes*, distinct from the first action, to which they are not immediately necessary. Indeed, in one sense, they may be said to be necessary; for Ulysses's absence being necessary, it follows, that not being in his own country, he must be somewhere else. If therefore the poet was at liberty, not to have used those particular adventures above mentioned; yet he was not at liberty not to have used any: But if he had omitted those, he must necessarily have substituted others in their room. On the whole, he would have omitted a part of the matter contained in his plan, and his poem would have been defective.

This third sense, therefore, of the word *episode*, comes to the second: all the difference between them, is, that what we call *episode*, in the second sense, is the ground, or plan of the *episode*, in the third: and that the third adds to the second, certain circumstances which are only probable, and not necessary, as the places, princes, and people, among whom Ulysses was cast by Neptune.

It must be added, that in an *episode* in the third sense, the incident, or *episode* in the first sense, whereon it is grounded, is to be extended and amplified; otherwise, an essential part of the action and fable, does not become an *episode*.

Lastly, it is in this third sense that we are to understand that precept of Aristotle, not to make the *episodes*, till after the names of the persons have been chosen. Homer would not have spoke of the fleet and ships as he has done; if, in lieu of the names of Achilles, Agamemnon, and Iliad, he had chose those of Adrastus, Capaneus, and Thebaid.

Upon the whole, the term *episode*, in the epic poem, as used by the father of the critics, Aristotle, does not signify any foreign, or accidental adventure; but the whole narration of the poet, or a necessary and essential part of the action and subject, amplified with probable circumstances.

Thus, Aristotle enjoins, that the *episode* be not added to the action, or fetched from elsewhere; but that it be a part of the action; and never uses the word *adding*, in speaking of *episodes*, though it occurred so naturally to his interpreters that they have generally used it in their translations and comments. He does not say, that after laying the plan, and chusing the names, the poet is to add the *episodes*; but uses a derivative of the word *episode*, ἐπεισόδω, as if in English we should say, *episode* his action.

Add, that to shew the different extension of tragedy and *epopœia*, that is, how the one becomes longer than the other; he does not say, that there is but little *episode* in tragedy; but more accurately, that the *episodes* of tragedy are short and concise; whereas the *epopœia* is lengthened out and extended by them. In one word, the taking vengeance of the wicked people in Ulysses's court, as expressed in a few words by Aristotle, in his plan of the odyssey, is a simple proper action, necessary to the subject. It is no *episode*, but the basis, and, as it were, flamen of an *episode*. And this same punishment explained and opened, with all the circumstances of time, place, and persons, is no simple and proper action, but an action *episodified*, or a real *episode*; which, though at the discretion of the poet, is yet necessary and proper to the subject.

From what has been said, we may venture to define *episodes* to be necessary parts of the action, extended and filled up with probable circumstances. Now, an *episode* is only a part of an action; and not a whole action. And this part of the action,

which is the basis, or ground of the *episode*, must not, when *episodified*, retain any thing of the simplicity which it had when first expressed in general, in the plan of the fable.

Aristotle rehearsing the parts of the plan of the Odyssee, says expressly, that they are proper; and by that, distinguishes them from *episodes*. Thus, in the Oedipus of Sophocles, the ceasing of the plague at Thebes is no *episode*. It is only the ground and matter of an *episode*, which the poet might have used, had he pleased. And Aristotle, observing that Homer, in the Iliad, had taken but few things for his subject, but that he had used abundance of his *episodes*, intimates, that the subject contains in it self abundance of *episodes*, which the poet may use, or let alone, at pleasure. That is, it contains the grounds, or flamina thereof, which may either be left in their general and simple brevity, as Seneca has done the ceasing of the plague; or may be extended and unfolded, as the same author has done the punishment of Oedipus.

The subject of a poem may be lengthened two ways: either, by the poets making use of a great many of his *episodes*; or by his amplifying, and giving a great extent to every one. By this latter method, chiefly, it is, that the epic poets lengthen their poems much beyond the dramatic. It must be added, that there are certain parts of an action, which, of themselves, do not naturally present or afford more than one *episode*; such as the death of Hector, of Turnus, or the like: whereas, there are other parts of the fable more copious and fertile, and which oblige the poet to make diverse *episodes* on each; though laid down in the first plan, with as much simplicity as the rest: such are the battles of the Trojans and Grecians; the absence of Ulysses; the wanderings of Aeneas, &c. For Ulysses's absence so many years from his own country, required his presence elsewhere; and the design of the fable was to throw him into several dangers, and different countries. Now each peril, and each new country, furnished an *episode*, which the poet might use if he pleased.

The result of the whole is, that *episodes* are not actions, but parts of actions; that they are not added to the action and matter of the poem, but what makes the action and matter themselves, as the members make the body: that, of course, they are not to be fetched from elsewhere, but raised from the ground, or basis of the action: that they are not united, and connected with the action, but with one another: that all the parts of an action are not so many *episodes*, but only such as are amplified, and extended with particular circumstances: and, lastly, that their union with each other, is necessary in the ground of the *episode*, and probable in the circumstances thereof.

EPISODIC, in poetry. A fable is said to be *EPISODIC*, when it is swelled with unnecessary incidents; and its *episodes* are not necessarily, nor properly connected with each other.

Aristotle lays it down, that those tragedies are most defective, whose *episodes* have no connection, or dependance, on each other; which he calls *episodic*, q. d. *superabundant in episodes*; by reason so many little *episodes* can never compose one whole one; but necessarily remain in a vicious plurality.

The most simple actions are most subject to this irregularity; in that, having fewer incidents and fewer parts than others, they afford less matter. An unwary poet will sometimes have consumed his whole stock in the first, or second time that his actors appear between the chorus: and be driven to a necessity of looking out for other actions, to supply the remaining intervals. Arist. Poet. c. 9.

The first French poets did the like: To fill each act, they took so many different actions of a hero; which had no other connection between them, but that they were done by the same person. Bossu, p. 106.

If an *episode* be used, the names and circumstances whereof are unnecessary, and whose ground and subject makes no part of the action, that is of the matter of the poem; such an *episode* renders the fable *episodic*. This irregularity is discovered, when one may take away a whole *episode*, without substituting anything in its room; and yet leave no chasm, or defect in the poem. The history of Hyppolyte; in Statius's Thebaid, affords an instance of these faulty *episodes*. If the whole story of that illustrious nurse were retrenched, the sequel of the principal action would be the better for it. Nor would any body imagine he had forgot any thing, or that there was any member of his action wanting. Bossu.

EPISPASTIC*, in medicine, a remedy, which being externally applied, draws or attracts some humour to the part; called also an *attractivum*.

* The word is Greek, formed of *επι*, and *σπασω*, *traho*, I draw.

Of *epispastics*, there are some which act very gently, and others with a deal of violence. Those of the latter kind swell, and bloat the skin, make it red, and even raise blisters thereon. See VESICATORY.

The principal simple *epispastics* are pellitory, garlic, mustard, onions, yeast, goose-dung, and that of pigeons, and cantharides. A blister plaster is now commonly denoted by the name of an *Epispastic*.

EPISTATES *, **ΕΠΙΣΤΑΤΗΣ**, in antiquity, a person who has the command and direction of an affair, or of a people.

* The word is derived from the Greek, *ἐπι*, *super*, over, and *στατης*, *stas*, I stand.

The term is of considerable use, in speaking of the ancient government of Athens; where the *epistates* was the senator in command for that day, or whose turn it was to preside that day. The constitution was this: the ten tribes of Athens, elected every year by lot, each of them fifty senators; which made a senate of five hundred. Every tribe had the precedence in its turn, and surrendered it again, successively, to another. The fifty senators in office were called *prytanes*; the particular place where they assembled *prytaneum*; and the term, or duration, of their office, *viz.* thirty-five days, *prytanea*. During these thirty-five days, ten of the fifty *prytanes*, presided weekly, under the name of *proedri*. And of these *proedri*, there was one to preside each day of the week, under the title of *epistates*. No person was allowed to hold this office more than once in his whole life; lest he should fall too much into the taste of dominion. The senators of all the other tribes still voted, according to the order the lot had given them; but the *prytanes* alone convened the assemblies; the *proedri* laid the business before them; and the *epistates* took their votes and opinions. It must be added, that of the ten *proedri*, of each week, there were but seven that would preside, each his day, in quality of *epistates*. The ten *proedri* elected the seven *prytanes*.

EPISTEMONARCH *, a dignitary in the ancient Greek church, appointed to watch over the doctrines of the church; and to inspect, or superintend every thing relating to the faith, in quality of a censor thereof. His office answered pretty much to that of *magister sacri palatii* at Rome.

* The word is derived from the Greek, *ἐπιστημον*, science, knowledge, and *αρχη*, command, precedence.

EPISTLE *, **ΕΠΙΣΤΟΛΗ**, a letter missive.

* The word is formed of the Greek, *ἐπιστella*, *mitto*, I send.

The term *epistle* is now scarce used, but for letters wrote in verse; and letters dedicatory.

In speaking of letters written by moderns, or rather in the modern languages, we never use the word *epistle*. Thus, we say, the letters, not *epistles*, of the cardinal d'Ossat; of Voiture, of Balzac, of Howel, of Pope, &c. But those wrote by the ancients, or rather in the ancient languages, we call *epistles*: as the *epistles*, not letters, of Cicero, Pliny, Seneca, Busbequius, Launoy, &c. of St. Augustine, St. Jerome, &c. The *epistles* of St. Paul, St. Peter, St. John, &c. to the Romans, Corinthians, &c.

James Altingius wrote 5000 letters, of which a few only are published in Bayle, in *viz.*—Druidus, belidæ Hebrew, Greek, French, English, and Flemish letters, received 2300 in Latin; where were found among his papers. *Curand. in Vit. p. 11.* See **LETTER**.

EPISTOLARY, a term chiefly used in the phrase, *epistolary style*.

EPISTOLARY is, sometimes, also applied to authors who have wrote *epistles*, or letters. The principal *epistolary* authors, are Sidorius Apollinaris, Tully, the younger Pliny, Seneca the philosopher, Petrarck, Politian, Busbequius, Erasmus, Lipsius, Muretus, Ascham, Milton, Petau, Launoy, Sarau, Balzac, and Voiture.

EPISTOMIUM, **ΕΠΙΣΤΟΜΙΟΝ**, in hydraulics, a plug, or instrument, by the application whereof, the orifice of a vessel may be opened, and shut again at pleasure.

EPISTROPHEUS, in anatomy, (from *ἐπιστρέφω*, *convertio*, I turn about) the same with *cardo*.

EPISTYLE *, **ΕΠΙΣΤΥΛΙΟΝ**, in the ancient architecture, a term used by the Greeks, for what we call *architrave*, *viz.* a massive of stone, or a piece of wood, laid immediately over the capital of a column.

* The word is derived from the Greek, *ἐπι*, *super*, upon, and *στυλ*, *column*.

The *epistyle* is the first, or lowest member of the entablature. See **ENTABLATURE**.

EPIGRAPH *, **ΕΠΙΓΡΑΦΗ**, a monumental inscription, in honour, or memory of a person deceased; or an inscription engraven, or cut, on a tomb, to mark the time of a person's decease, his name, family, and usually some eulogy of his virtues, or good qualities.

* The word comes from *ἐπι*, *upon*, and *γραφω*, *sepulchre*.

The style of *epitaphs*, especially those composed in Latin, is singular.

At Sparta, *epitaphs* were only allowed to people who died in battle. Boethius has made a collection of *epitaphs*, not very ample, but exceedingly well chosen. Fa. Labbe, has likewise given a collection of the like kind, in French; entitled, *trezor des epitaphes*. Camden and Weaver, have done something in the same way in our English *epitaphs*. An *epitaph* is said to be yet wanting to the duke of Marlborough's monument; though a premium of 500 pounds was offered by his dowager, to him that should compose one worthy of the hero deceased.

Vol. I.

In *epitaphs*, the dead person is sometimes introduced, by way of propoem, speaking to the living; of which we have a fine instance, worthy the Augustan age; wherein the dead wife thus bespeaks her surviving husband.

Immatura peris: sed tu felicior, annos

Vive tuos, conjux optime, vive meos.

The French have a proverb, *menteur comme une epitaph*: he lyes like an *epitaph*; in allusion to the eulogies ordinarily contained therein, which are not always over just.

EPIGRAPH, is also applied to certain eulogies, either in prose or verse, composed without any intent to be engraven on tombs.

In the anthologies, or collections of epigrams, we have abundance of such *epitaphs*; some of them ludicrous and satirical: others grave.—For a specimen, we shall here add a very beautiful one, composed by Mr. Cowley, on himself, to be put on a little country-house, whither he retreated from the court and town, to spend his last days.

Hic, O viator, sub late parvulo,

Couletus hic est conditus, hic jacet

Defunctus humani laboris

Sorte, supervacuus; vita;

Non indecora pauperie nitens,

Et non inerti nobilis otio,

Vanus; dilectis popello,

Divitiis, animosus hostis.

Possit ut illum cære mortuum,

et terra jam nunc quantula sufficit?

Exempta sit caris, viator,

Terra sit illa levis, precare.

Hic sorge flores, sparge breves rosas;

Nam vita gaudet mortua floribus;

Haribisq; ulcratis corona

Vatis adhuc cinerem calcitem.

EPISTASIS *, in the ancient poetry, denoted the second part, or division of a dramatic poem; wherein, the plot, or action proposed, and entered upon in the first part or protasis, was carried on, heightened, warmed, and worked up, till it arrived at its state, or height, called the *catastasis*.

* The word is pure Greek, *ἐπιστασις*, formed of *ἐπισταω*, *intendo*, I heighten.

This division is laid aside in the modern drama; in lieu whereof, our plays are divided into acts. See **ACT**.

The *epistasis* might, ordinarily, take up about our second or third act.

EPISTASIS, **ΕΠΙΣΤΑΣΙΣ**, in medicine, denotes the increase, or growth, and heightening of a disease; or the beginning of a paroxysm, particularly in a fever.

EPIPHALAMUM *, **ΕΠΙΘΑΛΑΜΙΟΝ**, in poetry, a nuptial song; or a composition, usually in verse, on occasion of a marriage between two persons of eminence.

* The word is formed of *ἐπι*, and *θαλαμ*, *bride-chamber*.

The topics it chiefly insists on, are the praises of matrimony, and of the married couple; with the pomp and order of the marriage solemnity: it concludes, with prayers to the gods for their prosperity, their happy offspring, &c.—Catullus exceeded all antiquity, in his *epithalamiums*; and the cavalier Marino, all the moderns.

EPITHEM *, **ΕΠΙΘΗΜΑ**, in pharmacy, a kind of fomentation, or remedy of a spirituous, or aromatic kind; applied externally to the regions of the heart, liver, &c. to strengthen and comfort the same, or to correct some intemperature thereof.

* The word is formed from the Greek, *ἐπι*, *upon*, and *τιθημι*, *pono*, I put.

There are two kinds of *epithems*; the one *liquid*, the other *solid*: the *liquid epithem* is a fomentation of a more spirituous nature than the rest; the *solid*, is usually a mixture of conserves, theriaca, confectious, and cordial powders, generally spread on a piece of scarlet, or leather.

EPIPHET *, **ΕΠΙΘΗΤΟΝ**, a noun adjective, expressing some quality of a substantive to which it is joined.

* The word is formed of *ἐπι*, *upon*, and *θεσις*, *positio*, putting.

As, a fruitful vine, a stately pile, an echoing vault, &c. *Epithets*, are engines of mighty use, and convenience among the poets, and orators; who supply in *epithets*, what they want in things. Card. Peron even blames Homer on the head of *epithets*; observing, that he frequently hooks in *epithets*, without any sense, or significancy at all, to help out his measures; and that he equips every hero with an *epithet*, not according to the exigence of the case, but the measure of the verse.

EPIPHET, is also used for a surname, or a person's second appellation.

Epithets, were anciently bestowed very frankly, either on account of any defects of the body, or mind: kings themselves, were not exempted from them: Hence, those *epithets* so frequent in history; as Henry Long-shanks, Edward Iron-sides, Richard Crook-back, John Lack-land, &c.

Nor have the French used their kings any better: witness their Charles the simple, Louis the lazy, *sainant*, (Ludovicus nihil faciens;) Pepin the short; Louis the flammer; *le hogue*.

EPITHYME, ΕΠΙΘΥΜΟΝ, *Dodder of Thyme*, a medicinal plant, of a very extraordinary nature, and figure. Its seed is very small, from which arise long threads like hairs, which soon perish, as well as the root, unless they meet with some neighbouring plant, both to sustain and feed them.

The *cuscuta*, in English called *dodder*, grows indifferently on all kinds of herbs; and, of consequence, the kinds thereof are infinite: to which writers usually attribute the particular virtues of the plants they grow on.

The most known of these plants, and those most used in medicine, are such as grow on thyme; which are the proper *epithymes*; and those on flax. There are two kinds in the shops; the one from Venice, the other from Candia: they have both an aromatic taste, but that of Venice has the strongest. Their use is to strengthen the parts, and prevent obstructions of the viscera, &c.

EPITOME *, an *abridgment*; or a reduction of the principal matters of a larger book, into a little compals.

* The word is Greek, ἐπιτομή, formed of ἐπιτείνω, *reftcare*, to retrench, abridge, or cut off.

The *epitome* of Baronius's annals is done by de Sponde (Spondanus) Bernier has given an *epitome* of the philosophy of Galfendus.

It is a popular objection against the *epitomizing* of authors, that it frequently occasions the loss of the originals. Thus the loss of the historian Trogus Pompeius, is attributed to his epitomizer Justin; and the loss of a great part of Livy to Lu. Florus.

EPITRITUS, in prosody, a foot consisting of four syllables; three long and one short.

Grammarians reckon four species of *epitrites*: the first consisting of an iambus and spondee: as Σάββατον. The second of a trochee and spondee: as Ἐκκλησίαν. The third of a spondee and an iambus: as Κομμουνισμός. And the fourth of a spondee and trochee: as Ἰνδιάνη.

EPITROPE, in rhetoric, a figure of speech, by the Latins called *conceffio*; whereby the orator grants something which he might deny; that, by this shew of impartiality, it may be more easily granted which he requires, in his turn.

This figure is frequently invidious; "Let them extol his probity; I acquiesce and am ready to be silent: but when they propose him for a pattern of wit, my spleen is raised," &c.

EPITROPUS, a kind of judge, or rather an arbitrator, which the Greek Christians, under the dominion of the Turks, elect, in the several cities, to terminate the differences that arise among them; and avoid carrying them before the Turkish magistrates.

There are several *epitropi* in each city: M. Spon, in his travels, observes, that at Athens there are eight, taken out of the several parishes, and called *vecchiardi*, i. e. old men. But Athens is not the only place where there are *epitropi*: they are in all the islands of the Archipelago.

Some Latin authors of the Vth century, call *epitropi*, those who more anciently were called *villici*, and since *vidames*.

In times still earlier, the Greeks used the term ἐπιτροπός, in the same sense as the Latins did *procurator*, viz. for a commissioner, or intendant.

Thus the commissioners of provisions in the Persian army, are called by Herodotus, and Xenophon, *epitropi*: in the New Testament, ἐπιτροπός, denotes the steward of a household, rendered in the vulgate, *procurator*.

EPLOYE, in heraldry. An eagle ΕΡΛΟΥΕ, is what in English we more usually call an *eagle displayed*, or a *spread eagle*.

EPOCH *, in chronology, a term, or fixed point of time, whence the succeeding years are numbered, or accounted.

* The word is Greek, ἐποχή, q. d. *inhibitio*, *repressio*, formed of ἐπιτείνω, *reftcare*, stop; by reason the *epoch* defines, or limits a certain space of time.

Different *epoch*'s, obtain in different nations; and no wonder: for there being no astronomical confederation to render one preferable to another, their constitution is purely arbitrary. That principally regarded among Christians, is the *epoch* of the *nativity*, or incarnation of Jesus Christ; that of the mahometans, the *hegira*; that of the Jews, &c. the *creation of the world*; that of the ancient Greeks, the *olympiads*; that of the Romans, the *building of the city*; that of the ancient Persians and Assyrians, the *epoch* of Nabonassar, &c.

The doctrine and use of *epoch*'s, is of very great extent in chronology.

To reduce the years of one *epoch* to those of another, i. e. to find what year of one, corresponds to a given year of another; a period of years has been invented, which com-

mencing before all the known *epoch*'s, is, as it were, a common receptacle of them all, called the *Julian period*. To this period all the *epoch*'s are reduced; i. e. the year of this period, whereon each *epoch* commences, is determined. All that remains therefore, is to add the given year of one *epoch*, to the year of the period corresponding with its rise; and from the same to subtract the year of the same period corresponding to the other *epoch*. The remainder is the year of that other *epoch*.

EPOCH of Christ, or of our Lord, is the *vulgar epoch* throughout Europe; commencing from our Saviour's nativity, December 25; or rather, according to the usual account, from his circumcision, that is from the first of January; but particularly in England, from the incarnation, or annunciation of the blessed virgin, on the 25th of March; nine months prior to the nativity.

Now, the year of the Julian period whereon Christ was born, and circumcised, is usually computed to be the year 4713, consequently, the first year of the æra of Christ, corresponds to the year 4714 of the Julian period.

Hence, 1°. If to any given year of Christ, you add 4713, the sum will be the year of the Julian period corresponding thereto. E. gr. if to the year 1725, be added 4713, the sum 6438, is that year of the Julian period.

2°. On the contrary, subtracting 4713, from any given year of the Julian period, the remainder is the current year of Christ; e. gr. from the year of the Julian period 6438, subtracting 4713, the remainder is the year of Christ 1725.

In effect, the *epoch* of our Lord, serves not only for the computation of the years elapsed since the *epoch* commenced; but even of those before it.

Now, to find the year of the Julian period, corresponding to a given year before Christ; subtract the given year from 4714; the remainder is the correspondent year required. Thus, e. gr. the year before Christ 752, is the year 3956 of the Julian period. On the contrary, subtracting the year of the Julian period from 4714, the remainder is the year before Christ.

The author of the *vulgar epoch*, or way of computing from Christ, is an abbot of Rome, one Dionysius Exiguus, by nation a Scythian; who flourished under Justinian, about the year 507: though this Dionysius borrowed the hint from Pannodorus an Egyptian monk. Till his time, the generality of Christians computed their years, either from the building of Rome, or according to the order of the emperors and consuls, and the other ways in use with the people they lived among.

This diversity occasioning a great distraction between the churches of the east and west; Dionysius, to compose the same, first proposed a new form of the year, with a new general æra, which in a few years time was generally admitted.

Dionysius began his account from the conception, or incarnation, by us popularly called *lady-day*, or the *annunciation*: which method still obtains in the dominions of Great-Britain, and there only; so that the Dionysian, and English *epoch*, is the same. In the other countries of Europe, they reckon from the first of January; except in the court of Rome, where the *epoch* of the incarnation still obtains for the date of their bulls.

It must be added, that this *epoch* of Dionysius is charged with a mistake: the common opinion is, that it places our Saviour's nativity a year too late; or, that he was born the winter preceding the time prescribed by Dionysius for his conception.

But, the truth is, the fault lies on Beda, who misinterpreted Dionysius, and whose interpretation we follow; as has been shewn by Petavius, from Dionysius's own epistles. For Dionysius began his cycle from the year of the Julian period 4712; but his *epoch* from the year 4713, wherein the *vulgar æra* supposes Christ to have been incarnate.

The year, therefore, which according to the *vulgar epoch* is the first year of Christ; according to Dionysius's æra, is the second. So that the year, which we call 1749, should, in justice, be 1750. Though some chronologers, instead of one year, will have the error two.

To this *vulgar æra*, as a sure, fixed point, chronologers use to reduce all the other *epoch*'s: though there is not one of them but what is controverted: so much uncertainty there is in the doctrine of time. We shall exhibit them as reduced to the Julian period.

EPOCH of the creation, *orbis conditi*, according to the computation of the Jews, called also the *Jewish epoch*, is the year of the Julian period 953; answering to the year before Christ 3761; and commencing on the seventh day of October.

Hence, subtracting 952 years from any given year of the Julian period, the remainder is the year of the Jewish *epoch*

correct-

corresponding thereto. Thus, *e. gr.* the year 1725 being the 6438th year of the Julian period; it is the 5486th year of the Jewish *epocha*, or since the creation of the world.

This *epocha* is still in use among the Jews.

The *Epocha of the creation*, used by the Greek historians, is the year before the Julian period 787; answering to the year before Christ 5500.

Hence, to any given year of the Julian period, adding 787; the sum gives the year of this *epocha*. *E. gr.* 6438 being the year 1725 of the Julian period; 7390 is that year of this *epocha*, or the age of the world, according to this computation.

The author of this *epocha*, is Julius Africanus, who collected it from the historians. But when it came to be admitted into civil use, 8 years were added to it; that so every year thereof divided by 15, might exhibit the indiction, which the eastern emperors used in their charters and diplomas.

The *epocha of the creation* used by the later Greeks, and Russians, is the year 795, before the Julian period; or the year 5509 before Christ; commencing from the 1st day of September. Though the Russians, having lately admitted the Julian calendar, begin their year from the 1st of January.

Hence, adding 795, to the year of the Julian period, the sum gives the year of this *epocha*. Thus, *e. gr.* the Julian period of the year 1725 being 6438; that year of this *epocha*, i. e. the years from the creation, on this footing, are 7233. Again, from that year 7233, subtracting 5508; the remainder is the year of the common *era* 1725.

This *era* was used by the emperors of the east, in their diplomas, &c. And thence also called the *civil era of the Greeks*. In reality, it is the same with the *epocha* of the Constantinopolitan period; whence some call it the *epocha of the period of Constantinople*.

The *Alexandrian Epocha of the creation*, is the year 780, before the Julian period; answering to the year before Christ 5494; and commencing on the 29th day of August.

Hence, adding 5493, to the year of Christ 1725; the sum, 7218, gives that year of this *epocha*: or years elapsed since the creation, according to this computation.

This *epocha* was first concerted by Panodorus, a monk of Egypt, to facilitate the computation of Easter; whence, some call it, the *Greek ecclesiastical epocha*.

The *Eusebian Epocha of the creation*, is the year of the Julian period 486; answering to the year before Christ 4228; and commencing in autumn.

Hence, subtracting 486, from the Julian period of the year 6438; or adding 4228 to the year of Christ, 1725 the result 5953, will be that year of this *epocha*.

This *epocha* is used in Eusebius's chronicon, and the Roman martyrology.

Epocha of the olympiads, is the year of the Julian period 3938; answering to the year 776, before Christ, and the year 2985 from the creation; commencing at the full moon next the summer solstice; and each olympiad containing four years.

This *epocha* is very famous in ancient history: it was used principally by the Greeks, and had its origin from the olympic games, which were celebrated at the beginning of every fifth year.

Epocha of the building of Rome, or urbis condita, U. C. is the year of the Julian period 3961, according to Varro; or 3962, according to the Fasti Capitolini; answering to the years before Christ 753, or 752, and beginning on the 21st of April. Hence, if the years of this *epocha* be fewer than 754, subtracting them from 754, or 753; you have the year before Christ. And, on the contrary, if they be more than 745, adding them to the same, the sum is the number of years since Christ. Lastly, adding the year before Christ, to 753, or 752; the sum will give the year of this *epocha*, or the time since the building of Rome. Thus, *e. gr.* the year 1725, according to Varro, is the year of Rome 2488.

Epocha of Nabonassar, is the year of the Julian period 3967; answering to the year before Christ 747; commencing on the 26th day of February.

This *era* takes its denomination from its institutor, Nabonassar king of Babylon; and is that used by Ptolemy in his astronomical observations, by Censorinus and others.

Dionysian Epocha, or *Epocha of martyrs*, is the year of the Julian period 4997; answering to the year of Christ 283; called the *era of martyrs* from the great number of christians, who suffered martyrdom under the reign of that emperor.

The Abyssinians, among whom it is still used in all ecclesiastical computations, call it the *year of grace*. Though they do not reckon their years in a continued series from this *epocha*. But when the Dionysian period of 534 years is expired, they begin their computation afresh from 1, 2, &c.

Epocha of the hejira, or *Mahometan Epocha*, is the year of the Julian period 5335 answering to the year of Christ 622. It commences on the 16th of July, the day of Mahomet's flight from Mecca to Medina.

This *epocha* is used by the Turks and Arabs, and even all who profess the Mahometan faith: it was first introduced by Omar,

the third emperor of the Turks. The Astronomers, Alfraganus, Albategnius, Alphonfus, and Ulugh Beigh, refer Mahomet's flight to the 15th of July; but all the people who use the *epocha*, agree to fix it on the 16th: See *HEGIRA*.

Epocha of the Selucida, which is used by the Macedonians, is the year of the Julian period 4402; answering to the year before Christ 312. See *SELUCIDA*.

Yezdegerdic, or *Perjian Epocha*, is the year of the Julian period 3545; answering to the year of Christ 632, and commencing on the 16th of June.

This *epocha* is taken from the death of Yezdegerdis, the last king of Persia, slain in battle by the Saracens.

Julian Epocha, or *Epocha of Julian years*, is the year of the Julian period 4668; answering to the year before Christ 45.

This *epocha* had its origin from the year of the reformation of the calendar under Julius Caesar; called the *year of confusion*.

Gregorian Epocha. See *GREGORIAN*.

Spanish Epocha, is the year of the Julian period 4676; answering to the year before Christ 38. See *RAA*.

Atiac, or *Asian Epocha*, is the year of the Julian period 4684, answering to the year before Christ 30. Commencing on the 29th day of August.

Other memorable *epochas* are, that of the deluge, in the year of the creation 1656; that of the birth of Abraham in 2039: the Israelites exodus or departure out of Egypt, in 2544: the building of the temple of Jerusalem, in 2023: and the destruction of the same in the year of Christ 70: the taking of Constantinople by the Turks, in 1453, &c.

EPODE, ΕΠΟΔΟΣ, in lyric poetry, the third or last part, of the ode; the ancient ode, or song, being divided into strophe, antistrophe, and epode.

The epode was sung by the priests standing still before the altar, after all the turns and returns of the strophe, and antistrophe.

The epode was not confined to any precise number, or kind of verses; as the strophe and antistrophe were. — But when the ode contained several epodes, strophes, &c. they were all alike.

As the word epode, then, properly signifies the end of the song; and as in odes, what they called the epode, finished the singing: it became customary, as M. Dacier shews, for any little verse, which being put after another, closed the period; and finished the sense which had been suspended in the first verse, to be called epode, ΕΠΟΔΟΣ.

And hence it is, that the VIth book of Horace's odes is entitled *Liber Epodon*, book of epodes; by reason the verses thereof are all alternately long and short; and that the short one, generally, though not always, closes the sense of the long one.

But the signification of the word is extended still further; epode being become a general name for all kind of short verses, that follow one or more long ones, of what kind soever they be: and, in this sense, a pentameter is an epode, after an hexameter, which in respect thereof is a pro-ode.

EPOMIS *, ΕΠΟΜΙΣ, in anatomy, the upper part of the shoulder, reaching up to the neck.

* The word is Greek, ΕΠΟΜΙΣ; where it primarily signifies a short cloak or mantle made to cover the shoulders.

Some authors apply the word *epomis* to the upper part of the os humeri: but the ancient Greek physicians only use it for the muscular, or fleshy part, placed as abovementioned.

EPOPOEIA, ΕΠΟΠΟΙΑ, in poetry, the history, action, or fable, that makes the subject of an epic poem.

* The word is derived from the Greek, ΕΠΟΙΕ, carmen, verse; and ποιεω, facio, I make.

In the common use of the word, however, *epopoeia* is the same with *epos*, or epic poem it self: in which sense it is defined, a discourse invented with art, or a fable agreeably imitated from some important action, and related in verse, in a probable and surprising manner; with a view to form the manners; &c. See *EPIC POEM*.

EPULO, in antiquity, the name of a minister of sacrifice among the Romans.

The pontifices not being able to attend all the sacrifices performed at Rome, to so many Gods, as were adored by that people; appointed three ministers, whom they called *epulones*, by reason they conferred on them the care and management of the *epula*, feasts in the solemn games and festivals.

To them belonged the ordering and serving the sacred banquet, offered on such occasions to Jupiter, &c. They wore a gown bordered with purple, like the pontifices. Their number was at length augmented from three to seven, and afterwards by Cæsar to ten.

Their first establishment was in the year of Rome 558, under the consulate of L. Furius Purpureo, and M. Claudius Marcellus.

EPULOTICS *, ΕΠΟΥΛΩΤΙΚΑ, in medicine, drying, astringent remedies, proper to harden, cicatrize, and incarnate wounds, and ulcers.

* The word is formed of the Greek, επι, super, and ανω, cicatrix, eschar. Whence the verb, επουλω, cicatricem infuso, I cicatrize.

Such are emplasters of cerus, and diapsalma; the unguent of pompholyx, &c.

EPULUM, in antiquity, *banquet*; a holy feast prepared for the gods.

The statues of the gods were commonly laid upon a bed, and served in the *epula* as if they had been very hungry; to perform which, was the function of the ministers of factice, hence called *epulenes*.

EQUABLE Motion, is that whereby the moveable body proceeds with the same continued velocity; neither accelerated nor retarded.

EQUABLE Pulse. } See the articles { **PULSE**.
EQUABLE Style. }

EQUAL, a term of relation between two or more things of the same magnitude, quantity, or quality.

Wolffius defines *equal* to be those things which may be substituted for each other, without any alteration of their quantity. It is an axiom in geometry, that two things which are *equal* to the same third, are also *equal* to each other. And again, if to, or from *equal*s, you add or subtract *equal*s, the remainder will be *equal*.

EQUAL Circles, in geometry, are those whose diameters are equal. See **CIRCLE**.

EQUAL Angles, are those whose sides are inclined alike to each other; or which are measured by similar arches of their circles.

EQUAL Arches. See the article **ARCH**.

EQUAL Figures, are those whose area's are equal; whether the figures be similar, or not.

The segments of a sphere, or circle, are of an *equal* concavity, or convexity, when they have the same ratio, or proportion to the diameters of the spheres, or circles whereof they are parts.

EQUAL Solids, are those which comprehend, or contain each as much as the other; or whose solidities, or capacities are *equal*. See **SOLID**.

EQUAL Hyperbola's, are those all whose ordinates to their indeterminate axes, are *equal* to each other; taken at *equal* distances from their vertices.

EQUAL Numbers } See the articles { **NUMBER**.
EQUAL Hours } **HOURLY**.

EQUAL geometrical ratio's, are those whose least terms are similar, aliquot, or aliquant parts of the greater.

EQUAL arithmetical ratio's, are those wherein the difference of the two last terms, is equal to the difference of the two greater. See **RATIO**.

EQUAL, in optics.—We say, that things seen under *equal* angles, are *equal*. *Equal* parts of the same interval, or magnitude, if unequally distant from the eye, appear unequal.—*Equal* objects, and at *equal* distances, only the one placed directly, and the other obliquely, seem unequal; and that placed directly, the bigger.

Masonry by EQUAL courses. See **MASONRY**.

EQUALITY, in astronomy. *Circle of EQUALITY*, or the **EQUANT**, is a circle used in the Ptolemaic astronomy, to account for the eccentricity of the planets, and reduce them more easily to a calculus. See **EQUANT**.

Ratio, or Proportion of EQUALITY, in geometry, is that between two equal numbers, or quantities.

Proportion of EQUALITY evenly ranged, or *ex æquo ordinata*, is that wherein two terms in a rank, or series, are proportional to as many terms in another series, compared to each other in the same order, *i. e.* the first of one rank to the first of another; the second to the second, &c.

Proportion of EQUALITY evenly distributed, called also *ex æquo perturbate*, is that wherein more than two terms of a rank, are as proportional to as many terms of another rank, compared to each other, in a different and interrupted order; *viz.* the first of one rank to the second of another; the second to the third, &c.

EQUALITY, in algebra, is a comparison of two quantities, that are equal both really, and representatively, *i. e.* which are so both in effect and letters.

A comparison of two quantities, equal in effect, but unequal in letters, to render them equal; is called an *equation*.

Equality, in algebra, is usually denoted by two parallel lines, as $a = 2$, thus, $2 + 2 = 4$, *i. e.* 2 plus 2, are equal to 4. This character was first introduced by Harriot. Des Cartes, and some after him in lieu thereof use \propto : thus, $2 + 2 \propto 4$, so $z - y = b + c$, signifies that z minus y , is equal to b plus c .

From an equation we arrive at an *equality*, by changing an unknown letter into another, whereby the two members of the equation, *i. e.* the two quantities compared together, and connected by the sign of *equality*, are rendered equal. See **EQUATION**.

Thus, in the equation $ax = bcd$; supposing $x = \frac{bcd}{a}$, we change x into $\frac{bcd}{a}$, and by this substitution arrive at the equality $bcd = bcd$.

In the solution of a numerical problem which is to be rendered rational; if there be only one power to be equal to a square, or other higher power; it is called *simple equality*.

When there are two powers to be equal, each to a square, it is called *double equality*, &c.

Diophantus hath given us a method for *double equalities*, and Fa. de Billy, another for *triple equalities*, in his *Diophantus Redivivus*.

Union of EQUALITY. See the article **UNION**.

EQUANT, or **ÆQUANT**, in astronomy, a circle, imagined by astronomers, in the plane of the deferent, or eccentric; for the regulating, and adjusting of certain motions of the planets. See **DEFERENT**, **EXCENTRIC**, &c. See also **APOGEE**, and **CIRCLE**.

EQUATED Anomaly. See the article **ANOMALY**.

EQUATION, or **ÆQUATION**, in algebra, an expression of the same quantity, in two different, that is, dissimilar, but equal terms or denominations.

As, when we say, $2, 3 = 4 + 2$; that is twice three is equal to four and two.

Stifelius defines *equation* to be the ratio of equality between two quantities differently denominated; as when we say 3 shill. = 36 pence. Or 50 shill. = 2 lib. 10 shill. = 600 pence, = 2400 farth. Or, $b = d + c$. Or, $12 = a - p$, &c.

Hence, the reduction of two heterogeneous, or dissimilar quantities to the same value, *i. e.* to an equality, is called the *bringing them to an equation*. See **EQUALITY**.

The character, or sign of an equation, is = or \propto . The resolving of problems, by means of *equations*, is the business of algebra.

Terms of an EQUATION, are the several quantities, or parts, of which an equation is composed, connected together by the signs + and -. Thus, in the equation $b + c = d$; the terms are b, c and d . And the tenor or import of the equation is, that some quantity, represented by d , is equal to two others represented by b and c .

Root of an EQUATION, is the value of the unknown quantity in the equation. *E. gr.* if $a^2 + b^2 = x^2$; the root will be $\sqrt{a^2 + b^2}$. See **ROOTS of equations**.

Equations are divided with regard to the powers of the unknown quantities, into *simple, quadratic, cubic*, &c.

Simple EQUATION, is that wherein the unknown quantity is only of one dimension, or in the first power. As, $x = (a + b) : 2$.

Quadratic EQUATION, is that wherein the unknown quantity is of two dimensions, or in the second power. As, $x^2 = a^2 + b^2$. See **QUADRATIC equation**.

Cubic EQUATION, is that wherein the unknown quantity is of three dimensions. As $x^3 = a^3 - b^3$, &c. See **CUBIC Equation**. If the unknown quantity be of four dimensions, as $x^4 = a^4 - b^4$, the equation is called a *biquadratic*; if of 5, a *surdsolid*, &c.

Equations are considered two ways: either, as the ultimate conclusions we arrive at in the solution of problems; or as means by the help whereof, we arrive at those final solutions.

An *Equation of the first kind*, consists only of one unknown quantity, which is intermixed with other known quantities. Those of the latter kind, consist of several unknown quantities, which are to be compared, and connected together, till out of them all arise a new equation, wherein there is but one unknown quantity, mixed with the known. To get the value of which unknown quantity, the equation is generally turned, and transformed various ways, till it be brought as low, and rendered as simple as possible.

The doctrine and practice of *equations*, that is, the solution of questions by equations, consists of several steps, or parts, *viz.* 1^o. The denominating of the several quantities, or expressing them in proper signs, or symbols. 2^o. The bringing the quantities thus denoted to an equation. 3^o. The reducing that equation to its lowest and simplest terms. To which, 4^o. may be adding the constructing of the equation, or representing it in geometrical lines.

With regard to the first; a question, or problem, being proposed; we conceive the thing sought, or required, as already done; and accordingly note, or express it by one of the vowels, as a , or more usually, by one of the last letters of the alphabet, x, y , or z ; noting the other known quantities, by the consonants, or the beginning letters of the alphabet, b, c, d , &c.

The question being thus stated in species; it is considered whether, or no, it be subject to any restrictions, *i. e.* whether it be determinate, or no: which is found by these rules.

1^o. If the quantities sought, or required, be more than the number of equations given, or contained in the question; it is indeterminate, and capable of innumerable solutions. The equations are found, if they be not expressly contained in the problem it self, by the theorems of the equality of quantities.

2^o. If the equations given, or contained in the problem, be just

just equal in number with the unknown quantities; the question is determinate, or admits but of a limited number of answers.

3°. If the unknown quantities be fewer than the given equations, the question is yet more limited, and sometimes it discovers it self impossible, by some contradiction between the equations.

Now, to bring a question to an EQUATION, that is, to bring the several mediate equations, to one final one; the principal thing to be attended to, is to express all the conditions thereof, by so many equations. In order to which, it is to be considered, whether the propositions, or sentences, wherein it is expressed, be all of them fit to be noted in algebraic terms; as our conceptions use to be in Latin, or Greek characters. And if so, as is generally the case in questions about numbers, or abstract quantities; then let names be given both to the known and unknown quantities, as far as occasion requires: and thus the drift of the question will be couched, as we may call it, in the algebraical language: and the condition, thus translated to algebraic terms, will give as many equations as are necessary to solve it. — To illustrate this by an instance: suppose it required to find three numbers, in continual proportion, whose sum is 20, and the sum of their squares 140; putting x, y, z , for the names of the three numbers sought, the question will be translated out of the verbal to the symbolical expression, thus:

The question in words.
Required three numbers, on these conditions,
That they be continually proportional
That the sum be 20.
And the sum of their squares 140.
Thus, is the question brought to these equations, viz. $xz=yy$, $x+y+z=20$, and $xx+yy+zz=140$, by the help whereof, x, y , and z , are to be found, by the rules already laid down.
The solutions of questions are, for the most part, so much the more expedite and artificial, by how much the unknown quantities, you have at first, are the fewer. Thus, in the question proposed, putting x for the first number, and y for the second, $\frac{yy}{x}$ will be the third continual proportional; which being put for the third number, bring the question into equations as follows:

The question in words.
There are sought three numbers in continual proportion,
Whose sum is 20.
And the sum of their squares 140.

You have therefore the equations $x+y+\frac{yy}{x}=20$, and $xx+yy+\frac{y^4}{xx}=140$, by the reduction whereof, x and y are to be determined.

Take another example: a merchant increases his estate annually by one third part, abating 100 *l.* which he spends yearly in his family; and after three years he finds his estate doubled. *Query*, What is he worth? — To resolve this, it must be observed, that there are (or lie hid) several propositions, which are all thus found out and laid down.

In words.
A merchant has an estate
Out of which the first year he spends 100 *l.*
And augments the rest by one third.
And the second year he spends 100 *l.*
And augments the rest by one third.
And so the third year he spends 100 *l.*
And by the rest gains likewise one third.
And he becomes at length twice as rich as at first.

Therefore the question is brought to this equation, $64x-14800=2x$, by the reduction whereof you will find the value of x .

VOL. I.

Viz. Multiply it into 27, and you have $64x-14800=2x$; subtract $2x$, and there remains $10x-14800=0$, or $10x=14800$; and dividing by 10, you have $x=1480$. So that the value of his estate at first was 1480 *l.*

It appears then, that to the solution of questions about numbers, or the relations of abstract quantities; there is scarce any thing more required, but to translate them out of the common, into the algebraic language, i. e. into characters, proper to express our ideas of the relations of quantities. Indeed, it may sometimes happen, that the language wherein the question is stated, may seem unfit to be rendered into the algebraic; though by making a few alterations therein, and attending to the sense, rather than the found of the words, the translation becomes easy enough. The difficulty here results merely from the difference of idioms, which is as observable between most languages as between the common and symbolical. However, to render the solution of such problems a little more easy and familiar, we shall add an example or two thereof.

1°. Given, the sum of two numbers a , and the difference of their squares b ; to find the numbers themselves. Suppose the lesser, x ; the other will be $a-x$; and their squares xx and $aa-2ax+xx$: whose difference, $aa-2ax$ is called b . Consequently, $aa-2ax=b$. Whence, by reduction,

$$aa-b=2ax; \text{ or } \frac{aa-b}{2a} = x = \frac{1}{2} \frac{aa-b}{a} = x.$$

E. gr. Suppose the sum of the numbers, or a , to be 8, and the difference of their squares, or b , 16: then will,

$$\frac{1}{2} \frac{a^2-b}{a} = \frac{1}{2} \frac{64-16}{8} = 3 = x. \text{ And } a-x=5. \text{ Therefore the numbers are 3 and 5.}$$

2°. To find three quantities x, y , and z , the sum of each pair whereof is given. Suppose the sum of the pair x and y be a ; that of x and z , b ; and that of y and z , c . To determine the three numbers required, x, y , and z ; we have three equations $x+y=a$; $x+z=b$; and $y+z=c$: now, to exterminate two of the unknown quantities, e. gr. y and z ; take away x , both from the first and second equations; and we shall have $y=a-x$ and $z=b-x$. Which values being substituted for y and z in the third equation; there will arise $a-x+b-x=c$; and by reduction $x=\frac{a+b-c}{2}$. Having found x , the former equations, $y=a-x$ and $z=b-x$ will give y and z .

Thus, e. gr. if the sum of the pair x and y be 9; of x and z , 10; and of y and z , 13: then, in the value xy , and z , write 9 for a , 10 for b , and 13 for c ; and you will have $a+b-c=6$; and consequently $x=\frac{a+b-c}{2}=3$, $y=(a-x)=6$, and $z=(b-x)=7$.

3°. To divide a given quantity into any number of parts, so as that the greater parts shall exceed the least by any given differences. Suppose a to be a quantity which is to be divided into four such parts, the first and smallest whereof is x ; the excess of the second part above this, b , of the third, c , and the fourth, d : then will $x+b$ be the second part, $x+c$ the third, and $x+d$ the fourth: the aggregate of all which $4x+b+c+d$ is equal to the whole line a . Now, taking away from each, $b+c+d$, and there remains $4x=a-b-c-d$, or $x=\frac{a-b-c-d}{4}$.

4. Suppose, e. gr. a line of 20 feet, to be divided into 4 parts, in such manner, as that the excess of the second above the first may be 2 feet, of the third, 3 feet, and of the fourth 7 feet. Then the four parts will be x ($=\frac{a-b-c-d}{4}$ or $\frac{20-2-3-7}{4}$) $=2$, $x+b=4$, $x+c=5$, and $x+d=9$. And after the same manner, may a quantity be divided into a greater number of parts on the like conditions.

4°. A person disposed to distribute a little money among some beggars; wants eight pence, of three pence for each of them: he therefore gives them two pence a-piece, and has three pence left: the number of beggars is required. Let the number of beggars be called x ; and the person want 8 pence of giving them all 3 pence. Consequently he has $3x-8$; out of which he gives 2 pence; and the remaining pence $x-6$ are 3. That is $x-8=3$ or $x=11$.

5°. The power or strength of one agent being given; to determine how many such agents will produce a given effect a , in a given time b . Suppose the power of the agent such, as that it may produce the effect c , in the time d ; then, as the time d , is to the time b , so is the effect c , which the agent can produce in the time d , to the effect it can produce in the time b , which accordingly will be $\frac{bc}{d}$. Then, as the effect of one agent $\frac{bc}{d}$ is to the joint effect of them all, a ; so is that one agent, to all the agents. Consequently the number of agents will be $\frac{ad}{bc}$.

Thus, *e. gr.* if a clerk, or writer, in 8 days time, transcribe 15 sheets; how many such clerks are required to transcribe 405 sheets in 9 days? *Ans.* 24. For if 8 be substituted for *d*, 15 for *c*, 405 for *a*, and 9 for *b*, the number $\frac{a \cdot d}{b \cdot c}$ will become

$$\frac{405 \times 8}{9 \times 15} \text{ that is } \frac{3240}{135} \text{ or } 24.$$

6°. The powers of several agents being given; to determine the time *x*, wherein they will jointly perform a given effect. Suppose the powers of the agents, A, B, C, such as that in the times *e*, *f*, *g*, they would produce the effects *a*, *b*, *c*, respectively: and these, in the time *x*, would produce effects $\frac{ax}{e}$, $\frac{bx}{f}$, $\frac{cx}{g}$. Consequently $\frac{ax}{e} + \frac{bx}{f} + \frac{cx}{g} = d$, and by reduction $x = \frac{a}{\frac{d}{e} + \frac{b}{f} + \frac{c}{g}}$.

Suppose, *e. gr.* that three workmen could finish a certain work in such and such times, *viz.* A once in three weeks, B thrice in eight weeks, and C five times in twelve weeks: and it is required, in what time they will finish it together? here, the powers of the agents A, B, C, are such as in the times 3, 8, and 12, respectively produce effects 1, 3, 5; and it is enquired in what time they will produce the effect, 1. For *a*, *b*, *c*, *d*, *e*, *f*, *g*, write 1, 3, 5, 1, 3, 8, 12; and there will come out $x = \frac{1}{\frac{1}{3} + \frac{1}{8} + \frac{1}{12}}$ or $\frac{24}{7}$ of a week, that is, 6

days, $\frac{6}{7}$ of an hour; the time they will finish it in together.

7°. Given, the specific gravities of a mixture, and of the several ingredients thereof; to find the proportion of the ingredients therein. Suppose *e* the specific gravity of the mixture $A+B$; *a* that of A, and *b* that of B: since the absolute gravity, or weight, is compounded of the bulk of the body, and its specific gravity; *a* A will be the weight of A; *b* B that of B; and *e* A+B the weight of the aggregate A+B. Consequently, $aA + bB = eA + eB$; and therefore $aA - eA = eB - bB$ or $a - e :: A : B$.

Thus, *e. gr.* suppose the specific gravity of gold to be as 19, that of silver as 10 $\frac{1}{2}$, and that of K. Hiero's crown as 17; then will 10. 3 :: $e - b$. $a - e :: A : B$:: the bulk of gold in the crown, to the bulk of silver: or 190. 31 :: 19 x 10. 10 $\frac{1}{2}$ x 3 :: $a \times e - b \cdot x \cdot a - e$:: the weight of the gold in the crown, to the weight of the silver, and 221. 31 :: the weight of the crown to the weight of silver.

To bring geometrical problems to EQUATIONS. — Geometrical questions, or those relating to continued quantities, are sometimes also brought to equations, after the same manner as arithmetical ones. So that the 1st rule to be here prescribed is, to observe every thing directed for the solution of numerical problems. Suppose, *e. gr.* it were required, to cut a right line, as AB, (*Tab. Algebra, fig. 6.*) in mean and extreme proportion in C; that is, so as that BE, the square of the greater part shall be equal to the rectangle BD, contained under the whole and the lesser part.

Here supposing AB = *a* and CB = *x*; then will AC = *a* - *x*; and $xx = a$ into $a - x$. An equation, which by reduction gives $x = \frac{a}{2} \pm \sqrt{\frac{a^2}{4}}$.

But it is very rare, that geometrical problems are thus brought to equation; as being generally found to depend on various complex positions, and relations of lines; so that, here, some further artifice, and certain special rules, will be required, to bring them to algebraic terms. Indeed, it is very difficult to prescribe any thing precise in such cases: every man's own genius should be the rule of his procedure.

Something, however, shall be said in the general, for the sake of such as are nothing versed in such operations, and that principally from Sir I. Newton.

Observe then, 1°. That problems concerning lines related to each other in any definite manner, may be variously stated, by supposing such or such *quæsitæ*, or things sought, to be required from such or such data: yet still, with whatever data and *quæsitæ* the question is proposed, its solution will arise after the very same manner, without the least alteration of any circumstance, except in the imaginary species of lines, or in the names whereby the data are distinguished from the *quæsitæ*.

Suppose, *e. gr.* the question were about an isosceles triangle, BCD, (*fig. 7.*) inscribed in a circle; whose sides, BC, BD, and base CD, were to be compared with the diameter of the circle AB. Here, the question may be either proposed, of the investigating of the diameter, from the given sides and base; or investigating the base, from the sides and diameter given. Or, lastly, of finding the sides, from the base and diameter given: and propose it under which form you will, it will be brought to an equation, by the same algebraic series.

Thus, if the diameter be sought, put AB = *a*, CD = *a*, and BC, or BD = *b*. Then, drawing AC, as the triangles ABC and CBE are similar; AB : BC :: BC : BE, or

$$x : b :: b : BE. \text{ Wherefore } BE = \frac{bb}{x} \text{ and } CE = \frac{1}{2} CD \text{ or } \frac{1}{2} a. \text{ And, by reason the angle CEB is a right angle,}$$

$CE^2 + BE^2 = BC^2$, that is, $\frac{1}{4} a^2 + \frac{b^2}{xx} = bb$. Which equation being reduced, gives the diameter required, *x*. Again, If the base be sought, put AB = *a*, CD = *x*, and BC, or BD = *b*. Then drawing AC, as the triangles ABC and CBE are similar; AB : BC :: BC : BE, or $c : b :: b : BE$.

Wherefore $BE = \frac{bb}{c}$. And $CE = \frac{1}{2} CD$ or $\frac{1}{2} x$. And since the angle CEB is right, $CE^2 + BE^2 = BC^2$; that is, $\frac{1}{4} x^2 + \frac{b^2}{c^2} = bb$; an equation, which reduced, gives the basis sought, *x*.

Lastly, If the side BC, or BD, were sought, put AB = *a*; CD = *a*, and BC or BD = *x*. Then drawing AC, the triangles ABC, and CBE, being similar; we have AB : BC :: BC : BE; or $c : x :: x : BE$. Wherefore, $BE = \frac{xx}{c}$. And $CE = \frac{1}{2} CD$ or $\frac{1}{2} a$; and the angle CEB being right $CE^2 + BE^2 = BC^2$. That is $\frac{1}{4} a^2 + \frac{xx^2}{c^2} = xx$. An equation, which by reduction, gives *x* required.

Thus, is the calculus for arriving at the equation, as well as the equation it self, the same in all the cases; except that the same lines are designed by different letters, according as they are data, or *quæsitæ*. Indeed, as the data, or *quæsitæ* differ, there arises a difference in the reduction of the equation found: but there is no difference in the equation it self. So that we need make no difference between given and sought quantities; but are at liberty to state the question with such data and *quæsitæ*, as we think most favourable to the solution of the question.

2°. A problem, then, being proposed, compare the quantities it includes; and, without making any difference between data and *quæsitæ*, consider what dependances they have on each other; that you may learn which of them will, by composition, give the rest. In the doing of which, it is not necessary you should at first contrive, how some may be deduced out of others, by an algebraic calculus; it suffices you remark in the general, that it may be deduced by some direct connection.

Thus, *e. gr.* if the question be about the diameter of a circle, AD (*fig. 8.*) and three lines AB, BC, CD, inscribed in a semi-circle; whereof, the rest being given, BC is required: it is evident at first sight, that the diameter AD, determines the semi-circle; as also, that the lines AB, and CD, by inscription, determine the points B and C, and consequently BC required, and that by a direct connection. Yet does not it appear how BC is deduced from the same data, by any analytical calculus.

3°. Having considered the several manners, wherein the terms of the question may be explained and compounded; chuse some of the synthetic methods; assuming some lines, as given, from which there is the most easy access, or progression to the rest, and to which the regression is the most difficult. For, though the calculus may be carried on diverse ways, yet must it begin with these lines. And the question is more readily solved, by supposing it to be of these data, and some *quæsitum* readily flowing from them; than by considering the question as it is actually proposed.

Thus, in the example already given, if from the rest of the quantities given, it were required to find AD: perceiving that this cannot be done synthetically; yet that if it were so done, I could proceed in my ratiocination on it in a direct connection from one thing to others; I assume AD as given, and begin to compute as if it was given indeed, and some of the other quantities, *viz.* some of the given ones, as AB, BC, or CD, were sought. And thus, by carrying on the computation, from the quantities assumed to the others, as the relations of the lines to one another direct, there will always be obtained an equation between two values of some one quantity; whether one of those values be a letter set down as a representation, or name, at the beginning of the work, for that quantity; and the other, a value of it found out by computation: or whether both be found by computation made different ways.

5°. Having thus compared the terms of the question in general, there is some further thought and address required, to find the particular connections, or relations of the lines, fit for computation. For, what to a person who does not so thoroughly consider them, may seem immediately, and by a very near relation, connected together; when we come to express that relation algebraically, are often found to require a longer circuit; and shall even oblige you to begin your schemes a-new, and carry on your computation step by step; as may appear by finding BC, from AD, AB, and CD. For you are only to proceed by such propositions, or enunciations, as can be fitly represented in algebraic terms, whereof there are several arise from Eucl. ax. 19. prop. 4. book 6. and prop. 47. lib. I. Elem.

To facilitate this discovery, of the relations of the lines in the figure, there are several things that contribute; as first, the ad-

addition and subtraction of lines; since from the values of the parts you may find the value of the whole; or from the value of the whole, and one of the parts, you may obtain the value of the other part. Secondly, by the proportionality of lines; since, as above supposed, the rectangle of the mean terms, divided by either of the extremes, gives the value of the other; or, which is the same thing, if the values of all four of the proportionals be first had, we make an equality (or equation) between the rectangles of the extremes and means. But the proportionality of lines is best found out by the similarity of triangles; which, as it is known by the equality of their angles, the analyst ought in particular to be conversant in. In order to which, it will be necessary he be master of Euclid, Prop. 5, 13, 15, 29, and 32, *Lib. I.* and of Prop. 4, 5, 6, 7, 8, *Lib. VI.* and of the 20, 21, 22, 27, and 31, *Lib. III.* To which may be added, the 3d Prop. *Lib. VI.* or the 35th and 36th Prop. *Lib. III.* Thirdly, the calculus is promoted by the addition, or subtraction of squares, *viz.* in right-angled triangles, we add the squares of the lesser sides, to obtain the square of the greater; or from the square of the greater side, we subtract the square of one of the lesser, to obtain the square of the other. On which few foundations, if we add to them Prop. 1. of the VIth Elem. when the business relates to superficies, and also some propositions taken out of the 11th and 12th books of Euclid, when solids come in question: the whole analytic art, as to right-lined geometry, depends. Indeed, all the difficulties of problems may be reduced to the sole composition of lines out of parts, and the similarity of triangles; so that there is no occasion to make use of other theorems; because they may all be resolved into these two, and consequently into the solutions that may be drawn from them.

6°. To accommodate these theorems to the solutions of problems, the schemes are oft times to be farther constructed, by producing out some of the lines, till they cut some others, or become of an assigned length; or by drawing lines parallel, or perpendicular, from some remarkable point; or by conjoining some remarkable points; as also, sometimes, by constructing them after other methods, according as the state of the problems, and the theorems, which are made use of to solve it, shall require.

As for example: if two lines that do not meet each other, make given angles, with a certain third line; perhaps we produce them so, that when they concur, or meet, they shall form a triangle, whose angles, and consequently the ratio of their sides, shall be given; or if any angle be given, or be equal to any one, we often complete it into a triangle given in specie, or similar to some other; and that by producing some of the lines in the scheme, or by drawing a line subtending an angle. If the triangle be an oblique-angled one, we often resolve it into two right-angled ones, by letting fall a perpendicular. If the business concern multilateral, or many sided figures, we resolve them into triangles, by drawing diagonal lines, and so in others; always aiming at this end, *viz.* that the scheme may be resolved either into given, or similar, or right-angled triangles.

Thus, in the example proposed, draw the diagonal BD; that the trapezium ABCD, may be resolved into two triangles, ABD, a right-angled one, and BDC an oblique-angled one, (fig. 8. n°. 2.) then resolve the oblique-angled one into two right-angled triangles, by letting fall a perpendicular from any of its angles B, C or D, upon the opposite side; as from B upon CD, produced to E, that BE may meet it perpendicularly. But since the angles BAD, and BCD, make in the mean while two right ones (by 22 Prop. 3 Eucl.) as well as BCE and BCD, the angles BAD, and BCE are perceived to be equal; consequently the triangles BCE, and DAB to be similar. And so the computation (by assuming AD, AB, and BC, as if CD were sought) may be thus carried on, *viz.* AD and AB (by reason of the right angled triangle ABD) give you BD. AD, AB, BD and BC (by reason of the similar triangles ABD, and CEB) give BE, and CE. BD, and BE (by reason of the right-angled triangle BED) give ED; and ED—EC gives CD. Whence there will be obtained an equation between the value of CD so found out, and the small algebraic letter that denotes it. We may also (and for the greatest part it is better so to do, than to follow the work too far in one continued series) begin the computation from different principles, or at least promote it by diverse methods, to one and the same conclusion; that at length there may be obtained two values of any the same quantity; which may be made equal to one another. Thus, AD, AB, and BC, give BD, BE, and CE as before; then CD+CE, gives ED; and lastly, DB and ED (by reason of the right-angled triangle BED) give BE.

7°. Having concerted your method of procedure, and drawn your scheme; give names to the quantities that enter the computation (that is, from which assumed, the values of others are to be derived, till you come to an equation) chusing such as involve all the conditions of the problem, and seem best accommodated to the business, and which may render the conclusion (as far as you can guess) more simple, but yet

not more than what shall be sufficient for your purpose. Wherefore, do not give new names to quantities, which may be denominated from names already given. Thus, of a whole line given, and its parts, of the three sides of a right-angled triangle, and of three or four proportionals, some one of the least considerable we leave without a name; because its value may be derived from the names of the rest. As in the example already brought, if I make $AD = x$, and $AB = a$, I denote BD, by no letter, because it is the third side of a right-angled triangle ABD, and consequently, its value is $\sqrt{xx - aa}$. Then if I say, $BC = b$, since the triangles DAB, and BCE are similar, and thence the lines AD, AB :: BC, CE proportional, to three whereof, *viz.* to AD, AB, and BC, there are already names given; for that reason I leave the fourth CE without a name, and in its room I make use of

$\frac{ab}{x}$ discovered from the foregoing proportionality. And so if DC be called c, I give no name to DE, because from its parts DC, and CE, or c and $\frac{ab}{x}$, its value $c + \frac{ab}{x}$ comes out.

8°. By this time, the problem is almost reduced to an equation. For after the aforesaid letters are set down for the species of the principal lines, there remains nothing else to be done, but that out of those species, the values of other lines be made out, according to a pre-conceived method; till after some foreseen way they come to an equation. And there is nothing wanting in this case, except that by means of the right-angled triangles BCE and BDE, I can bring out a double value of BE, *viz.* $BCq - CEq$ (or $bb - \frac{aabb}{xx}$) = BE q; as also $BDq - DEq$ (or $xx - aa - cc - \frac{2abc}{x} - \frac{aabb}{xx}$) = BE q.

And hence (blotting out on both sides $\frac{aabb}{xx}$) you shall have the equation $bb = xx - aa - cc - \frac{2abc}{x}$, which being reduced, becomes $xx = -aa + b^2x + 2abc$, as before, + c c.

9°. For the geometry of curve lines: we use to denote them either by describing them by the local motion of right lines, or by using equations indefinitely expressing the relation of right lines disposed in order, according to some certain law, and ending at the curve lines.

The ancients did the same by the sections of solids, but they effected it less commodiously. The computations, which regard curves, described after the first manner, are performed as above directed: thus, suppose A K C (fig. 9.) a curve line, described by K the vertical point of the square A K ϕ , whereof one leg AK, freely slides through the point A given in position, while the other K ϕ of a determinate length is carried along the right line AD, also given in position; and it is required to find the point C, in which any right line CD, given also in position, shall cut this curve: Draw two right lines AC, CF, which may represent the square in the position sought, and the relation of the lines (without any difference, or regard, of what is given or sought, or any respect had to the curve) being considered, you perceive the dependency of the others upon CF, and any of these four, *viz.* BC, BF, AF, and AC, to be synthetical; two whereof you assume, as $CF = a$, and $CB = x$; and beginning the computation from thence, you presently obtain $BF = \sqrt{aa - xx}$, and $AB = \frac{xx}{\sqrt{aa - xx}}$.

by reason of the right angle CBF; and that the lines BF, BC :: BC, AB are continual proportionals. Moreover, from the given position of CD, AD is given, which therefore call b; there is also given the ratio of BC to BD, which suppose as d to e; and you have $BD = \frac{ex}{d}$ and

$$AB = b - \frac{ex}{d}$$

Therefore $b - \frac{ex}{d} = \frac{xx}{\sqrt{aa - xx}}$, an equation, which (by squaring its parts, and multiplying by $aa - xx$) will be reduced to this form.

$$xx = 2 b d e x - b b d d - a a e e x x - 2 a a b d e x + a a b b d d.$$

Whence, lastly, from the given quantities a, b, d, and e; x may be found by rules given hereafter; and at that interval, or distance x or BC, a right line drawn parallel to AD, will cut CD in the point sought, which is C.

If, instead of geometrical descriptions, we use equations to denote the curve lines by; the computations will thereby become as much shorter and easier, as the gaining of those equations can make them. Thus, suppose the intersection C, of the given ellipsis ACE fig. 10. with the right line CD given

in position, be sought: to denote the ellipsis, take some known equation proper to it, as $rx - \frac{r}{q}xx = yy$, where x is indefinitely put for any part of the axis A b, or A B, and y for the perpendicular b c, or B C, terminated at the curve; and r and q are given from the given species of the ellipsis. Since therefore C D is given in position, A D will be also given, which call a ; and B D will be $a - x$; also the angle A D C will be given, and thence the ratio of B D to B C, which call i to c ; and B C (y) will be $= ca - cx$, whose square $ccaa - 2cex + cxxx$, will be equal to $rx - \frac{r}{q}xx$. And thence by reduction there will arise $xx = \frac{2acex + rxx - aace}{cc + r}$, or $x = \frac{ace + \frac{1}{2}r \pm \sqrt{ar + \frac{rr}{4cc} - \frac{aar}{q}}}{cc + \frac{r}{q}}$. Add, that though

a curve be denominated by a geometrical description, or by a section of a solid, yet thence an equation may be obtained, which shall define the nature of the curve, and consequently all the difficulties of problems proposed about it, may be reduced hither. Thus, in the former example, if A B be called x , and B C, y , the third proportional B F will be $\frac{yy}{x}$, whose square, together with the square of B C, is equal to C F q; that is, $\frac{y^4}{xx} + yy = aa$; or $y^4 + xxyy = aaxx$. And this is an equation, by which every point C, of the curve A K C, agreeing or corresponding to any length of the base, (and consequently the curve itself) is defined; and from whence consequently you may obtain the solutions of problems proposed concerning this curve.

After the same manner almost, when a curve is not given in specie, but proposed to be determined, you may feign an equation at pleasure, that may contain its general nature; and assume this to denote it, as if it was given; that from its assumption you some way arrive at equations, by which the assumptions may be determined.

What remains of the doctrine and practice of equations, relates to their reduction to the lowest and simplest terms, the better to come at the value of the unknown quantity in the equation; and their geometrical construction. See REDUCTION of equations.

EQUATION of time, in astronomy, denotes the difference between mean and apparent time; or the reduction of the apparent unequal time, or motion of the sun, or a planet, to equable and mean time, or motion.

Time is only measured by motion; and as time, in itself, flows ever equally; to measure it, such a motion must be used as is equable, or which always proceeds at the same rate.

The motion of the sun is what is commonly used for this purpose; as it is the most easy to be observed: yet it wants the great qualification of a chronometer, which is equability. In effect, the astronomers find that the sun's apparent motion is no ways equal, that he now and then slackens his pace, and afterwards quickens it again: and consequently, equal time cannot be measured thereby. See SUN.

Hence, the time which the sun's motion shews, called the apparent time, becomes different from the true and equable time, wherein all the celestial motions are to be estimated, and accounted.

This inequality of time is thus accounted for: the natural, or solar day is measured, not properly, by one entire revolution of the equinoctial, or 24 equinoctial hours; but by the time which passes while the plane of a meridian passing through the centre of the sun, does, by the earth's conversion round its axis, return again to the sun's centre: which is the time between one mid-day and the next.

Now, had the earth no other motion but that round its axis; all the days would be precisely equal to each other, and to the time of the revolution of the equinoctial: but the case is otherwise; for while the earth is turning round its axis, it is likewise proceeding forward in its orbit. So that when a meridian has completed a whole revolution from the sun's centre, its plane has not yet arrived at the sun's centre again: as will appear from the figure.

Let the sun be S (Tab. Astronom. fig. 50.) and let A B be a portion of the ecliptic: let the line M D, represent any meridian, whose plane produced, passes through the sun when the earth is in A. Let the earth proceed in its orbit, and in making one revolution round its axis, let it arrive at B; then, will the meridian M D be in the position m d parallel to the former M D; and consequently this has not yet passed through the sun, nor have the inhabitants under that meridian, yet had their mid-day. But the meridian d m, must still proceed with its angular motion, and describe the angle d B f before its plane can pass through the sun.

Hence it appears, that the solar days are all longer than the time of one revolution of the earth round its axis. However, were the planes of all the meridians perpendicular to the plane of the earth's orbit; and did the earth proceed with an equal motion in its orbit; the angle d B f would be equal to the angle B S A, and the arches A f and A B would be similar: consequently, the times would be always equal; the arch A B, and the angle d B f, of the same quantity: all the solar days equal to each other; and the apparent and real time agree.

But, as it is, neither of those is the case: for the earth does not proceed in its orbit with an equable motion; but in its aphelion, describes a less arch, and in its perihelion a greater, in the same time; beside, that the planes of the meridians, are not perpendicular to the ecliptic, but to the equator. Consequently, the time of the angular motion d B f, which is to be added to the entire revolution in order to make a whole day, is not always of exactly the same quantity.

The same will be found, if setting aside the consideration of the real motion of the earth, we consider the apparent motion of the sun in lieu thereof; as being what we measure time by. On this principle we observe, that the day not only includes the time of one reversion of the globe on its axis, but is increased by so much as answers to that part of the sun's motion, performed in that time. For when that part of the equinoctial, which, with the sun, was at the meridian yesterday at noon, is come thither again to-day; it is not yet noon; the sun not being now at the place where he yesterday was, but gone forward near a degree more or less. And this addendum above the 24 equinoctial hours is upon a double account unequal.

1^o. In that the sun, by reason of his apogee and perigee, does not at all times of the year dispatch an equal arch of the ecliptic in one day; but greater arches near the perigee, which is about the middle of December; and lesser nearer the apogee, which is about the middle of June.

2^o. In that though the sun should always move equably in the ecliptic, yet equal arches of the ecliptic do not in all parts of the zodiac, answer to equal arches of the equator, by which we are to estimate time; by reason some parts thereof, as the two solstitial points, lie nearer to a parallel position to the equinoctial than others, *e. gr.* those about the equinoctial points, where the ecliptic and equinoctial intersect. Whereupon an arch of the ecliptic, near the solstitial points, answers to a greater arch of the equinoctial, than an arch equal thereto near the equinoctial points.

The apparent motion of the sun to the east, then, being unequal; the natural and apparent days are no ways proper to be applied to measure the celestial motions; which have no dependance on that of the sun.

And hence astronomers have been obliged to invent other days for the use of their calculations: those others are equal; and are a mean between the shortest and longest of the unequal ones.

These are had by considering the number of hours in the whole revolution of the sun in the ecliptic, and dividing the whole time into as many equal parts as there are hours, 24 of which constitute the day: and this reduction of the days constitutes the equation of natural days.

Consequently, computing those motions, according to equal time, it is necessary to turn that time back again into apparent time, that they may correspond to observation: On the contrary, any phenomenon being observed, the apparent time thereof must be converted into equal time, to have it correspond with the times marked in the astronomical tables. As we do not know of any body in nature that moves equally; yet such a motion is alone proper to measure equal days and hours: it has been thought fit to imagine some body, *e. gr.* a star, moving in the equator, eastward; and never quickening, or slackening its pace, but going through the equator in precisely the same time, as the sun finishes his period in the ecliptic.

The motion of such a star will represent equal time; and its diurnal motion in the equator, will be 59° 8'; the same as the mean, or equated motion of the sun in the ecliptic. Consequently, the mean or equable day, is determined by the arrival of this star at the meridian; and is equal to the time wherein the whole circumference of the equator, or 360°, pass the meridian, and 59° 8' more. Which addition of 59° 8' remaining always the same, these mean or equated days will be constantly equal.

Since then the sun goes unequally eastwards with respect to the equator; it will sometimes arrive at the meridian sooner than this imaginary star, and sometimes later: the difference is the difference between true and apparent time: which difference is known by having the place of the imaginary star in the equator; and the point of the equator which comes to the meridian with the sun. For the arch intercepted between them, being converted into time, shews the difference between equal and apparent time, which, as before, is called the *equation of time*.

The *equation of time* then, may be defined, the time that flows while the arch of the equator intercepted between the point determining the right ascension of the sun, and the place of the imaginary star, passes the meridian: or, as Tycho, and, after him, Street, state it, it is the difference between the sun's true longitude, and his right ascension.

To *EQUATE* solar days, that is, to convert apparent into mean time, and mean into apparent time.—¹ If the sun's right ascension be equal to his mean motion, the imaginary and true sun will pass the meridian at the same time: consequently, the true coincides with the apparent time.

² If the right ascension be greater than the mean motion, subtract the latter from the former; and turning the difference into solar time, either subtract it from the apparent time, to find the mean time: or add it to the mean time to find the apparent.

³ Lastly, if the right ascension be less than the mean motion, subtract the former from the latter, and turning the dif-

ference into solar time, either add it to the apparent time, to find the mean time; or subtract it from the mean time to find the apparent.

This method of *equation* obtains, if the calculus be progressive; if it be retrograde, that is, if the time be reckoned backwards, the operation must be just the reverse.

This doctrine of the inequality and *equation* of natural days, is not only of use in astronomical computations, but also in the adjusting and directing of clocks, watches, and other time-keepers: hence we see, why a pendulum, or other movement, which measures equal time, does not keep pace with the sun, which measures apparent time; but is sometimes before, and sometimes later than the same. Whence, such automata and sun-dials, are necessarily found almost perpetually at variance.

The variations of the two kinds of time, are exhibited in the following table, for every day throughout the year. It is borrowed from Mr. Flamsteed; one part of whose praise it is, that he was the first who fully demonstrated and cleared this inequality of natural days: though others, and even Ptolemy, had a partial notion of it.

The use of the table is obvious: a clock or watch, that is to be kept to true or equal time, must be so many minutes and seconds faster or slower than a sundial, as is assigned in the table, for the respective day: or, if you would have it go by the sun-dial, it goes well, if it gains or loses each day the number of minutes and seconds in the table.

TABLE of the EQUATION of Natural Days, with the Regulation of a Movement by the same.

Absolute EQUATION. See the article ABSOLUTE.

EQUATION of the centre, called also *prosthaphæresis*, and *total prosthaphæresis*; is the difference between the true and mean place of a planet; or the angle made by the lines of the true and mean place; or, which amounts to the same, between the mean and equated anomaly.

The motions of the sun and moon, are affected with various inequalities; whence arises the necessity of so many *equations*. From these inequalities, the moon's place became exceeding difficult to be determined; to remove which difficulty, is the great design of Sir Isaac Newton's new *Theory of the Moon*; wherein we are furnished with *equations* for all the inequalities of the mean motion. The principal of these are,

Annual EQUATIONS of the mean motion of the sun and moon, and of the apogee and nodes of the moon.

The annual *equation* of the sun's centre being given, the three other corresponding annual *equations* will be also given; and therefore a table of that will serve for all. For if the annual *equation* of the sun's centre be taken from thence, for any time, and be called P ; and let $P = Q$, $Q + \frac{1}{2}P = R$, $\frac{1}{2}P = D$, $D + \frac{1}{2}P = E$; and $D - \frac{1}{2}P = F$; then shall the annual *equation* of the moon's mean mo-

tion for that time be R , that of the apogee of the moon will be E , and that of the node F .

Only observe, that if the *equation* of the sun's centre be required to be added; then the *equation* of the moon's mean motion must be subtracted, that of her apogee must be added, and that of the node subtracted. And on the contrary, if the *equation* of the sun's centre were to be subtracted, the moon's *equation* must be added, the *equation* of her apogee subtracted, and that of her node added.

There is also an *equation of the moon's mean motion*, depending on the situation of her apogee in respect of the sun; which is greatest, when the moon's apogee is in an octant with the sun; and is nothing at all, when it is in the quadratures, or syzygies. This *equation*, when greatest, is in the quadratures, or syzygies, is 3 min. 56 seconds. But if the sun be in apogee, it will never be above 3 min. 34 seconds. At other distances of the sun from the earth, this *equation*, when greatest, is reciprocally as the cube of that distance. But when the moon's apogee is any where but in the octants, this *equation* grows less, and is mostly at the same distance between the earth and sun, as the sine of the double distance of the moon's apogee, from the next quadrature or syzygy, to the radius. This is to be added to the moon's motion, while her apogee passes

EQU

from a quadrature with the sun to a syzygy; but is to be subtracted from it, while the apogee moves from the syzygy to the quadrature.

There is, moreover, another *equation of the moon's motion*, which depends on the aspect of the nodes of the moon's orbit with respect to the sun: and this is greatest, when her nodes are in octants to the sun, and vanishes quite, when they come to their quadratures or syzygies. This *equation* is proportional to the sine of the double distance of the node from the next syzygy, or quadrature; and at the greatest, is but 47 seconds. This must be added to the moon's mean motion, while the nodes are passing from their syzygies with the sun, to their quadratures with him; but subtracted while they pass from the quadratures to the syzygies.

From the sun's true place take the equated mean motion of the lunar apogee, as was above shewed; the remainder will be the annual argument of the said apogee. From whence the eccentricity of the moon, and the second *equation* of her apogee may be compared.

Excentric EQUATION. See the article **EXCENTRIC**.

EQUATOR, or **ÆQUATOR**, in astronomy and geography, a great moveable circle of the sphere, equally distant from the two poles of the world, or having the same poles with those of the world.

Such is the circle DA, (*Tab. Astronom. fig. 52.*) its poles being P and Q.—It is called the *equator*, by reason when the sun is therein, the days and nights are *equal*; whence also it is called the *equinoctial*; and when drawn on maps and planispheres, the *equinoctial line*, or simply the line.

Every point of the *equator* is a quadrant's distance from the poles of the world; whence it follows, that the *equator* divides the sphere into two hemispheres, in one of which is the northern, and in the other the southern pole.

By the passages, or transits of arches of the *equator* over the meridian, its equal or mean time is estimated: hence we have frequent occasion for the conversion of degrees of the *equator* into time; and, again, for the re-conversion of parts of time into degrees, or parts of the *equator*.

For performance whereof, we subjoin the following table; wherein are exhibited the arches of the *equator*, which pass the meridian in the several hours, minutes, &c. of equated, or mean time.

Conversion of Parts of the Equator into time, and vice versa.							
Deg. of Equat.	Hours.	I	Hours.	Deg. of Equat.	Hour.	Deg. of Equat.	I
Min.	I	II		Sec.			II
Sec.	II	III		Thir.			III
Thir.	III	IV		Four.			IV
1	0	4	1	15	1	0	15
2	0	8	2	30	2	0	30
3	0	12	3	45	3	0	45
4	0	16	4	60	4	0	60
5	0	20	5	75	5	0	75
10	0	40	0	90	6	0	90
15	1	0	9	135	10	2	30
30	2	0	12	180	20	5	0
60	4	0	15	225	30	7	30
90	6	0	18	270	40	10	0
180	12	0	24	315	50	12	30
360	24	0	24	360	60	15	0

The use of the table is obvious; suppose, *e. gr.* it were required to turn $19^{\circ} 13' 7''$ of the *equator* into time: against 15° deg. in the first column, we have $1^h 0' 00''$: against 4° deg. we have $16' 0''$: against 10 minutes, $40''$: against 3 minutes, $12'' 0''$: against 5 seconds, we have $0' 20''$: and against 2 seconds, $8''$: which added together, give $1^h 16' 52'' 20''$.

Again, suppose it were required to find how many degrees, minutes, &c. of the *equator*, answer to 23 hours 25 min. 17 sec. and 9 thirds. Against 21^h in the fourth column of the table you have 315° : against 2 hours, 32° : against $20'$, 5° : against 10 sec. 2° : against 5 sec. $1' 15'' 0''$: against 2 sec. $30'' 0''$: against 6 thirds, $1' 30''$: which added together give $351^{\circ} 19' 17'' 15''$.

Elevation, or **altitude of the EQUATOR**, is an arch of a vertical circle, intercepted between the *equator* and the horizon.

The *elevation of the equator*, with that of the pole, is always equal to a quadrant.

EQUERY *, or **ECURY**, a grand stable, or lodge for horses furnished with all the conveniences thereof; as stalls, manger, rack, &c.

EQU

* The word is formed from the French *écurie*, which signifies the same thing. Some, again, derive *écurie* from the Latin *scuria*, which not only denotes a place for beasts to be put up in, but also a grange, or barn. But a more probable derivation is from *equile*, a stable for horses, of *equus*, horse.

Some hold that the word *stable*, in propriety, relates only to bullocks, cows, sheep, hogs, &c. And *equery* to horses, mules, &c.

A *simple equery*, is that provided for one row of horses: A *double equery*, that provided for two, with a passage in the middle, or two passages; the horses being placed head to head: as in the little *equery* at Versailles.

Under *equery* are sometimes also comprehended the lodgings, and apartments, of the *equeries*, grooms, pages, &c.

EQUERY, *écuyer*, is also an officer, who has the care, and management of the horses of a king, or prince.

EQUERIES, or **EVERRIES**, popularly called **QUERRIES**, are particularly used among us, for officers of the king's stables; five in number, who when his majesty goes abroad, ride in the leading coach; are in waiting one at a time monthly, and have a table with the gentlemen ushers during the time.

They used to ride on horse-back by the coach-side, when the king travelled; but that being more expensive to them, than necessary to the sovereign, it has been discontinued.

EQUERIES of the crown stable have that appellation, as being employed in managing, and breaking the saddle horses, and preparing them for the king's riding.

There are two in number; whereof one is, or always should be, in close waiting at court; and when his majesty rides, holds the stirrup, whilst the master of the horse, or one of the *equeries*, in his absence, assists in mounting him; and when his majesty rides, they usually attend him.

EQUES Auratus, is used to signify a knight bachelor; called *auratus*, *q. d. gilt*, because anciently none but knights might gild or beautify their armour, or other habiliments of war, with gold.

In law, this term is not used; but instead of it, *miles*; and sometimes *chevalier*.

EQUESTRI *, **EQUESTRIAN**, a term chiefly used in the phrase, *equestrian statue*, which signifies a statue representing a person mounted on horse-back.

* The word is formed of the Latin, *equet*, knight, horseman; of *equi*, horse.

The *fortuna equestria*, in ancient Rome, was a statue of that goddess on horse-back.—We sometimes also say, *equestrian column*.

EQUESTRIAN order, among the Romans, signified the order of knights, or *equites*.

EQUILANGULAR, or **ÆQUILANGULAR**, in geometry, is applied to figures, whose angles are all equal. See **ANGLE**. A square is an *equilangular figure*. See **SQUARE**.—All equilateral triangles are also *equilangular*.

When the three angles of one triangle, are severally equal to the three angles of another triangle; such triangles are also said to be *equilangular*.

EQUICRURAL, or **ÆQUICRURAL**, *Triangle*, is what we more usually call an *Isosceles*. See **ISOSCELES**.

EQUICULUS, **ÆQUULUS**, or **EQUUS minor**, a constellation of the northern hemisphere. See **EQUULUS**.

EQUIDIFFERENT, or **ÆQUIDIFFERENT**, in arithmetic. If in a series of three quantities, there be the same difference between the first and second, as between the second and third, they are said to be *continually equidifferent*: but if in a series of four quantities, there be the same difference between the first and second, as between the third and fourth, they are said to be *discretely equidifferent*.

Thus, 3, 6, 9, and 12, are *discretely equidifferent*; and 3, 6, and 9, *continually equidifferent*.

EQUIDISTANT, or **ÆQUIDISTANT**, in geometry, a term of relation between two things, which are every where at an equal, or the same, distance from each other. See **DISTANCE**.

Thus parallel lines are said to be *equidistant*, as they neither approach nor recede.

EQUILATERAL, or **ÆQUILATERAL**, is applied to any thing whose sides are all equal.

Thus, an *equilateral triangle*, is that whose sides are all of equal length.—In an *equilateral triangle*, all the angles are likewise equal.

All regular polygons, and regular bodies, are *equilateral*. See **POLYGON**, **REGULAR**, &c.

EQUILATERAL Hyperbola, is that wherein the conjugate axes, as AB, and DE, are equal.—*Tab. Conics, fig. 20.*

Hence, as the parameter is a third proportional to the conjugate axes, it is also equal thereto. Consequently, if in the equation $y^2 = bx + b^2$, we make $b = a$; the equation $y^2 = ax + a^2$, defines the nature of an *equilateral hyperbola*. See **HYPERBOLA**.

EQUILIBRIUM, or **ÆQUILIBRIUM**, in mechanics, a term implying an exact equality of weight between two bodies, compared with each other.

A balance is in *equilibrium*, when the two ends are so exactly poised, that neither of them ascends or descends, but both retain their parallel position to the horizon. From this circumstance the word is originally taken; as being a compound of *æquus*, equal, and *libra*, balance.—Whence we frequently use the word *balance* in lieu thereof.

The *equilibrium* of fluids makes a considerable part of the doctrine of hydrostatics. See **FLUID**.

EQUILIBRIUM, is also used figuratively on other occasions. A painter must take care to observe the *equilibrium* of his figures, *i. e.* dispose them well on their centre of gravity, that they may not seem ill supported, or ready to tumble.

Thus, *e. gr.* if one arm be moving forward, the other must be proportionably backward, to poise the figure.

In a picture, there should always be an *equilibrium* between one part and another: that is, the objects are to be distributed so, as to balance, and contrast each other; and not too many, *e. gr.* be crowded on one side, and the other left bare.

EQUIMULTIPLE, in arithmetic and geometry, is applied to simple magnitudes, when multiplied equally, *i. e.* by equal quantities, or multipliers.

Thus, taking A as many times as B; or multiplying them equally, there will still remain the same ratio between the magnitudes thus multiplied, as between the primitive magnitudes before multiplication.

Now, those magnitudes, thus equally multiplied, are called *equimultiples* of the original ones A and B: whence we say, that *equimultiples* have the same ratio as the simple quantities. In arithmetic, we generally use the term *equimultiples* for numbers which contain equally, or an equal number of times, their *submultiples*.

Thus 12 and 6 are *equimultiples* of their *submultiples* 4 and 2; inasmuch as each of them contains its *submultiple* three times.

EQUINA Sella. See the article **SELLA**.

EQUINOCTIAL, or **ÆQUINOCTIAL**, in astronomy, a great and immovable circle of the sphere, under which the equator moves in its diurnal motion.

The *equinoctial* or *equinoctial line*, is ordinarily confounded with the *equator*; but there is a difference: the *equator* being moveable, and the *equinoctial* immovable; and the *equator* being drawn about the convex surface of the sphere, but the *equinoctial* on the concave surface of the *magnus orbis*.

The *equinoctial* is conceived, by supposing a semi-diameter of the sphere, produced through a point of the *equator*, and there, by the rotation of the sphere about its axis, describing a circle on the immovable surface of the *primum mobile*.

Whenever the sun, in his progress through the ecliptic, comes to this circle, it makes equal days and nights all around the globe: as then rising due east, and setting due west, which he never does at any other time of the year. And hence the denomination, from *æquus*, and *nox*, night; *quia æquat diem nocti*.

The *equinoctial*, then, is the circle which the sun describes, or appears to describe, at the time of the equinoxes; that is, when the length of the day is every where equal to that of the night: which happens twice per annum. See **EQUINOX**.

EQUINOCTIAL, in geography. See the article **EQUATOR**. People who live under this circle, by geographers and navigators called the *line*, have their days and nights constantly equal. And at noon, the sun is in their zenith, and therefore casts no shadow.

From this circle, is the declination, or latitude of places, accounted in degrees of the meridian.

EQUINOCTIAL Points, are the two points wherein the *equator* and *ecliptic* intersect each other.—The one, being in the first point of aries, is called the *vernal*; and the other in the first point of libra, the *autumnal point*.

EQUINOCTIAL Colure, is that passing through the *equinoctial* points. See **COLURE**.

EQUINOCTIAL Dial, is that whose plane lies parallel to the *equinoctial*. See **DIAL**.

EQUINOCTIAL Hours. } See the articles. } HOUR.

EQUINOCTIAL Line. } LINE.

EQUINOCTIAL Orient. } ORIENT.

EQUINOX, or **ÆQUINOX**, in astronomy, the time when the sun enters one of the *equinoctial* points.

The time when he enters the *vernal* point is particularly denominated the *vernal*; and that when he enters the *autumnal* point, the *autumnal equinox*.

The equinoxes happen when the sun is in the *equinoctial* circle; when, of consequence, the days are equal to the nights throughout the world, which is the case twice a year: *viz.* about the 20th of March, and the 22th of September, the first of which is the *vernal*, and the second the *autumnal equinox*.

As the sun's motion is unequal, that is, sometimes swifter,

and sometimes slower, (from the causes already explained under the article **EQUATION**) it comes to pass that there are about eight days more from the *vernal*, to the *autumnal equinox*, than from the *autumnal* to the *vernal*: the sun spending so much more time in travelling through the northern, than the southern signs.

According to the observations of M. Cassini, the sun is 186^h. 14^h. 53^h. in the northern signs; and only 178^h. 14^h. 56^h. in the southern. The difference of which is 7^h. 23^h. 57^h.

The sun being continually advancing forwards in the *ecliptic*, and gaining a degree every day; he makes no stay in the *equinoctial* points, but the moment he arrives in them, he also leaves them.

Of course, therefore, though the day the sun enters the *equinoctial* point, is called the *equinox*, as being reputed equal to night; yet is not it precisely so, unless the sun enter the *equator* at mid-day. For if the sun rising should enter the *vernal equinox*, at setting, he will have departed from it, and have got northwards about 12°: consequently, that day will be somewhat longer than 12 hours, and the night proportionably shorter.

The time of the *equinoxes*, *i. e.* the moment in which the sun enters the *equator*, is found by observation; the latitude of the place of the observation being given.

Thus, in the *equinoctial* day, or near it, take the just meridian altitude of the sun; if this be equal to the altitude of the *equator*, or the complement of the latitude, the sun is at that very moment in the *equator*. If it be not equal, the difference is the sun's declination. The next day observe the meridian altitude as before, and find his declination: if the declination be of different kinds, *viz.* the one north, and the other south, the *equinox* has happened in the interval of time between them. Otherwise, the sun has either not entered the *equinoctial*, or had passed it at first. From these two observations, a trigonometrical calculus gives the time of the *equinox*.

It is found by observation, that the *equinoctial* points, and all the other points of the *ecliptic*, are continually moving backward, or in antecedentia, that is, westward. This retrograde motion of the *equinoctial* points, is that famous and difficult phenomenon, called the *precession of the equinoxes*. See **PRECESSION of the equinoxes**.

EQUINUS Venter. See **VENTER Equinus**.

EQUIPAGE, in navigation. See **CAEW**.

EQUIPOLLENCE, in logic, is when there is an equivalence between any two or more terms, or propositions; *i. e.* when they signify one and the same thing, though they express it differently.—Such propositions, &c. are said to be *equipollent*. See **EQUIVALENT**.

EQUIPPE, in heraldry, expresses a cavalier equipped; *i. e.* armed at all points.

EQUITY, **ÆQUITAS**, denotes justice, or right mitigated and tempered by the consideration of particular circumstances; or a correction, and abatement of the severity of some law; or a temperament, which, without being unjust, abates the rigour of some just law.

This is what the Greeks call *ἐπιείκεια*.—The utmost severity of a good law, is frequently contrary to justice; it should always have *equity* for its rule, and guide. *Summum jus, sæpe summa injuria*.

The foundation of *equity*, is not, that there is any mistake in the law; but that the law was laid down universally; by reason all circumstances could not be considered, or taken in under one law.

Equity, therefore, is not so much a correction of a law, as art amendment; not yet so properly an amendment of the law as itself, as of some conclusion arising from its being ill understood, or ill applied.

In this it is distinguished from a *dispensation*, which takes away the obligation of the law in some particular case; whereas a correction does not take away any thing of the obligations, but only shews in what sense that is to be taken, if there should be imagined any obligation, where there is none.

For an instance, suppose it an express law, that the city being now beset with an enemy, the gates be all shut; and suppose it fall out, that the enemy is then in pursuit after some of the citizens by whom it is defended; so that it would be highly prejudicial thereto, not to open them the gates: *equity* here decrees the gates to be opened, contrary to the express word of the law.

Thom. Aquinas proposes another instance: suppose it law, that whoever refuses to restore what had been committed in trust to him, shall pay a grievous mulct; and suppose some person refuse to restore a sword left with him, to a mad-man. This case is comprehended in the sense and intendment of the law; though not in the words thereof. And the legislator himself, if he were present, would except it. *Equity*, therefore, must here step in, to correct or supply the defect of the judge, and acquit the man of the mulct.

In this view, *equity* is of two kinds, and those of contrary effects, the one abridges, and takes from the letter of the law; and the other enlarges, and adds thereto.

The first is defined, the correction of a law, made generally in that part wherein it fails: as, suppose a statute made, "That whosoever does such a thing, shall be a felon, or suffer death;" yet if a mad-man, or an infant, who hath no discretion, do the same, he shall neither be a felon, nor suffer death.

The other is defined, an extension of the words of the law, to cases which are not expressed, which yet come under the same reason; so that, when one thing is enacted, all other things, which are of the like degree, are so too.

Thus the statute which ordains, that in action of debt against executors, he who appears by distress shall answer; extends by *equity*, to administrators: and such of them as shall appear first by distress, shall answer, by the *equity* of the said act: *quia facti in equali genere*.

EQUITY is also used for the virtue of justice. See *JUSTICE*.

EQUITY, in our laws, &c. is also frequently used for the court of chancery, where controversies are supposed to be determined, according to the exact rules of *equity* and conscience, by mitigating the rigour of the common law.

Aequitas sequitur legem, is an old maxim in law; but from the great increase of suits in chancery, some have thought fit to give it this construction, that in all causes after a man has been at law, he must go to *equity*.

EQUIVALENT, is understood of something that is equal in value, force, or effect to another.

Equivalence is of various kinds, in propositions, in terms, and in things.

EQUIVALENT Terms are, where several words that differ in sound, have yet one and the same signification: as, *every body was there*, and *no body was absent*; *nihil nan, and omne*.

EQUIVALENT Things, are either *moral, physical, or statial*.—*Moral*, as when we say, that the commanding or advising a murderer, is a guilt *equivalent* to that of the murderer.—*Physical*, as when a man, who has the strength of two men, is said to be *equivalent* to two men.—*Statial*, whereby a less weight becomes of equal force with a greater, by having its distance, from the centre, increased.

EQUIVOCAL, EQUIVOCUM, denotes a word, or expression that is dubious, and ambiguous; or that may have several senses, one true, and another false.

Equivocal terms answer to what are otherwise called *homonyma*, or *homonymous terms*.

Such is the word *emperor*, which is both the name of a dignity, the proper name of a person, and the name of a plant. So also the Latin *gallus*, which stands indifferently for a cock, and a Frenchman.

In these cases one word denotes diverse conceptions, one word diverse things: whence that common definition of *equivocals* in the schools, *quorum nomen est commune, ratio vero essentia secundum illud nomen diversa*.

Philosophers distinguish *equivocals*, into *active and passive*; or *equivocalia equivocantia*, and *equivocalia*.

Equivocal equivocantia, or those that denominate and signify things, are words common to several things in a very different signification, *i. e.* to several things which have a similar essence, correspondent to the similar denomination. *E. gr.* The word *taurus*, which stands for a sign, a mountain, and an animal; and in one signifies a lowing animal; in another, a heap of stones and earth; and in the third, a constellation, or system of stars.

Equivocal equivocata, or those that are called or denominated; are the things signified by ambiguous names, *e. gr.* a sign, a mountain, and an animal. Which last species of *equivocals* alone Aristotle seems to have had in view in his definition, which agrees to these, and these only.

EQUIVOCAL Action. } See the article. } *ACTION*.

EQUIVOCAL Cause. } } *CAUSE*.

EQUIVOCAL Generation, is a method of producing animals and plants, not by the usual way of coition between male and female, but by I know not what plastic power, or virtue in the sun, &c.

Thus insects, maggots, flies, spiders, frogs, &c. have usually been supposed to be produced by *equivocal generation*, *i. e.* by the heat of the sun warming, agitating and impregnating the dust, earth, mud, and putrid parts of animals.

This method of generation, which we also call *spontaneous*, was commonly asserted and believed among the ancient philosophers: but the moderns, from more and better observations, unanimously reject it, and hold that all animals, nay and vegetables too, are univocally produced, that is, from parent animals, and vegetables of the same species and denomination.

It were a thing, one would imagine, sufficient to discredit the Aristotelian, or rather the Egyptian doctrine of *equivocal generation*, to find flies, frogs, lice, &c. to be male and female; and accordingly to engender, lay eggs, &c.

To imagine that any of those creatures could be spontaneously produced, especially in so romantic a manner, as in

the clouds, as they particularly thought frogs were, and that they dropped down in showers of rain, were, certainly, highly unphilosophical.

Yet some, even to this day, credit the stories of raining of frogs; and, among the rest, the very curious and learned Dr. Lister, seems inclined to the opinion: infancing in frogs, found on the leads of the lord Aston's gatehouse at Tixel in Staffordshire, which he imagines came there by some such means. But we may make a judgment of this, and a hundred the like reports to be met with in considerable authors, from some other the like relations that have been better inquired into. Such are several reports of the raining of millet-feed, wheat, whittings, &c. An account of which, with the grounds of the deceit, see under *RAIN* and *SHOWERS*.

The doctrine of *equivocal generation* we call an *Egyptian doctrine*, as having, in all probability, had its rise in Egypt, to save the hypothesis of the original production of men, and other animals, out of the earth, by the help of the sun's heat. To prove which, the Egyptians, as Diodorus Siculus observes, produce this observation; that about Thebes, when the earth is moistened by the Nile, and afterwards impregnated by the intense heat of the solar rays, an innumerable swarm of mice, do come forth: whence he infers, that all kinds of animals might equally have arisen out of the earth at the beginning of things. And from these, bishop Stillingfleet takes the other writers and adherents, to the doctrine of *equivocal generation*, Mela, Pliny, Ovid, &c. to have borrowed the hypothesis, without enquiring into its truth. Derham's *Phys. Theol.* lib. IV. c. 15.

EQUIVOCATION, ÆQUIVOCATIO, the using a term, or expression, that has a double signification.

Equivocations are expedients to save telling the truth, and yet without telling a lie for the matter. The fathers are great patrons of *equivocations*, and mental reservations; holding, that the use of such shifts, and ambiguities, is in many cases allowable.

St. Augustin, particularly, is reproached with endeavouring to vindicate Isaac for saving his wife from a crime, by an *equivocation*: *tacuit aliquid veri, & non dixit aliquid falsi*. To advance a dubious proposition, knowing it will be understood in a sense different from that you give it in your mind, is an *equivocation*, and a breach of good faith and sincerity.

EQUIVOCATION, in moral theology, is strictly understood of a term, or phrase, with two different significations: the one common, and obvious; the other more unusual, and remote: the latter of which being understood by the speaker, but the former by the hearers, they conceive something different from one another.

Of this we have an instance in St. John, chap. 11. where our Saviour is represented as saying, *Lazarus sleepeth*: for the disciples who took the word *sleeping* in the usual signification, concluded that Lazarus, whom they had been told was sick, began to take rest, and would soon recover; but Jesus, using the words in a less direct, and usual signification, meant that Lazarus was dead.

When the *equivoque* consists of several words, it is properly called an *ambiguity*: of which we have an instance in St. John, chap. ii. *destroy this temple*, says Jesus Christ, speaking to the Jews, *and I will raise it again in three days*.

The lawfulness of the use of *equivocations* has been greatly disputed among the modern casuists: many grave authors deny that it is allowable to use them on any occasion whatever. Their reason is, that an *equivoque* is to all intents and purposes the same thing with a lie.

Others, on the contrary, particularly Cabassut, a divine famous among the priests of the oratory, hold a world of difference between an *equivocation* and a lie; maintaining that it is always criminal to tell a lie; but that there are some occasions where an *equivocation* may be used innocently: and such, in effect, is the sentiment of St. Thomas, St. Antonin, St. Raymond, and especially St. Augustin, as Fa. Cabassut seems to have demonstrated. Lib. IV. *Theor. de Prax. Jur. Can. Edit. Lugd. 1685. cap. 4.*

EQUULEUS, or ECULEUS, in antiquity, a kind of rack, or engine of torture, used for extorting the truth; at first chiefly on slaves, but afterwards turned against the christians. The patient's arms and legs being fastened on the *equuleus* with chords, he was hoisted aloft, and extended in such manner, that all his bones were dislocated. In this state, red hot plates were applied to his body; and he was also goaded in the sides with an iron forked instrument, called *ungula*.

The *equuleus* was of wood, and had holes, at certain distances; with a screw, by which the criminal was stretched to the 20, sometimes to the 4th or the 5th hole: at intervals the screw was slackened again; by which he had some respite; but then was he tormented with questions.

Hieronymus Magius, when a prisoner among the Turks, wrote an express treatise de *Equaleis*; and another of bells; merely, as it is said, from his memory, without any assistance of books. Sigonius had another treatise on the same subject.

ERULEUS, in astronomy, a constellation of the northern hemisphere; whose stars in Ptolemy's catalogue are 4; in Tycho's 4; in Mr. Flamsteed's 10. The longitudes, latitudes, magnitudes, &c. whereof are as follow.

Names and situations of the stars.	Right Asc.	Longit.	Latitude.	Magn.

ERULEUS, in the arts and manufactures. See **HORSE**.

ERUDICATIVE, in medicine. See **RADICAL**.

ERANARCHA *, **EPANAPXHE**, a public officer among the ancient Greeks, whose business was to provide over, and direct the alms given, and provisions made for the poor.

* The word is formed of the Greek, *egros*, alms, contribution, and *agyn*, command.

The *eranarcha* was properly the administrator, or steward of the poor: when any person was reduced to poverty, taken captive, or had a daughter to marry, which he could not effect for want of money, &c. this officer called an assembly of friends and neighbours, and taxed each, according to his means and estate, to contribute towards his relief. This is what we learn from Corn. Nepos, in his life of Epaminondas.

ERASED, in heraldry, expresses any thing that seems violently torn off from its proper place.—It is used in contra-distinction to *couped*, which signifies a thing clean cut off.—The family of Card bears ermine, a demy lion rampant *erased*, azure, &c.

ERASTIANS, a religious sect, or faction, which arose in England during the time of the civil wars; thus called from their leader Tho. Erastus; whose distinguishing doctrine it was, that the church had no right to discipline, that is, no regular power to excommunicate, exclude, censure, absolve, decree, or the like.

ERECT Flowers, are such as grow upright, without hanging, or reclining the head. See **FLOWER**.

ERECT Vision. See the article **VISION**.

ERECT { Direct Declining, &c. } Dials. See **DIAL**.

ERECTION, the act of raising, or elevating a thing, in a right line.

The *erecting* a perpendicular on a line given, is a popular problem in geometry.

The term **ERECTION** is also used figuratively.—As, the *erection* of a marquise into a duchy; bishopricks can only be *erected* by the king.

It was anciently the practice to *erect* statues to great men. Cato, the censor, being asked why a statue was not *erected* him? I had rather, says he, hear that question made, than hear it asked why a statue was *erected* me.

ERECTION, is particularly used in medicine, for the state of the penis, when swelled, and distended by the action of the muscles, called *erectores*.

There is also an *erection* of the clitoris, which is performed by muscles provided for that purpose. See **CLITORIS**, and **ERECTOR**.

An alteration of *erection*, and flaccidity in the penis, Dr. Drake observes, is of absolute necessity: the first to the performance of its office; the second for the security of the part. Without an *erection* it were impossible to emit and lodge the seed where it ought to be; and with a constant one, almost as impossible to secure the part from external injuries.—To say nothing of the loss of intigitation, which must be a necessary consequence of constant *erection*.

The *erection* of the penis, consists in a distension of its corpora cavernosa, by an extraordinary quantity of blood pent up therein.

That the blood is the matter which distends the penis in *erection*, is evident from abundance of experiments; though the most convincing is that of firmly tying the penis of an animal (as has been frequently done to a dog) in coitu; wherein, nothing has been found but blood to distend it. Hence, in the bodies of criminals, that hang long after death, the penis becomes *erected*; the blood, in that position, falling to the inferior parts, and stopping there.

By blowing into the blood vessels of the penis after death, the part becomes *erected*. This was first discovered by Mr. Cowper, upon viewing its veins, after he had distended them with wind; whence it plainly appeared, that the external trunks palled, some under its skin only, and some over the ossa pubis; beside, that a vast number of other veins on the dorsum penis, unite and empty themselves into one trunk, called *vena penis*, which passes immediately under a transverse ligament of

the ossa pubis, which is compressed by the approximation of the dorsum penis, to the ligament of the pubis. This application of the dorsum penis is effected by its muscular directors pulling down the car of the corpora cavernosa penis, which are tied up at their juncture in the body of the penis to the os pubis, by the ligamentum suspensorium. Now, this cannot happen to the cavernous body of the urethra, by reason there is no bone, whose position can give rise to a ligament, which can have that effect on its veins: wherefore the muscular accelerators, embracing the veins of the bulb do that office, though not so effectually as in the penis it self.

Accordingly, the glans is not always perfectly distended with the penis, and it is this part that soonest becomes flaccid on an *erection*.

The blood, by such means, being precluded from its return, the corpora cavernosa distend of necessity become distended, if we consider their structure above-mentioned, with respect to the veins. The arteries, which before were flaccid, have now their trunks also distended, and do more plentifully import blood into the corpora cavernosa.

But since it is absolutely necessary some part of the detained blood should be still passing off, lest it become grumous, and unfit for a reflux; the vena præputii communicate with those of the penis it self; whereby part of the blood may be returned from the penis during its *erection*, and give way to a fresh supply from the arteries, and preserve the circulation uninterrupted.

ERECTORES Clitoridis, in anatomy, a pair of muscles arising from the protuberances of the ischium, and inserted into the spongy body of the clitoris; which they serve to erect in coition.

ERECTORES Penis, a pair of muscles arising fleshy from the protuberances of the ischium below the beginning of the cavernous bodies of the yard, into whose thick membranes they are inserted.

Their use is to pull the yard upwards towards the os pubis; whereby its greatest vein is compressed, and the reflux blood denied its passage under those bones; which makes it swell. See **ERECTION**.

EREMIT. See the article **HERMIT**.

ERICHTONIUS, in astronomy, a constellation, the same as *auriga*. See **AURIGA**.

ERIDANUS, in astronomy, a constellation of the southern hemisphere, in form of a river.

The stars in the constellation *eridanus*, in Ptolemy's catalogue are 30: in Tycho's 19: in Mr. Flamsteed's 68: the longitudes, latitudes, magnitudes, &c. whereof are as follow.

ERIGENS *Penis*. See **ERECTOR** *Penis*.

ERMIN, or **ERMINE**, in heraldry, denotes a white field, or fur, powdered, or interpersed with black spots. See **FUR**. It is supposed to represent the skin of an animal, of the same denomination; which some will have a water-rat, others a sort of weazle, and others an armenian mouse. In effect, there is no animal whose skin naturally corresponds to the herald's *ermine*.

The animal is milk white; and so far is it from spots, that the tradition has it, he will rather die, or be taken, than it will fully its whiteness. Whence its symbolical use.

But white skins having for many ages been used for the linings of the robes of magistrates, and great men; the furriers, at length, to add to their beauty, used to sew bits of the black tails of those creatures upon the white skins; to render them the more conspicuous. Which alteration was introduced into armoury. See *Tab. Herald*, fig. 57.

The sable spots in *ermine* are not of any determinate number, but they may be more or less, at the pleasure of the painter or furrier.

ERMINE'. A *Crofs* **ERMINE'**, is a crofs composed of four *ermine* spots, placed in the figure represented *Tab. Herald*, fig. 58.

It must be observed, that the colours in such arms are not to be expressed; by reason, neither the crofs, nor the arms, can be of any colour but white and black.

Colombiere blazons it *quatre queues d'ermine en croix*. The editor of Guillim describes it thus; a crofs of four *ermine*s; or, more properly, four *ermine* spots in crofs. It is the coat of Hurston in Cheshire.

Timbre of **ERMINE**. See the article **TIMBRE**.

ERMINEs, is used by some English writers for the reverse of *ermine*, i. e. for white spots on a black field: but on what foundation no body can tell; for the French, from whom we have our heraldry, have no such term; but call this black powdered with white, *contre-ermine*; as denoting the counter, or reverse of *ermine*; which is white powdered with black. See *Tab. Herald*, fig. 59.

ERMINITES, should seem a diminutive of *ermine*s, and naturally to signify little *ermine*s; but it is otherwise. *Erminites* expresses a white field powdered with black; only that every spot has a little red hair therein.

Some authors use the word *erminites*, for a yellow field powdered with black; which the French express much better by *or semé d'ermine*s de sable.

EROSION, in medicine, the act of sharp, acrid fluids, or humours, gnawing and tearing off parts from the flesh, and other substances.—Arsenic, and other poisons, make *erosions* in the intestines.

EROTIC *, is applied to any thing which has a relation to the passion of love.

* The word is derived from the Greek, *eros*, love; whence *erotics*.

In medicine, we particularly use the phrase *delirium eroticum*; for a kind of melancholy contracted through excess of love. Though, among the several species of pulses, there be no amorous pulse, that is, no pulse peculiar to that passion; yet we can certainly discover where the disorder is *erotic*, by the beating of the pulse, which, in that case, is changeable, unequal, turbulent and irregular. Speak to the patient of the person he loves, and his pulse instantly changes, becoming higher and quicker: and the minute you change the conversation, the pulse is lost again, and is disturbed a-new.

ERRANT, in law, the same with *itinerant*; the term is attributed to judges who go the circuit; and to bailiffs at large.

Knight ERRANTS. See the article **KNIGHT**.

ERRATA, a list usually placed at the beginning or end of a book, containing the faults that have escaped in the impression, and, sometimes, even in the composition of the work.

Lindenberg has an express dissertation on typographical errors, *de erroribus typographicis*; wherein he observes, that there is no book exempt from them, not even the sacred books. He sets himself to enquire into all the causes thereof; and proposes means to prevent them. But he advances nothing on that article, but what is either common or impracticable. The authors, compositors, and correctors of the press, he says, must do their duty; who disputes it? each author must have his own printing-press at home, as Calixtus and Optatus had; who can do it?

Fa. Hardouin's book on medals, might be entitled the *errata of the antiquaries*; and the critiques on history by Perizonius, the *errata of the ancient historians*. In the same sense, M. Bayle's dictionary might be called the *errata of Moreri*.

ERRATIC, in astronomy, an epithet applied to the planets, which are called *erratic* or wandering stars, in contradistinction to the fixed stars.

There is also a kind of fever called *erratic*. See **FEVER**.

ERRATIC *Winds*. See the article **WIND**.

ERRHINA, EPPINA, in medicine, are remedies taken by the nose, to enliven the spirits, stop bleeding, &c. but principally to purge the humidities of the head.

Of these, some are taken in powders, as betony, tobacco, marjoram, iris, white hellebore, euphorbium, &c.—others in a liquid form, made of the juice of marjoram, sage, beet, cyclamen, iris, &c.—Others in form of liniments, incorporated with unguent rofat.—Others, solid, formed like pyramids, to stop bleeding at the nose; composed of armenian bole, terra sigillata, mastic, human or hogs-blood dried, &c. Such *errhines* as are dry, and made up in powders, to excite sneezing, are properly called *sternutatories*.—Some moderns call them *caputurgaria*.

ERROUR, or **ERROR**, a mistake of the mind, in giving assent to a thing, or proposition which is not true. See **FALLACY**.

Some philosophers define *error* an act of the mind, whereby things that should be joined, are separated; or, things that should be separated, are joined: or a wrong judgment, disagreeing with the things whereon it is passed.

Error stands in opposition to *truth*, which consists in an agreement between the proposition, and the thing whereof it is affirmed or derived.

However, a bare failure, or non-attainment of truth, does not constitute *error*; that being common both to ignorance and doubting.

Error only stands distinguished from *falsehood*, in that the former is in the mind, and the latter only in the proposition.

The great origin of all *error*, i. e. of believing that to be true, which is false, is a liberty, or power in the human mind, of giving its assent to ideas, or propositions, that are obscure, as if they were perspicuous and plain.

Particular causes of *error* are, 1°. An inadvertency, or negligence, in passing judgment, without using or attending to the means proper to assist the judgment. As if a person should attempt to judge of the height of the pole, without proper instruments, or observations: or determine about nations, without knowing their history.

2°. Ignorance, in not having informed the understanding by study and application; or furnished it with the ideas that have an immediate relation to the matter in hand.

3°. Impatience of the labour and fatigue, of going through a long chain of reasons and arguments; or of waiting for a necessary number of experiments: with a fondness for the opinion of being knowing; and a prejudice for, or against, some particular person, sect, &c.

4°. The fallacious rules of probability, and opinion. See **PROBABILITY**, and **OPINION**.

5°. Interest, which makes us incline to believe those things true, from which we are like to derive advantage.

6°. Authority: education: and vulgarly received opinions, imbibed ere we were qualified for judging. See **FAITH**.

Against all which, there is this one general rule or caution

1411

laid down, by Fa. Malebranche and others, viz. never to give our full assent to any proposition, unless the evidence for it be so strong, as that we can no longer withhold it, without incurring the secret reproaches of our own reason.

Mr. Locke reduces the causes of all our errors to these four, viz. 1^o. Want of proofs. 2^o. Want of ability to use them. 3^o. Want of will to use them. And, 4^o. Wrong measures of probability.

F. Malebranche considers five occasional causes of error, or rather five different kinds of errors, accommodated to the different manners we have of perceiving things. 1^o. Errors of sense. 2^o. Of the imagination. 3^o. Of the understanding. 4^o. Of our inclinations. And, 5^o. Of the passions. See SENSE, IMAGINATION, UNDERSTANDING, INCLINATION, and PASSION.

Popular ERRORS. See the article POPULAR.

ERROR, in law, generally denotes a fault, or oversight, either in pleading, or in process; upon either of which is brought a writ, by way of remedy, called a writ of error; in Latin, *de errore corrigendo*.

Fitzherbert defines a writ of error to be, that which lies to redress false judgment given in any court of record, having power by charter, or prescription, to hold plea of debt or trespass above xx sh.—There is also a writ of error for reversing a fine, &c.

To assign ERROR. See the article ASSIGN.

Clerk of the ERRORS. See the article CLERK.

ERUCTION, Belching, the same as ructation. See RUCTATION.

ERUDITION, denotes learning, or knowledge; and chiefly that of antiquity.

The Scaligers were men of deep erudition: the writings of M. Launoy, a priest of the oratory, are full of erudition.

Mr. Locke says, it is of more use to fill the head with reflections, than with points of erudition. If the mind be not just and right, ignorance is better than erudition, which only produces confusion and obscurity: M. Balzac calls a heap of ill chosen erudition, the luggage of antiquity.

ERUPTION, a bursting forth, or exclusion of something which was before covered, or concealed.

The eruption of pustles in the small-pox, ordinarily begins on the 4th day.—in the inoculated kind, the eruption often does not begin till the 9th day, or later.

The eruption of volcano's, or burning mountains, is frequently the effect, and issue, of earthquakes. See EARTHQUAKE, &c.

The eruptions of mount Ætna, and Vesuvius, are observed to be somewhat periodical: they are of two kinds; the one less violent, happening once in 2 or 3 months, and lasting usually three or four days, without much damage to the adjacent country.—The other more furious, and of longer continuance, happening to mount Vesuvius about once in 80 years. That in 1632; was so violent, that, by the best of S. Peccacario's observations, it cast the rocks three miles into the air. Hartop in *Philosop. Transact.* N^o. 202.

M. Oldenburg gives us an historical account of the several eruptions of mount Ætna, recorded in authors. The first, whereof we have any credible account, was at the time of the expedition of Æneas, described by Virgil, *Æneid.* lib. III. The 2d, described by Thucydides, was 476 years before Christ: in the time of Roman consuls there were four: another in Cæsar's time, so fierce, that Diodorus assures us, the ships near the island of Lipara were injur'd with the extreme heat of the water: another under Caligula: another at the time of the martyrdom of St. Agatha, said to have been stopped at her intercession: another in the year 812: several between the years 1160 and 1169: others in 1284, 1329, 1408, 1444, 1536, 1633, 1650. *Phil. Transact.* N^o. 48.

Another extraordinary eruption happened in 1669, particularly described in the said *Transactions*, N^o. 51. It was preceded for the space of 18 days, with a dark thick sky, thunder, lightning, and frequent concussions of the earth: the place of the eruption was 20 miles from the old mouth.

The matter here yielded, was a stream, or river of melted metals and minerals, rendered liquid by the fierceness of the fire, and boiling up, and gushing forth, as water does at the head of some great river; till, having run in a full body for a stone's cast, or more, the extremity thereof began to crust and curdle, and turned, when cold, into hard, porous stones, called *sciarris*, as resembling huge cakes of sea-coal, full of a fierce fire. These came rolling and tumbling over one another, and where they met a bank, wall, building &c. would fill up and swell over; by their weight bearing down any common building, and burning up what was combustible. The progress of this inundation was at the rate of a furlong a day; which it continued for 15 or 20 days; running, at first, into the sea, but afterwards into the city of Catania; in its course, it overwhelmed 14 towns and villages, containing three or four thousand inhabitants. The noise of the eruption at the mouth was heard 60 miles.

Dr. St. Clair, in the *Philosop. Transact.* gives an account of a constant eruption of fire, on one side of one of the Appenines,

between Bologna and Florence: a spot of ground 3 or 4 miles in diameter, he observes, incessantly sends up a flame, rising very high, without noise, smoke, or smell; though it gives a very great heat. In great rains it sometimes intermits, but rekindles with greater vigour and heat. Within 3 or 4 yards of it, he adds, there grows corn. The flame he conjectures to arise from a vein of bitumen, or naphtha. There are three other such fires on the same hills.

ERUPTIVE Fevers. See the article FEVER.

ERYSIPELAS*, EPTΣIΠEAAΣ, in medicine, a disease of the skin; called also *scar ignis*, and St. Anthony's fire.

* The word is formed of the Greek, *epus*, *trabes*, to draw, to draw, *prop*, near, whence it is also called by the Latins, *vicinitraba*, and *vicinirubia*.

Its seat is any part of the body, but principally in the face: it shews it self in a ruddy inflammation of the part, with a little swelling of the fame; attended an intense pain, and a crowd of little pustles, which, as the inflammation increases, grow into vesicles.

The disease spreads it self apace; shifting from one place to another, with a fever attending it. It attacks the patient all at once, and chiefly when out in the air; whence the country people call it *blasting*, *sideratio*.

Dr. Quincy accounts for the *erysipelas*, from a too sily blood, which obstructing the capillaries, occasions inflammations: others, from a too sharp and bilious blood, which, on account of its great subtilty, occasions no sensible tumour; but spreads, or diffuses it self all around. Its colour, though red, generally inclines towards a yellow, on account of the mixture of bile; and always the more there is of the bile, the more dangerous the disease.

There is another species of *erysipelas*; though less usual than the former; most commonly arising from a too copious drinking of spirituous liquors. It begins with a fever, after which there is an universal eruption of pustles, almost over the whole body, much like those after the stinging of nettles, and sometimes rising into vesicles. At going off, they leave an intolerable itching, and as often as scratched return again.

Etmuller gives it as the distinguishing character of an *erysipelas*, that when pressed very lightly by the finger, there follows a white spot, which presently after becomes red again; which does not happen in an ordinary inflammation, unless when violently pressed. Scorbatic people are most subject to this disease. It is disputed, whether purging be good in the *erysipelas*? Sydenham recommends it the next day after bleeding. Etmuller cautions us against them both; and recommends diaphoretics. Dr. Friend observes, that in the last stage of an *erysipelas* of the head, attended with a coma, delirium, &c. unless cathartics will do good, the case is desperate. All unctuous, astringent, and cold applications, externally, are dangerous, and sometimes make the *erysipelas* degenerate into a gangrene. The *erysipelas* is either simple, or attended with an ulcer. See Supplement, article ERYSIPELAS.

ERYTHROIDES, EPTPOEIDHΣ, in anatomy, the first of the proper membranes that inclose the testicles.

It is interspersed with fleshy fibres, derived to it from the cremaster muscle, which make it appear reddish*.

* And hence its name from the Greek, *erythros*, red, and *eidos*, form.

ESCALADE, or SCALADE; a furious attack of a wall, or a rampart; carried on with ladders, to mount by; without proceeding in form, breaking ground, or carrying on regular works to secure the men. See SCALADE.

ESCAMBIO, was anciently a license granted any one for the making a remittance or giving a bill of exchange to another beyond sea.

For, by stat. 5. Rich. II. no person might exchange, or return money beyond sea, without the king's license.

ESCAPE, in law, an evasion out of some lawful restraint, either by violence or stealth.

Escapes are either voluntary, or negligent.

Voluntary, as when one arrests another for felony, or other crime, and afterwards lets him go; in which *escape*, the party that permits it, is by law guilty of the fault, committed by the person who *escapes*: be it felony, treason, or trespass.

Negligent *escape* is, when one is arrested, and afterwards *escapes* against his will that arrested him; and is not pursued by fresh suit, and taken again, before the party pursued hath lost sight of him.

ESCARTELE', in heraldry, quartered, or quarterly. See QUARTERING, and QUARTERLY.

ESCHAR*, EΞΧΑΡΑ, in chirurgery, a hard crust, or scab, formed on the flesh, by means of a hot iron, or a caustic medicine, or some sharp, corrosive humour within.

* The word is Greek, *esxares*, crust, or scab; which some authors derive from *es* and *xaio*, I burn; but this comes with some difficulty, by reason *xaio* is wrote with a *z*; and *esxares* with a *z*.

The caustic stone, or lapis infernalis, produces a round *eschar* in the place where it has burnt. See **ESCHAROTICS**, **CAUSTICS**, and **CAUTERY**.

ESCHAROTICS *, medicines, which being applied externally, produce *eschars*, or scabs, by burning the flesh. See **ESCHAR**.

* The word is derived from the Greek, *εσχαρος*, *eschar*.

Such are the lapis infernalis, red precipitate, &c.—These are also called *caustics*.

ESCHEAT, in law, signifies lands, or other profits, falling to a lord within his manor, either by way of forfeiture, or the death of his tenant dying without heir general or special, or leaving his heir within age, and unmarried.

The civilians call such *escheats*, or forfeitures, *bona caduca*; and in the same sense as we say, the fee is *escheated*, they say *feudum aperitur*.—

The word *escheata* sometimes also signifies a lawful inheritance descending on the heir. But then, it is usually distinguished by the addition of *reita*: as *reita escheata*.

ESCHEAT, is also used for the place or circuit within which the king, or other lord, hath *escheats* of his tenants.

ESCHEAT is also sometimes used for a writ, lying where the tenant having estate of fee simple, in any lands or tenements holden of a superior lord, dies seized, without heir general, or special: in which case, the lord brings this writ against him that possesses the lands, after the death of his tenant; and thereby recovers the same in lieu of his services.

ESCHEATOR, an officer, who anciently took care of the king's *escheats* in the county, and certified them into the exchequer, or chancery.

He was appointed by the lord treasurer, held his office only for one year; nor could any person be *eschator* above once in three years. But this office having its chief dependance on the court of wards, is now out of date.

ESCHEQUER. See the article **EXCHEQUER**.

ESCHEVIN, or **ECHVIN**, *Scabini*, in the French and Dutch polity, a magistrate elected by the inhabitants of a city, to take care of their common concerns, the good order, convenience, and decoration of the city, &c.

At Paris, there is a *prevot*, and four *eschervins*; in most other cities, a *maire*, or mayor, and *eschervins*.—In Languedoc, Provence, and Dauphiné, they are called *consuls*: at Toulouse, *capituls*: and *jurats* at Bourdeaux.

Anciently, the *eschervins* were the assessors, and counsellors of the comites, or judges of cities: on which account they were called in some places, *pairs*, *parers*: they even took cognizance of petty causes themselves.

Du Cange observes, that the judges, and their assessors, who were chose by the inhabitants, were called *scabini*, *eschervins*, and their college, *scabinatum*, or *eschervinage*. He adds, that some authors call them *pacarii*, by reason their office and jurisdiction extended to the securing peace in their city and banlieue, called *pax villæ*.

In Holland, the *scabini*, or *eschervins*: judge of all civil affairs at first hand. They also take cognizance of criminal matters, and if the criminal confess himself guilty, they can see their sentence executed without appeal. They can even give torture.—The number is not the same in all cities: at Amsterdam there are nine, at Rotterdam seven, &c.

ESCHRAKITES, or **ESRAKITES**, a sect of philosophers, among the Mahometans, who adhere to the doctrines and opinions of Plato.

* The word is derived from the Arabic *شراک*, *sharaka*, which in the fourth conjugation *شَرَك* *ashraka*, signifies to shine, glitter like the sun: so that *eschrakite* seems to import illuminated.

The *Eschrakites*, or Mahometan platonists, place their highest good and happiness in the contemplation of the divine majesty; despising the gross imaginations of the Alcoran touching paradise. See **MAHOMETANISM**.

They are very careful in avoiding all vice, they preserve an equal and easy temper, love music, and divert themselves with composing little poems, or spiritual songs.—The *Scheics*, or priests, and the chief among the preachers of the imperial mosques, are *Eschrakites*.

ESCHYNOMENOUS plants. See **ÆSCHYNOMENOUS**.

ESCLAIRCISSEMENT, a French term, which we find retained in some late English writers: It properly signifies the act, or effect of clearing a thing, or rendering it more bright and transparent; being formed from the verb *esclaircir*, to clear, &c.

It is chiefly used in a figurative sense, for an explication of an obliquity, or difficulty.—The *esclaircissement* of difficult passages in the bible, is to be sought for from similar passages, or passages of the like kind occurring in other places.

ESCLATTE, in heraldry, is applied to a thing violently broke.—Thus a bend, or other partition, *esclatté*, is represented torn, or broke off like a shield shattered with the stroke of a battle ax.

ESCORT *, a French term, sometimes used in English authors, to denote a convoy, or company of armed men, attend-

ing some person or thing, in a journey or voyage, to defend or secure it from insults.

* Some derive the word from the Latin *coloris*.

A supply was sent to the camp before Arras, with an *escort* of 1200 men. In times of war, merchant vessels seldom stir much abroad without an *escort* of men of war. People that travel in Turkey generally take Janizaries to *escort* them. After the victory, the general sent the prisoners under a strong *escort* into the neighbouring towns.

ESCOUADE, is usually the third part of a company of foot; so divided for mounting guards, and for the more convenient relieving of one another.—It is equivalent to a brigade of a troop of horse. See **BRIGADE**.

ESCROL, or **SCROLL**, in heraldry, a long slip, as it were of parchment, or paper, whereon a motto is placed.

Leigh observes, that no person, under the degree of a knight, might, long after king Henry V. place his crest on a wreath, as is now usually done, but only on an *esrel*.

ESCU, or **ECU**, the French crown, of 60 sols, or three livres.

The *escu* was thus called by reason the escutcheon, or arms of France, which they call *escu*, was struck thereon.

Emaux de l'Escu. See the article **EMAUX**.

ESCUAGE, or **SCUTAGE**, an ancient kind of knight's service, called also *service of the shield*; the tenant holding, by which, was obliged to follow his lord to the Scottish or Welsh wars, at his own expence. See **SCUTAGE**.

He who held a whole knight's fee, was bound to serve with horse and arms for 40 days: and he who held half a knight's fee, 20 days.

ESCUAGE, is also used for a sum of money, paid by such as held by this tenure, when they neither attended the wars, nor provided another in their room.

ESCUAGE, was also a reasonable aid, demanded by the lord of his tenants, who held of him in knight's service *. See **AID**.

* *Concesserat domino regi ad maritandum plures annos de quibusdam qui tenent de domino iure in capite de feodo iurati 20 libras solvendis*. Matt. Paris. Anno 1242.

ESCULENTS, a term usually applied to vegetables which are fit for food, as artichokes, carrots, turnips, parsnips, calabages, colliflowers, &c.

ESCURIAL, by the Spaniards wrote **ESCORTAL**, a term that occurs pretty frequently in our gazettes, and news papers, for a place of residence of the kings of Spain.

Escorial, originally denotes a little village in Spain, situate in the kingdom of Toledo, seven leagues to the west of Madrid, and nine to the east of Avila; on the side of a chain of mountains, called by some the *Carpetane*, or *Carpentanian* mountains, and by others the *Pyreneans*, as being the branch of the Pyrenean ridge.—Here king Philip II. built a stately monastery of the order of St. Jerom, held by the Spaniards for one of the wonders of the world, and called the *escorial*.

Fa. Francisco de los Padros, in a description thereof, entitled, *descripción breve del monasterio de S. Lorenzo el real del Escorial*, &c. assures us it was built by that prince in memory of the battle of S. Quintin, gained on the day of S. Lawrence, Lorenzo, a famous Spanish Saint, and at his intercession.

The king and queen have their apartments therein; the rest being possessed by the monks.—Whence, many of the great transactions of that court, are dated from the *escorial*.

The *escorial* has a very fine church, to which Philip IV. built a beautiful chapel, called the *pantheon*, or *retendo*, wherein the kings and queens of Spain, who leave any posterity, are interred. The rest being laid in another vault of the same church, together with the infants and other princes.

ESCUTCHEON *, or **SCUTCHEON**, in heraldry, the shield, or coat, wherein the bearing, or arms of any person is represented.

* The word *escutcheon* is formed of the French *escusson*, and that from the Latin *scutum*, shield; which was the place arms were originally bore on, before ever they came on banners; and still, wherever they are placed, it is on something representing the form of a shield.—The Latin *scutum*, no doubt, came originally from the Greek, *εσκή*, *eske*, leather, wherein the shields were usually covered. See **SHIELD**.

The *escutcheon* is of a square figure, excepting the bottom part, which is usually a little rounded, ending in a point in the middle.—See *Tab. Herald. fig. 38*.

Till within a few hundred years, the *escutcheons* of the French and English were triangular: those of the Spaniards, are still quite round at bottom without any point: those of the Italians, are oval: and those of the Germans, in form of ear-toozes.

The ancient *escutcheons* were generally couched, or inclined; and they only began to place them upright, when crowns, &c. were put over them by way of crest.

In France *escusson*, *escutcheons*, was formerly restrained to a shield, or coat, pointed at bottom; by which it was distinguished from the *escu*, which was quite square, and was only allowed to be bore by the counts and viscounts. Those of

Inferior quality were confined to the escutcheon, or pointed escu.

The several parts, and points of the *escutcheon*, have their several names: the point A, for instance, is the *dexter chief point*; B the *middle chief*; and C the *sinister chief point*; D is the *honour point*; E the *sejfe point*; F the *nombil point*; G the *dexter base*, H the *middle*, and I the *sinister base point*.

The *escutcheon* is diversely denominated, according to its divisions. It is called *dexterated*, when the perpendicular line that divides it, is to the right of a third part of the *escutcheon*, *sinisterated*, when on the left: *tierced in pale*, when this line is double, and divides the whole *escutcheon* into three equal parts: *paled*, when incited to the number of six, eight, or ten. A horizontal line makes the *chief*, when at one third part from the top; the *plein*, when at a third from the bottom: and when double, in the middle, at an equal distance from both extremes, it makes the *sejfe*, and the *tierced in sejfe*: when it is multiplied, it denominates it, *sejfed*: when there are 8, or 10 equal spaces, *burrells*: a diagonal from the dexter point, of the chief, to the sinister of the base makes it *tranché*; the contrary, *double*. If it be doubled at equal distances, the first makes *bandé*, and the *tierce in bend*; and the other *barré*, or *tierce in bar*: increasing the number of the first makes *bandé and cotticé*; and increasing that of the second, *barré and traversé*.

ESCUTCHEON, of *pretence*, is an *incutcheon*, or little *escutcheon*, which a man, who has married an heiress, and has issue by her, may bear over his own coat of arms; and in it the arms of his wife: and, in this case, the surviving issue will bear both coats quarterly. See *Tab. Herald. fig. 63*.

ESCUTCHEON-GRAFTING, in gardening. See **ENGRAFTING**.

ESDRAS. See the article **EZRA**.

ESPALIER, in the French gardening, a wall-tree; or a fruit-tree, which is not left to grow at liberty in full air, but has its branches nailed or fastened to a wall, or some other flat surface, near which it is planted; and thus growing, it is made to conform it self to the flat, though unnatural, figure thereof. See **FRUIT-TREE**, **WALL**, &c.

ESPALEERS, in our gardening, are rows of trees, planted regularly round the outside of a garden, or plantation, for the general security thereof, from the violence and injury of the winds; or else only round some part of a garden, for the particular security of a plantation of orange trees, lemon trees, myrtles, or other tender plants; or, lastly for the bounding of borders, walks, avenues, &c.

Espaliers are now come into mighty use, with respect to the first of these intentions: in effect, it is found by experience, that the best brick, or stone walls, are not of themselves sufficient security to fruit-trees, from the ravages of blighting winds.

The reason may be, that being built close and compact, they repel the winds, and by that means damage the tender plants, that lie within the reach of the repulsion. But these *espaliers* serve to deaden the violence of the winds, so as the tender greens, or plants, encompassed by them, rest serene and quiet.

Thus, if the *espaliers*, for instance, be of spruce, fir, holly, or yew, they give way to the force of tempestuous winds beating against them, without occasioning any restitution thereof. Mess. London, and Wife, direct them to be planted at some distance, without the outmost bounds, or walls of gardens, &c. Two, or three rows of trees, they think sufficient, from 18 or 20 to 25 foot a-part. And as to the method, or order, of disposing the trees, the most commodious is where the middle row makes every where equilateral triangles with the extreme rows, in the following manner. See **QUINCUNX**.

The trees recommended for making, or planting, these *espaliers* fences, are the elm, lime, beech, Scotch fir, oak, pine and sycamores; but particularly the two first. For the method of planting them.

As for *espalier hedges*, or hedge rows for defence of tender greens, and plants from destructive winds in the summer season; if there be occasion to use them the first or second year after they are planted, a substantial frame of wood must be made, seven or eight feet high, with posts and rails. And to this *espalier* frame, must the side boughs of the young trees be tied, to cause the *espalier* to thicken the sooner.

For the form of such an *espalier*, it must be oblong, running north and south.—It may be planted with apples, pears, holly, laurel, lime, maple, white-thorn, yew, &c.

To prevent the disorders that might befall *espalier* fruit trees when in blossom, Mr. Bradley mentions a nursery man at Brentford, who having most sorts of fruit in *espaliers*, had portable hedges made of reeds in frames, which he set both at the back, and front of his *espaliers*, as he saw occasion. See Supplement, article **ESPALEIER**.

ESPAULE, **ESPAULEMENT**, &c. in fortification. See **ESPAULE**, **ESPAULEMENT**, &c.

ESPLANADE, in fortification, called also *glacis*, a part which serves the counterescarp, or covert way, for a parapet; being a declivity, or slope of earth, commencing from the top of the counterescarp, and losing itself insensibly in the level of the campaign.

ESPLANADE, also signifies the ground which has been levelled from the glacis of the counterescarp, to the first houses; or the vacant space between the works and the houses of the town.

The term is also applied in the general to any piece of ground which is rendered flat or level, and which before had some eminence that incommoded the place.

ESQUADRILLE, } See the articles } **QUADRIL**.
ESQUADRON, } **SQUADRON**.

ESQUINANCY, in medicine, a disease called also *angina squinancy*, and popularly *quincy*.

ESQUIRE, a title of nobility, next below that of knight, and above that of a simple gentleman.

The origin, both of the name, and the thing, *esquire*, is very dark: the English denomination is confessedly borrowed from the French, *escuyer*; and that from the Latin, *scutum*, shield, as some will have it; or as others, from *scutarius*, or *scutiger*, shield bearer, or from *scuria*, stable, or from *equis*, groom. So many different opinions of the formation of the word, have given rise to as many about the primitive office of *esquires*; unless, perhaps, the latter hath given occasion to the former. Paquier, in his *Recherches*, L. II. C. 15. maintains the title of *esquire*, *escuyer*, *scutarius*, to be very ancient. From the time of the declension of the Roman empire, he observes; there were two extraordinary kinds of soldiery, in the Roman army; the one called *gentiles*, and the other *scutarii*.

Ammian. Marcellin, L. XIV. C. 7. and L. XVI. C. 4. speaks of these *scutarii* as men of redoubted prowess; and even deemed invincible. It is added, that Julian the apostate set a mighty value on those troops, when he was in the Gauls: and hence, probably, it was, that the Gauls, or perhaps, only the Franks, finding the bravest among the Roman forces were called *gentiles*, and *scutarii*, gave the like names to the boldest and bravest among themselves: such, according to that curious antiquary, is the origin of *esquires*.

Esquire, however, afterwards came to be used in a somewhat different sense, viz. for a gentleman who attended a knight in the wars, and on other military occasions; bearing his shield, *scutum*, before him (whence he was called *scutarius*, *scutiger*, or *scutifer*) as also his lance, and other weapons: whence his other Latin appellation, usual among us, *armiger*, q. d. armourer-bearer.—And hence likewise it is, that in all our ancient romances, the hero is constantly attended by a gentle, and trusty *squire*.

After all, the most probable derivation of *escuyer*, is not from *escu*, *scutum*, as is the common opinion, but from *equus*, horse, the primitive *esquires* being no other than what the Latins call *equifones*, who had the care and intendance of the equeries, or stables only.

Be this as it will, the title *esquire*, *armiger*, as now established among us, is the next below that of knight, *equus*. They who bear this title, are all younger sons of noblemen, and the eldest sons of such younger sons; the eldest sons of knights, and their eldest sons (successively); the four *esquires* of the king's body; and *esquires* created by the king, by putting about their necks a collar of S S's, and bestowing on them a pair of silver spurs. Lastly, diverse others in the superior public offices, are reputed *esquires*, or equal to *esquires*; as sheriffs of counties, serjeants at law, justices of peace, mayors of towns, counsellors at law, batchelors of divinity, law, physick, &c. though none of them are really so: lastly, the heads of some ancient families are likewise *esquires* by prescription.

ESQUISSE, in the French painting, a term signifying the first slight sketch, or draught of a picture; the first thought of a design drawn hastily with a crayon, or in colours on paper, canvas, or the like; in order to be finished, and painted or engraven afterwards.

He had not the trouble of making a finished, and correct design; but went to work upon the *esquisse*.—The word is formed of the Italian *schizzo*, a splash; by reason an *esquisse* of a painting only represents, as it were splashes, or dabs of colours.

ESRAKITES. See the article **ESCHRAKITES**.

ESSÉANS. See the article **ESSENI**.

ESSART *, or **ASSART**. See the article **ASSART**.

* Du Cange derives the word from some of the Barbarous Latin words, *exartus*, *exartum*, *essartum*, *essartum*, *fortatus*, and *fortus*; which all signify a forest cut down, or dug up: though Spelman chafes to deduce it from the Latin *exerium*, torn up, or unrooted: others from *farrire*, to weed. And others, lastly, from *exaro*, I plow, whence *exarare*, and, by contraction, *exartum*. In our ancient law books, *exartum facere in sylva*, is to *essart* a place in a forest.

To *essart*, is to grub up, or extirpate bushes, trees, old roots, stumps, or the like; in order to fit the ground for tillage.

ESSAY *, a trial, or experiment, to prove whether a thing be of the requisite quality, or goodness.

* The word is French, *Essai*, which some authors derive farther from the Latin *examen*.

ESSAY is also used for an attempt, or tentative, to learn whether or no a thing will succeed.

Essays of machines should be made in large; it is not enough that they succeed in little.

ESSAY, in monasteries, is particularly used for a trial which a person makes of the monastic life, in a secular habit.

This *essay* is of one, two, and in some monasteries, of three months.—The *essay* is not reckoned in the noviciate. See PROBATION.

ESSAY, or ASSAY, or simply SAY in coinage. See ASSAY.

ESSAY, in matters of learning, is a peculiar kind of composition; whose character is to be free, easy, and natural; not tied to strict order, or method, nor worked up and finished, like a formal system.

The matter of an *essay* is supposed to consist principally of sudden and occasional reflections, which are to be wrote much at the rate, and in the manner a man thinks; sometimes leaving the subject, and then returning again, as the thoughts happen to arise in the mind.

At least, this has hitherto been the practice; and Montaign, who has got no small reputation by this way of writing, seldom keeps many lines to the subject he proposes: though it is our opinion, that my lord Bacon, in many of his works, is a better pattern in the *essay* kind.

Mr. Locke, however, and a few other authors use *essay* in a feverish sense: the *essay* of human understanding, every body knows is a regular, artful and laboured work.

ESSAY-Master. See the articles MINT, and ASSAY.

ESSE *, in the school philosophy, is used in the same sense with essence: principally for that which is actual, or actually existing.

* The word is pure Latin, being the infinitive of the verb *sum*, I am; whence *esse*, to be.

From *esse* arises *essatum*, a barbarous term, now almost obsolete, signifying that which is endowed with essence, or nature; or affected with the virtue or efficacy of another. Some distinguish *esse* into *real* and *intentional*; and again into *essatum* and *volitum*.

ESSENCE, that which constitutes, or determines the nature of a thing; or which is absolutely necessary to its being what it is.

In philosophy, the *essence* of a thing is defined to be that whereby a thing is distinguished from every other thing.

The Cartesians hold the *essence* of matter to consist in extension; and on that principle, deny that there is any such thing as mere space, or vacuity: but the hypothesis is false, as is shewn under the articles MATTER, SPACE, VACUITY, PLENUM, &c.

Gassendus, and most of the corpuscular philosophers, hold the *essence* of matter to consist in solidity, or impenetrability, or resistance, or more adequately, in a solid impenetrability resisting the touch; which, it must be allowed, of all the properties of matter, seems to have the fairest title to it.

The school philosophers give us two significations of the word *essence*: the first denotes the whole essential perfection of a being, and consequently its entity, with all its intrinsic, or essential, and necessary attributes taken together. In which sense, *essence* may be defined to be all that whereby a thing is, and is what it is. In which case, the *essence* of a thing, is to the thing itself, what humanity, *e. gr.* is to man.

The second signification of *essence*, is that whereby it denotes the principal, and most intimate of all the attributes of a thing; or that which agrees to every such thing, and such alone, and that always, and in such manner, as that the mind, with all its attention, cannot perceive any thing prior thereto. By which, *essence* is distinguished from the essential attributes, *i. e.* from such as flow from its *essence*, or first attribute. Thus, the *essence* of the human mind is commonly supposed to consist in the power of thinking; by reason all its other perfections seem to pre-suppose this; but this pre-supposes none. And thus, the powers of understanding, doubting, assenting, willing, &c. do all flow from the power of thinking; and cannot exist without it, though this may without any of them.

It must be allowed, however, that the essential properties of a thing do so closely cohere, nay, and inhere in the *essence* itself, that it is scarce possible to distinguish the one from the other. Hence, what some urge, that setting aside all the attributes and properties of a thing, and what remains is its *essence*; is a mere chimera. For set aside, *e. gr.* from the mind, the powers of understanding and willing, with the rest of its attributes: and what will there remain to call its *essence*?

It is greatly disputed in the schools, whether the *essences* of created things be eternal: or, whether the *essences*, as well as the existences, had their origin in time? The Cartesians hold, that the *essences* of things depend absolutely on the free concurring will of God.

ESSENCE, in medicine and chymistry, denotes the purest, most subtle and balsamic part of a body, extracted from the rest by means of fire.

Of these there are a great variety, drawn from flowers, fruits, and the like, used on account of their agreeable smells, and tastes, by the apothecaries, perfumers, &c.—The principal are *essence* of rosemary: of turpentine: of anise: of cloves: of cinnamon: and of citron.

The *essences* commonly sold by the perfumers: are only the distilled oils of behn, and of bitter almonds; to which they give the smell of certain flowers, or spices, as violets, jessamy, cinnamon, &c.

The *essences* to be drunk, or mixed with liquors, are of a more elaborate composition: the most usual and best, is prepared with spirit of wine, cloves, cinnamon, mace, long-pepper, and coriander: the whole being put up in a very close vessel, is exposed to the sun for six weeks, or two months, during the day time, and in the night set near the fire.

In winter they use the fire alone: this *essence* being exceedingly strong; it is frequently used only to give a strength to other weaker liquors. After the same manner may the *essences* of ambergrise, musk, &c. be drawn.

The *essence* of odoriferous flowers, to give a fine smell to liquors, are drawn by disposing strata, or layers of the flowers, and of sugar alternately, in a proper vessel, and leaving them to infuse in a cellar for 24 hours; and after that as long in the sun; and lastly, straining or percolating the whole through a sieve, without squeezing the flowers.

ESSENI, ESENEES, or ESSEANS, an ancient sect among the Jews.

Josephus making mention of the several sects among his countrymen; distinguishes three; viz. the Pharisees, Sadducees, and *Esseni*: which last he prefers to the two former, as to their manner of life. He assures us, further, that they were Jews by original; from which it should appear, that S. Epiphanius was mistaken, in ranking them among the Samaritans.

In effect, the *Esseni* appear to have been true Pythagorean philosophers, in every thing that related to their manner of living. For they greatly affected solitude and retirement, and avoided all conversation with women, to devote themselves more entirely to the contemplative life.

The *Esseni* seem to have been among the Jews, what the most retired and austere monks are, or were, among the Christians; which was what gave them their denomination of *Ἰουδαῖοι ἀσκηταί*, *Jewish ascetics*.

Many catholic writers have even deduced the origin of monks from them: building, principally, on what Philo relates of them, who divides them into two branches or sects: the one who married, and the other who lived in celibate.

Josephus seems likewise to have had an eye to these two sorts of *Esseni*. Serrarius, who has wrote very amply on the subject, follows Philo, in making two classes of *Esseni*: the first, are those whom he calls *πραΐσι*, and who lived in community: the second, those called *θερητικοί*, who lived in solitude, and led a life of pure contemplation. He adds, that Josephus only makes mention of the first; passing, untouched, over the contemplative kind, whom Philo calls *Therapeutæ*, and who were principally found in Egypt. See THERAPEUTÆ.

Grotius will have the *esseni* the same with the ancient *ἡσυχασταί*, *hyschastai*, thus called, according to Philo, from their singular piety, humility, and devotion. Among these, Gale observes, it was, that the Hebrew philosophy chiefly flourished. Porphyry is very prolix in his praises of the *esseni*; *ἔστι τοῦτον οἱ Ἰουδαῖοι ἰδούσι μὴν τὸ γινώσκειν, φιλαλήκας*, &c. He represents them as despisers of pleasure, riches, glory, and delicacy, and strenuous retainers to continency, austerity, study, &c. He adds, they decline marriage, and adopt and educate other peoples children in the principles of religion and philosophy: they are all on a level, hold every thing in common. neither buy nor sell, &c. By long habit, they arrived at such a degree of patience, that Porphyry assures us, flames and tortures had not the least effect on them. They scorned to treat their torturers; nor ever shed a tear; but would smile under all their agonies, &c. As to their learning, Philo Judæus, in his treatise, *That every good man is free*, tells us, that they despised logic, as useless to the acquiring of virtue: physics, they left to the sophists and disputers, as judging it to transcend the human faculties; and applied themselves wholly to morality. Porph. *de Abstin.* l. IV. §. 21, seqq. Gale, *Philos. Gener.* l. I. c. 1. §. 11.

Eusebius holds, that the *Esseni* called *Therapeutæ*, were real Christians, or Jews converted by St. Mark; who had embraced this kind of life. Scaliger, on the contrary, maintains, that these *Therapeutæ* were no Christians, but real *Esseni*, who made profession of Judaism. However, he allows of the two kinds of *Esseni* abovementioned. But Valesius, in his notes on Eusebius, absolutely rejects any such distinction: he denies, that the *Therapeutæ* were any real *Esseni*; and that, chiefly, on the authority of Philo himself, who never calls them *Esseni*, and who places the *Esseni* in Judæa and Palestine; whereas

whereas the *Therapeutæ* were spread throughout Greece, Egypt, and other countries.

ESSENTIAL, something that is necessary to constitute a thing, or that has such a connexion with the nature and reason of a thing, that it is found, or supposed, wherever the thing itself is.

Thus, it is *essential* to God to be just. Mr. Locke has overturned that great principle of the Cartesians, that thinking is essential to the soul.

The heart, brain, and spinal marrow, are parts ordinarily supposed *essential* to life, or without which life cannot be; yet we have instances in history, of children being found, and alive, without almost any of those parts. See **BRAIN**, &c.

ESSENTIAL Oils, are such as are really contained in a plant, and are drawn from it by distillation, in an alembic, with water; they are thus called in contradistinction to empyreumatic oils, which are raised by a naked fire without water.

ESSENTIAL Properties, are such as necessarily depend on, and are connected with, the nature and *essence* of any thing, so as to be inseparable from it: in distinction from *accidental*.

ESSENTIAL Salts, are those prepared from decoctions; or those which are found crystallized in the juices or infusions of plants; in contradistinction from those made by incineration. See **SALT**.

ESSENTIAL Fever,

ESSENTIAL Form,

ESSENTIAL Mode,

ESSENTIAL Part,

ESSENTIAL Perfection,

ESSOIN *, or **ESSOIGN**, in law, an excuse for him who being summoned to appear and answer to an action real, or to perform suit to a court baron, &c. cannot attend by reason of some legitimate hindrance.

* The word is formed of the French *essoin*, or *exaigne*, and that from the barbarous Latin *essonia*, or *exonia*, which signifies the same.

The causes that serve to *essoin*, are diverse; yet they may be reduced to five heads: the first is, *essoin de ultra mare*, when the party is beyond sea: the second, *de terra sancta*, when on an expedition in the holy land: the third, *de malo veniendi*, when he is infirm of body, and cannot come; which is also called, the common *essoin*: the fourth, *essoin de malo lecti*, when the defendant is sick a-bed: the fifth, *de servitio regis*, when he is in the king's service. Horn mentions several other *essoins* touching the service of the king celestial, &c.

Clerk of the ESSOINS. See the article **CLERK**.

ESSORANT, in heraldry, a term used to express a bird standing on the ground with the wings expanded, as if it had been wet, and were drying itself.

ESTANDARD. See the article **STANDARD**.

ESTATE, in law, the tide, or interest a man hath in lands, or tenements.

Estate is either *simple* or *conditional*.

ESTATE simple, called also *fee simple*, is where a man by deed indentured, enfeoffes another in fee, reserving to him and his heirs a yearly rent; with this proviso, that if the rent be behind, &c. it shall be lawful for the feoffor and his heirs, to enter.

ESTATE conditional, is such as hath a condition annexed to it, though it be not specified in writing: e. gr. if a man grant to another, by his deed, the office of park-keeper for life; this *estate* is upon condition in law, viz. if the park-keeper shall so long well and truly keep the park.

Additions of ESTATE.

Base ESTATE.

Personal ESTATE.

Que ESTATE.

Real ESTATE.

ESTATE, or simply **STATE**, denotes also the empire, kingdom, provinces, or extent of lands under the government of any sovereign.

The *estates* of the grand feignior, of the king of Spain, &c. are very extensive: those of the king of France are compact, and well peopled. Italy is cantoned out into a great number of petty *estates*.—We say, ministers of *estate*, secretaries of *estate*, &c.

ESTATE is more particularly applied to the several ranks, or classes of a people assembled together, for concerting measures, reforming public abuses, or composing the disturbances of a state.

In England, the three *estates*, viz. kings, lords, and commons, meet ordinarily in parliament.—In France, the *estates* consist of the churchmen, the nobility, and the people or third *estate*.

Some will have these assemblies of *estates* to be a very ancient constitution: all we know is, that there were general assemblies held in the Gauls, before Cæsar's conquest. But then the people, or third *estate*, had no share in them. Under the 1st and 2d race of the French kings, that were also solemn convocations, called *parliaments*; but it was only the great lords of the realm that were called to them. See **PARLIAMENT**.

ESTATES General.

ESTATES of Holland.

} See { **STATES General**, &c.

ESTERLING, or **EASTERLING**. See **STERLING**.

ESTETE, in heraldry, is used by the French to signify a beast whose head has been, as it were torn off by force; and consequently the neck left rough and rugged: in contradistinction to *deffait*, or *decapite*, where the neck is left smooth; as if the head had been cut off.

ESTHER, a canonical book of the Old Testament; denominated from a celebrated Jewish captive of that name, in Persia, whose beauty preferred her to the bed of Ahasuerus, and the throne of Persia; and who, in that quality, saved her countrymen the Jews, from the death to which Ahasuerus had doomed them, by the counsels of his favourite Haman: the history of which transaction makes the subject of the book of *Esther*.

The critics are divided about the author of this book: S. Epiphanius, S. Augustin, and Isidore, attributes it to Ezra; but Eusebius will have it to be of a later date. Some ascribe it to Joachim, high-priest of the Jews, and grand-son of Josedek. Others will have it composed by an assembly, or synagogue of the Jews, to whom Mordecai wrote letters, informing them of what happened. *Esth.* ix. 29.

But the generality of interpreters, both Hebrew, Greek, Latin, &c. ascribe the book to Mordecai himself: Elias Levita, in his *Masse hamum*, pref. 3. mentions this opinion as unquestionable.

It is chiefly founded on that passage, ch. ix. ver. 20. where it is said, *That Mordecai wrote these things, and sent letters unto all the Jews, That were in all the Provinces*, &c. It is also supposed, that queen Esther herself, might have some share therein; it being expressed in the same chapter, ver. 29. that Esther and Mordecai wrote a second letter by the king's authority, to ordain the solemnizing a yearly feast, called *purim*, that is, day of lots, in commemoration of the Jews being delivered from the lots, or sortes, whereby they had been condemned.

Some will have this book to be only deuterocanonical, or apocryphal. Others contend for its being canonical, as far as chap. x. ver. 3. inclusive; and all the rest deuterocanonical. Of this sentiment are St. Jerom, De Lyra, Dionysius the Carthusian, Cajetan, and others. The council of Trent turned the scale for its being canonical throughout: so that the matter is determined for the catholic countries.

But as to the protestants, they retain to the old opinion, and only admit it as far as the 3d verse of the xth chapter: the rest, to the end of the xvth chapter, is thrown among the apocryphal books. See **DEUTEROCANONICAL**, and **APOCRYPHA**.

ESTIVAL, or **ÆSTIVAL Solstice**. See **SOLSTICE**.

ESTOILE. A *Crofs Estoile*, is a star with only four long rays, in manner of a cross; and accordingly broad in the centre, and terminating in sharp points.

ESTOPPEL *, in law, an impediment, or bar of action growing from a man's own act, or deed; against which a man is forbidden by law to speak, though it be to say the truth. See **BAR**.

* The word is formed of the French, *estopper*, *opplare*, *obstipare*, to stop, or block up.

Goddard defines an *estoppel* to be any bar, or hindrance, to one to plead the truth; and extends it not only to the impediment given by his own act; but by another's also.—There are three kinds of *estoppel*, viz. *matter of record*; by *matter in writing*; and by *matter in pais*.

ESTOVERS, in law, is used by Bracton, for that sustenance, which a man committed for felony, is to have out of his lands, or goods, for himself and his family, during imprisonment.

In stat. 6, Edw. I. it is used for an allowance in meat or clothes.—In some manors, the tenants have *common of estovers*; that is, necessary botes or allowances out of the lord's wood.—In which last sense, *estovers* comprehends *house-bote*, *hay-bote*, and *plow-bote*: so that if a man have in his grant these general words, *de rationabili estoveria in bajis*, &c. he may thereby claim all three.

ESTRADE *, a French term, literally signifying a public road, or high-way. Hence the military phrase, *battre l'estrade*, to beat the *estrade*, that is, to send scouts, or horsemen, to get intelligence, to learn the dispositions of the enemy, and inform the general of every thing like to fall in the way. An army never marches, without sending *battreurs d'estrade* on every side.

* The word is formed of the Italian *strada*, street, or road, which is derived from the Latin *strata*, a paved street. Some derive it from *estradioti*, who were cavaliers anciently employed in beating the *estrade*.

ESTRADE is also used, for a little elevation on the floor of a room, frequently encompassed with an alcove, or rail, for the placing a bed in; and sometimes, as in Turkey, only covered with fine carpets, to receive visitors of distinction in.

ESTRANGEL, **ESTRANGELUS** in the Syriac grammar. *ESTRANGEL character*, is a particular species, or form of Syriac letters; serving as the masculine letters in that language.

Abraham Ecchellenfis, takes the *eftrangel* character, for the true, ancient, Chaldee character. And it is certain, the Abyssinians, who call themselves Chaldeans, still occasionally use the *eftrangel* character; if we may credit Hottinger in his *Theſaur. Philol.* p. 286. Bishop Walton, in his *Prolegomena*, gives us an *eftrangel alphabet*.

ESTRAY, or **STRAY**, ſignifies any tame beaſt found within a lordſhip, and not owned by any man; in which caſe, being cried, according to law, in the market adjoining, if it be not claimed by the owner within a year and a day, it becomes the lord's of the ſoil where found.

ESTREAT, in law, is uſed for the true copy, or duplicate of ſome original writing; eſpecially of amercements, or penalties, ſet down in the rolls of a court, to be levied by the bailiff, or other officer, on every offender.

Clerk of the Eſtreats. See the article **CLERK**.

ESTREPEMENT *, in law, an impoveriſhing, or making of land barren, by continual ploughing and ſowing, without due manuring, reſt, and other huſbandry.

* The word is derived from the French, *eftréper* to maim; or the Latin *extirpare*, to extirpate, root up.

ESTREPEMENT is alſo uſed, for any waſte, or ſpoil made by the tenant for life, upon lands, or woods, to the prejudice of him in reverſion; as the cutting down of trees, or lopping them further than the law allows, &c.

ESTREPEMENT, is alſo a writ which lies in two caſes; the one, when a man having an action depending, as a formedon, writ of right, or the like; ſues, to inhibit the tenant from making waſte during the ſuit.

The other is for the demandant who is adjudged to recover ſeiſin of the land in queſtion; and before execution, for fear of waſte to be made ere he can get poſſeſſion, ſues out this writ.

ESULA, or *cortex ſulæ*, in medicine, the bark of a little reddiſh root, which produces green, narrow, ſucculent leaves.—It is a kind of rithymal or ſpurge, and is found chiefly in France: ere they uſe it, it is infuſed in vinegar; after which, they draw extracts from it, of uſe in the dropſy.

ESURINE Salts, in ſome authors, denote thoſe of a fretting, eating, or corroding nature; which chiefly abound in places near the ſea ſide, and where great quantity of ſea-coal is burnt, as appears from the ſpeedy ruſting of iron in ſuch places.

ETAPPE, in war, an allowance of provisions, and forage made to the ſoldiers, upon march through a kingdom or province, to or from winter quarters.

Hence, he that contracts with the country, or territory, for furniſhing the troops, in their march, is called *etappier*.

ETCHING, a method of engraving on copper; wherein the lines, or ſtrokes, inſtead of being cut with a tool, or graver, are eat with aqua fortis.

Etching was invented much about the ſame time with *engraving* on copper, properly ſo called, by Alb. Durer, and Lucas. It has ſeveral advantages over that art; as, that it is done with more eaſe and expedition; that it requires fewer inſtruments; and even, that it repreſents diſerſe kinds of ſubjects better, and more agreeably to nature, as landſcapes, ruins, grounds, and all ſmall faint, looſe, remote objects, buildings, &c.

The method of *etching* is thus: the plate being well poliſhed, is heated over the fire; and when hot, covered over with a peculiar ground, or varniſh. When cold again, the ground is blackened with the ſmoke of a candle; and on this ground, thus blackened, the back of the deſign, or draught, is laid.

This done, the deſign remains to be calked, or tranſferred upon the plate; which is more eaſily effected, than in the common graving; for the back of the deſign having been before rubbed over with red chalk, nothing remains but to trace over all the lines and ſtrokes of the draught with a needle or point; which preſſing the paper cloſe down to the ground, occasions the wax therein to lay hold of the chalk, and ſo bring off the marks of the ſeveral lines: ſo as at length, to ſhew a copy of the whole deſign in all its correſtneſs.

The draught thus calked, the artiſt proceeds to draw the ſeveral lines, and contours with a point, through the ground, upon the copper.

To finiſh his work, he makes uſe of points of diſerſe ſizes, or bigneſſes; and preſſes on them ſometimes more ſtrongly, and ſometimes more lightly, accordingly as the ſeveral parts of the figures, &c. require a greater or leſs ſtrength or boldneſs; ſome of the points being as fine as needles, for the tender hair ſtrokes, and the remoter, fainter objects; and others again, as big as bodkins, made oval-wiſe, for the deeper ſhadows, and the figures in the front of the work.

Things thus prepared, a rim, or border of wax, is raiſed round the circumference of the plate, and aqua-fortis poured on; which, by the ſaid border, is kept from running off at the edges.

The ground being impenetrable to that corroſive water, the plate is defended from it every where but in the lines, or hatches, cut through it with the points; which, lying open, the water paſſes through them to the copper, and eats into the ſame, to the depth required: which done, it is poured off again.

Of *etching* grounds, it muſt be obſerved, there are two kinds; the one ſoft, and the other hard. There are alſo two kinds of

aqua fortis: the one white, which is only uſed with the ſoft ground, and is applied as above directed: the other green, made of vinegar, common ſalt, ſal ammoniac, and verdegreaſe. This is uſed indifferently with either kind of ground: its application is ſomewhat different from that of the white.

Without making any border, they pour it on the plate, which is placed for that purpoſe a little inclined; and as the water runs off, it is received in a veſſel placed underneath. This they repeat, pouring it again and again, till it has eaten deep enough.

Add, that the aqua fortis, of which kind ſoever it be, muſt not continue equally long, or be poured equally often, on all the parts of the deſign. The remote parts muſt be bitten more ſlightly, than thoſe which are nearer to the view.

To manage this, they have a compoſition of oil and greaſe, wherewith they cover the parts that are to be bitten no further. Or elſe they lay the compoſition on as a defensive at firſt, and take it off again when they find proper. In effect, they are every now and then covering and uncovering this or that part of the deſign, as occaſion requires; the conduct of the aqua fortis being one of the principal concerns in the whole art, and that on which the effect of the whole very much depends. The operator is alſo to be very attentive to the ground, that do not fail or give way, in any part to the water; and where it does, to ſtop up the place with the compoſition aforeſaid.

Laſtly, it is to be remembered, that a freſh dip of aqua fortis be never given, without firſt waſhing out the plate in fair water, and drying it at the fire.

The aqua fortis having done its part, the ground is taken off, and the plate waſhed and dried; after which nothing remains but for the artiſt to examine the work with his graver in his hand, to touch it up, and heighten it, where the aqua fortis &c. has miſſed.

ETERNITY, an attribute of God, whereby the duration of his exiſtence is conceived incommenſurable with time, and excluſive of beginning, progreſs, ending, &c.

Authors are terribly frightened for a proper and juſt definition of *eternity*: that of Boethius *de Conſol. Philoſ.* L. V. Pr. 6. viz. *interminabilis vita, tota ſimul & perfectæ poſſeſſio*, i. e. a perfect poſſeſſion of a whole endleſs exiſtence all together, though retained by S. Thomas, and others, is faulty in diſerſe reſpects.

Cenſorinus, *de Die Natali*, defines *eternity*, by infinite duration, that is, duration which has always been, and always will be.

—Others, more fully deſcribe it by, a duration that exiſts all together, without any flux or ſucceſſion of parts, prior, or poſterior to each other: where, the word *duration*, taken abſtractedly, imports no more than the perſeverance of a thing in its exiſtence; the *to durare*, being here oppoſed to the *to ceſſare*, in exiſtendo.

But ſoften the word duration how you will, it is ſcarce conceivable, but by conceiving a quantity thereof; nor a quantity, without conceiving a ſucceſſion.—Others, therefore define *eternity* by a *perpetuum nunc*, a *perpetual now*; or a *nunc ſemper ſtans*, an *ever-ſtanding now*: but neither are theſe unexceptionable; the words *perpetuum*, and *ſemper ſtans*, importing an obſcure fort of duration. See **DURATION**.

ETESIE, or **ETESIAN Winds**. See **WIND**, and **MONSOON**.

ETHELING, or **ÆTHELING**. See the article **ÆTHELING**.

ETHER. See the article **ÆTHER**.

ETHERIAL Oil. See **ÆTHERIAL Oil**.

ETHICAL Good. } See the articles } **GOOD**.

ETHICAL Poſſible. } } **POSSIBLE**.

ETHICS *, **ἠθικα**, the doctrine of manners; or the ſcience of moral philoſophy. See **PHILOSOPHY**, and **MORALITY**.

* The word is formed from *ἠθος*, *nḗn*, *mores*, manners; by reaſon the ſcope, or object thereof, is to form the manners.

Gale makes *ethics* only the firſt part, or branch of moral philoſophy, viz. that which regards private perſons, or in a private capacity.

By manners, or morals, is here meant a way, or manner of living, confirmed by cuſtom, or habit; or certain habitudes of doing; or actions which are often repeated; which, if they be according to right reaſon, the morals, or manners, are ſaid to be good; otherwiſe evil and vicious.

Hence, the object of *ethics*, is the exerciſe of right reaſon in all our affairs, actions and relations; or it is man himſelf conſidered as dirigible, and to be conducted according to reaſon: and the end of *ethics*, is to make him good and happy. For that if a man conduct himſelf, according to right reaſon, in all the circumſtances of his actions, affairs and relations, he will arrive at the higheſt pitch of moral perfection and beatitude.

Whence, *ethics* may be defined, a right manner of thinking, in order to attain to human felicity; or a ſcience whereby man is directed to conduct his will, and the actions thereof, ſo as to live well and happily. See **WILL**.

The principal, nay, the only topics thereof, are happineſs and manners; whence ariſe two parts, or branches of *ethics*; the firſt on moral happineſs, conſidered as the end; and the

ſecond

Second on moral virtues, or good manners, as the means to arrive therat.

ETHIOPROSCOPTÆ *, in antiquity, the name of a sect.—Damascenus, in his treatise of heresies, tells us, that the denomination *Ethioproscoptæ* was given to such as erred in matters of morality, and things relating to practice, that were to be done, or be avoided, &c. who blamed things laudable, and good in themselves, or recommended or practised things evil.—On this footing the *Ethioproscoptæ*, though a numerous body, were no particular sect.

* The word is formed of the Greek, ἠθῶν, *manners*, and προσκοπῶν, *offendo*, I offend.

ETHIOPIC Year. See the article **YEAR**.

ETHMOIDAL, ETHMOIDALS, in anatomy, a denomination given to one of the futures of the human cranium.

The common futures are those which separate the bone of the cranium from those of the cheeks; and are four: the transverse, *ethmoidal*, sphenoidal, and zygomatical. See **SUTURE**. The *ethmoidal* takes its denomination from its turning round the os ethmoides.

ETHMOIDES *, ΕΘΜΟΙΔΗΣ, in anatomy, a bone situate in the middle of the basis of the forehead, or os frontis, and at the top of the root of the nose; filling almost the whole cavity of the nostrils.

* It has its name from ἠθῶν, *cribrum*, sieve, and εἶδος, *form*, because all spongy, and porous.

By its cribrous part it is joined to the head; by the spongy part, to the cavity of the nostrils; and by the plain and broad part, to the orbits of the eyes.

In the cribrous part is an apophysis, which jets out, in a point, into the cavity of the skull; called from its figure, *crista galli*, or the cock's comb. From its under side, there goes a thin bone, which divides the cavity of the nostrils into two, called the *vomere*. It is perforated by a number of small holes, through which the fibres of the olfactory nerves pass.

J. Philip Ingrassias, a Sicilian, who flourished about the year 1546, was the first who gave a just account of the structure of the os ethmoides or cribriform.

ETHNARCHA *, ΕΘΝΑΡΧΗ, a governor, or ruler of a nation.

* The word is Greek, formed of εἶνος, *nation*, and ἀρχή, *command*.

There are some medals of Herod I. furnished the great, on one side whereof is found ἩΡΩΔΟΥ, and on the other ΕΘΝΑΡΧΟΥ, *g. d. Herod the ethnarch*: Now, after the battle of Philippi, we read that Anthony passing over into Syria, constituted Herod and Phasael his brother tetrarchs, and in that quality committed to them the administration of the affairs of Judea, Jos. Ant. L. XIV. C. 23. Herod therefore had the government of the province before ever the Parthians entered Syria, or before Antigonus's invasion, which did not happen till six or seven years after Herod was commander in Galilee. Jos. L. XIV. C. 24. 25.—Consequently, Herod was then truly *ethnarch*; for he can be no otherwise denominated: so that it must have been in that space of time that the medals were struck which only give him this title. Which medals are a confirmation of what we read in history of the government that prince was intrusted withal before he was raised to the royalty.

Josephus gives Herod the appellation of *tetrarch*, in lieu of that of *ethnarch*; but the two terms came so near to each other, that it was very easy to confound them together.

Though Herod the great left by will, to Archelaus, all Judea, Samaria, and Idumæa; yet, Josephus tells us, he was then only called *ethnarch*.

ETHNOPHRONES *, in antiquity, a sect of heretics in the VIIth century, who made a profession of christianity, but joined thereto all the ceremonies and follies of paganism, as judicial astrology, fortileges, auguries, and other divinations.

* And hence their denomination; from εἶνος, *nation*, and φρονέω, *thought, sentiment*, *g. d. paganizers*, or persons, whose thoughts, or sentiments were still heathen or gentile.

They practised all the expiations of the gentiles, celebrated all their feasts, and observed all their days, months, times, and seasons. See Damascenus, *Heref. N. 94*.

ETHOPEIA *, or ΕΘΟΡΕΙΑ, in rhetoric, called also **ETHOLOGY**, a draught, or description, expressing the manners, passions, genius, tempers, aims, &c. of another person.

* The word is of Greek original, being formed of ἠθῶν, *mos, consuetudo*, and ὁμοίωσις, *facio, fingo, describo*. Quintilian, L. IX. C. 2. calls this figure *imitatio morum alienorum*; and in Greek, *ὑμῶν, imitation*.—In English we denominate it a *picture, or character*.

Such is that beautiful passage in Sallust, in his *Bellum Catilinarium*, wherein he gives us a picture of Catiline: *sui magna vi & animi & corporis sed ingenio malo pravoque huic*, &c. He had an uncommon strength both of body and mind; but an ill-turned, and wicked disposition. When a very

VOL. I.

boy, his great pleasure was in intestine broils, rapine; slaughter, and civil discord. His body was formed to undergo fasting, cold, and watching, beyond all belief. His mind was daring, deceitful and various; and could imitate, or accommodate itself to every body: he was extremely covetous of other people's goods; and profuse of his own. His lusts and desires were very high; his stock of eloquence considerable; but his discretion scarce any.

The *ethopeia* is divided into *protoprographia*, and *ethopeia* properly so called; the former of which is a picture of the body, countenance, make, dress, gait, &c. and the latter of the mind.

ETYMOLOGY *, ΕΤΥΜΟΛΟΓΙΑ, that part of grammar which considers, deduces, and explains the origin, reason, and derivation of words; in order to arrive at their first, and primary signification.

* The word is formed of the Greek, εἶναι, *verus*, true, and λέγω, *dico*, I speak; whence λεγόμενος, *dictor*, &c. and thence Cicero calls the etymology, *notatio*, and *verborum*; though Quintilian chuses rather to call it *originatio*.

In all ages there have been people curious in *etymologies*: Varro has wrote on the *etymology* of the Latin words; and we have a Greek *etymologicon*, under the name of Nicas.

The *etymologies* of our English words have been deduced from the Saxon, Welsh, Walloon, Danish, Latin, Greek, &c. by Somner, Camden, Verstegan, Spelman, Casaubon, Skinner, Henlshaw, Junius, &c.

Those of the French and Italian words; by Menage, in what he calls his *origines*: Henry Stephens, Tripot, Borel, Caneuue, &c. have also laboured on the French *etymologies*. Guichard, and Fa. Thomassin, have carried the *etymologies* of abundance of French words as high as the Hebrew. Fostel had the same design before them.

We have a Latin *etymologicon* of Gerard Vossius; another of Martinus, &c. Octavio Ferrati has given a body of *etymologies* of the Italian tongue: and Bernard d'Aldetta, another of the Spanish.

Fa. Dom. Pezron, abbot of Charmoye, and priest of the Sorbonne, has traced up to the Celtic Language the *etymologies* of abundance of Greek, Latin, German, French; and other words used by Plato, Servius, Donatus, and other Latin authors, without knowing their true origin, and *etymology*, for want of being acquainted with the roots of the Celtic tongue; from which abundance of Greek, Latin, &c. words are derived. It must be added, that his *etymologies* are frequently so far fetched, that one can scarce see any resemblance, or correspondence at all.

A strict, and solicitous enquiry into *etymologies*; is no frivolous and impertinent design; but has considerable uses: Nations, who value themselves on their antiquity, have always looked on the antiquity of their language as one of the best titles they could plead. The *etymologists*, by seeking the true, and original reason of the notions and ideas annexed to each word, and expression, may often furnish an argument of antiquity from the vestigia, or traces remaining thereof; and from the indices still subsisting in the present use of the words, compared with the ancient uses.

Add, that *etymologies* are necessary to the thorough understanding of a language: for, to explain a term precisely, there seems a necessity of recurring to its first imposition, in order to speak justly and satisfactorily thereof. The force and extent of a word is generally better conceived, and entered into, when a person knows its origin and *etymology*.

It is objected, however, that the art is arbitrary, and built altogether on conjectures and appearances; and the *etymologists* are charged with deriving their words from where-ever they list. But the science is certainly real, and as regular as diverse others; having its proper principles, and as regular a diverse method.

It must be owned, indeed, that it is no easy matter to return into the ancient British, and Gaulish ages; to follow, as it were by the track, the diverse imperceptible alterations a language has undergone from age to age. A sober *etymologist* has need of all the lights he can come at, to conduct and bring down words variously disguised in their passage, and remark all the changes that have befallen them. And as those alterations have sometimes been owing to caprice, or hazard, it is easy to take a mere imagination, or conjecture, for a regular analogy; so that it is nothing strange the public should be prejudiced against a science which seems to stand on so precarious a footing.

EVACUANTS, in medicine; remedies proper to expel, or carry off any ill, peccant, or redundant humours, in the animal body; by the proper outlets, or emunctories.

Of *evacuants*, there are diverse kinds, distinguished according to their various humours, and emunctories. Some, *g. gr.* carry off their matters by stool, called *purgatives*, or *cathartics*. Others by urine, called *diuretics*. Others by perspiration, called *diaphoretics*. (See **DIAPHORETICS**.) Others by sweat, called *sudorifics*. Others by the mouth, called *emetics*, or *emetics*. Others by the salival glands, as *siologues*; and

others, lastly, by the menses and Lochia, as *Enimenagogues* and *aristobolus*.

EVACUATION, in medicine, a diminution of the animal fluids, in order to a discharge of some morbid, or redundant matters therein; or only for the sake of thinning, attenuating, and promoting the motion, and circulation thereof. The matter of a disease, or what is prescribed by art to remove or ease it, is evacuated two ways.—1°. By the naturalemuntories, or out-lets of the skin; the nostrils, mouth, fauces, oesophagus, stomach, intestines, bladder, and urethra. And 2°. by artificial out-lets, made either in the blood-vessels; as by phlebotomy, arteriotomy, scarifications, and leeches. Or, in the lymphatic vessels; as by caustics and vesicatories. Or, lastly, in both, as by issues, setons, ulcers, fistula's, &c. Hence, the first division of *evacuants* is derived from the different emunctories; and the second, from the diversity of matters evacuated through them.

Most of the chronic diseases, the infirmities of old age, and the short periods of the lives of Englishmen, Dr. Cheyne observes, are owing to repletion. This is evident from hence; that *evacuation* of one kind or another, is nine parts in ten of their remedy: for not only cupping, bleeding, blistering, issues, purging, vomiting and sweating, are manifest *evacuations*, or drains, to draw out what has been superfluously taken down; but even abstinence, exercise, alteratives, cordials, blisters, &c. are but several means to dispose the gross humours, so be more readily *evacuated* by insensible perspiration. *Essay on health*.

For the periodical *evacuations* of women. See **MENSES**.—For the *evacuations* of women after delivery. See **LOCHIA**. **EVACUATION** is likewise used in the art of war: where, to *evacuate a place*, is to make the garrison quit, or march out of it, in order for another power to take possession of it; or to make room for another garrison.

EVANGELICAL Harmony, } See **HARMONY**,
EVANGELICAL Oeconomy, } See **OECONOMY**.
EVANGELISTS *, the inspired authors of the Gospels.

* The word is derived from the Greek, *euangeliston*, formed of *eu*, bene, well, and *angelos*, angel, messenger.—*O saaves epistolae tuas uno tempore mihi datas duas! quibus evangelia tua reddam nescio; deberi quidem plane fateor. Cic. ad Attic.*

The denomination *evangelists* was likewise given, in the ancient church, to such as preached the gospel up and down; without being attached to any particular church.

In which sense, some interpreters think it is, that St. Philip, who was one of the seven deacons, is called the *evangelist*, in the 21st chapter of the *Acts of the Apostles*, ver. 8. Again, St. Paul writing to Timothy, Ep. 2. C. IV. v. 5. bids him do the work of an *evangelist*.—The same Apostle, Eph. IV. 11. ranks the *evangelists* after the apostles, and prophets. Hence, M. Tillemont takes the liberty to use the word *evangelist* in the same sense. * Most of those who then embraced the faith, being filled with the love of a holy philosophy, began to distribute their goods to the poor, and after that went into diverse countries to do the office of *evangelists*, to preach Christ to such as had not yet heard of him, and to furnish them with the sacred writings of the gospel.

EVANID, a name which some authors give to those colours which are transient, or not of long duration.—As those in the rain-bow, in clouds before and after sun-set, &c. *Evanid* colours are the same with those otherwise called *fantastical*, and *emphatical* colours. Some authors also use the same term to express those flowers of plants whose petals fall off as soon as they are opened.

EVANTES *, in antiquity, the priestesses of Bacchus; thus called, by reason, in celebrating the Orgia, they ran about as if distracted, crying *evan, evan, obé evan!*

* The word is formed from *Evay*, a tide, or appellation of Bacchus.

EVAPORATION, in philosophy, the act of exhaling the humidity of a body; or of dissipating it in fumes, or vapour. Common salt is formed by evaporating all the humidity in the salt-water, or brine; which *evaporation* is either performed by the heat of the sun, as in the salt-works by the sea-coast, &c. or by means of fire, as at the salt springs, &c.

By the observations of M. Sedileau it appears, that what is raised in vapour, exceeds that which falls in rain. Though the *evaporation* of fluids be generally looked on as an effect of the heat, and motion of the air; yet M. Gaucheron, in the *Memoires de l'Acad. des Scienc. An. 1705*. shews, that a quite opposite cause may have the same effect; and that fluids lose a deal more of their parts in the severest frost, than when the air is moderately warm. In the great frost of the year 1708, he found, that the greater the cold, still the more considerable the *evaporation*; and that ice itself lost full as much as the warmer liquors that did not freeze.

Dr. Halley furnishes us with some experiments of the quantity, or measure of the *evaporation* of water.—The result is contained in the following articles:

1. That water salted to about the same degree as salt water, and exposed to a heat equal to that of a summer's day, did, from a circular surface of about eight inches diameter, *evaporate* at the rate of 6 ounces in 24 hours. Whence, by a calculus, he finds, that the thickness of the pellicle, or skin of water, *evaporated* in two hours, was the 53d part of an inch: But, for a round number, he supposes it only a 60th part; and argues thence, that if water as warm as the air in summer, *evaporates* the thickness of one 60th part of an inch in two hours, from its whole surface; in twelve hours it will exhale one tenth of an inch. Which quantity, he observes, will be found abundantly sufficient to furnish all the rains, springs, dews, &c.

In effect, on this principle, every ten square inches of the surface of the water, yield in vapour, *per diem*, a cubic inch of water; and each square foot half a wine pint; every space of four foot square, a gallon; a mile square 6914 tons; and a square degree, suppose of 69 English miles, will *evaporate* 33 millions of tons a day.

2°. A surface of eight square inches *evaporated*, purely by the natural warmth of the weather without either wind or sun, in the course of a whole year, 16292 grains of water, or 64 cubic inches; consequently, the depth of water thus *evaporated* in one year amounts to 8 inches. But this being much too little to answer the experiments of the French, who found that it rained 19 inches of water in one year at Paris; or those of Mr. Townley, who found the annual quantity of rain in Lancashire, above 40 inches: He concludes, that the sun and wind contribute more to *evaporation*, than any internal heat, or agitation of the water.

3°. The effect of the wind is very considerable, on a double account. For the same observations shew a very odd quality in the vapours of water, *viz.* that of adhering and hanging to the surface that exhales them, which they clothe, as it were, with a fleece of vaporous air; which once investing the vapour, it thenceforwards rises in much less quantity. Whence, the quantity of water lost in 24 hours, when the air was very still from winds, was very small; in proportion to what went away when there was a strong gale of wind abroad to dissipate the fleece, and make room for the emission of vapour: and this, even though the experiment was made in a place as close from the wind as could be contrived.

Add, that this fleece of water hanging on the surface of waters in still weather, is the occasion of very strange appearances, by the refraction of the vapour's differing form, and exceeding that of common air. Whence every thing appears raised, as houses like steeples, ships as on land above the water, the land raised and as it were lifted from the sea, &c.

4°. The same experiments shew, that the *evaporation* in May, June, July, and August, which are nearly equal, are about three times as great as those in the months of November, December, January, and February.

EVAPORATION, in pharmacy, denotes an operation by which the more aqueous and volatile parts of fluids are spent, or drove away in steam; so as to leave the remaining part stronger, or of a higher consistence than before.

Evaporation differs from *exhalation*, in that the former is practised on moist things, and the latter on dry.

Evaporation is effected by setting a liquor over a gentle heat, to carry off the moist fluid, and volatile parts, without lessening the quantity of the other matters the liquor is impregnated withal.

EVATES, a branch, or division of the ancient celtic philosophers the druids.

Strabo distributes the philosophers among the Britons and Gauls, into three sects: *Bardoi, bardis, Oualis, evates*, and *Aquilas, druids*. He adds, that the *bardi* were poets and musicians: the *evates*, priests and naturalists; and the *druids*, moralists as well as naturalists.—But Marcellinus, Vollius, and Hornius, reduce them all to two sects, *viz.* *bardi* and *druids*.—Lastly, Cæsar lib 6. comprehends them all under the names of *Druids*.

The *evates*, or *vates*, of Strabo, might probably be what other authors, and particularly Ammian. Marcellin. calls *eubages*: but Mr. Bouche, in his *Hist. de Provence*, L. II. c. 2 distinguishes between them. The *vates*, he says, were such as took care of the sacrifices, and other ceremonies of religion; and the *eubages*, those who spent their time in the search and contemplation of the great mysteries of nature.

EUBAGES, an order of priests, or philosophers, among the ancient Celts, or Gauls.—Chorier takes the *eubages* to be the same with the druids and sacerdotes of Diolorus: others will have, the *eubages* to be those whom Strabo, L. IV. p. 197. calls *Oualis, evates*, or *vates*: on which principal there

there is room to conjecture, that the word should be wrote *Ouafes*; it being easy to mistake a T for a U.

Be this as it will, the *eubages* appear to have been a different order from the druids. See *DRUID*.

EUCHARIST *, *eucharistia*, the sacrament of the supper; or a participation of the body, and blood of Christ, under the species, or figures of bread and wine. See *COMMUNION*, *SACRAMENT*, *SPECIES*, *TRANSUBSTANTIATION*, and *CONSUBSTANTIATION*.

* The word in its original Greek, *Eucharista*, literally imports *thanksgiving*; being formed of *eu*, bene, well, and *charis*, gratia, thanks.

EUCHITES, or *EUCHITÆ*, a sect of ancient heretics, thus called, by reason they prayed without ceasing; imagining that prayer alone was sufficient to save them.

Their great foundation, were those words of St. Paul, Epist. I. to the Theſſalon. C. 5. V. 17. *pray without ceasing*.

The word is formed of the Greek, *ευχη*, prayer; whence *ευχισται*, the same with the Latin *precatores*, prayers. They were also called *Enthufasts* and *Masilians*.

St. Cyril of Alexandria, in one of his letters, takes occasion to censure certain monks in Egypt, who, under pretence of resigning themselves wholly to prayer, led a lazy, scandalous life. The originals, however, lay a further charge on the *Euchites*, or *Masilians*.

EUCHOLOGIUM, *ΕΥΧΟΛΟΓΙΟΝ*, a Greek term, signifying, literally, a *discourse on prayer*.

The word is formed of *ευχη*, prayer, and *λογος*, discourse.

The *euchologium* is properly the Greek ritual, wherein is prescribed the order, and manner of every thing relating to the order and administration of their ceremonies, sacraments, ordinations, &c.

Fa. Goar has given us an edition of the Greek *euchologium* in Greek and Latin, with notes, at Paris.

EUCRASY, an agreeable, well proportioned mixture of qualities; whereby a body is said to be in good order, and disposed for a good state of health.

EUDOXIANS, a party or sect of heretics, in the IVth century, so denominated from their leader *Eudoxius*, patriarch of Antioch and Constantinople, a great defender of the Arian doctrine.

The *Eudoxians* adhered to the errors of the Arians and Eunomians; maintaining, that the son was created out of nothing; that he had a will distinct and different from that of the father, &c.

EVE. See the article *VIGIL*.

EVECTION, is used by some astronomers for the liberation of the moon. See *LIBRATION*.

EVEN *foot* in poetry. See *FOOT*.

EVEN number, is that which may be divided into two equal parts, or moieties. See *NUMBER*.

EVENLY even number, is that which is exactly divisible by an even number taken an even number of times; such is 32; since divisible by eight, taken four times.

EVENLY odd number, is that which an even number measures by an odd one; as 30, which is measured by 6, taken five times.

EVERARDS *sliding rule*. See the article *SLIDING*.

EVERGETES, *ΕΥΕΡΕΤΗΣ*, a Greek term, signifying *benefactor*; being formed of *eu*, bene, well, and *εργον*, opus, work.—It is still retained in our language, by way of addition, or epithet, given to two princes, or kings of Syria, and Egypt, who succeeded Alexander. Thus we say, Ptolemy *Evergetes* king of Egypt; Antiochus *Evergetes* king of Syria ascended the throne 139 years before Christ.

EVER-GREENS, a class of perennials, which continue their verdure, leaves, &c. all the year.

Of these, our gardeners reckon twelve, which are peculiarly fit for English air, viz. the alaternus, arbutus, bay-tree, box-tree, holly, juniper, laurustinus, phyllirea, pyracantha or ever-green thorn, italian green privet, and the yew-tree.

EVIDENCE, a quality in things whereby they become visible, and apparent to the eyes, either of the body, or the mind.

The schoolmen distinguish *evidence* into *formal* and *objective*.

Formal EVIDENCE, is the act of the intellect, considered as clear and distinct.

Objective EVIDENCE, consists in the clearness, and perspicuity of the object; or it is the object itself, so constituted, as that it may be clearly, and distinctly known.

Others divide *evidence* into *moral*, *physical*, and *metaphysical*.—A thing is said to be *morally evident*, so far as I have a distinct notion, or knowledge thereof, by unexceptionable witnesses: *physically*, so far as natural sense and reason pointing out any thing, convinces me thereof: *metaphysically*, when I enter so fully and clearly into the essence of any thing, that nothing can be clearer.

Evidence, is the essential and infallible character, or criterion of truth; and is that, in effect, which with us constitutes truth.

If *evidence* should be found in propositions that are false, we

should be compelled into error; since the assent we give to *evidence* is necessary. Whence would follow this impious position, that God who made us, is the author of our errors, as he has constituted us so, as to put us under a necessity of falling into them.

It may be added, that as we necessarily love truth, and hate error, it seems inconsistent with the nature of a beneficent being, to furnish us with a love of what we could not obtain, or not know, whether we did obtain it or not; beside, that if we should err in things that are *evident*, as well as in those that are not so, we should sometimes find contradictions in *evident* propositions, as we commonly do in things that are obscure.

Evidence therefore must be allowed the mark of truth; and those things must be allowed true, which carry with them such a degree of *evidence*, as obliges us to assent to them. Whatever we see *evidently* agreeable to things whereof we speak, that we must acknowledge to be true.

The Epicureans allow of no other *evidence* but that of sense or that arising from sense, (it being a fundamental with them, that sense is the first and primary criterion of all truth.)

By *evidence* of sense, they mean that species, or image exhibited by the sense, or phantasia; which, when all impediments to a just judging, as distance, motion, medium, &c. are removed, cannot be contradicted, or gain-said. Wherefore, the question being put, whether or no a thing be such as it appears; the answer is not to be given, till it have been tried and examined all the ways, and by all the senses that it can be an object of.

EVIDENCE, in law, is any proof, whether by testimony of men on oath, or by writings and records.

It is thus called, because the point in issue is hereby made *evident* to the jury.

Sir Tho. Smith refrains *evidence* to authentic writings of contracts, written, sealed, and delivered. *De Rep. Angl.* lib. II.

EVIL, *Malum*, in ethics, a privation, or absence of some proper, or necessary good; or of some due measure, or degree thereof.

The schoolmen deny, that any thing is every way *evil*; and refrain all *evil*, to be only so, *quoad hoc*; i. e. as the thing wants this, or that degree of a certain quality, necessary to constitute it, in that respect good. There is nothing *evil*, say they, without some good in it, wherein the *evil* relides as in its subject, for, as every being depends on the supreme being, it cannot but be good, as flowing from the supreme good.

Evil is either *natural* or *moral*; between which there is this relation, that moral *evil* produces natural.

Moral Evil, is defined a deviation from right reason, and consequently from the will and intendment of the great legislator, who gave us that as a rule.—This the philosophers call *inhonestum* and *turpe*, as staining the image of God, and furling our original beauty; likewise *malum culpæ*.

Natural Evil, is a want of something necessary to the *bonæ effe*, or perfection of a thing, or to its answering all its purposes.—Such are defects of the body, blindness, lameness, hunger, diseases, death.—This species is denominated, *triste*, *injunctum*, *noxium*; and *malum pænæ*.

Again, *evil* is either *absolute*, as envy, impiety, &c. or *relative*, as meat, which in it self being good, may be *evil* to a man on account of some disease; as wine to a feverish person, &c.

Thus far the schools have gone in the nature and reason of moral and natural *evil*; a late ingenious author sets the thing in another light, and furnishes a much finer, and more adequate theory of moral good and *evil*, in his inquiry into the origin of our ideas of beauty and virtue.

Moral evil, according to this philosopher, denotes our idea of a quality apprehended in actions which excites aversion and dislike towards the actor, even from persons who receive no disadvantage thereby: as moral goodness denotes our idea of a contrary quality which procures approbation and love towards the actor, even in persons unconcerned in its natural tendency. This notion supposes an universally acknowledged difference of good and *evil*, from natural. Moral good, we all know, procures love towards those we apprehend it related to it: whereas natural good does not. How differently, for instance, are we affected towards those we suppose possessed of honesty, faith, generosity, &c. when we expect to benefit from those qualities: and those possessed of the natural good, as houses, lands, gardens, health, strength, &c. So, whatever quality we apprehend morally *evil*, raises our hatred towards the person in whom we observe it; as treachery, cruelty, ingratitude, &c. Whereas we love and prize any exposed to natural *evils*, as pain, hunger, sickness, &c.

The origin of these different ideas of action, has greatly puzzled the moralists: the generality make it a necessary condition, that love, the source of them all; we approve the virtuous actions,

as it has some small tendency to our happiness, either from its own nature, or from this general consideration; that a conformity to nature and reason is in the general advantageous to the whole, and to us in particular: and, on the contrary, disapprove the vice of others, as tending at the long run to our particular detriment.

Others suppose an immediate *natural evil*, in the actions called *vicious*; that is, that we are determined to perceive some deformity or displeasure in such actions, without reflecting on any disadvantage that may any way redound to us from the action; and that we have a secret sense of pleasure accompanying such of our own actions as are called *virtuous*, when we expect no further advantage from them: but then they add, that we are excited to perform those actions, even as we pursue or purchase pictures, statues, landscapes, &c. from self-interest, to obtain the pleasure which accompanies the action.

But the author just mentioned has shewn the mistake: some actions, he proves, have to men an immediate goodness, and others an *immediate evil*, i. e. we perceive pleasure in some, and pain in others, and are determined to love, or hate the doers, without any view of natural advantage, without any view to future rewards or punishments, or even without any intention to obtain the sensible pleasure of the good; but from a very different principle, viz. an internal moral sense, or a natural determination of the mind to receive amiable, or disagreeable ideas of actions, when they shall occur to our observation, antecedently to any opinion of advantage or loss to redound to our selves from them; even as we are pleased with a regular form or an harmonious composition, without any knowledge of the mathematics, or seeing any advantage in that form or composition, different from the immediate pleasure. See farther under the articles *SENSE*, *GOOD*, *VIRTUE*, and *VICE*.

EVIL, or Kings-EVIL, in medicine, a disease by the physicians called *brucina*, and *scrophula*, consisting in scirrhous tumours, arising most commonly about the neck, but some also on the other glandulous parts, as the breast, arm-pits, groin, &c.

The kings of England and France, have, of a long time, pretended to the privilege of curing the *kings-evil* by *touching*. The right, or faculty, it is said by some, was originally inherent in the French kings; and those of England only claimed it, as an appendage, or appurtenant to that crown, to which they laid a claim. But some of our own monkish writers set the thing on a different footing; and will have it to have been practised by our kings, as early as Edward the confessor; which opinion the ingenious Mr. Becket has abundantly overthrown.

Raoul de Pruelles addressing his translation of St. Augustin *de civitate Dei*, to Charles V. of France, says expressly, *vos devanciers, & vous avez telle vertu & puissance que vous est donnée & attribuée de dieu, que vous faites miracles en votre vie, telles, si grandes & si apertes que vous guerissez d'une très horrible maladie que s'appelle les escrouelles* [i. e. the *kings-evil*] *de laquelle nul autre prince terrien ne peut guerir hors vous*.

Steven de Conti, a religious of Corbie, who lived in the year 1400, and wrote a history of France still preserved in MS. in the library of St. Germain des Prez, describes the practice of touching for the *evil*. After the king had heard mass, a vessel of water was brought him, and his majesty having put up his prayers before the altar, touched the diseased part with his hand, and washed it with water.

Matthew Paris will have S. Louis the first who practised it: others contend, that king Robert was the first who was gifted this way. It is certain, we find no mention of any such prerogative, before the kings of the 11th century, when that prince reigned. Fa. Daniel, *hist. de France*, T. I. p. 1032. Polydore Virgil strains hard to prove the same virtue in the kings of England. Favyn *hist. de Navarre*, 1062. The continuer of Montfret, observes, that Charles VIII. touched several sick persons at Rome, and cured them, *dont ceux des Italiens, says he, voyant ce mystère ne furent onques si émerveillés*.

The same virtue, we know not on what grounds, is commonly attributed to a seventh son, born without any daughter between; as also to the chiefs of certain particular families; particularly, to the eldest person of the house of Aumont in Burgundy.

Hungry EVIL. See the article *HUNGRY*.

EULOGY *, **EULOGIA**, in church-history. — When the Greeks have cut a loaf, or piece of bread, to consecrate it, they break the rest into little bits, and distribute it among the persons who have not yet communicated, or send it to persons that are absent; and these pieces of bread are what they call *eulogies*.

* The word is Greek, *εὐλογία*, formed of *eu*, bene, well; and *logos*, dico, I say, speak, q. d. *benedictum*, blessed.

The Latin church has had something like *eulogies* for a great many ages; and it was thence arose the use of their holy bread. The name *eulogy*, was likewise given to loaves, or cakes brought to church by the faithful, to have them blessed.

Lastly, the use of the term, passed hence to mere presents made a person, without any benediction. — See the Jesuit Gretser, in his treatise *de Benedictionibus & Maledictionibus* l. II. c. 22, 24, &c. whereof he treats *eulogies* thoroughly.

From a passage in Bollandus, on the life of S. Melaine, c. 4. it appears, that *eulogies* were not only of bread, but any kind of meat blessed, and hallowed for that purpose. Add, that almost every body blessed and distributed *eulogies*; not only bishops and priests, but even hermits, though laymen, made a practice of it. Women also would sometimes send *eulogies*, as appears from the life of S. Waulry, c. 3. N°. 14. in the Bollandists, *Acta Sancti Jan.* T. 1. p. 20.

The wine sent as a present, was also held an *eulogy*. Bollandus remarks further, that the eucharist itself was called *eulogy*. *Act. Sancti Jan.* T. 2. p. 199.

EUNOMIANS, a sect of heretics, denominated from Eumnius, bishop of Cyzicus, who, in the IVth century, maintained most of the errors of Arius, and added others to them; as, particularly, that he knew God, as well as God knew himself.

He re-baptized such as had already been baptized in the name of the trinity: he had dissembled his errors for some time, but having at length made a discovery, he was expelled his see.

The Arians endeavoured to have put him into that of Samolata, but could not effect it: in lieu thereof, the emperor Valens restored him to Cyzicus.

EUNOMIOEUPSYCHIANS, a sect of heretics of the IVth century, mentioned by Nicephorus, l. XII. c. 30. being the same with those called *Eutychiens* by Sozomen, l. VII. c. 17.

The author hereof, according to Sozomen, was an Eunomian, named Eutyclus, and not Euppsychius, as Nicephorus has it: and yet this latter writer only copies Sozomen in this passage; so that it is past doubt, they both speak of the same sect. But on whose side the error lies, is not easy to decide: Valesius durst not undertake to shew it; but contented himself to mark the difference in his notes on Sozomen, as Fa. Fronto has done on Nicephorus.

EUNUCH *, **ΕΥΝΟΥΧΟΣ**, a term applied, in the general, to all who have not the faculty of generating, either through imbecility, or frigidity; but more particularly to such as have been castrated, or have lost the parts necessary thereto.

* The word is formed of *ευνν* *ευνν*, q. d. *lecti curam habet, guardian, or keeper of the bed*.

In England, France, &c. *eunuchs* are never made but on occasion of some disease, which renders such an operation necessary; but in Italy, they make *eunuchs*, for the sake of preserving the voice; and, in the east, they make *eunuchs* to be guards, or attendants on their women.

Great numbers of children, from one to three years of age, are yearly castrated in Italy, to supply the operas and theatres, not only of Italy, but other parts of Europe, with fingers: though it is not one in three, that after having lost their virility, have a good voice for a recompence.

Tavernier assures us, that in the kingdom of Boutan in the East-Indies, there are every year made twenty thousand *eunuchs*, and sold thence into other countries.

The seraglio's of the eastern emperors, are chiefly served, and guarded by *eunuchs*. And yet we have very good testimonies, that the rich *eunuchs* in Persia and other countries, keep seraglio's for their own use.

By an arret of the grand chamber of Paris in 1665, it is adjudged, that an *eunuch* could not marry, not even with the consent of the woman and all the parties on both sides.

Claudian has a very severe satyr against the *eunuch* Eutropius, who had been elected consul of Rome. He represents him as an old woman, dressed up in the honours of the consulate.

The story of Origen is notorious: that learned and pious father upon a too literal interpretation of that passage in St. Matthew, c. xix. ver. 12. where mention is made of, *eunuchs so born from their mother's womb*, — *eunuchs who were made so of men* — and *eunuchs who made themselves eunuchs for the kingdom of heaven*: castrated himself.

In the council of Nice, those were condemned, who, out of an indiscreet zeal, and to guard themselves from sensual pleasures, should make themselves *eunuchs*: such as thus mutilated their bodies, were excluded from holy orders; witness Leoncius bishop of Antioch, who was deposed for having practised this cruelty on himself. And the bishop of Alexandria excommunicated two monks, who had followed his example on pretence of securing themselves from the impetuous motions of concupiscence. Several of the emperors made very severe prohibitions against the making of *eunuchs*, or peoples castrating themselves.

EUNUCHS, **EUNUCHI**, is also the denomination of a sect of heretics in the 3d century, who had the folly, or madness, to castrate not only those of their own persuasion, but even all they could lay hands on.

They took their rise from the example of Origen, who, upon a misunderstanding of our Saviour's words in St. Mat-
thew

threw, made himself an *evanch*, by cutting off the offending part, as some say; or, as others, particularly S. Epiphanius, by the use of certain medicines.—These heretics were also called *Valisians*.

EVOLVENT, in geometry, a term which some writers use for the curve resulting from the evolution of a curve; in contra-distinction to the *evolute*, which is the curve supposed to be opened or evolved.

The *evolute* always both touches and cuts the *evolvent* at the same time: the reason is, that it has two of its infinitely small sides in common with the *evolvent*, or rather exactly placed on two equal sides thereof: one of them within side that of the *evolvent*, i. e. on the concave side thereof; and the other, on the convex side of its correspondent side. So that the *evolute* touches the *evolvent* in two points; whence, instead of being a tangent, it is said to osculate the *evolvent*, and hence it is also called *osculator*, and *circulus osculator*.

There is one, and but one osculator, to each point of the *evolvent*; but to the same point there are an infinity of other circles, which only touch, and do not osculate. The osculator and the *evolute* make no angle in the place where they touch and cut: nor can any curve line be drawn between; as there may betwixt a tangent and a curve.

EVOLUTE, *EVOLUTA*, in the higher geometry, a curve first proposed by Mr. Huygens, and since much studied by the later mathematicians.

The *evolute* is a curve, supposed to be evolved, or opened; and which in opening, describes other curves.

To conceive its origin and formation; suppose a flexible thread, wound exactly over the convexity of any curve, as ABCG, (*Tab. Geometry*, fig. 20.) and suppose the thread fixed in G, and every where else at liberty, to A. Now, beginning to unwind the thread from the point, and continuing it to D, and throughout keeping it tight on the curve surface ABCG; when the thread is become quite straight, and is only a tangent, FG, to the curve in the point G; it is evident the extremity A, in its progress to G, has described another curve line ADEF.

Here, the first curve ABCG is called the *evolute*: each of its tangents BD, CE, &c. comprehended between it, and the curve ADEF, is called a *radius of the evolute*, or *radius of curv*, or *radius osculator* of the curve ADEF, in the respective points D, E, &c. And the circles whereof the osculators BD, CE, &c. are radii, are called *circuli osculatores* of the curve ADEF, in D, E, &c. And lastly, the new curve resulting from the evolution of the first curve, begun in A, is called the *curve of evolution*, or *curve described by evolution*.

The *radius of the EVOLUTE*, then, is the part of the thread comprized between any point where it is a tangent to the *evolute*, and the correspondent point where it terminates in the new curve. Which appellation *radius* is the more proper, as one may actually consider this part of the thread in every step it takes, as if it described an arch of an infinitely small circle, making a part of the new curve, which thus consists of an infinite number of such arches, all described from different centres and with different radii.

Every curve, therefore, may be conceived as formed by the evolution of another. And we are to find that whole evolution formed it, which amounts to the finding the *radius of the evolute* in any point. For, as it is always a tangent to the generating curve, it is properly no more than one of its infinitely small parts, or sides prolonged; and all its sides, whose position are determined of course, are no other than the generating curve it self.

The same thread is also called *radius curvædinis*, or *radius osculi*, by reason a circle described hereby, from the centre G, is said to osculate or kiss it; as both touching and cutting at the same time, i. e. touching both the inside and the out.

Hence, 1^o. The *evolute* BCF, (*fig. 21.*) is the place of all the centres of the circle that osculate the curve AM described by evolution. 2^o. When the point B, falls on A, the *radius of the evolute* MC, is equal to the arch BC; or to the aggregate of AB, and the arch BC. 3^o. Since the element of the arch Mm, in the curve described by evolution, is an arch of a circle described by the radius CM; the *radius of the evolute* CM is perpendicular to the curve AM. 4^o. Since the *radius* by the *evolute* MC, is always a tangent to the *evolute* BCF; curves by evolution may be described through innumerable points, if only tangents be produced in their several points of the *evolute*, till they become equal to their correspondent arches.

The finding of the *radii of evolutes*, is a thing of great importance in the higher speculations of geometry; and even, sometimes, is of use in practice, as the inventor of the whole theory, Huygens, has shewn in applying it to the pendulum. Horol. *Ofcill.* part 3.—The doctrine of the *oscula of evolutes*, is owing to M. Leibnitz; who first shewed the use of *evolutes* in the measuring of curves.

To find the *radius of the evolute* in the diverse kinds of curves, with equations to the *evolutes*, See Wolf, *Elem. Math.* Vol. I.

Tom. I. p. 524, *segg.* Or the *Infinim.* Pet. ter of M. le Marquis de l'Hopital.

Since the *radius of an evolute* is either equal to an arch of the *evolute*, or exceeds it by some given quantity; all the arches of *evolutes* may be rectified geometrically, whose radii may be exhibited by geometrical constructions; whence we see why an arch of a cycloid is double its chord: the *radius of the epicycle* being double the same; and the *evolute* of a cycloid, being it self a cycloid.

M. Varignon has applied the doctrine of the *radius of the evolute* to that of central forces; so that having the *radius of the evolute* of any curve, one may find the value of the central force of a body, which moving in that curve, is found in the same point where that *radius* terminates: or reciprocally, having the central force given, the *radius of the evolute* may be determined. *Hist. de l'Acad. Roy. des Sciences*, An. 1706.

Imperfect EVOLUTE. M. Reaumur has given a new kind of *evolute* under this denomination. Hitherto, the mathematicians had only considered the perpendiculars let fall on the points of the convex side of the curve: if other lines, not perpendicular, were drawn upon the same points, provided they were all drawn under the same angle, the effect would be the same; that is, the oblique lines would all intersect within the curve, and by their intersections, form the infinitely small side of a new curve, whereof they would be to many tangents.

This curve would be a sort of *evolute*, and would have its radii; but, an imperfect *evolute*, since the radii are not perpendicular to the first curve. *Hist. de l'Acad. Sci.* An. 1709.

EVOLUTION*, in geometry, the unfolding, or opening, of a curve, and making it describe an *evolvent*. See *EVOLVENT*.

* The word is Latin, *evolutio*, formed of the preposition *e*, out, and *volvo*, I roll or wind, *q. d.* an unwinding, or unravelling.

The equable *evolution* of the periphery of a circle, or other curve, is such a gradual approach of the circumference to rectitude, as that all its parts do all concur, and equally evolve, or unbend; so that the same line becomes successively a less arch, of a reciprocally greater circle, till at last they change into a straight line. In *Philos. Transact.* N^o. 260, a new quadratrix to the circle, is found by this means; being the curve described by the equable *evolution* of its periphery.

EVOLUTION is also used for the extraction of roots out of powers.

In which sense it stands contrary to *involution*.

EVOLUTION, in the art of war, is a term applied to the diverse figures, turns, and motions, made by a body of soldiers, either in ranging themselves in form of battle, or in changing their form; and this whether in the way of exercise, or in time of an actual engagement.

It is by the *evolutions*, that the form, and posture of a battalion, squadron, &c. are changed; either to make good the ground they are upon, or to possess themselves of another, that they may attack the enemy, or receive an onset more advantageously.

The *military evolutions*, are conversions, countermarches, or wheelings, doublings of rank or file, &c.

Fa. Holte, a Jesuit in 1697, printed a treatise of *naval evolutions*, in folio.—By *naval evolutions* he means the motions made by a fleet, squadron, or naval armament, in order to put themselves into a proper disposition for attacking the enemy, or defending themselves with the most advantage.

EUPHONY*, *ΕΥΦΩΝΙΑ*, in grammar, an easiness, smoothness, and elegance of pronunciation.

* The word is Greek, formed of *eu*, bene, well; and *φωνη*, vox, voice. Quintilian calls *euphonia*, *suavitas*; Scaliger, *facilis pronuntiatio*.

Euphonia is properly a kind of figure, whereby we suppress a too harsh letter, or convert it into a smoother, contrary to the ordinary rules. There are examples enough in all languages.

EUPHORBIVM, *ΕΥΦΟΡΙΟΝ*, in pharmacy, a kind of gum, brought from Africa, in little roundish pieces, whitish when new, and yellowish when old, very pungent to the taste, but void of smell.

The principal use of *euphorbium*, is external; it is a great ingredient in diverse resolutive plaisters, as well as in tincture, and powder for stopping of gangrenes, cleansing of foul ulcers, and exfoliating carious bones.

Internally taken, it is a purgative, but so violent a one, that it is almost out of use, as tearing off the necessary mucus or covering of the stomach and bowels, and occasioning dysenteries. Yet we are told the Africans use it very commonly; but they first quench its fire in pusillan water.

Its powder is a violent sternutatory, and to be used very cautiously, and never alone, but mixed with a small quantity of some other powder, to guard against its intolerable acrimony.

The gum we call *euphorbium*, is formed of the juice of a plant,

plant, of the same name, pretty frequent in Mauritania; though the species of the plant, has been greatly controverted. The generality of our late botanists, make it a thorny, fucculent plant; and Mr. Professor Hermannus calls it the *tibymalus mauritanicus aphyllus angulosus & spinosus*. Hort. Acad. Lug. Batav. 598.

It has no leaves; but in lieu thereof puts forth along its stem a kind of long prickly eyes, or buds. Which buds, it is, that yield that gummy juice, called *euphorbium officinarum*. See Bradl. *Hist. of Succul. Plants*, dec. 2. p. 4. and dec. 5. p. 12.

Some authors will have it, that the gum is drawn from the plant by incision; others, on the contrary, say it oozes spontaneously: the juice, we are told, is so very subtle, and penetrating, that the person who taps the plant, is forced to stand at a good distance, and make the incision with a long pike; otherwise it gets to the brain, and occasions dangerous inflammations. It oozes out in great abundance, and is gathered in a sheep's skin, wrapped round the plant.

Pliny tells us, that the first discovery of *euphorbium* is attributed to Juba king of Lybia, who denominated it from *Euphorbus* his physician, brother of Musa, physician to Augustus. Et Muller assures us, that the plant, which yielded the *euphorbium* of the ancients, is now unknown to us; but if we go by Pliny's description, the plant called *schadida calli*, in the *Hortus malabaricus*, must be the ancient *euphorbium*. This discovery is owing to Commelinus, a burgher-master of Amsterdam, and professor of botany.

EUPHORY, signifies the same as *eucrasy*. See EVCRASY.

EUPSYCHIANS. See EUNOMIOEUPSYCHIANS.

EURIPUS, ΕΥΡΙΠΟΣ, in hydrography, properly signifies a certain strait of the sea, between Boeotia, and Euboea; where the currents are so strong, that the sea is said to ebb and flow seven times a day: in which place, as the story commonly goes, Aristotle drowned himself, out of chagrin, for not being able to account for so unusual a motion.

EURIPUS has since become a general name for all straits where the water is in great motion, and agitation.

The ancient circus's had their *euripi*, which were no other than pits, or ditches, on each side of the course; into which it was very dangerous falling with their horses and chariots, as they run races. The term *euripus* was more particularly applied by the Romans to three canals, or ditches, which encompassed the circus on three sides; and which were filled occasionally, to represent Naumachia, or sea battles.

The same people called their smaller fountains, or canals in their gardens, *euripus's*; and their largest, as cascades, &c. *niles*.

EURO-Notus. }

EUROPEAN Hours. See the article HOUR.

EUROPEAN Ocean. See the article OCEAN.

EURYTHMY *, ΕΥΡΥΘΜΙΑ, in architecture, painting, and sculpture, a certain majesty, elegance, and easiness appearing in the composition of diverse members, or parts of a body, building, or painting; and resulting from the fine proportions thereof.

* The word is Greek, and signifies literally a consonance, or fine agreement, or as we may call it, a harmony of all the parts; being compounded of *eu*, well, and *ρυθμος*, rhythmus, cadence, or agreement of numbers, sounds, or the like things.

Vitruvius ranks *eurythmia* among the essential parts of architecture: he describes it as consisting in the beauty of the construction, or assemblage of the several parts of the work, which render its aspect, or whole appearance graceful: *e. gr.* when the height corresponds to the breadth, and the breadth to the length, &c.

From these three ideas, (or designs, *viz.* orthography, scenography, and profile) it is, that same *eurythmy*, majestica, and *venusta species ædificii*, does result; which creates that agreeable harmony between the several dimensions; so as nothing seems disproportionate, too long for this, or too broad for that, or corresponds in a just and regular symmetry, and consent of all the parts with the whole. Evelyn's *Account of Archit.* &c.

EUSEBIANS, a denomination given to the sect of Arians, on account of the favour and countenance, which Eusebius bishop of Cæsarea shewed, and procured for them at their first rise. See ARIANS.

EUSTATHIANS, a name given to the Catholics of Antioch, in the IVth century; on occasion of their refusal to acknowledge any other bishop beside S. Eustathius, deposed by the Arians.

The denomination was given them during the episcopate of Paulinus, whom the Arians substituted to S. Eustathius, about the year 330, when they began to hold their assemblies apart. About the year 350, Leontius of Phrygia, called the *eunuch*, who was an Arian, and was put in the see of Antioch, desired the *Eustathians* to perform their service in his church; which they accepting, the church of Antioch served indifferently both the Arians and Catholics.

This, we are told, gave occasion to two institutions, which have subsisted in the church ever since: the first was psalmody in two choirs; though, M. Baillet thinks, that if they instituted an alternate psalmody between two choirs, it was between two Catholic choirs; and not by way of response to an Arian choir. The second was the doxology, *Gloria be to the Father, and the Son, and the Holy Ghost*.

This conduct, which seemed to imply a kind of communion with the Arians, gave great offence to abundance of Catholics, who began to hold separate meetings; and thus formed the schism of Antioch. Upon this, the rest, who continued to meet in the church, ceased to be called *Eustathians*, and that appellation became restrained to the dissenting party.

S. Flavianus, bishop of Antioch in 381, and one of his successors, Alexander in 482, brought to pass a coalition, or reunion, between the *Eustathians* and the body of the church of Antioch, described with much solemnity by Theodoret, *Ecl.* l. III. c. 2.

EUSTATHIANS, was also a sect of heretics, in the IVth century; denominated from their author *Eustathius*, a monk so foolishly fond of his own profession, that he condemned all other conditions of life.

He excluded married people from salvation; prohibited his followers from praying in their houses; and obliged them to quit all they had, as incompatible with the hopes of heaven.

He drew them out of the other assemblies of Christians, to hold secret ones with him; and made them wear a particular habit: he appointed them to fast on Sundays; and taught them that the ordinary fasts of the church were needless, after they had attained to a certain degree of purity, which he pretended to. He shewed a world of horror for chapels built in honour of martyrs, and the assemblies held therein.

Several women, seduced by his reasons, forsook their husbands, and abundance of slaves deserted their masters houses. He was condemned in the year 342, at the council of Gangra, in Paphlagonia.

EUSTYLE *, in architecture, a kind of edifice, where the columns are placed at a most convenient distance one from another; the intercolumniations being all just two diameters and a quarter, of the column; except those in the middle of the fronts before and behind, which are three diameters distant. — See *Tab. Archit.* fig. 44.

* The word is Greek, being formed of *eu*, bene, well, and *στυλ*, column.

The *eustyle* is a medium between the pycnostyle, and aræostyle.

Vitruvius, l. III. c. 2. observes, that the *eustyle* is the most approved of all the manners of intercolumniation; and that it surpasses all the rest, in convenience, beauty, and strength.

EUTYCHIANs, ancient heretics, who denied the duplicity of natures in Christ; thus denominated from *Eutyches* the archimandrite, or abbot of a monastery at Constantinople.

The aversion *Eutyches* bore to the heresy of Nestorius, threw him into another extreme, not less dangerous than that he so warmly opposed; though some passages in St. Cyril, which raised the unity of the person of Jesus Christ very high, contributed, likewise, to his delusion.

At first he held, that the *logos*, word, brought his body down with him from heaven: which was a near approach to the heresy of Apollinarius; and though he afterwards testified the contrary in a synod at Constantinople, wherein he was condemned; yet he could not be brought to acknowledge, that the body of Jesus Christ was consubstantial with ours.

In effect, he did not seem quite steady, and consistent in his sentiments; for he appeared to allow of two natures, even before the union; which was apparently a consequence he drew from the principles of the platonic philosophy, which supposes a pre-existence of souls: accordingly, he believed that the soul of Jesus Christ had been united to the divinity before the incarnation; but then he allowed no distinction of natures in Jesus Christ, since his incarnation.

See the dissertation of Fa. Hardouin, *de Sacramento Altaris*, wherein that jesuit endeavours to unfold all the sentiments of the *Eutychians*.

This heresy was first condemned in a synod held at Constantinople, by Flavian in 448: and re-examined, and fulminated in the general council of Chalcedon in 451. The legates of pope Leo, who assisted thereat, maintained, that it was not enough to define that there were two natures in Jesus Christ, but insisted strenuously, that to remove all equivocations, they must add these terms, *without being changed, or confounded, or divided*.

But this decree of the council of Chalcedon, at which assisted upwards of 360 prelates, did not stop the progress of *Eutychianism*: some bishops of Egypt, who had attended at the council, upon their return, proclaimed openly, that St. Cyril had been condemned, and Nestorius acquitted therein: which occasioned great disorders; several persons, under pretence of contending for the sentiments of St. Cyril, making no scruple of weakening the authority of the council of Chalcedon.

The heresy of the *Eutychians*, which made a very great progress

gress throughout the east, at length became divided into several branches. Nicephorus makes mention of, no fewer than twelve: some called *Schematici*, or *Apparentes*, as only attributing to Jesus Christ, a phantom, or appearance of flesh, and no real flesh: others *Theodisians*, from Theodotus bishop of Alexandria: others, *Jacobites*, from one James, *Jacobus*, of Syria; which branch established itself principally in Armenia, where it still subsists.

Others were called *Acephali*, q. d. without head, and *Severians*, from a monk called *Severus*, who seized on the see of Antioch in 513.

These last were subdivided into five factions, viz. *Agnoetes*, who attributed some ignorance to Jesus Christ: the followers of Paul: *Melanius*, that is, the black Angelites, thus called from the place where they were assembled: lastly, *Adrites*, and *Conovites*.

EUTYCHIANS, was also the name of another sect half Arian, half Eunomian; which arose at Constantinople, in the IVth century.

It being then a matter of mighty controversy among the Eunomians at Constantinople, whether or no the Son of God knew the last day and hour of the world, particularly with regard to that passage in the gospel of St. Matthew, c. xxiv. ver. 36. Or rather that in St. Mark, xiii. 32. where it is expressed, that the Son did not know it, but the Father only: *Eutyebi* made no scruple to maintain, even in writing, that the Son did know it: which sentiment displeasing the leaders of the Eunomian party, he separated from them, and made a journey to Eunomius, who was then in exile. That heretic acquiesced fully in *Eutybius's* doctrine, that the Son was not ignorant of any thing the Father knew, and admitted him to his communion; Eunomius dying soon after, the chief of the Eunomians at Constantinople, refused to admit *Eutybius*; who, upon this, formed a particular sect of such as adhered to him, called *Eutybians*.

This same *Eutybius*, with one Theophrastus, as was said in *Sozomen's* time, were the occasions of all the changes made by the Eunomians in the administration of baptism; which consisted, according to Nicephorus, in only using one immersion, and not doing it in the name of the trinity, but in memory of the death of Jesus Christ.

Nicephorus calls the chief of this sect, not *Eutybius*, but *Euphybius*, and his followers *eunomioeuphybians*.

EWRY, an office in the king's household, where they take care of the linen for the king's table; lay the cloth, and serve up water in silver ewers after dinner: whence the office takes its name.

EXACERBATION, the same as *paroxysm*. See **PAROXYSM**.

EXACHORD. See the article **HEXACHORD**.

EXACTION, in law, a wrong done by an officer, or one pretending to have authority, in taking a reward or fee, for that which the law allows not.

The difference between *exaction* and *extortion* consists in this, that extortion is where the officer takes more than his due; and *exaction*, where he wrests a fee or reward, where none is due.

EXAGON. See the article **HEXAGON**.

EXÆRESIS*, in chirurgery, an operation whereby something foreign, useless, and even pernicious, is taken from the human body.

* The word is Greek, *ἐξαιρέσις*, which signifies the same.

The *exæresis* is performed two ways.—By *extraction*, when something formed in the body is drawn out of the same.—And by *detractio*, when something is taken away, that had been introduced into the body from without. See **LITHOTOMY**, &c.

EXAGGERATION*, in rhetoric, a figure, whereby we enlarge, or heighten things; making them appear more than they really are, whether as to goodness, badness, or other qualities.

* The word is formed of the Latin, *exaggero*, I exaggerate: which is a compound of *ex*, and *agger*, a mound, or elevation of earth.

EXAGGERATION, in painting, is a method of representing things, wherein they are loaded too much, or marked too strongly; whether in respect of the design, or the colouring.

Exaggerating differs from *caricaturing*, in that the latter perverts, or gives a turn to the features, &c. of a face, which they had not; whereas the former only improves, or heightens upon what they had.

The latter is a kind of burlesque on the object, and is generally meant to ridicule. The former is usually an exalting, or enlivening of the beauties of the object beyond what nature allows. The painter is obliged to have recourse to an *exaggeration* of colours, both on account of the surface of his ground, the distance of his work, and of time and the air which diminish and weaken the force of the colours. But this *exaggeration* must be conducted in such manner, as not to put the objects out of their natural characters. De Piles.

EXALTATION, *Elevation*, is chiefly used in a figurative sense, for the raising, or advancing a person to some ecclesiastical dignity; and particularly, to the papacy.

The term *exaltation*, is in some measure appropriated to the pope, and expresses his inauguration, coronation, taking possession, and the beginning of his pontificate.

EXALTATION of the Cross, **EXALTATIO CRUCIS**, is a feast of the Romish church, held on the 14th of September; memory, as is generally supposed, of this, that the emperor Heraclius brought back the true cross of Jesus Christ on his shoulders, to the place on mount Calvary, from which it had been carried away fourteen years before, by Cosroe king of Persia, at his taking of Jerusalem, under the reign of the emperor Phocas.

The cross was delivered up, by a treaty of peace made with Siroe, Cosroe's son.—The institution of this feast is commonly said to have been signalized by a miracle; in that Heraclius could not stir out of Jerusalem with the cross, while he had the imperial vestments on, enriched with gold and precious stones; but bore it with ease in a common dress.

But long before the empire of Heraclius, there had been a feast of the same denomination observed both in the Greek and Latin churches, on occasion of what our Saviour said in St. John xii. 32. *And I, if I be exalted, or lifted up, will draw all men unto me.* And again, in ch. viii. ver 26. *When ye have exalted, or lift up the son of man, then shall ye know that I am he.* Fa. Du Soulier assures us, that M. Chastelain was of opinion, this feast had been instituted, at least at Jerusalem, 240 years before Heraclius.

The feast of the dedication of the temple built by Constantine, was held, says Nicephorus, on the 14th of September, the day the temple had been consecrated on, in the year 335; and this feast was also called, the *exaltation of the cross*, by reason it was a ceremony therein, for the bishop of Jerusalem to ascend a high place built by Constantine for that purpose, in manner of a pulpit, called by the Greeks, the *sanctus mysterium of God*, or the *holiness of God*; and there hoist up the cross for all the people to see it.

EXALTATION, in physics, denotes the act, or operation of elevating, purifying, subtilizing, or perfecting any natural body, its principles and parts; also, the quality, or disposition, which bodies acquire by such operation.

The term *exaltation*, is peculiarly affected by the chymists and alchymists, who imagining it to have some extraordinary emphasis, are employing it at every turn.—Most sulphurous matters, much *exalted*, are observed to be of a red colour.

It is this *exhalation* of the sulphurous part in straw berries, that gives them their agreeable, vinous taste. Lemeray.—A gentle and temperate heat of the body, *exalts* and disengages the more volatile parts of our food, and disposes them for nutrition.

EXALTATION, in astrology, is a dignity which a planet acquires in certain signs, or parts of the zodiac; which dignity is supposed to give it an extraordinary virtue, efficacy, and influence.—The opposite sign, or part of the zodiac, is called the *dejection* of the planet.

Thus, the fifteenth degree of Cancer, is the *exaltation* of Jupiter, according to Albumazar, by reason it was the ascendant of that planet at the time of the creation: that of the sun is in the 19th degree of Aries; and its dejection in Libra: that of the moon, is in Taurus, &c.—Ptolemy gives the reason hereof in his first book *de Quadrup.*

EXAMEN, or **EXAMINATION**, an exact, and careful search, or inquiry; in order to discover the truth, or falsehood, of a thing.

The way of authority is, without comparison, more easy, and better proportioned to the reach and capacity of simple man, than the way of discussion and *examen*. Nicole.

Such a person had his house robbed; and has made a severe *examination* of all his domestics, to find out the criminal. A student stands a rigorous *examination* to be admitted to a degree of matter, bachelor, doctor, &c.

Self-EXAMINATION, is a point much insisted on by divines, and particularly the ancient fathers, by way of preparation to repentance. S. Ignatius reduces it to five points, viz. 1°. A returning of thanks to God for his benefits. 2°. A begging of grace and light to know and distinguish our sins. 3°. A running over all our actions, occupations, thoughts and words, in order to learn what has been offensive to God. 4°. A begging of pardon, and conceiving a sincere sorrow for having displeased him. And, 5°. Making a firm resolution not to offend him any more, and taking the necessary precautions to preserve our selves from it.

EXAMILION, &c. See the article **HEXAMILION**, &c.
EXAMINERS, in chancery, are two officers, whose business is to examine, on oath, the witnesses produced on both sides; upon such interrogatories, as the parties to the suit do exhibit for the purpose.

EXAMPLE, in rhetoric, denotes an imperfect kind of induction, or augmentation; whereby it is proved that a thing which has happened on some other occasion, will happen again on the present one; from the similitude of the cases.

As, "The war of the Thebans, against their neighbours the Phocians, was ruinous; consequently, that of the Athenians against their neighbours, will likewise be fatal."

XANTHEMA*, **EXANHEMA**, in medicine, a preternatural eruption, or efflorescence on the skin.

* The word is formed of the Greek, *ξανθεον*, *effluvisco*, *effloresco*, I flower, or work out.

Exanthemata are of two kinds: the one only a discolouring of the skin; such are the measles, the purple spots in malignant fevers, &c.—The other are little eminences, or papillæ standing out from the skin; such are pustules, small-pox, &c.

EXARCH, **EXARCHUS**, in antiquity, an appellation given, by the emperors of the east, to certain officers sent into Italy, in quality of vicars, or rather prefects, to defend that part of Italy which was yet under their obedience, particularly the city of Ravenna, against the Lombards, who had made themselves masters of the greatest part of the rest.

The residence of the *exarch* was at Ravenna; which city, with that of Rome, were all that was left the emperors.

The first *exarch* was the patrician Boetius, famous for his treatise, *de Consolatione Philosophiæ*; appointed in 568 by the younger Justin. The *exarchs* subsisted about 185 years; and ended in Eutychius; under whose *exarchate*, the city of Ravenna was taken by the Lombard king Aistolphus, or Aistolphus.

Fa. Papebroch, in his *Proptæum ad Acta Sancti Maii*, has a dissertation on the power and office of the *exarch* of Italy, in the election and ordination of the pope.

The emperor Frederic created Heraclius archbishop of Lyons, a descendant of the illustrious house of Montboissier; created him, we say, *exarch* of the whole kingdom of Burgundy: a dignity, till that time, unknown any where but in Italy, particularly in the city of Ravenna. Menestrier. *Hist. de Lyons*.

Homer, Philo, and other ancient authors, give, likewise, the name *exarchus* to the choragus, or master of the fingers, in the ancient choruses; or him who sung first: the word *αρχος*, or *αρχουαι*, signifying equally to begin, and to command.

EXARCH of a diocese was, anciently, the same with *Primate*.—This dignity was inferior to the patriarchal, yet greater than the metropolitan.

EXARCH, also denotes an officer still subsisting in the Greek church; being a kind of deputy, or legat *à latere* of the patriarch; whose office it is to visit the provinces allotted him, in order to inform himself of the lives and manners of the clergy; take cognizance of ecclesiastical causes, the manner of celebrating divine service, the administration of the sacraments, particularly confession; the observance of the canons, monastical discipline, affairs of marriages, divorces, &c. But above all, to take account of the several revenues, which the patriarch receives from several churches; and particularly as to what regards the collecting the same.

The *exarch*, after having greatly enriched himself in his post, frequently rises to the patriarchate itself.

EXARCH, is also used, in the eastern-church antiquity, for a general, or superior over several monasteries; the same that we otherwise call *archimandrite*: being exempted, by the patriarch of Constantinople, from the jurisdiction of the bishops, as are now the generals of the Romish monastic orders.

In 493, Sebas was established *exarch*, or chief of all the anchorites within the territory of Jerusalem. Du Bois.

EXARTICULATION, a dislocation of some of the jointed bones; or a breach of articulation. See **LUXATION**, and **DISLOCATION**.

EXCALCEATION, *Discalceation*, or the act of putting off the shoes.

Among the Hebrews, there was a particular law, whereby a widow, whom her husband's brother refused to marry, had a right to summons him into a court of justice; and upon his refusal, might *excalceate* him, i. e. pull off one of his shoes, and spit in his face: which were both actions of great ignominy among that people.

The house of the person who had undergone them, was thenceforward called *the house of the excalceated*.

EXCAMBIATOR. See **ESCAMBIATOR**, and **EXCHANGE**.

EXCAVATION*, the act of hollowing, or digging a cavity; particularly in the ground.

* The word is originally Latin, *excavatio*, formed of *ex* and *cavus*, hollow, or *cavata*, a pit, &c.

The excavation of the foundations of a building, by the Italians called *cavazioni*, is settled by Palladio at a sixth part of the height of the whole building. Unless there be cellars under ground, in which case he would have it somewhat more. See **FOUNDATION**.

EXCELLENCY, a quality, or title of honour, given to ambassadors, and other persons, who are not qualified for that of highness; as not being princes; and yet are to be elevated above the other inferior dignities.

In England and France, the title is now peculiar to ambassadors; but it is very common in Germany and Italy. Those it was first appropriated to, were the princes of the blood, of the several royal houses; but they quitted it for that of highness, upon several great lords assuming *excellency*.

The ambassadors have only bore it since the year 1593, when Henry IV. of France sent the duke de Nevers, ambassador to the pope; where he was first complimented with *excellency*. After that, the same appellation was given to all the other ambassadors residing at that court: from whence the practice spread through the other courts.

The ambassadors of Venice have only had it since the year 1636, when the emperor and king of Spain consented to allow it them.

The ambassadors of crowned heads, dispute the giving that title to the ambassadors from the princes of Italy; where the practice is not established.

The court of Rome never allow the quality of *excellency* to any ambassador who is a churchman; as judging it a secular title.

The common rules and measures of *excellency* are a little varied with respect to the court of Rome.—The ambassadors of France, at Rome, anciently give the title *excellency* to all the relations of the pope then reigning; to the constable Colonna, to the duke de Bracciano, and the eldest sons of all those lords; as also the dukes Savelli, Cesarini, &c. But they are now more reserved in this respect; though they still treat all the Roman princesses with *excellency*.

The court of Rome in their turn, and the Roman princes, bestow the same title on the chancellor, ministers, and secretaries of state, and presidents of the sovereign courts of France, the presidents of the councils in Spain, the chancellor of Poland, and those on the first dignities of other states, if they be not ecclesiastics.

The word *excellency*, was anciently a title of kings and emperors; accordingly, Anastasius the library-keeper, calls Charlemagne, his *excellency*. The same title is still given to the senate of Venice; where, after saluting the doge under the title of *serenissimo*, the senators are addressed to under your *excellencies*. The *Liber Diurnus Pontif. Rom.* gives the title *excellency* to the Exarchs and Patricians.

The Italians and French have improved on simple *excellency*; and made *excellenssime*, and *excellenssimo*, which have been bestowed on certain popes, kings, &c.

EXCELSIS. See **GLORIA** in *excelsis*.

EXCENTRIC, in geometry, is applied where two circles, or spheres, though contained, in some measure, within each other, yet have not the same centre; and consequently are not parallel: in opposition to *concentric*; where they are parallel, have one and the same common centre.

The sun's orbit is *excentric*, with regard to the globe of our earth; Mars is very *excentric*, with regard to the sun, that is, his motion is about a very different centre.

EXCENTRIC, in the new astronomy, or *excentric circle*, is a circle, as P D A E, (*Tab. Astronom. fig. 1.*) described from the centre of the orbit of the planet C, with half the axis C E, as a radius.

EXCENTRIC, or *excentric circle*, in the ancient Ptolemaic astronomy, was the very orbit of the planet it self, which it was supposed to describe about the earth; and which was conceived *excentric* thereto; called also the *deferent*. See **DEFERENT**.

In lieu of *excentric circles* round the earth; the moderns make the planets describe elliptic orbits round the sun; which accounts for all the irregularities of their motions, and their different distances from the earth, &c. more justly and naturally.

Anomaly of the **EXCENTRIC**, is an arch of the *excentric circle* as A K, intercepted between the aphelion A, and the right line K L, which passing through the centre of the planet K, is drawn perpendicularly to the line of the apides A P.

EXCENTRIC Equation, in the old astronomy, is an angle made by a line drawn from the centre of the earth, with another drawn from the centre of the *excentric*, to the body or place of any planet; the same with the prosthaphæresis; and equal to the difference, (accounted in an arch of the ecliptic) between the sun's, or a planet's, real, and apparent place.

EXCENTRIC Place of a planet, in its orbit, is the place wherein the planet is seen from the sun. See **PLACE**.

EXCENTRIC Place, in the ecliptic, is the point of the ecliptic to which the planet viewed from the sun, is referred. This coincides with the heliocentric place.

EXCENTRICITY, the distance between the centres of two circles, or spheres, which have not the same centre.

EXCENTRICITY, in the old astronomy, is the distance of the centre of the orbit of a planet, from the centre of the earth.

'That the five planets have such an *excentricity*, is allowed on all sides, and may be evinced from several considerations; chiefly this, that Saturn, Jupiter, Mars, Venus, and Mercury, at some times appear larger, and at others less; which can only proceed from hence, that their orbits being *excentric* to the earth, in some parts thereof they are nearer us, and in others more remote.—But as to the *excentricities* of the sun and moon, some dispute has been made.

The moderns many of them hold, that the sun and moon appear sometimes larger, and sometimes less; not that they are nearer us at one time than another, but because they are viewed through different columns of air, which producing a difference in the refraction of their light, may occasion those different appearances. Accordingly, we find very sudden alterations of the apparent magnitude of the moon; where nothing but a change in the air can take place.

Thus Kepler, on the 2d of March, in the year 1588, found the moon's apparent diameter 31 minutes, presently after 32', 2", then 30' 3"; and the preceding day it had been 33'. And again, on the 22d of February, 1591, he observed the moon's diameter twice 31', six times 32', seven times 33', and six times 34'.

They add, that when the sun and moon are in the southern signs, and consequently lower, being then seen through a longer column of dense air, they must appear bigger: consequently, in the winter time, when the sun is in capricorn, being seen through a greater quantity of air, he must appear larger than in summer; when, being nearer our zenith, the quantity of air he is seen through is lesser. And the like may be said of the moon.

But others take the *excentricities* of the sun and moon to be sufficiently proved, both from eclipses; from the moon's greater and less parallax, at the same distance from the zenith; and from the sun's being observed to continue longer in the northern hemisphere, than in the southern, viz. 186 or 187 days in the first, and only 178 or 179 days in the latter.

EXCENTRICITY, in the new astronomy, is the distance of the centre of the orbit of a planet, as C, from the centre of the sun S, i. e. the distance between the centre of the ellipsis and the focus thereof: called also *simple*, or *single excentricity*.

DOUBLE EXCENTRICITY, is the distance between the two foci in the ellipsis; which is equal to twice the *single excentricity*.

To find the *excentricity* of the sun; since the sun's greatest apparent semi-diameter is to his least, as 32' 42" to 31' 38", or as 1963" to 1898"; the sun's greatest distance from the earth will be to his least, as 1963 to 1898. Since then, $PS + SA = PA = 3861$; (Tab. Astron. fig. 1.) the radius of the *excentric* CP, will be found 1935; and consequently $SC = PC - PS = 32$. Wherefore, CP being 10000, CS will be found = 1658.

Hence, as the earth's *excentricity* SC, is scarce the sixteenth part of the radius of the *excentric* CP; the earth's elliptic orbit does not deviate much from a circular one. So that it is no wonder a calculus, made on the foot of an *excentric* circle, should answer near enough to observation. And since the *excentricity*, determined from the difference of the apparent diameters, (in observing which, an error of some minutes cannot easily be avoided) does not seem exact enough; nothing hinders but that the *excentricity*, and the place of the apogee, may be determined on the hypothesis of the *excentric* circle.

EXCEPTION, something reserved, or set aside, and not included in a rule.

It is become proverbial, that there is no rule without an *exception*; intimating, that it is impossible to comprehend all the particular cases under one and the same maxim. But it is dangerous following the *exception*, preferably to the rule.

EXCEPTION, in law, is a stop, or stay to an action.

The term is used indifferently both in the civil, and common law; and in each, *exceptions* are divided into *dilatory* and *peremptory*.

Exception, in a general sense, includes all the kinds of defence, or vindication, which a person, against whom a process is brought, makes use of to prevent, or retard its effect.

The civilians reckon three kinds of *exception*; viz. *declinatory*, whereby the authority of the judge, or court, is disallowed; *dilatory*, intended to defer, or prevent the thing from coming to an issue; and *peremptory*, which are proper and pertinent allegations, founded on some prescription that stands for the defendant; as want of age, or other quality in the party; or other matter, that may be decided without entering into a full discussion of the merits of the cause.

EXCEPTIVE CONJUNCTIONS. See the article CONJUNCTION.

EXCEPTIVE PROPOSITIONS, are those wherein something is affirmed of a whole subject, abating some one of the parts thereof, which is *excepted* by a particle, thence called an *exceptive* particle, or particle of *exception*.

Thus, "all the sects of the ancient philosophers, *except* the

"Platonists, held God to be corporeal: *covetousness* is *inexcusable* in respect of every thing, but *time*."

EXCESS, is distinguished into *natural* and *moral*: the *first*, is a part whereby one quantity is greater than another.—Thus, we say, this line is longer than that; but the *excess* is inconsiderable.

The *latter*, is an intemperance, or going beyond the just bounds and measures precribed for any thing.—Thus, we say, *excess* in wine, women, &c. is prejudicial to the health.

EXCHANGE, *Permutation*; an agreement, whereby one thing is trucked, or given for another.

The first commerce carried on among men, was by *exchange*; people furnishing each other mutually with what things they wanted: but such *exchanges* were clogged with too considerable difficulties. 1^o. On account of the unequal values of commodities; and, 2^o. In that every body had not just what might accommodate him he would *exchange* withal.

To remove these inconveniences, money was invented for a common medium; and instead of *exchanging*, buying and selling was introduced.

Yet there are nations among whom the primitive way of *exchange* still obtains: and even among the most civilized people, there are frequent occasions, whereon they have recourse to this method.—Such, for instance, is the trade of several cities of the north, and Baltic sea, where the French *exchange* their wines and brandies for woods, metals, hempes, and furs.

The commerce of bills of *exchange* is, it self, a mere trading by *exchange*; a truck of money for money; of money, for instance, which I have here at London, for what a merchant, or banker, has at Venice, Rome, Amsterdam, or Constantinople. In this sense,

EXCHANGE properly denotes the business, or trade of money, as carried on between one place and another, by means of bills of *exchange*, i. e. by giving money in one city, and receiving a bill to entitle the giver to receive the value in another city. See *BILL of Exchange*.

There is also another species called *dry exchange*, *cambium sicum*, or *usurer's exchange*, which consists in giving money at one place to be repaid it, after a certain time, in the same place, with a certain sum over, which is usually more than common interest.

The ceremony of a real *exchange* is observed in this fictitious kind, which is only a method of borrowing money.—The borrower draws a bill of *exchange* on any imaginary person, perhaps at Amsterdam, at the price the *exchange* then goes at, and delivers it to the lender. After the time affixed comes a protest from Amsterdam for non-payment, with the *re-exchange* of the money from thence to London; all which with costs; besides a deduction perhaps at the making of the bargain, must the borrower pay.

EXCHANGE, is also used for the profit; which a merchant, negotiant, or broker, makes of a sum of money received, and for which a bill of *exchange* is drawn payable in some other place, and by some other person; for the interest of his money, or the salary and reward of his negotiation.

This profit is exceedingly various; being sometimes 2, sometimes 3, 4, or even 10 and 15 per cent. according as the alloy of the species differs; or as money is more or less plentiful, or bills of *exchange* more or less scarce in the places.—This kind is ordinarily called *real exchange*, and sometimes *mercantile* and *mix'd exchange*.

The price of *exchange* is regulated according to the course of the place where the bill is drawn, or that of the place where the remittance is to be made: some pretend that it is the city of Lyons gives the law, or rule, for the price of *exchange* to most of the other cities of Europe.

The word *exchange*, according to some, is derived from that perpetual alteration observed in the price of this *exchange*, which is sometimes higher, and sometimes lower; there being sometimes somewhat to get, and sometimes to lose thereby; and sometimes nothing to be either got or lost: as is the case when the *exchange* is at par.

From this diversity in the price of *exchange*, arises that common proverb, *The exchange, and the wind are often varying*.—But the more natural way of deriving the word *exchange*, is from this, that a man here *exchanges* his money for a bill; or that he changes present money for absent money; or changes his debtor.

Exchange is not to be looked on as a loan; from which it differs, in that in the one, the risque, or danger, lies on the person who borrows; and in the other, on him who lends. It likewise differs from interest, in that *exchange* is not paid in proportion to the time, which interest is. See *INTEREST*.

EXCHANGE, is also used in diverse places for the profit allowed for exchanging one sort, or species, of money for another.

This is particularly called *small exchange*, *natural exchange*, *pure exchange*, &c.

EXCHANGE, is sometimes also used for the agio, or profit allowed for the monies advanced in any one's behalf. See *AGIO*.

EXCHANGE also denotes a public place, in most considerable cities, wherein the merchants, negotiants, agents, bankers, brokers, interpreters, and other persons concerned in commerce, meet, on certain days, and at certain times thereof; to confer, and treat together of matters relating to exchanges, remittances, payments, adventures, assurances, freightments, and other mercantile negotiations both by land and sea. In Flanders, Holland, and several cities of France, these places are called *bourses*; at Paris and Lyons, *places de change*; and in the hanse towns, *colleges of merchants*. These assemblies are held with so much exactness, and merchants and negotiants are so indispensably required to attend at them; that a person's absence alone, makes him be suspected of a failure or bankruptcy.

The most considerable exchanges in Europe, are that of Amsterdam; and that of London, called the *Royal Exchange*. See *ROYAL EXCHANGE*.

That of Antwerp was little inferior to either of them; till the port of that city was rendered impracticable by the Hollanders, to bring the commerce thereof to themselves.

Even in the time of the ancient Romans *, there were places for the merchants to meet, in most of the considerable cities of the empire. That said by some to have been built at Rome, in the year of the city 259, 493 years before our Saviour, under the consulate of Appius Claudius, and Publius Servilius, was called *collegium mercatorum*; whereof 'tis pretended there are still some remains, called by the modern Romans *loggia*, the lodge; and now, usually, the *place of St. George*.

* This notion of a Roman exchange is supposed to be founded on the authority of Livy; whose words are as follow, *viz. Certamen consilium incidit uter dedicaret Mercurii aedem. Senatui a se rem ad populum rejicit: utri eorum dedicatio iuxta populi data esset, eum praestitit annonae, mercatorum collegium instituit iuxta Liv. lib. 2.*—But it must be here remarked, that *collegium* never signified a building for a society in the purer ages of the Latin tongue: so that *collegium mercatorum instituit* must not be rendered to build an exchange for the merchants, but to incorporate the merchants into a company. As Mercury was the god of traffick, this *aedem Mercurii* seems to have been chiefly designed for the devotions of this company or corporation.

EXCHANGE, in law, denotes the compensation which the warrantor must make the warrantee, value for value, if the land warranted be recovered from the warrantee. *Bracton. l. II. See WARRANTY.*

The king's EXCHANGE, is the place appointed by the king for exchange of plate, or bullion for the king's coin. See *BULLION*. These places have formerly been diverse; but now there is only one, *viz.* that of the tower of London, joined with the mint.

Bill of EXCHANGE, is a writing given by a merchant, or other negotiant, to procure a sum of money to be paid the bearer thereof, in some distant place; in consideration of a like sum paid the writer, by the person in whose behalf the bill is drawn. See *BILL of exchange*.

What we call *re-exchange*, is the due, or premium of a second exchange, when a bill is protested. See *RE-EXCHANGE*.

EXCHANGE-BROKERS, are persons who make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to notify to those who have money to receive or pay beyond sea, who are proper persons for the exchanging and doing thereof.

When the matter is accomplished, that is, the money paid, they are to have for brokerage 2 shillings per 100 pound sterling. Though of late, the humour of gaining, and dealing in stocks, hath so prodigiously increased the number of persons who act as brokers, that their business, and their pay is very uncertain.

EXCHANGERS, are those who return money beyond sea, by bills of exchange, &c. called anciently also *excambiators*, and since remitters.

EXCHEQUER *, or simply *CHEQUER*, originally denotes a chess-board; or a frame divided into 64 squares, of two colours, wherein to play at draughts, chess, &c. See *CHESS*, &c.

* The word is formed from the French *eschiquier*, which signifies the same. Hence, trees are said to be planted *chequer-wise*, in *quincunx*, when disposed so as to form diverse squares representing a chequer.

EXCHEQUER, is more particularly used for a chamber, or apartment in Westminster-hall, consisting of two parts; the court of *exchequer*, and the lower *exchequer*.

Court of EXCHEQUER, is a court wherein are tried all causes relating to the king's treasury, or revenue; as, touching accounts, disbursements, customs, fines, &c.

It consists of seven judges, *viz.* the lord treasurer, the chancellor of the *exchequer*, the lord chief baron, and three other barons of the *exchequer*, with one custos baron.

The lord chief baron is the principal judge of the court. See *BARONS of the exchequer*.

The court of *exchequer* is divided into two: the one of law, the other of equity.

All judicial proceedings according to law, are filed, *coram baronibus* only: but the court of equity held in the *exchequer*

chamber, is *coram thesaurario, cancellario, & baronibus*; before the treasurer, chancellor, and barons.

For a long time after the conquest, there sat in the *exchequer*, both spiritual and temporal barons of the realm: but of later times, there have sat in their places other judges, who, though no peers of the realm, yet retain the original denomination.

The common opinion of our historians is, that this court was erected by William the conqueror, soon after his having obtained the kingdom: and that it took its form from the *eschiquier*, or *scaccarium*, established in Normandy long before that time. In effect, the two *exchequers* have this in common, that the Norman was the supreme court of that dutchy, or a general assize whereat all the great lords attended, to judge finally of all concerns of the greatest importance; and was ambulatory: and that the *English exchequer* was a court of the highest jurisdiction; that the acts thereof were not to be examined by any of the ordinary courts; that it was the repository of the records of all the other courts; and that it was to be held in the king's court, and before him; and that it was concerned in the prerogative, as well as the revenue of the crown.

The immediate profits of the crown, as of franchises, lands, tenements, hereditaments, debts, duties, accounts, goods, chattels, all disbursements, seizures, and fines imposed on the subjects, &c. are all within the jurisdiction of the *exchequer*. And the king's attorney may exhibit bills, for any matter concerning the king in inheritance, or profits; so also may any person who finds himself aggrieved in any cause prosecuted against him on behalf of the king, or any patent by grant of the king, exhibit his bill against the king's attorney, &c. to be relieved by equity in this court.

To this court belong two officers, the king's remembrancer's office, and that of the lord treasurer's remembrancer. See *REMEMBRANCER*.

Authors are divided about the origin of the denomination of this court, *exchequer*. Du Cange is of opinion, it came from a *chequer*-wrought carpet, covering the great table in that court; or from the pavement of the court, which was *chequer-wise*: others, from the accountants in this office using *cheques*, or chess-boards, in their computations: Nicod, from the court's being composed of persons of different qualities, as the pieces or partitions in a chess-board: others, by reason people pleaded here, ranged, as it were, in battle array, as they do at chess. Menage, after Pithou, &c. derives the word from the German, *schicken*, to send; by reason this court succeeded those commissioners called in ancient titles, *missi dominici*. Skinner, &c. derives it from *schatz*, which signifies, treasure: whence Polydore Virgil also writes it, *scattarium*, instead of *scaccarium*. Lastly, Somner derives it from *schaken*, to ravish; which, according to him, is the character of the treasury.

The lower *EXCHEQUER*, called also the *receipt of the exchequer*, is the place wherein the king's revenue is received and disbursed.

The principal officers hereof are, the lord treasurer, a secretary of the treasury, a chancellor of the *exchequer*, two chamberlains of the *exchequer*, an auditor of the receipts of the *exchequer*, four tellers, a clerk of the pells, an usher of the receipt, a tally cutter, &c. See farther under the articles *TREASURER*, *CHANCELLOR of the exchequer*, *SECRETARY*, *CHAMBERLAIN*, *UNDERCHAMBERLAIN*, *TELLER*, *PELLS*, *TALLY*, &c.

Messengers of the EXCHEQUER. See *MESSANGER*. *Black book of the EXCHEQUER*, is a book under the keeping of the two chamberlains of the *exchequer*; said to have been composed in 1175, by Gervais of Tilbury, nephew of king Henry II. and divided into several chapters.

Herein is contained a description of the court of England, as it then stood, its officers, their ranks, privileges, wages, perquisites, power, and jurisdiction; and the revenues of the crown, both in money, grain, and cattle.

Here we find, that for one shilling, as much bread might be bought, as would serve a hundred men a whole day; that the price of a fat bullock was only twelve shillings; and a sheep, four, &c. Larrey, P. I. p. 394. See also *DOMESDAY*.

EXCISE, a duty, or imposition, charged on beer, ale, cyder, and other liquors made for sale, within the kingdom of England, Wales, and town of Berwick upon Tweed.

The duty of *excise*, was first granted to king Charles II. by act of parliament, in the year 1660; during the life of that prince: it has been since continued and augmented by diverse parliaments, under the several succeeding princes, and extended to Scotland.—This duty, as it now stands, on strong beer and ale, is at the rate of 4s. and 9d. per barrel; and upon small beer 1s. 6d.

Now, brewers being allowed for leakage of beer, 3 barrels in 23; and of ale, 2 in 22; the neat *excise* of a barrel of strong beer amounts to 4s. 1d. and 7; of a barrel of ale, 4s. 3d. 39; and of a barrel of small beer, 1s. 1d. 19. 1/2.

The *excise* is one of the most considerable branches of the king's revenue.—It was formerly farmed out: but is now managed for the king by seven commissioners, who sit in the *general excise-office*, receive the whole product of the *excise* of beer,

beer, ale, and other liquors, and malt, collected all over England, and pay it into the exchequer. See EXCHEQUER. Their salary is 800 l. per annum each, and they are obliged by oath, to take no fee, or reward, but from the king only. From the commissioners of *excise* there lies an appeal to five others, called *commissioners of appeals*.

The number of officers employed in this branch of the revenue, is very great. Beside the commissioners abovementioned, and their subordinate officers, as registers, messengers, &c. there is an auditor of the *excise*, with his clerks, &c. A comptroller with his clerks; a register; secretary; solicitor; cashier; teller; clerk of securities; housekeeper; doorkeeper; an accountant for the imprest money; general gauger; general accountants, with their assistants; messengers; a clerk for stationary wares; examiners; clerks for supervisors diaries; accountants, examiners, &c. for the London distillery, vinegar, cyder, &c. also examiners for malt; general and other surveyors of the London brewery: with assistants, and other officers, to the number of an hundred: general and other surveyors of the London distillery, with other officers, to the number of forty; a collector, and surveyor, of imported liquors; with a land surveyor at the customhouse, &c.

The yearly salaries of all the officers in the *excise* office, as computed by Mr. Chamberlayne amount to 23650 l. Beside which, there are in the country fifty collectors; and one hundred and fifty supervisors; with a great number of inferior officers, called *gaugers*, or *excisemen*; which may make the number of persons employed in this revenue about 2000.

The *excise* on beer, ale, and other exciseable liquors, even during a time of war, is computed to amount to 1100000 l. per annum, and is collected from above 300000 people.

The duty on malt, with the additional duty on cyder, &c. amount to betwixt six and seven hundred thousand pound per annum; and are collected from more hands than the former. And yet the whole charge of the managing all these duties, does not amount to twenty pence per pound; which, considering every thing, is esteemed an exactness and frugality, not to be paralleled in any revenue levied in this or any other country.

The rates, with the neat produce of the several impositions of *excise*, are as follow:

1 ^o . A duty of 2s. 6 d. per barrel, whereof 15 d. per barrel during his majesty's life; and the other 15 d. hereditary; appropriated to the civil government, after a deduction of 3700 l. per week for annuities.	L.
Neat produce,	269837
2 ^o . A duty of 9 d. per barrel, granted 4 Will. and M. for 99 years, commencing Jan. 1692, charged with 124866 l. per ann. for annuities, and 7567 l. per ann. on survivorship.	150106
Neat produce,	
3 ^o . Another 9 d. per barrel perpetual, 5 W. and M. for payment of 100000 l. per ann. to the bank, as also several annuities on lives.	150094
Neat produce,	
4 ^o . Another 9 d. per barrel, for 16 years, continued 4 Ann. from May 1713, for 95 years, for paying 140000 l. per ann. on million lottery tickets; with annuities of 99 years, &c.	184898
Neat produce 150898	
—which, with some additional duties granted in a later act may amount to	
5 ^o . A duty on low wines, and spirits of the first extraction, continued to the 24th of June 1710.	25267
Neat produce,	
6 ^o . The <i>excise</i> on ale and beer in Scotland, is farmed at	33500

Total L. 1006102

EXCLAMATION, in rhetoric, a figure, wherein, by raising the voice, and using an interjection either expressly or understood, we testify an uncommon warmth, and passion of mind; and express the magnitude of the thing, or the importance of the occasion.

Such is, O heavens! O earth! &c. such also is that of Cicero against Catiline, O times! O manners! this the senate knows, the consul fees; and yet he lives. Lives fast! nay, and comes into the senate! Or that for Cælius, *pro dii immortales! cur interdum in hominum sceleribus maximis aut comitibus, aut præsentis fraudis pœnas in diem reservatis!* —Ob præclarum custodem ovium, ai aiant, lupum! In English, the interjections O! or oh! alas! or good God! are generally adjoined in an exclamation. In Latin they use O! heu! cheu! ah! uah! pro superi! pro superum atque hominum fidem! sometimes, however, the interjection is understood, as, wo is me! *miserrum me!* bocine faculum!

EXCLUSION, that whereby a thing is excluded, i. e. shut out, or set aside.—A crown imports an exclusion from the papacy: he appointed a stranger his heir, in exclusion of his own relations.

Great efforts were made towards the close of the reign of K. Charles II. to procure a bill of exclusion, for setting aside the duke of York, the king's brother, on account of his being a papist.

EXCLUSIONS, in mathematics. The method of **EXCLUSIONS**, is a way of coming at the solution of problems (in numerical cases) by previously rejecting, or excluding out of consideration, such numbers, as are of no use in solving the question; whereby, of consequence, the process may be regularly, and judiciously abbreviated.

EXCLUSIVE, is sometimes used adjectively, for the force, or power of excluding: as, a patent carries with it an *exclusive* privilege; sovereign princes have *exclusive* voices in the election of popes.

Sometimes it is also used adverbially: as, marriage is allowed at all times, the first day of lent *exclusive*; i. e. Ash-Wednesday is not comprised in the permission.—He sent him all the Gazettes, from N^o. 105, to N^o. 300, *exclusive*; i. e. all between those two numbers, which themselves were excepted.

EXCLUSIVE Propositions, are those wherein the predicate agrees with its subject, as to agree with no other. See PROPOSITION.—E. gr. Virtue alone makes nobility: nothing else renders a man truly noble.

EXCOMMUNICATION, an anathema, or ecclesiastical censure, and punishment; whereby a heretic is cut off from the society of the faithful; or an obstinate sinner from the communion of the church, and the participation of the sacraments.

The power of *excommunication* properly belongs to the bishop; but he may delegate it to any grave priest, with the chancellor.

Every *excommunication* should be preceded by three public admonitions, two days, at least, distant from each other: but this is to be understood of *excommunications* imposed by the ecclesiastical judge; for those imposed by the law, are incurred to all intents and purposes the moment the action is committed.

These latter are called *excommunications* by the canon, or *late sententia*: and are so very numerous, that it would be difficult, even for the best canonists, to give an exact list of them: there are 50 in the clementines; 20 in the bull *cœna domini*, &c.

Rebuffe on the concordat, reckons up 60 penalties accruing upon *excommunication*.

Excommunication is founded on a natural right which all societies have, of excluding out of their body, such as violate the laws thereof.

Excommunication is either *major* or *minor*, i. e. *greater* or *less*: the first, which is that understood when we say, simply, *excommunication*, separates, or cuts off the delinquent from all communion and fellowship with other Christians; disables him from defending his rights, bringing an action at law, &c.—The second, or lesser, only excludes from the communion of the Lord's Supper.

The greater *excommunication*, called also *ab homine*, is when a prelate, or his deputy, *excommunicates* any man personally, and interdicts him all society with the faithful, all use of sacraments, &c.

The lesser *excommunication* is incurred *pleno jure*, by having any communication with a person *excommunicated* in the greater *excommunication*.—And this too imports a privation of communion, but not an interdiction from entering the church, nor having commerce with the faithful.

Anciently, the *excommunicated* were obliged to procure absolution from their bishop, and make satisfaction to the church in forty days time; otherwise they were compelled to it by the secular judge, by a seizure of their effects, imprisonment of their persons, &c. In France they were allowed a whole year.

By an edict of S. Louis, in the year 1228, vassals, tenants, &c. were dispensed, or freed from the oath of fidelity, homage, &c. they had taken to their lords, or superiors, when *excommunicated*, till they had made their submission.

In Spain, to this day, a person who is not absolved from his *excommunication* in a year's time is deemed a heretic.

There was a time, when the people were fully convinced, that the bodies of *excommunicated* persons, unless they were first absolved, could not rot, but remained entire for several ages, a horrible spectacle to posterity; as is attested by Matthew Paris, and other writers. And the Greeks are full of the opinion; and affirm, they have infinite proofs thereof; as is shewn by Du Cange, from the testimony of a vast number of authors.

By the laws, an *excommunicated* person was not to be buried, but the body hung into a pit, or covered with a heap of stones; which was called *imblocare corpus*. See FUNERAL, &c.

In the ancient church, there were diverse degrees of *excommunication*: in effect, *excommunication* did not always import an interdiction of the sacraments; but frequently, a separation, or kind of schism between the several churches, or a suspension of spiritual communication between the bishops.

But, afterwards, the occasions of *excommunications* growing more frequent, they began to use it with less circumspection and reservedness.

EXC

In the IXth century, the ecclesiastics were continually making use of this spiritual weapon, to repel any violence, or affronts, offered them; and time and familiarity rendering offenders more and more obdurate, they proceeded, by degrees, to rigorous unknown to antiquity; as the *excommunicating* of whole families, or provinces; prohibiting the exercise of all religion therein; and even accompanying the *excommunications* with horrible ceremonies, and direful imprecations.

In the Xth and XIth centuries, the severity against the *excommunicated* was carried to its highest pitch: no body might come near them, not even their own wives, children, or servants; they forfeited all their natural and legal rights and privileges; and were excluded from all kind of offices. Thus was an *excommunicated* king reduced to the condition of a private man. By thus stretching the power of the church to extravagance, they rendered it contemptible. Gregory VII. tempered it a little; exempting the wives and children of *excommunicated* persons, from incurring *excommunication*, by holding conversation with their husbands and parents.

To render the *excommunicated* still more odious, the priest was obliged to stop, and break off divine service, if an *excommunicated* person entered the church. Nothing of which aversion is any where discovered in the practice of the primitive church. At present we have but little of the terror or respect of our fore-fathers, for *excommunication*; and it is even judged, and proclaimed an abuse, whenever impudently employed.

Thus, the official of Tholouse having *excommunicated* the officers of the Senechaussée of Tholouse, on occasion of their refusing to deliver up a prisoner; the official was condemned to take off, and revoke the *excommunication*. It is judged an abuse to fulminate an *excommunication* against a king, or kingdom, or the officers thereof, for any thing relating to the discharge of their offices.

The form of *excommunication* in the Romish church, as related by Fevret, is to take lighted torches, throw them on the ground with curses and anathema's, and trample them out under foot to the ringing of the bells.

— *Auctoritate dei patris omnipotentis & filii, & spiritus sancti, & beate dei-genetricis Mariæ, omniumque sanctorum, excommunicamus, anathematizamus, & a limitibus sanctæ matris ecclesiæ sequestramus illos malefactores, N. consentaneos, quoque & participes & nisi respuerint, & ad satisfactionem venerint sic extinguetur lucerna eorum ante-viventes in sæcula sæculorum. Fiat Amen: Amen: Amen: Ex Emendat. Leg. Will. Conquest.*

We have now none of this folly; the sentence is gravely read, and the person remains *excommunicated* without farther ceremony.

Petrus Blesensis assures us, that in England it was anciently the practice, only to *excommunicate* such as had killed an ecclesiastic; whereas they were put to death who had killed a lay-man.—But the reason was, they held *excommunication* a greater punishment than death.

We have instances of bishops, who have pronounced formal *excommunications* against caterpillars, and other insects, after a formal, juridical process against them, wherein those animals were allowed an advocate and proctor, to defend their cause. See EXORCISM.

Fevret relates diverse instances of such *excommunications*, against rats, mice and other animals, for infecting a country. See the form of these *excommunications* in that author, *Traite de l'Albus*.

In the ancient church there were two different kinds of *excommunications* in use: the one called *medicinal*, whereby persons convicted of a crime by their own confession, were removed from communion: the other called *mortal*, was fulminated against rebels, who persisted obstinately in their errors and impieties.

The power of *excommunicating* was lodged in the whole church in general: that is, the bishops and priests had the administration thereof, by and with the consent of the people; which was practised even in St. Cyprian's time. But afterwards they ceased to consult the people about the matter: the bishop and clergy arrogated the whole power to themselves. Recourse, however, might still be had to a synod of the province, to judge of the validity of an *excommunication*.

It frequently happened, that churches *excommunicated* each other, that is, broke off all communion with each other. In which case, Du Pin observes, it might be dubious, which of the two parties was *excommunicated* and cut off from the body of the church.

EXCOMMUNICATION was also practised among the Jews, who used to expel from their synagogue, such as had committed any grievous crime. See the gospel according to St. John, ix. 22. xii. 42. xvi. 2. And Joseph. *Antiq. Jud.* l. IX. c. 22. and l. XVI. c. 2.

The Esseni, when *excommunicated*, durst not so much as receive food at any person's hand, for fear of violating their oath, but contented themselves to live on herbs; inasmuch that they frequently perished, and died for want. See Joseph. *de Bell.* l. II. c. 12.

Godwyn, in his Moses and Aaron, distinguishes three degrees, or kinds of *excommunication* among the Jews. The first, he

EXC

finds intimated in St. John, ix. 22. The second in St. Paul, *epist.* 1 Cor. v. 5. And the third, in the 1st ep. to Corinth. xvi. 52.

The rule of the Benedictines, gives the name EXCOMMUNICATION, to the being excluded from the oratory, and the common table of the house, call'd in our inns of court called *discommoking*. This was the punishment of such monks as came too late.

EXCOMMUNICATION, or a being secluded; or cut off from a participation in the mysteries of religion, was also in use under paganism.

Such as were thus *excommunicated*, were forbid to assist or attend at the sacrifices, or to enter within the temples; and were afterwards delivered over to the demons and furies of hell, with certain imprecations; which was called among the Romans, *diris devovere*.

The Druids among the ancient Britons and Gauls, likewise, made use of *excommunication* against rebels; and interdicted the communion of their mysteries, to such as refused to acquiesce in their decisions. See DRUIDS.

EXCOMMUNICATO *Capiendo*, a writ directed to the sheriff, for the apprehension of one who stands obstinately *excommunicated* the space of forty days.

Such an one not seeking absolution, hath, or may have, his contempt certified into the chancery; whence this writ issues for laying him up, without bail, or main-prize, until he conform himself.

EXCOMMUNICATO *Deliberando*, is a writ directed to the under-sheriff, for the delivery of an *excommunicated* person out of prison; upon certificate of the ordinary, of his conformity to the ecclesiastical jurisdiction.

EXCOMMUNICATO *Recipiendo*, is a writ whereby persons *excommunicated*, being for their obstinacy committed to prison, and unlawfully delivered thence before they have given security to obey the authority of the church, are commanded to be fought for, and laid up again.

EXCORIATION *, the act of rasing, or tearing off the skin from any part of the body. See SKIN.

* The word is Latin, *excoriatio*, formed of *ex*, of, and *corium*, skin, leather, &c.

He had a grievous excoriation behind, with riding post:—We also say, an *excoriation* in the throat, &c. when the membrane that covers, or lines it, is torn by the acrimony of a humour, a medicine, or the like; which is ordinarily the case in what we call a *fore throat*.

EXCORTICATION, the act of stripping off the cortex, or bark, from any thing; called also *decortication*. See BARK, and DECORTICATION.

EXCREMENT, that which is evacuated, or *excreted*, out of the body of an animal, after digestion; being what in other respects is superfluous and prejudicial thereto. See EXCRETION. *Excrement*, is all that matter taken in by way of food, which cannot be assimilated; and which, of consequence, not growing or adhering to the body, wanders about through the laxer, and more patent parts thereof, till it be ejected.

The urine and feces or fecal matter, are the *great excrements*, expelled from the bladder and the intestines, by stool, &c.

The matter of insensible perspiration is also an *excrement*, and a more considerable one than either of the others.

Among *excrements* are likewise ordinarily ranked, diverse humours and matters, separated from the blood by the several strainers, or emunctories of the body, though far from being useless, but serving diverse valuable purposes of the economy. Such are the cerumen, or ear-wax; the mucus of the nose; lacrymæ, or tears; saliva, bile, lymphæ, menfes, lochia, &c. See each of these under its several head, CERUMEN, MUCUS, TEARS, SALIVA, BILE, MENSES, &c. Some hold ambergrease an *excrement* of the whale; others an *excrement* of the sea.

All foods consist of two sorts of parts, the one nutritious, the other *excrementitious*.

EXCREMENT, is also attributed, by way of analogy, to plants.—Thus gums, diverse juices, balms, &c. issuing spontaneously from their respective trees, are sometimes called *excrements*.

EXCRESCENCE *, in chirurgery, denotes superfluous, or luxuriant flesh, or other matter, growing on certain parts of the bodies of animals, contrary to, or beyond the ordinary structure, and disposition of nature.

* The word is formed of the Latin, *ex*, and *cresco*, I grow; *q. d.* something that grows from, or out of another.

Such are wens, warts, fucus's, polypus's, &c.—Such also are the woman's horn lately shewn in London; a parallel case to which, see in the *Philosoph. Transact.* N^o. 297. Natural, or customary *excrecences*, as those of bones, &c. are called by physicians *apophyses*.

EXCRETION *, in medicine, the act of expelling or ejecting out of the body, some humour that is useless, or even hurtful thereto.

* The word is formed of the Latin, *excernere*, to excern, separate.

Most

Most crises are effected by *excretion*; as fluxes of blood and urine, sweat, vomitings, loosenesses, &c.

EXCRETORY, in anatomy, is applied to certain little ducts, or vessels, in the fabric of the glands.

Excretory ducts are the tubes through which the humours separated in the several glands, are emitted, or discharged out of the gland, into some convenient receptacle, or emunctory. A capillary artery, to which a capillary vein is joined; with an *excretory duct*, convolved, or wound together, make up the body of the glands, the organs of secretion. The *excretory ducts* spring from the extremities of the arteries and veins, and carry off a liquor separated from the blood. Drake.—The lymphatic glands, have either lymphaducts for their *excretory ducts*, or lacteal vessels, as in the mesentery. Id.—The muscles of these two bones being contracted, they compress the bag, and squeeze out the liquor through two *excretory ducts*, terminating in the two gums of the great teeth of the viper. Lemery.

EXCURSION, in astronomy. See the article **ELONGATION**.

Circles of Excursion, are circles parallel to the ecliptic, at such distance from it, as is capable of bounding, or comprehending the greatest digressions, or *excursions*, of the planets from the same; which is commonly fixed at 10 degrees.

EXEAT, in church discipline, a Latin term, used for a permission, which a bishop grants a priest to go out of his diocese; or an abbot, to a religious, to go out of his monastery.

The word is also used in several great schools, for leave given a scholar, a student, to go out. His master has given him an *exeat*.

EXECUTED *Fine*. See the article **FINE**.

EXECUTION, the act of *executing*, i. e. of accomplishing, finishing, or achieving any thing, to be done.

We say, the *execution* of a testament; of a law; of a treaty; of a building, or the like.

EXECUTION is particularly used in the French music, for the manner of singing, or of the performance of a song. As to the manner of singing, called in France, *execution*; notation may, with any probability, dispute it with the French. If the French, by their commerce with the Italians, have gained a bolder composition; the Italians have made their advantage of the French, in learning of them a more polite, moving, and exquisite *execution*. St. Evremont.

EXECUTION, in common law, signifies the last performance of an act; as of a writ, a judgment, or the like.

EXECUTION of a judgment, is the obtaining the possession of any thing recovered by judgment of law.

There are two sorts of *executions*: one *final*; another *with a quousque*, as only tending to an end.

EXECUTION final, is that which maketh money of the defendant's goods, or extendeth his lands, and delivers them to the plaintiff; for this the party accepts in satisfaction: and this is the end of the suit, and all that the king's writ commands to be done.

EXECUTION with a quousque, is that which only tends to an end; as in the case of a *capias ad satisfaciendum*, &c.

This is not final, but the body of the party is to be taken, to the intent and purpose to satisfy the plaintiff; and his imprisonment is not absolute, but till he doth satisfy: so that the body is but a pledge for the debt.

Tenant by EXECUTION. See **TENANT**.

Military EXECUTION, is the pillage, or plundering of a country by the enemies army.

The towns and villages of the province were required to pay contribution, on penalty of military *execution*.

EXECUTIONE facienda, a writ commanding *execution* of a judgment.

EXECUTIONE facienda in withernamium, lies for taking his cattle, who had formerly conveyed out of the county the cattle of another.

EXECUTOR *, a person nominated by a testator, to take care to see his will, and testament, *executed* or performed; and his effects disposed of according to the tenor of the will.

* The testaments made in Latin in the XIVth century, call *executors, provisores testamentarii*.

An *executor* is either *universal*, as having the charge and disposal of the whole; or, only *particular*, entrusted with some particular branch thereof.

By the French law, an *executor* should be seized of all the moveables of the deceased during one year; at the end whereof he is to account for them. To the validity of a testament, it is not necessary there be an *executor* nominated therein.

EXECUTOR de son tort, or of his own wrong, is he who takes on him the office of an *executor* by intrusion, not being constituted thereto by the testator, or deceased, nor authorized by the ordinary to administer.

EXECUTORY, that which has, or carries with it a sufficient authority for being *executed*.

A contract is only *executory*, when it is in form, and sealed: the great seal of England is *executory* throughout the whole island.

EXECUTORY *Fine*. See the article **FINE**.

EXEDENS *Herpes*. See the article **HERPES**.

EXEDRÆ *, among the ancients, were places wherein the philosophers, sophists, rhetors, &c. used to hold their conferences and disputes.

* The word is pure Greek, *ἐξεδρα*, which signifies the same.

M. Perrault is of opinion, the *exedra* were a sort of little academies, where the men of learning met together. See **ACADEMY**.

Budæus rather thinks, that what the ancients called *exedra*, might answer to what we call *chapters* in the cloisters, or monks, or collegiate churches.

EXEGESIS, *ἐξηγησις*, a term sometimes used by the learned, to signify *explication*.

Several interpreters of the Bible are of opinion, that in the passages of scripture, where we meet with Abba Pater, two words, the first Syriac, and the second Greek or Latin, but both signifying the same thing; the second is only an *exegetis*, or explanation of the first.

EXEGESIS is also used for an entire discourse by way of explication, or comment, on any thing.

EXEGESIS *Numerosa*, or *Linealis*, signifies the numeral, or lineal solution, or extraction of roots, out of affected equations; first invented by Vieta.—Ozanam calls it *la rhetique*. See **EXTRACTION of Roots**.

EXEGETES *, among the Athenians, persons learned in the laws, whom the judges used to consult in capital causes.

* The word is Greek, *ἐξηγηται*, formed of *ἐξηγῶμαι*, I explain.

EXEGETICA, in algebra, the art of finding, either in numbers or lines, the roots of the equation of a problem, according as the problem is either numerical, or geometrical. See **ROOT**, and **EQUATION**.

EXEMPLAR, a model or original, to be imitated, or copied. See **MODEL**.

EXEMPLAR also denotes the idea, or image, conceived, or formed in the mind of the artist, whereby he conducts his work.

Such is the idea of Cæsar, which a painter has in his mind when he goes to make a picture of Cæsar.

The *exemplar* is ordinarily number'd among the causes. See **CAUSE**.

EXEMPLIFICATION of letters patent, denotes an *exemplar*, or copy of letters patent, made from the enrolment thereof; and seal'd with the great seal of England.

Such *exemplifications* are as effectual to be shewed, or pleaded, as the letters patent themselves.

EXEMPTION, a privilege, or dispensation, whereby a person is excepted out of some general rule.

Exemption is particularly applied to churches, chapels, and monasteries, which have a privilege given them by the popes, or princes, whereby they are exempted from the jurisdiction of the bishop, or ordinary.

The council of Constance revoked all *exemptions*, to restore to the general law, weakened and diminished by a relaxation of several ages, its ancient force and vigour; and make it every where obtain in all its latitude.

The first *exemptions* granted to monks were only for the liberty of electing their abbot, independently on the bishop; and not to screen them from the regular jurisdiction of the bishops. The pretence for these *exemptions* was, that the bishops abused their authority, and exacted extravagant dues on the monasteries in their dependence. But the real cause was, rather, that the monasteries, being fallen from the severity of their rules, did not care for inspectors so near at hand, and therefore solicited *exemptions* at Rome.

As this was to derogate from the common laws, the popes were a good while very reserved in the point; and seldom granted them, but with the consent of the bishops themselves. But, by degrees, the popes began to assume a power of granting such *exemptions* at pleasure; and made their account of the indulgence of the bishops, who were not sufficiently apprehensive of all the consequences. Accordingly, they favoured whole orders with the privilege of *exemption*, as the Cistercians, Dominicans, Carthusians, Jesuits, &c.

Things, at length, were brought to such a pass, that there was a necessity for putting a check to *exemptions*; accordingly, the council of Trent prohibited, and declared them null for the future; confirming only such as were well founded, on legal concessions from the holy see.

EXERCISE, a repetition of any operation, for the strengthening, or retaining of a habit.

Thus, we use *exercise* of the body, for the acquiring, or maintaining of health; as it contributes both to the expulsion of the excrements, and preserving the tone, and spring of the solids.

People who live a sedentary life, and do not use *exercise*, are liable

liable to defluxions, which bring on other disorders.—Games of hazard are to be discountenanced, and those of *exercise* to be promoted.

Exercise and quiet make one of the physicians non-naturals. See NON-NATURALS, and GYMNASTICS.

Labour, or *exercise*, Dr. Cheyne observes, is indispensibly necessary to preserve the body any time in due plight. Let what diet will be pursued, however adjusted both in quantity and quality; let whatever evacuations be used to lessen the malady, or any succedaneum be proposed to prevent the ill effects; still, our bodies are so made, and the animal oeconomy now so contrived, that without due labour and *exercise*, the juices will thicken, the joints will stiffen, the nerves will relax, and on these disorders, chronical diseases, and a crazy old age, must ensue. *Essay on Health*, p. 90.—Of all the *exercises* that are or may be used for health, as walking, riding a horseback, or in a coach, fencing, dancing, bowling, digging, pumping, ringing, &c. walking is the most natural, and would be the most useful, if it did not spend too much of the spirits of the weakly. But riding is certainly the most manly, the most healthy, and is less laborious and expensive of spirits than any. *Id.* p. 94, &c.—Those organs of the body that are most used, always become strongest; so that we may strengthen any weak organ by *exercise*: Thus the legs, thighs, and feet of chairmen; the arms and hands of watermen; the backs and shoulders of porters, grow thick, strong, and brawny by time and use. It is certain also, that speaking strong and loud, will strengthen the voice, and give force to the lungs. *Id.* p. 96.—To the asthmatic, therefore, and those of weak lungs, I would recommend talking much and loud; walking up easy ascents, &c. To those of weak nerves, and digestion, riding on horseback: To those troubled with the stone, riding over rough causeways in a coach: To those troubled with rheumatic pains, playing at billiards, cricket, or tennis: To those of weak arms or hams, playing at tennis or football: To those of weak backs, or breasts, ringing a bell, or working at the pump. Walking through rough roads, even to lassitude, will best recover the use of the limbs to the gouty; though riding will best prevent the disease. But the studious, the contemplative, the valetudinary, and those of weak nerves, must make *exercise* a part of their religion.—A condition necessary to render *exercise* as beneficial as may be, is that it be used on an empty stomach.—Under the head of *exercise*, cold bathing, and the flesh-brush, come also to be recommended.—*Id.* *Ibid.* p. 103, 104, &c.

EXERCISES, in the plural, are particularly understood of what is taught young gentlemen in the academies, or riding schools, &c.—As, riding the great horse, dancing, fencing, vaulting, drawing fortifications, &c.—This young nobleman went through all his *exercises* with great applause.

EXERCISE, in the art of war, denotes the ranging a body of soldiers in form of battle, and making them practise the several motions, and military evolutions, with the diverse management of their arms, &c. to make, or keep them expert thereat against occasion.

This is what Vegetius, and other Latin writers call *meditatio*.

EXERGUM *, **EXERGUE**, or **EXERGE**, among medalists, a word, motto, date, or the like, sometimes found under the ground, whereon the figures are represented.

* The word is derived from the Greek, *εργον*, *opus*, work. Evelyn often writes it *exurge*.

Exergues are most commonly placed on the reverses, though sometimes also on the fronts, or face-sides of medals.

EXFOLIATION *, in chirurgery, the scaling of a bone; or its rising, and separating in leaves, or laminae.

* The word is compounded of the Latin *ex*, and *folium*, leaf.

Any part of the surface of the cranium that has been bared, is liable to *exfoliation*. The use of a cephalic powder avails nothing for promoting the *exfoliation*. Dionis. The wound must not be stopp'd too much, but the bone left at liberty to recover itself, which it sometimes does, without *exfoliating*, particularly in children.

EXFOLIATIVE.—An **EXFOLIATIVE Trepan**, is a trepan proper to scrape, and at the same time pierce, a bone, and so to *exfoliate*, or raise several leaves, or scales, one after another.

The use of the *exfoliative* trepan is very dangerous; as being apt to shake and disorder the brain.

EXHEREDATIO. See DISHERISON, ABDICATION.

EXHALATION, a fume, or steam, *exhaling*, or issuing from a body, and diffusing itself in the atmosphere.

The terms *exhalation* and *vapour*, are ordinarily used indifferently; but the more accurate writers distinguish them: appropriating the term *vapour* to the moist fumes raised from

water, and other liquid bodies; and *exhalation* to the dry ones emitted from solid bodies; as earth, fire, minerals, sulphurs, salts, &c.

In this sense, *exhalations* are dry, subtil corpufcles, or effluvia, loofened from hard terreftrial bodies, either by the heat of the fun, or the agitation of the air, or fome other caufe; and emitted upwards to a certain height of the atmofphere, where mixing with the vapours, they help to conftitute clouds, and return back again in dews, mifts, rains, &c.

Nitrous, and fulphurous *exhalations* are the chief matter of thunder, lightning, and diverfe other meteors generated in the air.

Sir Ifaac Newton takes true and permanent air to be formed from the *exhalations* raised from the hardeft and moft compact bodies. See AIR.

EXHAUSTED, *Receiver*, a glafs, or other vefel, applied on the plate of an air-pump, and the air extracted out of the fame by the working of the engine. See AIR-PUMP.

Things placed in an *exhausted Receiver*, are faid to be in *vacuo*. See VACUUM.

EXHAUSTIONS, in mathematics.—*Method of EXHAUSTIONS*, is a way of proving the equality of two magnitudes, by a *reductio ad abfurdum*; fhewing, that if one be fuppofed either greater or lefs than the other, there will arife a contradiction.

The *method of exhaustions*, was of frequent ufe among the ancient mathematicians, as Euclid, Archimedes, &c.

It is founded on what Euclid fays in his tenth book, *viz.* that thofe quantities, whole difference is lefs than any assignable quantity, are equal; for if they were unequal, be the difference never fo fmall, yet it may be fo multiplied, as to become greater than either of them; if not fo, then it is really nothing.

This he affumes in the proof of prop. 1. of book X. which imports, that if from the greater of two quantities, you take more than its half, and from the remainder more than its half, and fo continually, there will at length remain a quantity lefs than either of thofe propofed.

On this foundation it is demonftrated, that if a regular polygon of infinite fides be infcribed in, or circumfcribed about, a circle, the fpace, which is the difference between the circle and the polygon, will, by degrees, be quite exhausted, and the circle become equal to the polygon.

EXHEREDATION, **EXHEREDATIO**, in the civil law, with us ordinarily called *difinheriting*, is the father's excluding his fon from inheriting his eftate.

There are fourteen caufes of *exheredation* expreffed in Juftinian's novel; without fome one of which caufes, he decrees the *exheredation* null, and the teftament inofficious, as the civilians call it.

Indeed, by the ancient Roman law, the father might pronounce *exheredation* without any caufe; but the rigour of this law was reftained, and moderated by Juftinian.

EXHIBIT, in law.—When a deed, acquaintance, or other writing, is in a chancery fuit *exhibited* to be proved by witnefs; and the examiner writes on the back, that it was fhewed to the witnefs at the time of his examination: This is called an *exhibit*.

EXHIBITION, a producing, or fhewing of titles, authorities, and other proofs of a matter in conteft.

The parties have *exhibited* their titles and pretentions before the arbitrators.

Anciently, they ufed the phrafe, *exhibition* of a tragedy, comedy, or the like; but now we fay *representation* in lieu thereof.

EXHUMATION *, the act of digging up a body interred in holy ground, by the authority of the judge.

* The word is compounded of the Latin *ex*, out of; and *humus*, ground.

In France, the *exhumation* of a dead body is order'd upon proof that he was killed in a duel.—By the French laws, a parfon has a right to demand the *exhumation* of the body of one of his parifhioners, when interred out of the parifh, without his confent.

EXIGENCE, or **EXIGENCY**, that which a thing requires, or which is expedient and fuitable thereto.—The criminals were remitted back to the judges, to be punifhed according to the *exigency* of the cafe.

EXIGENT, in law, a writ which lies where the defendant in a perfonal action cannot be found, nor any thing of his within the county, whereby to be attached, or diftrained.

It is directed to the fheriff, ordering him to proclaim and call the party five county days fucceffively, and charge him to appear under pain of outlawry.

The fame writ alfo lies in an indictment of felony, where the party indicted cannot be found.

It is called an *exigent*, by reason it *exigit*, i. e. *exalts* or requires the party to appear, or by forthcoming, to answer the law.—If he appear not at the last day's proclamation, he is said to be *quinqnes exactus*, and then is outlawed. See OUT-LAWRY.

EXIGENTERS, four officers of the court of common pleas, who make all *exigents* and proclamations, in all actions, where the process of outlawry lies.

Anciently, the making writs of superdeas upon such *exigents* as passed in their offices, did likewise belong to them; but this branch of business was taken from them under king James I. and committed to a particular officer in the court of common-pleas, created by patent. See SUPERSEDEAS.

EXILE, *Banishment*. See the article BANISHMENT.

Among the Romans, the word *exile*, *exilium*, properly signified an interdiction, or exclusion from water and fire; the necessary consequence of which was, that the interdicted person must betake himself into some other country, since there was no living without fire and water.—Thus, Cicero ad Herenn. observes, that the form of the sentence did not express *exile*, but only *aqua & ignis interdictio*. See INTERDICTION.

The same author remarks, that *exile* was not properly a punishment, but a voluntary flying, or avoiding the punishment decreed: *Exilium non esse supplicium sed persequium, potiusq; supplicium*. Pro Caelina.

He adds, that there was no crime among the Romans, as among other nations, punished with *exile*; but *exile* was a resource people flew voluntarily to, in order to avoid chains, ignominy, starving, &c.

The Athenians frequently sent their generals, and great men into *exile*, out of envy of their merits, or distrust of their too great authority.

EXILES, is sometimes also used for the regulating a person into a place, whence he is obliged not to stir without leave.

The word is derived from the Latin *exilium*, or from *exul*, a banished person; and that, probably, from *extra solium*, out of his native soil.

Figuratively, we use the phrase *honourable exile* for an office, or employment which obliges a man to reside in some remote, or disagreeable place.

Under the reign of Tiberius, remote employments were a kind of mysterious *exiles*.—A bishopric, or even a lord lieutenancy, in Ireland, has been sometimes deemed a kind of *exile*. A residence, or embassy, in some barbarous country, is also a sort of *exile*.

EXINATION, the same as *evacuation*. See EVACUATION.

EXISTENCE, that whereby a thing has an actual essence: or is said to be, *esse*.

This notion of *existence*, is applicable not only to a created, but an uncreated substance.—But it must be added, that the *existence* of created substances, and especially corporeal ones, implies a respect to place, time, and even an efficient cause; whence the schoolmen generally define it; That whereby a thing is formally and extrinsically without [*extra*] its causes, and that here, and now.

Existence, and essence, come very near the nature of each other: in effect, they only differ in that we have different manners of conceiving the same thing.

For, 1°. Essence is usually explained either by the first, noblest, and radical attribute of the thing, *a. gr.* That of body, by extension; that of mind, by thinking, &c. or by specifying all the intrinsic attributes: and *existence*, either by specifying all place, and all time, as in that of God: or by specifying some definite place, and time, together with the cause, as in the creatures.

2°. The foundation, and occasion of this distinction, is this; that essence belongs to the question, what is it? *quid est?* but *existence* to the question, is it? *an est?*

3°. *Existence* necessarily presupposes essence, and cannot be conceived without it: but essence may be conceived without *existence*; in that essence belongs equally to things that are in potentia, and in actu: but *existence*, only to those in actu. Note, however, that this does not obtain in God; about whose nature and essence the mind cannot think, without conceiving his *existence*.

We have diverse ways of arriving at the knowledge of the *existence* of things.—Our own *existence* we know by intuition; the *existence* of a God, by demonstration; and that of other things, by sensation.

As for our own *existence*, we perceive it so plainly, that it neither needs, nor is capable of any proof. I think, I reason, I feel pleasure and pain: can any of these be more evident to me than my own *existence*? If I doubt of all other things, that very doubt makes me perceive my own *existence*, and will not suffer me to doubt of that. If I know I doubt, I have as certain a perception of the thing doubting, as of that thought which I call doubt. Experience then convinces us, that we have an intuitive knowledge of our own *existence*, and an in-

ternal, infallible perception that we are. In every act of sensation, reasoning, or thinking, we are conscious to our selves of our own being, and in this matter come not short of the the highest degree of certainty.

As to our knowledge of the *existence* of a God; though he has given us no innate ideas of himself, yet having furnished us with faculties of sense, perception and reason, we can never want a clear proof thereof.

The knowledge of the *existence* of other things, i. e. of external objects, bodies, a world, &c. we only have by sensation; for there being no necessary connexion of real *existence* with any idea a man hath in his memory; nor of any other *existence* but that of God, with the *existence* of any particular man; no particular man can know the *existence* of any other being, but only, when by actually operating upon him, it makes it self be perceived by him. The having the idea of any thing in our mind, no more, proves the *existence* of that thing, than the picture of a man evidences his being in the world; or the visions of a dream make a true history. It is therefore the actual receiving of ideas from without, that gives us notice of the *existence* of other things, and makes us know that something doth *exist* at that time without us, which causes that idea in us, though we neither know, nor consider how it doth it.

This notice which we have by our senses of the *existing* of things without us, though it be not altogether so certain as intuition and demonstration, yet deserves the name of knowledge, if we persuade our selves, that our faculties act and inform us right, concerning the *existence* of those objects that affect them.

Now, besides the assurance of our senses themselves, that they do not err in the information they give us of the *existence* of things without us, we have other concurrent reasons: as 1°. It is plain those perceptions are produced in us, by exterior causes affecting our senses, because those that want the organs of any sense, never have the ideas belonging to that sense produced in their minds. 2d°. Because we find we cannot avoid the having those ideas produced in our minds: when our eyes are shut, we can at pleasure recal to our mind the ideas of light, or the sun, which former sensations had lodged in our memories; but if we turn our eyes towards the sun, we cannot avoid the idea, which the light or the sun then produces in us; which shews a manifest difference between those ideas laid up in the memory, and such as force themselves upon us, and we cannot avoid having. Besides, there is no body who doth not perceive the difference in himself between actually looking upon the sun, and contemplating the idea he has of it in his memory; and therefore he hath certain knowledge, that they are not both memory or fancy. 3°. Add to this, that many ideas are produced in us with pain, which we afterwards remember without the least offence: thus, the pain of heat or cold, when the idea of it is received in our minds, gives us no disturbance; which when felt, was very troublesome; and we remember the pain of hunger, thirst, head-ach, &c. without any pain at all, which would either never disturb us, or else constantly do it, as often as we thought of it, were there nothing more but ideas floating in our minds, and appearances entertaining our fancies, without the real *existence* of things affecting us from abroad. 4°. Our senses, in many cases, bear witness to the truth of each others report, concerning the *existence* of sensible things without us: he that doubts, when he sees a fire, whether it be real, may feel it too, if he pleases, and by the exquisite pain may be convinced, that it is not a bare idea or phantom.—Such is Mr. Lock's demonstration of the *existence* of external bodies.

The most ingenious Dr. Berkeley has a quite different system: external bodies, he contends, have no *existence* but in a mind perceiving them, that is, they only *exist*, *quatenus* they are perceived. And of this he has given us what he and many others account a demonstration.

In reality, "that neither our thoughts, passions, nor ideas formed by the imagination, exist without the mind, he observes is allowed; and that the various sensations impressed on the mind, whatever objects they compose, cannot exist otherwise than in a mind perceiving them, is not less evident: this appears from the meaning of the term *exist*, when applied to sensible things. Thus, the Table I write on exists; i. e. I see and feel it: and were I out of my study, I should say it existed; i. e. that were I in my study, I should see and feel it as before. There was an odour; i. e. I smelt it, &c. But the *existence* of unthinking beings, without any relation to their being perceived, is unintelligible; their *esse* is *percepti*."—The notion of bodies, he endeavours to shew, is founded on the doctrine of abstract ideas: "What are light and colours, heat and cold, extension and figure, in a word, the things we see and feel, but so many sensations, notions, ideas, or impressions on the sense? And is it possible to separate, even in thought, any

"any of these from perception? The several bodies then, that compose the frame of the world, have not any subsistence without a mind; their *esse* is to be perceived or known: and as long as they are not perceived by me, nor any other thinking being, they have no shadow of *existence* at all.—The things we perceive, are colour, figure, motion, &c. that is, the ideas of those things: but has an idea any *existence* out of the mind? To have an idea, is the same thing as to perceive: that therefore wherein colour, figure, &c. exist, must perceive them. It is evident, therefore, there can be no unthinking substance, or substratum of those ideas.—But you may argue, if the ideas themselves do not exist without the mind, there may be things like them, whereof they are copies or resemblances, which exist without the mind: It is answered, an idea can be like nothing but an idea; a colour or figure can be like nothing else but another figure or colour.—It may be farther asked, whether those supposed originals, or external things whereof our ideas are the pictures, be themselves perceivable or not? If they be, they are ideas: if they be not, I appeal to any one, whether it be sense to say, a colour is like something which is invisible: hard or soft, like somewhat intangible, &c.—Some distinguish between primary and secondary qualities; the former, *viz.* extension, solidity, figure, motion, rest and number, they maintain have a real *existence* out of the mind: for the latter, under which come all other sensible qualities, as colours, sounds, tastes, &c. they allow the ideas we have of them, are not resemblances of any things existing without the mind, or unperceived; but depend on the size, texture, motion, &c. of the minute particles of matter: now it is certain, that those primary qualities are inseparably united with the other secondary ones, and cannot even in thought be abstracted from them; and therefore must only exist in the mind. Can any man conceive the extension and motion of a body, without it's other sensible qualities? for my part, I find it impossible to frame an idea of a body extended and moving, without giving it some colour, &c. In effect, extension, figure and motion, abstracted from all other qualities, are inconceivable: where the others, therefore, are, there these two must be; *i. e.* in the mind, and no where else. Again, great and small, swift and slow, are allowed to exist no where without the mind; being merely relative and changing, as the frame or position of the organ changes: the extension therefore that exists without the mind, is neither great nor small, the motion neither swift nor slow; *i. e.* they are nothing.—That Number is a creature of the mind, is plain (even though the other qualities were allowed to exist) from this; that the same thing bears a different denomination of number, as the mind views it with different respects: Thus the same extension is 1, or 3, or 36, as the mind considers it, with reference to a yard, a foot, or an inch. Nay, many of the modern geometricalians hold, that a finite line may be divided into an infinite number of parts, and each of those infinitesimals into an infinity of others; and so on, *in infinitum*: so that the same thing is either unity or infinity; either no number or all number. In effect, after the same manner as the modern philosophers prove colours, tastes, &c. to have no *existence* in matter, or without the mind; the same thing may be proved of all sensible qualities whatsoever. Thus, they say, heat and cold are only the affections of the mind, not at all patterns of real beings existing in corporeal substances; for that the same body which seems cold to one hand, seems warm to another. Now why may we not as well argue, that figure and extension are not patterns or resemblances of qualities existing in matter; because to the same eye, at different stations, or to eyes of different structure at the same station, they appear various? Again, sweetness, it is proved, does not exist in the thing itself; because the thing remaining unaltered, the sweetness is changed to bitterness, as in a fever, or by an otherwise vitiated palate. Is it not as reasonable to say, that motion does not exist out of the mind? since, if the succession of ideas in the mind become swifter, the motion, it is acknowledged, will appear slower, without any external alteration.—Again, were it possible for solid figured bodies to exist out of the mind, yet it were impossible for us ever to know it: our senses, indeed, give us sensation of ideas, but do not tell us that any things exist without the mind, or unperceived, like those which are perceived: this the materialists allow. No other way therefore remains, but that we know them by reason's inferring their *existence* from what is immediately perceived by sense. But how should reason do this, when it is confessed, there is not any necessary connection between our sensations and these bodies? It is evident from the phenomena of dreams, phantasies, &c. that we may be affected with the ideas we have now, though there were no bodies existing without them: nor does the supposition of external bodies at all forward us, in conceiving how our ideas should come to be produced. The materialists own themselves unable to conceive in what manner body can act on

"spirit, or how it should imprint any idea on the mind. To suppose, therefore, bodies existing without the mind, is little else than to suppose, God has created innumerable beings entirely useless, and serving to no purpose at all. On the whole, it appears that the *existence* of bodies out of a mind perceiving them, is not only impossible, and a contradiction in terms; but is it possible, may really, it were impossible we should ever know it. And again, that supposing there are no such things, yet we should have the very same reason to suppose there were, that we now have: suppose, *e. gr.* an intelligence affected with the same train of sensations, impressed in the same order, and with the same vividness; would it not have all the reason to believe the *existence* of bodies represented by his ideas that we have? —All our ideas and sensations are visibly inactive; nay, the very being of an idea implies passiveness and inertness: so that it is impossible for an idea to do any thing; or, in strictness, be the cause of any thing: it cannot therefore be the resemblance or pattern of any active being; unless opposites can be said to resemble one another. Now we find a continual succession of ideas in the mind; but these, it has been proved, do not depend on any external body as their cause: it remains therefore, that their cause is an incorporeal active substance or spirit. For that I am not the cause of my own ideas, is plain from this, that when I open my eyes in broad day-light, I cannot help seeing various objects. Now the fixed Rules or methods wherein the mind we depend on excites in us the ideas of sense, are called *laws of nature*: these we learn by experience; which teaches us, that such and such ideas are attended with such and such other ideas in the ordinary course of things. Ideas are not any how, and at random produced; there is a certain order and connexion established among them, like that of cause and effect: and there are several combinations of them made in a very regular artful manner, which we call *bodies*; and the system of those, *the world*. In strictness, however the connexion of ideas does not imply the relation of cause and effect, but only of a mark or sign of the thing signified: the fire I see is not the cause of the pain I feel, but the mark that forewarns me of it. The noise I hear, is not the effect of this or that motion or collision of natural bodies, but the sign thereof. The Cartesians own somewhat like this: the action of bodies on our organs, say they, is not the efficient cause of our ideas and perceptions, but only the occasional cause, which determines God to act on the mind, according to the laws of the union of the soul and body. See CAUSE. Dr Berkeley, indeed, taking away bodies, takes away what these philosophers account the occasions of their ideas: by an occasion, he says, must either be meant the agent that produces an effect, or something observed to accompany or go before it, in the ordinary course of things: but matter is allowed to be passive and inert, and cannot therefore be an agent or efficient cause; and this matter primitively and in itself, is allowed imperceptible, and devoid of all particular sensible qualities; *i. e.* it has not this or that particular colour, this or that particular figure, &c. but has colour in the general, figure in the abstract, &c. but an abstract is no object of sense: matter therefore cannot be the occasion of our ideas in the latter sense." See BERKELEY, *Princip. of Hum. Knowl.*

How far the great argument of the maintainers of a material world, from the impossibility of God's deceiving us, and from the evidence that he does so, if there be no such thing, will go against this reasoning, we leave to the reader. See STANL. *Hyst. Philof.* P. XII. p. 816. where the objections of the ancient Pyrrhonist to the existence of bodies are recited, As to the *existence* of spirits, M. Locke allows, that our having ideas of them, does not make us know, that any such things do exist without us; or that there are any finite spirits, or any other spiritual beings, but God. We have ground from revelation, and several other reasons, to believe with assurance, that there are such creatures; but our senses being not able to discover them, we want the means of knowing their particular *existence*: for we can no more know that there are finite spirits really existing by the idea we have of such beings, than by the ideas any one has of fairies, or centaurs, he can come to know that things answering to those ideas do really exist.

EXIT, properly expresses the departure of a player from off the stage, when he has acted his part.

The word is also used in a figurative sense to express any kind of departure, even death.

EXITUS, in law, *issues*; the yearly rents, or profits of lands, or tenements. See ISSUES, &c.

EX MERO MOTU, formal words used in the king's charters, and letters patent; signifying that he does what is contained therein of his own will, and motion.

The effect of these words is to bar all exceptions that might be taken to the instrument, by alleging that the prince, in passing such charter, was abused by false suggestion.

EXOCATACOELEUS*, in antiquity, a general denomination, under which were included several grand officers of the church at Constantinople. As, the—grand oeconomus, grand facellarius, grand master of the chapel, grand scevo-phylax, or keeper of the vessels, grand chartophylax, the master of the little chapel, and the protedictus, or first advocate of the church.

* The critics are not at all agreed about the origin of the word *exocatacali*: Junius, in his edition of *Codin*, breaks the word into two, and reads *ἐξ Κατακαλῆ*, q. d. *ex catacali*; but this reading, though authorized by several MSS. is faulty; the generality of copies only making one word: beside that they are called *exocatacali*, even when there were only five of them. The same Junius derives *catacalus* hence, that these officers dwelt in the valleys, *κατα τὰς κοιλάδας*. Pet. Gregor. Tolosan, takes the word to have been formed from *κατακαλῶ*, *permulco*, *suavitate animam delinco*: but Gretser rejects this etymology, as without any foundation. In lieu thereof, he proposes another conjecture, though with a good deal of timidity: he reads *ἐξ οὐκατακοντῆς*, instead of *ἐξ οὐκατακαλῆς*, as if they were thus called by reason they lodged, or lived out of the patriarchal palace.—Fa. Goar rejects this opinion, and had rather we should read *ἐξ οὐκατακαλλῶς* as intimating they were thus called in opposition to the *synclerus*, who lay in the patriarch's apartment, which the rest did not; but he is far from being of the opinion that officers of so much eminence, should take their denomination from a thing which testifies a want of privilege. He chuses, therefore, to imagine that all the inferior priests were called *Κατακαλῆς*, *catacali*, q. d. people of a low condition; and that their superiors were called *exocatacali*, q. d. people out of the number of *catacali*, or above them.—Upon the whole, however, he adheres to the sentiment of G. Corelius, who says, that the patriarchal palace, and the apartments of the *synclerus*, and of the monks in the patriarch's service, were in a very low part of the city, which with regard to the rest seemed a valley or pit; and that the offices above-mentioned had their several houses or palaces, *ἐξω*, out of the valley: whence the name *exocatacali*. The opinion of M. du Cange is the last we shall name; he derives the appellation from their being above the level, or rank of the other clerks; and seated at church, &c. in more honourable places erected for that purpose, on either side the patriarch's throne: these two last sentiments seem the most probable.

The *exocatacali* were of great authority: in public assemblies they had the precedence of bishops; and in the patriarchate of Constantinople did the office of deacons; as the cardinals originally did in the church of Rome. Accordingly, in the letter of John IX. to the emperor Basilus Leo, they are called *cardinales*.

At first they were priests; but some patriarch of Constantinople, whom Codin does not mention, would have them for the future to be no more than deacons. The reason was, that being priests, each of them had their several churches, wherein they were to officiate on all the grand festival days; so that it unhappily fell out, the patriarch on the most solemn days was deserted by all his chief Ministers.

EXOCIONITÆ, **EXOCIONITES**, in church antiquity. —Meursius tells us, that there was a monastery at Constantinople, called *exocionium*; and that the first who were called *exocionites*, were the monks thereof.—But this is a mistake. It was the Arians who were first called *exocionites*; by reason, when expelled the city by Theodosius the great, they retired into a place called *exocionium**, and there held their assemblies. Justinian gave the orthodox all the churches of the heretics, excepting that of the *exocionites*. Cedrenus.

* The word is derived from *ἐξοκλονία*, or *ἐξοκλονισμός*, the name of the place above-mentioned.—Codin, in his *Origines*, says, that the *exocionium* was a place encompassed with a wall, built and adorned by Constantine; and that without the circumference of this wall, there was a column, with a statue of that emperor, whence the place took its name, *ὠκλον*, from *ἐξω*, without, and *κλον*, column.

Gothofred holds, that Theodoret was mistaken, in saying that the Arians were called *exocionites*, or *exocionites*, from the name of the place where they assembled; and takes the denomination to be the same with that of *exocionians*, which was attributed to the Arians, by reason they held that the son was made out of nothing, *ἐξ οὐκ ὄντος*. But a mere conjecture of Gothofred is not sufficient to make us set aside the authority of so able a person as Theodoret.

EXODIARY, **EXODIARIUS**, in the ancient Roman tragedy, was a droll, or mime, who appeared on the stage, when the tragedy was ended, and performed what they called the *exodium*, or conclusion of the show; to divert the company.

EXODIUM*, *ἐξόδιον*, in the ancient Greek, drama, was one of the four parts, or divisions of a tragedy.

* The word is formed from the Greek, *ἐξοδος*, going out, *δι-γρησιον*, going aside out of the way; of *ἐξ* and *αὐτος*, away, road, Festus, Lib. V. calls it *exitus*.

The *exodium*, according to Aristotle, was so much as was rehearsed after the chorus had ceased to sing for the last time; Vol. I.

so that *exodium* with them, was far from being what the epilogue is with us, as several people have imagined it was.

The *exodium* was so much of the piece as included the catastrophe and unravelling of the plot; which catastrophe, &c. in pieces regularly composed, always begun after the last singing of the chorus; answering nearly to our 4th and 5th acts. See M. Dacier's *Comment*, on Aristotle's *Poetics*, c. 12. See also the articles **CATASTROPHE** and **CHORUS**.

Among the Romans, the *exodium* was a different thing; it was pretty nearly what farces are with us. After the tragedy was over, came a pantomime on the stage, called the *exodiarus*, who by his grimace, jesting, and buffoonry, diverted the people, composed their minds, and wiped away the tears which the tragic spectacle had occasioned to be shed.—This was his office, as related by the ancient scholiast on Juvenal: *exodiarus, apud veteres in fine ludorum intrabat, quod ridiculus foret, ut quidquid lacrymarum atque tristitia cepissent ex tragicis affectibus, hujus spectaculi risu detergeret*.—At least this was the original intention of the *exodium*: but it afterwards degenerated into a bitter, malicious kind of railery.

Viginere on T. Livy, says the *exodium* consisted of certain humorous, drolling verses, rehearsed by the youth at the end of the *fabula atellanæ*, and answering to our farces. In another place, the same author says, that the *exodia* were a kind of interludes, in the intervals between the acts, partly fable and pleantry, partly music, &c. to give time both for the spectators and actors to recover breath.—The passage in Livy, whence he takes the notion, is lib. VII. Dec. 1: *Ridicula intexta versibus, quæ juvenitus inter se more antiquo jactare cepit, eoque conferta sunt fabulis potissimum atellanis*. So also Juvenal,

*Urbicus exodio risum movet atellanæ
Gestibus Antones.*

EXODIUM*, in the septuagint, signifies the end, or conclusion of a feast.

* The Hebrew text calls the Day *עֶרֶב*, which the seventy render *ἐξόδιον*.

In particular, *exodion* is used for the eighth day of the feast of tabernacles, which, it is said, had a special view to the commemoration of the Exodus, or departure out of Egypt. Though there is nothing of it expressed in scripture.

EXODIUM, was also the name of a song, sung at the conclusion of a meal, or feast.

EXODUS, the second of the five books of Moses.

The word in its original Greek, *ἐξοδος*, literally imports a going out, or journey; and was applied to this book, by reason the history of the Israelites passage out of Egypt is related therein.—Beside this, it contains the story of what was transacted in Egypt, from the Death of Joseph, to the delivery of the Jews; as well as what passed in the wilderness, and particularly at mount Sinai, to the building of the tabernacle.

The Hebrews call it *veile semoth*, q. d. *hæc nomina*, these are the initial words of the book: for the same reason they call Genesis, *beresith*, q. d. *in principio*, in the beginning.

EX OFFICIO, denotes the power a person has in virtue of his office, to do certain things without being applied to. By a Branch of a statute, 1 Eliz. the queen, by her letters patents, might authorize any persons exercising ecclesiastical jurisdiction, to administer an oath *ex officio*; whereby supposed offenders were forced to confess, accuse, or clear themselves of any criminal matter, &c.—But this branch relating to this oath, is repealed by 17 Car. I. cap. 11.

EXOMOLOGESIS*, *ἐξομολογησις*, a term little used but in speaking of the ancient ceremonies of repentance; whereof the *exomologesis*, by us called *confessions*, was a part.

* The word is Greek, formed of *ἐξομολογῶ*, I confess.

Some of the ancients, and particularly Tertullian, *de penit.* c. 9. use the word in a greater latitude, as comprehending the whole of repentance.

A publick *exomologesis* was never commanded by the church for secret sins; as may be seen in the capitulars of Charlemain, and the canons of diverse councils.

EXOMPHALUS, *ἐξομφαλῶς*, in medicine, a general name, comprehending all kinds of navel ruptures.—The first are tumors, or swellings of the solid parts; whereof there are three varieties, denominated from the several parts affected, as the *enteromphalus*, *epiplotomphalus*, and *entero-epiplotomphalus*.—The second are tumors formed by collections, or gatherings of humours; of which there are four varieties, distinguished by the particular humours they are formed of, as the *hydromphalus*, *pneumatomphalus*, *sarcemphalus*, and *varicemphalus*: The third are those compounded of both the other, viz. the *enterohydromphalus*, and *epiplotosarcemphalus*. See each species under its several heads, **ENTEROMPHALUS**, &c.

EXORCISM *, *ἑξορκισμὸς*, prayers, or conjurations, wherewith to *exorcise*, i. e. drive out devils from persons possessed, or to preserve from danger.

* The word is derived from the Greek, *ἑξορκισμὸς*, *adjuratio*, *conjuratio*, to adjure, or conjure.—In most dictionaries, *exorcism* and conjuration are used as synonymous; but, in reality, conjuration is only a part of the *exorcism*; and the *exorcism* the ceremony entire.—The conjuration is properly the formula, where the devil is commanded to come forth, &c.

Exorcisms are of great use in the Romish church; their prelates, &c. are frequently exorcising demoniacal persons. The priests make holy water, by exorcising common water a certain number of times.—In reality, the *exorcism* is a part in most of their consecrations.

It must be allowed, the use of *exorcisms* is almost as ancient as the church: recourse was had to such means to drive away diseases both of men and beasts, to expel and destroy vermine, and other animals noxious to the earth, and the fruits thereof. M. Thiers, in his *Traité de Superstitions*, gives divers formula's of such *exorcisms*; and quotes, particularly, the of God, of St. Grat, who, by means of *exorcisms*, obtained for instance the favour, that there should be no rat found in the country of Aost, nor three miles round the same.

The same author pretends, that such *exorcisms* may be still used to good purpose, against rats, mice, locusts, caterpillars, storms, &c. But in order to perform any thing of this kind, he observes, a man must have the proper quality and character, and be approved of by the church; and must likewise use words and prayers authorized thereby: otherwise, his *exorcisms* will be damnable superstitions.

Exorcisms had anciently another and further purpose, being applied by way of trial, or purgation, to extort the truth from the accused.

The *exorcism*, in this sense, was a sort of bread conjured and exorcised for the purpose: and the opinion was, that if the person were criminal, he could not swallow the bread.

This, it seems, was a frequent practice in the time of our Edward III. and the bread thus exorcised, was said to be *confined*.

Linderbroeck gives instances of *exorcisms* with barley bread, and others with cheese. And hence, probably, might arise that popular imprecation, "may this bread choke me, if I tell a lie." See *ORDEAL*, and *JUDICIUM DEI*.

EXORCIST, in the Romish church, a priest, or tonsured clerk, who has received the four lesser orders, one of which is that of *exorcist*.

The term is likewise applied to a prelate, who actually exorcises a person possessed.

It is a dispute among divines, whether ever the Greeks had properly any such order, as that of *exorcist*: Fa. Goar, in his notes on the Greek euchologion, has made it probable they had from several concurring passages in St. Dionysius, and St. Ignatius Martyr.

The ordination of *exorcists* is performed in the time of mass: their principal office being to expel devils. The IVth council of Carthage, can. 7. appoints, that in the ordination of *exorcists*, the bishop putting the book of *exorcisms* in their hands, shall say these words, "receive it, and keep it in remembrance, and have power to lay hands on energumens, whether baptized, or catechumens:" which form still obtains.

M. Fleury mentions certain people among the Jews, who travelled round the country, making profession of driving out devils by invocations, which they pretended had been taught them by Solomon: These were also called *exorcists*. See Joseph. *Antiq. Jud.* l. VIII. c. 2. Origen. *Tract.* XXXV. in Matt. XXVII. 63.

EXORDIUM *, in oratory, the preamble, or beginning of a discourse, or speech; serving to prepare the audience, and introduce the matter in hand.

* The word is formed of the Latin, *ordiri*, to begin; by a metaphor taken from the weavers, who are said *ordiri telam*, to begin, or warp a web, by disposing and ordering the threads in a certain manner for the future work. See *WARP*.

The *exordium* on other occasions is called the *prologue*, *prælud*, and *præm*.

Cicero defines *exordium*, a part of an oration, whereby the minds of the audience are duly prepared for what remains to be said.—The *exordium* is a part of principal importance, and is to be laboured with extraordinary care; whence Tully calls it, *difficilima pars orationis*.

Exordiums are of two kinds: either just, and formal; or vehement and abrupt. In the first, the audience is prepared and conducted, by due and easy steps: in the second, the orator, as if seized with some sudden passion, breaks out upon his audience at once. Such is that *exordium* of Isaiah, *hear, oh heavens, and give ear, oh earth*. Or that of Cicero against Catiline, *quousque tandem abutere patientia nostra Catilina?*

Abrupt *exordiums* are the most suitable on occasions of extraordinary joy, indignation, or the like; though we have instances of pangs of the greatest orators begun abruptly without any such occasions: such is that of Gorgia, who began his eulogy of the city and people of Elis, with *ἡλικὸν πόλιν*, *Elis, beata civitas*: or that of Greg. Nazianzen, in praise of Athanasius, *Ἀθανάσιον ἑταίρον ἀγρίου ἐκ ἀνθρώπων*, *Athanasium laudans virtutem laudabo*. Abrupt, hasty *exordiums*, were more to the taste and manner of the Greek, than the Latins.

The requisites in an *exordium* are, 1°. *Propriety*, whereby the *exordium* becomes of a-piece with the whole discourse, and matches it, as a part does a whole; so that it could not be accommodated to any other, or perhaps a contrary occasion.

The ancient orators were very defective in this point: their *exordiums* had frequently nothing in common with the subject. 2°. *Care*, accuracy, and magnificence, as being the part most minded, and most exposed to view. Thus Tully, *vestibula, aditusque ad causam facias illustres*.

3°. *Modesty*, or an ingenious bashfulness, which recommends the orator exceedingly to the favour of his audience. This is what Cicero extols so much in L. Crassus, *suit enim in L. Crasso pudor quidam, qui non modo non obesse ejus orationi, sed etiam probitatis commendatione profest*. The same Tully owns, of himself, that at the beginning of his orations, he trembled every limb, and his whole mind was in a flutter.

And, 4°. *Brevity*, not amplified, or swelled with a detail of circumstances, or a long circuit of words: such as that must be of the lawyer, who being to speak of a difference between two neighbours, deduced his *exordium* from Adam.

The *exordium* appears an essential part of an oration: though, anciently, in the acropagus, Julius Pollux tells us, they spoke without any *exordium*, any passions, and any peroration, or epilogue. The like is said to have been done by Xenophon, who began thus, *Darius & Persæis dux habuerit filios*.

EXOSTOSIS, *ἑξοστῶσις*, an unnatural protuberance of a bone, frequent in venereal cases: See *BONE*.

EXOTIC *, *ἑξωτικὸς*, a term properly signifying foreign, or extraneous, i. e. brought from a remote, or strange country. In which sense we sometimes say, *exotic*, or barbarous terms, or words, &c.

* The word is derived from the Greek, *ἑξω*, *ἐξωθεν*, *extra*, without, on the outside.

Exotic is chiefly applied to plants which are natives of foreign countries; particularly those brought from the East and West-Indies: and which do not naturally grow in Europe. The generality of *exotics*, or *exotic* plants, do not thrive in England, without some peculiar care and culture: they require the warmth of their own climates; whence the use of hot-beds, glass-frames, green-houses, &c. See *Supplement*, article *STOVE*.

The green-house is properly a conservatory of *exotics*.

Dr. Lister has a discourse in the *Philosoph. Trans.* on *exotic diseases*, i. e. such diseases as are never bred among us, but brought from time to time by infection from other countries. Such, according to this author, are, 1°. *The plague*, which is properly a disease of Asia, where it is epidemic. 2°. *The small-pox*, which is an oriental disease, and not known to Europe, or even Asia minor, or Africa, till a spice trade was opened to the remotest part of the Indies; whence it originally came, and where it still rages more cruelly than among us.

3°. *The griping of the guts*, which he takes for a disease peculiar to the West-Indies, and yearly received from thence. For this, he adds, is a quite different disease from the tormina ventris of the ancients; and is scarce even known in the mid-land countries, or far in the North of England.

EXPANSION, in metaphysics, expresses the idea we have of lasting or perishing distance; i. e. of distance, all the parts whereof exist together.

EXPANSION, in physics, is the dilating, stretching, or spreading out of a body; whether from any external cause, as the cause of rarefaction; or from an internal cause, as elasticity. Bodies naturally expand by heat, beyond their dimensions when cold; whence their specific gravities are different; as the different seasons of the year.

Air compressed, or condensed, as soon as the compressing, or condensing force is removed, *expands* itself by its elastic power, to its former dimensions.

Dr. Halley found by experiment, that water *expands* itself by one twenty-sixth part of its bulk, when made to boil: but a moderate heat does not induce any sensible *expansion* at all.—Mercury, with a very gentle heat, *expands* itself one seventy-fourth part of its ordinary dimensions.

Spirit of wine, with a heat less than that of boiling water, *expanded* itself by one twelfth part of its bulk; and then fell a boiling. The most sensible *expansion* of water, is in freezing: M. Boyle, in his *Hist. of Cold*, assures us, that ice takes up one twelfth part more space than water.

Dr. Gregory, in his *Astrum*, p. 407. proves, that a globe of our air, of an inch diameter, if it were removed to the distance of a semi-diameter of the earth, would expand it self to, as to fill all the planetary region, as far as, nay, far beyond, the sphere of Saturn.

EXPANSUM *Foliaceum*. See FOLIACEUM.

EXPARTE, *i. e.* partly, or of one part.—A commission *ex parte*, is that taken out, and executed by one party only: where both parties join, it is called a *joint commission*. See COMMISSION.

EXPECTANT-*Fee*, in law, where lands are given to a man and his wife, and the heirs of their bodies: in which sense it differs from *fee simple*, where lands are given to a man and his wife, in frank marriage, to hold to them and their heirs.

EXPECTATIVE, in the canon law, a hope, founded on a promise, of obtaining the next benefice that shall become vacant; or a right to the reversion of the next. See BENEFICE.

EXPECTATIVE *Canonis*. See the article CANON.

EXPECTATIVE *Graces*, *Gratiae EXPECTATIVÆ*, called also *prebends*, were bulls frequently given by the popes, or kings, for future benefices.—The bishops were exceedingly mortified with them; by reason they encroached on their privileges: besides that such *expectatives* are odious, as they induce people to wish for the death of others.

The use of *expectatives* is very ancient, though it was not near so frequent in the first ages, as afterwards. Originally they were no more than simple requests made on the part of kings, or popes, which the bishops consented to with the more willingness, as they only presented to them persons fit to serve the church. But the frequent exercise of this privilege, made it at length be deemed a matter of obligation and necessity.

The council of Trent annulled all *expectatives*; but the canons relating thereto were never admitted in France; where the right of conferring *expectative* *graces*, is looked on as one of the regalia. See GRACE.

EXPECTORATION, the act of evacuating, or bringing up phlegm, or other matters, out of the trachea, lungs, &c. by coughing, hawking, spitting, &c. See COUGH.

Expectoration eases the lungs of the viscid, or putrid matters, which obstruct their vessels, and straiten the breast.

EXPEDITATION, in the forest laws, signifies a cutting out the balls of a dog's fore-feet, for the preservation of the king's game.

Every one that keeps any great dog not *expeditated*, forfeits three shillings and four-pence to the king. In mastiffs, not the ball of the feet, but the three claws, are to be cut to the skin. *Instit.* P. IV. p. 308. *Nullo dominico canes abbatis & monachorum expeditari cogit.* Chart. Hen. 3. *Et sint quieti de expeditamentis canum.* Ex. Mag. Rot. Pip. de Anni. 9. Ed. 2.

This *expeditation* was to be performed once in every three years; and was done to every man's dog who lived near the forest, and even the dogs of the foresters themselves.

EXPEDITION, the march of an army to some place, with a view of hostilities.

Such were the *expeditions* of Cyrus against Xerxes, and of Bacchus and Alexander from the Indies.—The *expedition* of Xerxes against Greece, was unhappy: Cæsar himself, in the middle of his *expeditions* in the Gauls, composed two books of the analogy of words.

Expeditions for the Recovery of the Holy Land, were called *croisades*.

EXPENCES, in book-keeping. See book of *expences*.

EXPENSIS *militum levandis*, is a writ directed to the sheriff, for levying allowance for the knight of parliament. See PARLIAMENT, and REPRESENTATIVE.

EXPERIENCE, a kind of knowledge acquired by long use, without any teacher.

Experience consists in the ideas of things we have seen, or read, which the judgment has reflected on, to form it self a rule, or method.

Authors make three kinds of *experience*: the 1st. is the simple use of the external senses, whereby we perceive the phenomena of natural things, without any direct attention thereto, or making any application thereof.

The 2^d. is, when we premeditatedly, and designedly, make trials of various things, or observe those done by others; attending closely to all effects and circumstances.

The 3^d. is that preceded by a fore-knowledge, or at least, an apprehension of the event; and determines whether the apprehension were true or false.—Which two latter kinds, especially the third, are of great service in philosophy.

EXPERIMENT, in philosophy, a trial of the effect or result of certain applications, and motions of natural bodies; in order to discover something of the laws and relations thereof, or to ascertain some phenomenon, or its cause.

The schoolmen define *experiment*, a comparison of several things before observed by the senses, and retained in the memory; in some one similar convenient instance.

The nature of *experiment*, therefore, according to them, consists in comparing several things, by one act; whence they distinguish two things in every *experiment*, the one *material*, viz. the several ideas remembered: the other *formal*, viz. the comparing of these ideas in the mind.

This will be illustrated by an example: a physician gives a quantity of rhubarb to ten several persons, and remembers each of them: now, coming afterwards to compare the several remembrances together, and finding the effect of the exhibition of rhubarb to be the same in all, viz. a purging: this is an *experiment* of rhubarb.

The making of *experiments*, is grown into a kind of formed art; and we now abound in systems of *experiments*, under the denomination of *courses* of *experimental philosophy*. Sturmius has made a curious collection of the principal discoveries and *experiments* of the last age, under the title of *colligum experimentalum*. The chemists chuse to call their *experiments*, by way of distinction, or eminence, *processes*, or *operations*.

Toricellian *EXPERIMENT*. See TORICELLIAN.

EXPERIMENTAL *Philosophy*, by the Greeks called *ἐμπειρική*, or *ἐμπειρία*; is that which proceeds on *experiments*, or which deduces the laws of nature, and the properties and powers of bodies; and their actions upon each other, from sensible *experiments* and observations.

Experimentation is of the utmost importance in philosophy; and the great advantages the modern physics have above the ancient, is chiefly owing to this, that we have a great many more *experiments*, and that we make more use of the *experiments* we have.

Their way of philosophizing was, to begin with the cause of things, and argue to the effects and phenomena; ours, on the contrary, proceeds from *experiments* and observations alone.

My lord Bacon first paved the way for the new philosophy, by setting on foot the making of *experiments*. His method has been prosecuted with laudable emulation by the academy del Cimento, the Royal Society, Royal Academy at Paris, and by Mr. Boyle, Sir Isaac Newton, and many others.

In effect, *experiments*, within these 50 or 60 years, are come into such a vogue, that nothing will pass in philosophy, but what is founded on *experiment*, or confirmed by *experiment*, &c. So that the new philosophy is almost altogether *experimental*.

Indeed, the ancients, whatever we commonly say to the contrary, seem to have thought as well of the *experimental* way, as the moderns. Plato makes no occasion of speaking of the advantages of the *empiric*; and as to Aristotle, his history of animals may bear witness for him. Democritus's great business was to make *experiments*; and even Epicurus himself owes part of his glory to the same cause. Plato calls it, in respect to its subject, *ἐμπειρία*, subtlety of sense.

Yet there are some, even among the learned, who conceive of *experiments* in a different manner.—Dr. Keil allows, that philosophy has received very considerable advantages from the makers of *experiments*; but he complains of their dissimilarity, in too often wresting and distorting their *experiments*, and observations, to favour some darling theories they had espoused.—But this is not all: M. Hartsoeker, in his *Recueil de plusieurs pieces de physique*, undertakes to shew, that they who employ themselves in the making of *experiments*, are not properly philosophers, but, as it were, the labourers, or operators of philosophers, who work under them, and for them, furnishing them with materials to build their systems and hypotheses upon.

The learned M. Dacier, in the beginning of his discourse on Plato, at the head of his translation of the works of that philosopher, deals still more severely with the makers of *experiments*. He breaks out with a sort of indignation, at a tribe of idly curious people, whose sole employ consists in making *experiments* on the gravity of the air, the equilibrium of fluids, the loadstone, &c. and yet arrogate to themselves the noble title of philosophers. See PHILOSOPHY.

EXPERIMENTAL *Physics*. See the article PHYSICS.

EXPERIMENTUM *Crucis*, denotes a capital, leading, or decisive experiment; thus called, either as, like a cross, or direction-post placed in the meeting of several roads, it guides and directs men to the true knowledge of the nature of the thing they are enquiring after: or, as it is a kind of torture, whereby the nature of the thing is as it were extorted by violence.

EXPIATION, the act of suffering the punishments adjudged to a man's crimes, and thus paying off, and discharging the debt, or guilt.

The Romanists hold, that souls, after death, are sent to purgatory, to *expiate*, or atone for their sins.

EXPIATION is also applied to sacrifices offered to the deity, to implore his mercy, and forgiveness.

The feast of EXPIATION, among the Jews, called by our translators the day of atonement, was held on the tenth day of the

EXP

7th month of the Jewish year, answering to our September. —It was instituted by God himself, Levit. xxiii. 27, &c. On that day, the high-priest, the figure or type of Jesus Christ, confessed his sins; and after several ceremonies, made an atonement for all the people to wash them from their sins.

EXPIATION, among the heathens, denoted a purification used for effacing, or abolishing a crime.

It was practised with diverse ceremonies: the most usual was abolution.

Expiations were performed for whole cities, as well as particular Persons. —After the young Horatius had been abolved by the people from the murder of his sister; he was further purified by several *expiations* prescribed by the laws of the pontifices for involuntary murders. Halicarnass.

EXPIATION, in the civil law, the act of withdrawing, or diverting some thing belonging to an inheritance, before any body had declared himself heir thereof.

This made a peculiar species of theft: for there could not properly be a theft in taking a thing not possessed by any body; or ere the inheritance was accepted.

For this reason, the Roman legislature introduced the action of *expilation*, for the punishment of this crime.

EXPIRATION, in medicine, that motion in an animal, whereby the air, inspired into the lungs, is expelled, or thrown out of the frame, and the cavity of the breast contracted.

Respiration consists of two alternate motions, or actions of the lungs, corresponding to those of a pair of bellows; *inspiration*, whereby the air is drawn in; and *expiration*, whereby it is driven out again.

By means of this alternation, the circulation of the blood, and the motion of the heart are maintained.

EXPIRATION, is also used figuratively, for the end of a term of time granted, agreed on, or adjudged.

It is not above eight days, till the *expiration* of the term of his imprisonment: the time of such a bill of exchange is *expired*, i. e. it is fallen due. See BILL.

EXPLICITE, in the schools, something clear, distinct, formal, and unfolded.

The will, or intention, is said to be *explicite* when it is fully explained in proper terms; and *implicite*, when it is only to be learnt by deductions, and consequences.

The Jews had not all an *explicite* knowledge of Jesus Christ, but they had at least an *implicite* one.

Such a testator has declared his will *explicite*, i. e. in formal terms; there is no need to have recourse to explanations.

EXPLOSION, in physics, the act of a thing which drives another out of the place it before possessed.

The term is chiefly used for the going off of gun-powder, and the expulsion of the ball, shot, or the like, consequent thereon.

Hence, **EXPLOSION** comes likewise to be figuratively used to express such sudden actions of bodies, as have some resemblance hereto: *e. gr.* those which ferment with violence, immediately upon their mixture, and occasion a crackling sound.

Some writers have likewise applied *explosion* to the excursions of the animal spirits, and instantaneous motions of the nervous fibres arising without the direction of the mind: but the term here seems too figurative to express any determinate idea, so as really to inform the understanding.

EXPOLITION, in rhetoric, a figure, whereby we explain the same thing in different phrases, and expressions, in order to shew it more fully.

Expolition was the favourite figure of Balzac. —A man, but moderately versed in the style of scripture, will perceive that this is no more than an *expolition*; that is, a figure whereby the sacred author explains the same thing in different terms. The scriptures are full of such figures; and I scarce think there is any one more ordinary. Soucier.

EXPONAS Venditioni. See VENTIONI.

EXPONENT, in arithmetic. **EXPONENT** of a power, denotes the number which expresses the degree of the power; or which shews how often a given power is to be divided by its root, ere it be brought down to unity.

Thus the *exponent*, or index of a square number is 2; of a cube 3: the square being a power of the second degree; the cube of a third, &c.

EXPONENT, is also used in arithmetic, in the same sense with index, or logarithm.

Thus a series of numbers in arithmetical progression, being placed under another series in geometrical progression, are called the *exponents*, *indices*, or *logarithms* thereof. —*E. gr.* In the two progressions,

Geom. 1, 2, 4, 8, 16, 32, 64, 128, 256, 512

Arith. 0, 1, 2, 3, 4, 5, 6, 7, 8, 9

0 is the *exponent*, index, or logarithm, of the first term 1; 5 that of the 6th. 32, &c.

Hence, unity is the *exponent* of a power, as the logarithm of

EXP

the root, to the logarithm of its power: consequently, the logarithm of the power is had, by multiplying the logarithm of the root by its *exponent*; and the logarithm of the root is had, by dividing the logarithm of the power by its *exponent*.

EXPONENT of a ratio, is the quotient arising upon dividing the antecedent by the consequent.

Thus, in the ratio 3 to 2, the *exponent* is $1\frac{1}{2}$; and the *exponent* of the ratio 2 to 3, is $\frac{2}{3}$. See RATIO.

Hence, 1^o. If the consequent be unity, the antecedent is the *exponent* of the ratio. Thus, *e. gr.* the *exponent* of the ratio 4 to 1, is 4. —And again: the *exponent* of a ratio is to unity, as the antecedent to the consequent,

2^o. Since, in a rational ratio, the *exponent* of a ratio is had by dividing a rational number by another rational; the *exponent* of a rational ratio, is a rational number.

EXPONENTIAL Calculus, *Calculus EXPONENTIALIS*, is a method of differencing *exponential* quantities, and of summing up the differences of *exponentials*. See CALCULUS.

EXPONENTIAL Curve, is that which is defined by an *exponential equation*.

Exponential curves partake both of the nature of algebraic and transcendental ones; of the former, because they consist of a finite number of terms, though those terms themselves are indeterminate; and of the latter, because they cannot be algebraically constructed.

EXPONENTIAL Equation, is that wherein there is an *exponential* quantity. See EQUATION, &c.

EXPONENTIAL Quantity, is a power whose *exponent* is an indeterminate, or variable quantity.

Exponential quantities are of several degrees and orders; when the *exponent* is a simple indeterminate quantity, it is called an *exponential of the first or lowest degree*.

When the *exponent* it self is an *exponential* of the first degree, then the quantity is an *exponential of the second degree*.

Thus xy is an *exponential* of the first degree, because the quan-

tity y is a simple flowing quantity. But xy is an *exponential* quantity of the second degree; because y^2 is an *exponential* of

the first degree. So also xyz is an *exponential* of the third de-

gree, the *exponent* yz being one of the second.

EXPORTATION, in commerce, the act of sending commodities out of one country into another. See COMMERCE.

The merchandizes yearly *exported* from England are immense. —The principal articles are corn, cattle, cloth, iron, lead,

tin, leather, coal, hops, flax, hemp, hats, malt liquors, fish, watches, ribbands, &c.

The woollen manufactures alone, yearly *exported*, is computed to amount to 2000000 pound sterling; and lead, tin, and coals, to 500000 pound.

Wool, fullers earth, &c. are contraband goods, *i. e.* they are prohibited to be *exported*. —For the duties of *exportation*, see DUTY.

EXPOSING, the act of setting a thing to public view.

Perjury, forgery, libelling, false weights and measures are punished by *exposing* the criminal in the pillory, to the derision of the people.

In the Romish church, the sacrament is said to be *exposed*, when it is shewn in public, uncovered, on festival days, and during the time of plenary indulgences.

EXPOSING is also used with a further latitude: thus, we say, it is prohibited to *expose* false and clipped money.

Children are sometimes *exposed* in the streets; *i. e.* they are left in the streets, with design to be lost.

Such a house stands very high, and as a delicious prospect, but it is *exposed* to all the four winds. Such a city being on the frontiers, and not fortified, is *exposed* to the insults of every party of forces.

EXPOSITION, the act of *exposing*. See EXPOSING.

EXPOSITION is likewise applied to the interpretation, or explanation of an author, or a passage therein. See EXEGESIS.

Thus we say, an *exposition* of the 39 articles; of the Lord's Prayer, &c. See COMMENTARY, ANNOTATION, &c.

In this sense we do not say, *exposing*, but *expounding*.

EXPOSITION, in gardening. See EXPOSURE.

EXPOSITOR, or **EXPOSITORY**, a title which some writers have given to a lesser kind of dictionaries, or vocabularies, serving to expound, or explain the meaning of the hard words of a language.

EXPOSURE, or **EXPOSITION**, in gardening, the aspect, or situation of a garden, wall, building, or the like, with respect to the sun, wind, &c.

There are four regular kinds of *exposures*, *viz.* east, west, north, and south: but it must be observed, that among gardeners, these terms signify just the contrary to what they do among geographers.

The gardeners, in effect, do not give the names *east*, *west*, &c. to the places where the sun is; but to those whereon he shines; and they consider the manner wherein he shines, whether as to the whole garden, or some one of its sides.

If they find, that the sun at his rising, and during the first half of the day, continues to shine on one side of a garden or wall; they call that an *eastern exposure*, or *east wall*, &c. And if the sun begin to shine later, or end sooner, it is not a proper *eastern exposure*.

For the same reason, they call the *west*, the side the sun shines on in the latter half of the day, i. e. from noon to night. And accordingly, the *south*, or *southern exposure*, is the place whereon he shines, from about nine o'clock in the morning, till night; or which, in the general, he shines longest on in the whole day: and the part he shines least on, is the *north*, or *northern exposures*, at what hour soever it begin or end, being usually from 11 o'clock to 1.

Such is the gardeners language with regard to the *exposures*, and particularly those of walls; by which we are let into the signification of this or the like expression, usual amongst them.—My east wall proves, hits, or thrives better, than my west. My eastern fruit-trees have had fewer showers than my western, &c. The *eastern* and *southern exposures* are, by common consent of all gardeners, the two principal; and have a considerable advantage above the rest. A *west exposure* is not much amiss; at least, it is better than a northern one, which is the worst of all. Each has its inconveniencies.

The eastern, commencing differently at different seasons of the year and ending about noon, subjects the trees, &c. to the N. E. winds, which wither the leaves and new shoots, blow down the fruit, &c. beside that it has little benefit of rains, which come mostly from the west. Yet does the reverend Mr. Lawrence judge the east, better than the west wall, for all kinds of fruit: not that it has more hours of sun, or that there are any peculiar virtues in the eastern rays, but because the early rays of the sun do sooner take off the cold chilly dews of the night.

M. Gentil recommends the *eastern exposure* as best for all kinds of peaches; adding, that they ripen soonest, grow bigger, are better coloured, and of a finer taste than in any other: But Mr. Carpenter refrains the rule to the early and middle sorts: for the backward, he rather chuses a *southern*, or *south-east exposure*, which is best for all late fruits; because the influence of the sun is strongest, and continues longest therein.

The *western*, accounted from half an hour past 11, till sunset, is backwarder than an *eastern* one by 8 or 10 days; but it has this advantage, that it receives little damage from the frosts, which melt before the sun comes to shine upon the fruit, and fall off like dew, without doing any prejudice: so that it may bear apricots, peaches, pears, and plums. But it is incommoded with north west winds in the spring, as also with the autumnal winds, which blow down a deal of fruit.

The *northern exposure* has less sun than the west; yet is it not without its advantages. In the northerly parts of England, it bears little but pears, cherries, and plums. But in the warmer parts it serves for apricots, which have the advantage of continuing later, than in any other *exposure*, besides being free from insects.

The *southern exposure*, accounted from about 9 till 4, is recommended for peaches, pears, grapes, and plums.

EXPRESS, something that is precise, in formal terms, or for some particular design.—I told him as much in *express* terms: he gave me a commission *express*: he had *express* orders. A courier was dispatched *express*.

We also say, somewhat abusively, to send an *express*, meaning a courier.

EXPRESSED Oils, are such as are procured from bodies only by pressing; as the oils of olives, almonds, and the like. See **OIL**.

EXPRESSED Species. See the article **SPECIES**.

EXPRESSION, in medicine, chemistry, &c. the act of *expressing*, or extracting the juices of plants, fruits, or other matters, by squeezing, wringing, or pressing them in a press. After having let the herbs infuse a due time, their juice must be drawn by *expression* in a linen cloth, or by a press.

EXPRESSION, in oratory, denotes the manner of delivering, or conveying a man's ideas to another.

EXPRESSION is more particularly used for the elocution, diction, and choice of words in a discourse.

It is not enough a poet, or orator, have fine thoughts, he must likewise have a happy *expression*: defects in the *expression* ordinarily arise from defects in the imagination: abundance of the beauties of the ancient writers, are annexed either to *expressions* which are peculiar to their language; or to relations, which not being so familiar to us as to them, do not give us the same pleasure. De la Motte.

EXPRESSION, denotes in painting, a natural and lively representation of the subject, or of the several objects intended to be shewn.

representation of the subject, or of the several objects intended to be shewn.

The *expression* consists principally in representing the human body, and all its parts in the action suitable to it; in exhibiting in the face, the several passions proper to the figures; and observing the motions they impress on the other external parts.

The term *expression*, is ordinarily confounded with that of *passion*: but they differ in this, that *expression* is a general term, implying a representation of an object, agreeable to its nature and character, and the use, or office it is to have in the work; whereas *passion*, in painting, denotes a motion of the body, accompanied with certain dispositions, or airs of the face, which mark an agitation in the soul. So that every *passion* is an *expression*; but not every *expression* a *passion*.

LAWS, or rules of EXPRESSION in painting.—*Expression*, we have said, is a representation of things according to their character; and may be considered either with respect to the subject in general; or to the passions peculiar thereto.

I. With regard to the subject, it is to be observed, 1^o. That all the parts of the composition are to be transformed, or reduced, to the character of the subject: so as they may conspire to impress the same sentiment, passion, or idea: thus, e. g. in a representation of joy and peace, every thing is to appear calm and agreeable; of war, turbulent, and full of terror, &c.

2^o. In order to this, if any circumstance occur in history, or description, that would invert, or take from the idea; it must be suppressed; unless essential to the subject.

3^o. To this end, the history, or fable, is to be well studied in the authors who describe it, in order to conceive its nature and character truly, and impress it strongly on the imagination; that it may be diffused and carried through all the parts of the subject.

4^o. A liberty is to be taken of chusing favourable incidents, in order to diversify the *expression*; provided they be not contrary to the principal image of the subject, or the truth of history.

5^o. The harmony of the *tout ensemble* to be particularly regarded, both with regard to the actions, and the light and colour.

6^o. The modes and customs to be observed; and every thing made conformable to time, place, and quality.

7^o. The three unities of time, place, and action, to be observed: that is, nothing to be represented in the same picture, but what passes at the same time, and may be seen at the same view.

II. With regard to the particular passions and affections of the subject; the rules are, 1^o. That the passions of brutes are few and simple, and have almost all an immediate respect, either to self-preservation, or the propagation of the kind: but, in men, there is more variety; and accordingly, more marks and *expressions* thereof. Hence, man can move his eye-brows, which, in brutes, are immoveable: and can likewise move the pupil every way, which brutes cannot.

2^o. Children, having not the use of reason, act much on the footing of brutes; and *express* the motions of their passions directly, and without fear or disguise.

3^o. Though the passions of the soul may be *expressed* by the actions of the body; it is in the face they are principally shewn; and particularly in the turn of the eye, and the motion of the eye-brows.

4^o. There are two ways of lifting up the eye-brows, the one at the middle, which likewise draws up the corners of the mouth, and argues pleasant motions: the other at the point next the nose, which draws up the middle of the mouth, and is the effect of grief and sadness.

5^o. The passions are all reducible to joy and sadness; each of which is either simple, or mixed and passionate.

6^o. Simple joy causes a dilatation of all the parts: the eye-brows rise in the middle, the eyes half open, and smiling, the pupil sparkling and moist, the nostrils a little open, the cheeks full, the corners of the mouth drawn a little upwards, the lips red, the complexion lively, and the forehead serene.

7^o. Passionate joy proceeding from love, shews the forehead smooth and even, the eye-brows a little elevated on the side the pupil is turned to, the eyes sparkling and open, the head inclined towards the object, the air of the face smiling, and the complexion ruddy.—That proceeding from desire, shews itself by the body, the arms being extended towards the object, in uncertain and inquiet motions.

8^o. Simple sadness, is *expressed* by the body being cast down, the head carelessly hanging aside, the forehead wrinkled, the eye-brows raised to the midst of the forehead, the eyes half shut, the mouth a little open, the corners downwards, the under lip pointing and drawn back, the nostrils swelled, and drawn downwards.—Sadness mixed with fear, causes the parts to contract and palpitate, the members to tremble and fold up, the visage to be pale and livid, the point of the nostrils elevated, the pupil in the middle of the eye, the mouth openest

at the sides, and the under-lip drawn back.—In that mixed with anger, the motions are more violent, the parts all agitated, the muscles swelled, the pupil wild and sparkling, the point of the eye-brows fixed towards the nose, the nostrils open, the lips big, and pressed down, the corners of the mouth a little open and foaming, the veins swelled, and the hair erect.—That with despair, resembles the last, only it is more excessive and disordered.

9°. The hand has a great share in the *expression* of our sentiments and passions: the raising of the hands conjoined towards heaven, *expresses* devotion; wringing the hands, grief: throwing them towards heaven, admiration: faintings, and dejected hands, amazement and despair: holding the hands, idleness: holding the fingers indented, musing: holding forth the hands together, yielding and submission; lifting up the hand and eye to heaven, calling God to witness: waving the hand from us, prohibition: extending the right hand to any one, pity, peace, and safety: scratching the head, thoughtfulness and care: laying the hand on the heart, solemn affirmation; holding up the thumb, approbation: laying the forefinger on the mouth, bidding silence: giving with the finger and thumb *parce dare*: and the fore-finger put forth, the rest contracted, *monstrari & dicere hic est*.

10°. The sex of the figure is to be regarded; and man, as he is of a more vigorous and resolute nature, is to appear in all his actions freer and bolder than women, who are to be more reserved and tender.

11° So also the age, the different stages whereof incline to different motions both of body and mind.

12° The condition, or honours, a person is invested withal, render their actions more reserved, and their motions more grave; contrary to the populace, who observe little conduct or restraint; giving themselves, for the most part, up to their passions: whence their external motions become rude and disorderly.

Lastly, in spirits we must retrench all those corruptible things, which serve only for the prelevation of life, as veins, arteries, &c. only retaining what may serve for the form and beauty of the body.—In angels, particularly, as being symbolical figures, we are to mark out their offices and virtues, without any draught of sensual passions; only appropriating their characters to their functions of power, activity, and contemplation.

EXPULSION, the act of driving a man by force out of a city, community, or the like.

We say, *expulsion* out of parliament.—Milton is unbraided by archbishop Bramhall, with his *expulsion* from the university of Cambridge; but he shews it a groundless suggestion.—Mr. . . . was expelled from Cambridge, on suspicion of heresy, &c.

EXPULSION, is also used in medicine, for the act of driving out a foreign body with violence, from the place it was in.

The uterus has the chief office in the *expulsion* of the fœtus: if the *expulsion* of the fœtus happen very soon after conception, it is called a *false birth*. See **FŒTUS** and **DELIVERY**.

EXPURGATION, in astronomy, is used by some authors, for that state or action of the sun, wherein, after having been eclipsed and hid by the interposition of the moon, it begins to appear again.

Later astronomers call this *emersion*, not *expurgation*.

EXSICCATION*, in chemistry, &c. the act of drying up, or evaporating the moisture of a thing.

* The word is Latin, formed of *ex*, and *secus*, dry.

EXSORS Particula. See the article **PARTICULA**.

EXTANT, something that still subsists, or is in being.

It is but part of the history of Livy, of the writings of Cicero, Cæsar, &c. that are *extant*; the rest are lost. We have nothing *extant* of Socrates; though he wrote a great deal.

EXTASY, *Enrasis*, a rapture, or removal of the mind out of its natural state and situation: or, a transport, whereby a person is hurried out of himself, and the office of his senses are suspended.

In ecclesiastical history, we read of diverse monkish saints being in *extasies* for several days successively.—St. Paul's being taken up into the third heaven, was what we call an *extasy*.

EXTASY, in medicine, is considered as a disease, near a-kin to a catalepsy; only differing from it in this, that the cataleptic patient has no perception of what passes in his paroxysm, nor any remembrance thereof when it is over; whereas the *extatic* is taken up with a very lively idea, or imagination, which he remembers afterwards.

In an *extasy*, there must be an unusual tension of the fibres of the sensory, as in most deliriums, &c.

EXTEMPORANEOUS Prescription. See **PRESCRIPTION**.

EXTENDENDA Terra. See the article **TERRA**.

EXTENDING, in a legal sense, signifies the valuing of lands and tenements, of one bound by statute, &c. and who hath forfeited his bond, at such an indifferent rate, as that by the yearly rent, the obligator may, in time, be fully paid his debt. See **EXTENT**.

EXTENSION, in physics, that whereby a thing is constituted long, broad, or thick, &c.

Extension is usually described, as consisting in the situation of parts, beyond parts; which some authors cavil withal, as holding, that we can conceive absolute *extension*, without any relation to parts.

If a man consider the distance between two bodies, abstractedly, and without any regard to bodies which may fill that interval, it is called *space*: and when he considers the distance between the extremes of a solid body, it is called *extension*.

Extension is frequently confounded with quantity and magnitude; and, for what we can perceive, without much harm: the thing signified by them all appearing to be the same. Unless we admit a distinction made by some authors, that the *extension* of a body is something more absolute; and its quantity and magnitude more relative, or implying a nearer relation to much and little. See **QUANTITY**, **MAGNITUDE**, and **MASS**.

EXTENSOR, in anatomy, a name common to diverse muscles, serving to extend, or stretch out the parts; and particularly the hands and feet: such are the

EXTENSOR Carpi Ulnaris, called also *cubiteus internus*, a muscle, which coming from the internal protuberance of the humerus, and passing tendinous under the ligamentum annulare, is inserted into the upper part of the bone of the metacarpium, which answers to the little finger. This, and the ulnaris flexor, moving together, draw the hand side-wise towards the ulna.—See *Tab. Anat. (Myol.) fig. 8. n. 16*.

EXTENSOR Carpi Radialis, called also *radiceus externus*, and *biceps*, is really two distinct muscles. The first arises from above the external protuberance of the humerus; and the second from the lowermost part of the external protuberance. They both lie along the external part of the radius, and passing under the annular ligament, one is inserted into the bone of the metacarpus, that sustains the fore-finger; and the other to that which sustains the middle-finger. These two extend the wrist.—See *Tab. Anat. (Myol.) fig. 1. n. 19*.

EXTENSOR Communis digitorum manus, arises from the external protuberance of the humerus, and at the wrist divides into three flat tendons, which pass under the annular ligament, to be inserted into all the bones of the fore, middle, and ring-finger.—See *Tab. Anat. (Myol.) fig. 1. n. 36. fig. 6. n. 26*.

EXTENSOR Primi internodii pollicis, arises from the upper and external part of the ulna, and passing obliquely over the tendon of the *radiceus externus*, is inserted near the second joint of the thumb.

EXTENSOR Secundi internodii pollicis, arises from the upper and internal part of the radius, and is inserted into the upper part of the second bone of the thumb.

EXTENSOR Tertii internodii pollicis, arises from the ulna, a little below the first extensor, and is inserted into the third bone of the thumb.

EXTENSOR Indicis, comes from the middle and external part of the ulna, and passing under the annular ligament, is inserted into the third bone of the fore-finger, where it joins the extensor communis.

EXTENSOR Minimi digiti, arises from the external protuberance of the humerus, and from the upper part of the ulna; and passing under the annular ligament, is inserted the third bone of the little finger.—See *Tab. Anat. (Myol.) fig. 1. n. 37. and fig. 6. n. 17*.

EXTENSOR Digitorum pedis longus, is a muscle derived from the fore part of the upper epiphysis of the tibia, and growing tendinous about the middle thereof, it runs in four tendons under the annular ligament, to the third bone of every toe, except the pollex.—See *Tab. Anat. (Myol.) fig. 2. n. 45. fig. 1. n. 64*.

EXTENSOR Digitorum pedis brevis, comes from the exterior and fore part of the calcaneum, and goes to the second joint of the toes.—See *Tab. Anat. (Myol.) fig. 1. n. 73*.

EXTENSOR Pollicis pedis longus, rises large and fleshy from the fore part of the fibula, a little below its upper process; whence, passing under the annular ligament, it is inserted into the upper part of the second bone of the great toe.—See *Tab. Anat. (Myol.) fig. 1. n. 71*.

EXTENSOR Pollicis pedis brevis, springs fleshy from the fore part of the os calcis, and after a short belly, is contracted into a slender tendon; which running obliquely over the upper part of the foot, is inserted into the second bone of the great toe.—See *Tab. Anat. (Myol.) fig. 1. n. 75. fig. 2. n. 51*.

EXTENT, in law, sometimes denotes a writ, or commission to the sheriff, for the valuing of lands and tenements: sometimes the act of the sheriff upon this writ; and sometimes the estimate, or valuation of lands, *per proprios viros*. *Flota*, l. 2.

EXTENUATION, the act of diminishing, or lessening the bulk, or substance of a thing, especially of the human body. Fevers, agues, long abstinences, &c. occasion great *extenuations*, or emaciations.

EXTENUATION, is also a figure in rhetoric, opposite to the hyperbole.—The Greeks call it *ἀλλοτρίωσις*.

EXTERIOR Polygon. } See the articles { **POLYGON**.

EXTERIOR Talus. } See the articles { **TALUS**, &c.

EXTIRPATION *, the act of *extirpating*, or totally destroying a people, race, family, &c.

* The word is Latin, formed of *ex* and *terminus*, boundary.

The Jews have been *exterminated* out of Portugal; the Moors out of Spain; the Albigenses out of France, &c. Philip the Fair of France, to be revenged on the Knights Templars, took a resolution in 1307, to *exterminate* them.

EXTERNAL, or **EXTERIOR**, a term of relation, applied to the surface, or out-side of a body; or that part which appears, or presents it self to the eye, touch, &c.

In which sense it is exposed to *internal*, or *interior*.

External medicines are also called *local medicines*, and *topics*.

The senses are divided into *external*, which are those whereby we perceive ideas, or have the perception of external objects; as seeing, hearing, &c. and *internal*. See **SENSE**.

EXTERNAL, is also used to express any thing that is without-side a man, or that is not within him, and particularly in his mind. In which sense, we say *external objects*, &c.

The existence of an *external world*, i. e. of bodies, out of the mind, is a thing has been greatly called in question of late. See **EXISTENCE**, and **BODY**.

In reality, 'were it possible for bodies, i. e. solid, figured, &c.

'substances to exist without the mind, corresponding to those

'ideas we have of *external* objects, yet how were it possible

'for us to know it? either we must know it by sense, or

'reason: as for our senses, by them we have only the know-

'ledges of our sensations or ideas: they do not inform us that

'things exist without the mind, or unperceived, like those

'which are perceived. It remains, therefore, that if we

'have any knowledge at all of *external* things, it must be by

'reason, inferring their existence from what is immediately

'perceived by sense. But how shall reason induce us to be-

'lieve the existence of bodies without the mind, when the

'patrons of matter themselves deny that there is any necessa-

'ry connection betwixt them and our ideas. In effect, it is

'granted on all hands, that what happens in dreams, phren-

'sies, deliriums, extasies, &c. puts it beyond dispute, that

'we might be affected with all the ideas we have now, though

'there were no bodies existing without, resembling them.

'Hence, it is evident, the supposition of *external* bodies is

'not necessary for the production of our ideas.' Berkel.

Princ. of Human Know. p. 59.

'Granting the materialists their *external* bodies, they by their

'own confession, are never the nearer knowing how our ideas

'are produced; since they own themselves unable to com-

'prehend in what manner body can act upon spirit; or how

'it is possible it should imprint any idea in the mind. Hence,

'the production of ideas, or sensations, in our minds, can

'be no reason why we should suppose matter, or corporeal

'substances; since that is equally inexplicable with or with-

'out the supposition. In short, though there were *external*

'bodies, it is impossible we should ever come to know it; and

'if there were none, we should have the same cause to think

'there were that we now have.' *Id. Ibid.* p. 60, 61.

'Try, whether you can conceive it possible for a sound, or

'figure, or motion, or colour, to exist without the mind, or

'unperceived. This may perhaps convince you, that what

'you contend for, is a downright contradiction.—I am con-

'tent to put the whole upon this issue: if you can but con-

'ceive it possible for one extended, moveable substance, or,

'in general, for any one idea to exist otherwise than in a

'mind perceiving it; I shall readily give up the cause.' *Id.*

Ibid. p. 63.

'It is worth while to reflect a little on the motives which

'induced men to suppose the existence of material substance;

'that so, having observed the gradual ceasing and expiration

'of those motives, we may withdraw the assent grounded

'on them. First, therefore, it was thought that colour,

'figure, motion, and the rest of the sensible qualities, did

'really exist without the mind; and for this reason, it seemed

'necessary to suppose some unthinking substratum, or sub-

'stance, wherein they did exist, since they could not be con-

'ceived to subsist by themselves. Afterwards in process of

'time, men being convinced that colours, sounds, and the

'rest of the sensible secondary qualities had no existence

'without the mind; they stripped this substratum of these

'qualities, leaving only the primary ones, figure, motion,

'&c. which they still conceived to exist without the mind;

'and consequently to stand in need of a material support.

'But having shewn above, that none, even of these, can

'possibly exist otherwise than in a spirit, or mind, which per-

'ceives them, it follows, that we have no longer any reason

'to suppose the being of matter.' *Id. Ibid.* p. 118, 119. See

QUALITY.

EXTERNAL Denomination. } See { **DENOMINATION**.

EXTERNAL Modes. } See { **MODE**.

EXTERNAL Place. } See { **PLACE**.

EXTERNAL Angles, are the angles of any right-lined figure

formed without it, when all the sides are severally produced.

These are all, taken together, equal to four right angles.—

Particularly, in a triangle, the *external* angle DOA (*Tab.*

Geometry, fig. 76.) is equal to both the internal and opposite

ones z and y. See **TRIANGLE**.

EXTERNAL Beauty. } See { **BEAUTY**.

EXTERNAL Ear. } See { **EAR**, and **AURICLE**.

EXTERNUS Auris, in anatomy, a small muscle coming from

the side of the meatus auditorius, to the short process of the

malleus; serving to draw the handle thereof downwards,

and so to relax the membrana tympani. See **EAR**.

EXTERNUS Brachiius. }

EXTERNUS Cubitiueus. }

EXTERNUS Gastrocnemius. }

EXTERNUS Iliacus. }

ORBITER,
PTERYGOIDEUS,
VASTUS,
RECTUS.

EXTINCTION, the act of *extinguishing*, that is, of putting

out, or destroying fire, flame, or light.

Boerhaave denies, that there is properly any such thing as *ex-*

tinguishing of fire: it is a body *sui generis*, of an immutable

nature, and we can no more *extinguish*, or destroy it, than

we can create it.

The Aristotelians account for the *extinction* of fire from the

principle of contrariety; thus say they, water puts out fire,

by reason the qualities of water are contrary to those of fire;

the one being cold, and moist, and the other, hot and dry.

But how far this will go, may appear hence, that fire is *ex-*

tinguished by hot water as readily as cold; may even by oil,

earth, &c.

Some of the moderns offer two more plausible causes of *ex-*

tingition, viz. *dissipation*, as when the next, immediate fuel of

the flame, is dispersed and blown off by too forcible a wind:

and *suffocation*, when it is so compressed, as that its free mo-

tion cannot be maintained; as happens upon throwing water

&c. thereon.

EXTINCTION, in chemistry, and pharmacy, is when a metal,

mineral, or the like body, after having been heated red-hot

in the fire, is plunged in some fluid; either to soften or tem-

per its acrimony, as tully in rose-water; or to communi-

cate its virtue to the liquor, as iron or steel to common wa-

ter; or, lastly, to give it a temper, as in the *extinction* of

steel in water, or some other preparation.

EXTINGUISHMENT, in law, is used for a *consolidation*.

Thus, if a man, having a yearly rent due to him out of my

lands, afterwards purchase the same lands; both the property

and rent becoming consolidated, or united in one possessor,

the rent is said to be *extinguished*.

So, where a man has a lease for years, and afterwards buys

the property, there is a *consolidation* of the property, and an

extinguishment of the lease.

So also if there be lord mesne, and tenant, and the lord

purchase the tenancy, the mesnalty is *extinct*.

EXTIRPATION *, the act of pulling up, or destroying a

thing to the very roots.

* The word is formed of the Latin *ex*, and *stirps*, root.

Dogs grass is a weed very difficult to *extirpate*.—Among the

prayers of the Romish jubilee, there is one for the *extirpa-*

tion of heresy.

EXTIRPATION, is also used in chirurgery, for the cutting off

any part entirely; as a wen, &c. or the eating it away, as a

wart, &c. by corrosive medicines. See **AMPUTATION**, and

CORROSION.

EXTISPEX *, in antiquity, an officer who viewed, and exa-

mined the entrails of victims; in order to draw presages

therefrom as to futurity.

* The word is formed of the Latin *exta*, and *species*, of

specio, I view, consider.

This kind of divination, called *extispicium*, was mightily in

vogue throughout Greece, where there were two families,

the Jamidae and Clytidae, consecrated, or set apart, pecu-

liarily for it.

In Italy, the first *extispices* were the Etrurians; among

whom,

EXT

whom, likewise, the art was in great repute. Lucan gives us a fine description of one of these operations in his first book.

EXTORTION, in law, an illegal manner of wresting any thing from a man, either by force, menace, or authority. If an officer, by terrifying, or spurning upon another on pretence of his office, takes more than his ordinary fees, or dues, he commits, and is indictable for *extortion*.

So the exacting of unlawful usury, winning by unlawful game, and, in fine, all taking of more than is justly due by colour, or pretence of right, as excessive tolls in millers, excessive prices of ale, bread, victuals, wares, &c. come under *extortion*.

Crompton says, that wrong done by any man, is properly a trespass, but excessive wrong is *extortion*; which is most properly applicable to sheriffs, mayors, bailiffs, and other officers, who, by colour of their office, greatly oppress and wrong the king's subjects, by taking excessive rewards, or fees, for executing their office.

EXTRA-JUDICIAL, something done out of the proper court, or the ordinary course of law.—As when judgment is given in a cause, or case, not depending in that court where such judgment is given, or wherein the judge has not jurisdiction.

EXTRA-PAROCIAL, a place out of the bounds of any parish; or privileged, and freed from the duties of a parish.

EXTRACT, **EXTRACTUM**, in pharmacy, the purest, and finest part of a vegetable, or other body, separated from the coarser, by dissolution and digestion with a proper menstruum; and afterwards reduced into a thick, moist consubstance by distillation, or evaporation of the humidity of the menstruum.

EXTRACT, in matters of literature denotes a short abridgement of a book, or paper, or of some of the matters thereof. The journals, nouvelles, biliotheques, memoirs, and other monthly or quarterly accounts of the affairs of learning, consist principally of *extracts* of the most material passages, doctrines, &c. found in the several books, published in that time.

EXTRACTI ab Ecclesia. See **RESTITUTIONE Extracti**.

EXTRACTION, in pharmacy and chemistry, an operation, whereby essences, tinctures, &c. are drawn from natural bodies.

Some will have *extraction* to signify any solution made by menstrua: but, in strictness, there is this difference; that in *solution* the menstruum absorbs the whole substance of the body, but in *extraction* it carries off only a certain part of it; and in this sense, camphire is dissolved in spirit of wine, but jalap is more properly said to be *extracted*; for the resin is only taken out by the menstruum, the other particles being left untouched.

EXTRACTION also frequently signifies such an inspissation, or thickening of a solution, so that a certain quantity of the menstruum being drawn off, the remaining mixture is reduced to the consistency of honey; as in the *extracts* of saffron, gentian, and the like.

Extracts are chiefly made from vegetables, and require different menstrua, according to the different nature of the plants; especially the gummy kind: for such as are mucilaginous, as gum arabic, and tragacanth, &c. are not easily dissolved but in aqueous liquors; whereas resinous gums, as galbanum, scammony, &c. must have burning spirits to dissolve them.

There are others again of a middle nature, which may be dissolved in either sort of menstrua, though not so easily in one as the other: thus aloes, and rhubarb, which are something resinous, are better made into *extracts* of spirit of wine, than water: but plants, which abound less with resin, such as hellebore, &c. are more commodiously *extracted* with water.

To perform *extraction* therefore aright, a proper menstruum is necessary, and one which is as near a-kin as possible to the body to be *extracted*.

EXTRACTION, in chirurgery, denotes an operation whereby some foreign matter lodged in the body, contrary to the order of nature, is drawn out of the same by manual application, or the help of instruments.

Such is the *extraction* of a stone, formed in the bladder, or in the kidneys, &c.

Extraction belongs to the *exercitia*, as a species to its genus. See **EXERCISII**.

EXTRACTION, or *Descent*, in genealogy, denotes the stock, or family which a person is descended from.

In some military orders, chapters, &c. a candidate must make proof of the nobility of his *extraction* before he is admitted.

EXTRACTION of Roots, the method of finding the roots of given numbers, or quantities. See **ROOT**.

The square, cube, and other powers of a number, or root, are formed by multiplying the given number into itself a greater, or less number of times, as the power required is higher or lower. See **POWER**.

This multiplication compounds the powers; and the *extraction* of the root decomposes them again, or reduces them

EXT

to their first principles or roots. So that the *extraction* of the root is to the multiplication of the power, what the analysis is to the synthesis.

Thus, 4, multiplied by 4, produces 16; which is the square of 4, or the factum of 4 by it self; and 16, multiplied by 4, makes 64, which is the cube of 4, or the factum of 4 by its square.—Such is the composition of powers.

Again, the square root of 16 is 4, by reason 4 is the quotient of 16 divided by 4; and the cube root of 64 is likewise 4, by reason 4 is the quotient of 64 divided by the square of 4:—Such is the *extraction* of roots.

Hence, to *extract* the root out of a given power, is the same thing as to find a number, *e. gr.* 4, which being multiplied a certain number of times into itself, produces the given power, *e. gr.* 16 or 64.

For the *extraction* of square and cube roots, it is necessary to have the squares, and cubes of all the digits in readiness; as exhibited in the following table.

Roots	1	2	3	4	5	6	7	8	9
Square	1	4	9	16	25	36	49	64	81
Cubic	1	8	27	64	125	216	343	512	729

To *extract* the square root out of a given number.—1°. Divide the given number into classes, of two figures a-piece; and include each class between two dots, commencing with the place of units, or the right hand figure: the root will consist of so many parts, or figures, as you have classes.—By the way observe, it may happen that for the last class on the left hand there shall only be one figure left.

2°. Then the left hand class being the square of the first figure of the root sought; look in the table of roots for the square root answering to that number: or, if that square number be not precisely there, to the next lesser number: this root write down for the first figure of the quotient: and subtract its square from the left hand class.—2. the remainder, bring down the next class toward the right.

3°. Write down the double or the quotient-figure under the left hand figure of the second class; and seek how oft this decuple is contained in the figure over it: the quotient gives the second figure of the root.

4°. Write the same quotient under the right hand figure of the same class; and subtract the product of the whole number-underwritten, multiplied by the first figure of the root, from the number over it, as in division.

5°. The operation being repeated according to the third and fourth steps, *i. e.* the remainder being still divided by the double of the root as far as *extracted*, and from the remainder, the square of the figure that last came out, with the decuple of that foreaid divisor augmented thereby, being subtracted; you will have the root required.

E. gr. To *extract* the root of 99856, point it after the following manner, 99856, then seek a number, whose square shall equal the first figure 9, *viz.* 3, and write it in the quotient; then having subtracted from 9, 3 x 3, or 9, there will remain 0; to which set down the figures as far as the next point, *viz.* 98 for the following operation.

Then, taking no notice of the last figure 8, say, how many times is the double of 3, 99856 (316 or 6, contained in the first figure 9? Answer 1. Wherefore having wrote 1 in the quotient, subtract the product, of 1 x 61, or 61 from 98, and there will remain 37, to which connect the last figures 56, and you will have the number 3756, in which the work is next to be carried on. Wherefore also neglecting the last figure of this, *viz.* 6, say how many times is the double of 31, or 62, contained in 375 (which may be guessed at from the initial figures 6 and 37, by taking notice how many times 6 is contained in 37?) Answer 6; and writing 6 in the quotient, subtract 6 x 626, or 3756, and there will remain 0; whence it appears, that the business is done, the root coming out 316.

Otherwise, with the divisors set down, it will stand thus:

$$\begin{array}{r}
 99856 \quad (316 \\
 9 \\
 \hline
 6) 98 \\
 61 \\
 \hline
 62) 3756 \\
 3756 \\
 \hline
 0
 \end{array}$$

o. And so in others. Again,

EXT

Again, if you were to *extract* the root out of 22178791:

22178791 (4709, 43681, &c.)
16
617
609
88791
84681
411000
376736
3426400
2825649
60075100
56513196
356190400
282566169

the root, *viz.* neglecting the last figure 7, say, how many times 8 is contained in 61? Answer, 7; wherefore write 7 in the quotient, and from 617, take the product of 7 into 87, or 609, and there will remain 8, to which join the two next figures 87, and you will have 887; by the division whereof by the double of 47, or 94, you are to obtain the third figure; in order to which say, how many times is 94 contained in 88? Answer 0; wherefore write 0 in the quotient, and adjoin the two last figures 91, and you will have 88791, by whose division by the double of 470, or 940, you are to obtain the last figure, *viz.* say, how many times 940 in 8879? Answer 9; wherefore write 9 in the quotient, and you will have the root 4709. But since the product 9 x 9409, or 84681, subtracted from 88791 leaves 4110, the number 4709 is not the root of the number 22178791 precisely, but a little less.

If then it be required to have the root approach nearer; carry on the operation in decimals, by adding to the remainder two cyphers in each operation. Thus the remainder 4110, having two cyphers added to it, becomes 411000; by the division whereof, by the double of 4709, or 9418, you will have the first decimal figure 4. Then having writ 4 in the quotient, subtract 4 x 94184, or 376736, from 411000, and there will remain 34264. And so having added two more cyphers, the work may be carried on at pleasure, the root at length coming out 4709, 43637, &c.

But when the root is carried on half way or above, the rest of the figures may be obtained by division alone: as in this example, if you had a mind to *extract* the root to nine figures, after the five former 47094 are *extracted*, the four latter may be had, by dividing the remainder by the double of 47094.

Thus, if the root of 32976, were to be *extracted* to five places, in numbers; after the figures are pointed, write 1 in the quotient, as being the figure whose square 1 x 1, or 1, is the greatest that is contained in 3, the figure to the first point; and having taken the

32976 (181, 59
1
2)229
224
36)576
361
362)215(59, &c.)

square of 1 from 3, there will remain 2; then having set the two next figures, *viz.* 29 to it, (*viz.* to 2) seek how many times the double of 1, *viz.* 2, is contained in 22, and you will find indeed that it is contained more than 10 times; but you are never to take your divisor 10 times, no, nor 9 times in this case; because the product of 9 x 29, or 261, is greater than 229, from which it would be to be taken, or subtracted: wherefore write only 8. And then having wrote 8 in the quotient, and subtracted 8 x 28, or 224, there will remain 5; and having set down to this the figures 76, seek how many times the double of 18, or 36, is contained in 57, and you will find 1, and so write 1 in the quotient; and having subtracted 1 x 361, or 361, from 576, there will remain 215. Lastly, to obtain the remaining figures, divide this number 215, by the double of 181, *viz.* 362, and you will have the figures 59, which being writ in the quotient, give the root 181, 59.

After the same manner are roots *extracted* out of decimal numbers.—Thus the root of 32976 is 181,59; and the root of 3,2976 is 1,8159; and the root of 0,32976 is, 0,18159, and so on. But the root of 3297,6 is 57, 4247; and the root of 32976 is 5,74247. And thus the root of 9,9856 is 3,16.

To *extract* the other, or higher root, out of a given number.—The *extraction* of the cubic root, and of all other roots may be comprehended under one general rule, *viz.* every third

EXT

figure, beginning from unity, is first to be pointed; if the root to be *extracted* be a cubic one; or every fifth, if it be a quadrato-cubic, (or of the fifth power) and then such a figure is to be writ in the quotient, whose greatest power (that is, whose cube, if it be a cubic power, or whose quadrato-cube, if it be the fifth power, &c.) shall either be equal to the figure, or figures, before the first point, or next less under them; and then having subtracted that power, the next figure will be found by dividing the remainder augmented by the next figure of the resolvend, by the next least power of the quotient multiplied by the index of the power to be *extracted*, that is, be the triple square, if the root be a cubic one; or by the quintuple biquadrate (that is, five times the biquadrate) if the root be of the fifth power, &c. And having again subtracted the power of the whole quotient from the first resolvend, the third figure will be found by dividing that remainder, augmented by the next figure of the resolvend, by the next lesser power of the whole quotient; multiplied by the index of the power to be *extracted*. Thus, to *extract* the cube root of 13312053, the number is first to be pointed after this manner, *viz.* 13312053; then you are to write the figure 2, whose cube is 8, in the first place of the quotient, as, that which is the next lesser cube to the figures 13, (which is not a perfect cube number) or as far as the first point; and having subtracted that cube, there will remain 5;

which being augmented by the next figure of the resolvend 3, and divided by the triple square of the quotient 2, by seeking how many times 3 x 4, or 12 is contained in 53, it gives 4 for the second figure of the quotient. But since the cube of the quotient

13312053(237
Subtract the cube 8
12) rem: 53 (4 or 3
Subtract cube 12167
1587) rem: 11450 (7
13312053
Remains 0

24, *viz.* 13824, would come out too great to be subtracted from the figures 13312 that precede the second point, there must only 3 be writ in the quotient: then the quotient 23 being in a separate place multiplied by 23, gives the square 529, which again multiplied by 23, gives the cube 12167; and this taken from 13312, will leave 1145; which augmented by the next figure of the resolvend 0, and divided by the triple square of the quotient 23, *viz.* by seeking how many times 3 x 529, or 1587, is contained in 11450, it gives 7, for the third figure of the quotient. Then the quotient 237, multiplied by 237, gives the square 56169, which again multiplied by 237, gives the cube 13312053, and this taken from the resolvend, leaves 0. Whence it is evident, that the root sought is 237.

So also, to *extract* the quadrato-cubical root of 36430820, it must be pointed over every fifth figure; and the figure 3, whose quadrato-cube, or fifth power 243, is the next lesser to 364, *viz.* to the first point, must be writ in the quotient. Then the quadrato-cube 243, being subtracted from 364, there remains 121, which augmented by the next figure of the resolvend, *viz.* 3, and

divided by five times the biquadrate of the quotient, *viz.* by seeking how many times 5 x 81, or 405, is contained in 1213, it gives 2 for the second figure. That quotient 32, being thrice multiplied by it self,

36430820 (32, 5
243
405) 1213 (2
33554432
5242880) 2876388, 0 (5

makes the biquadrate 1048576; and this again multiplied by 32, makes the quadrato-cube 33554432, which being subtracted from the resolvend, leaves 2876388. Therefore 32 is the integer part of the root, but not the true root; wherefore, if you have a mind to prosecute the work in decimals, the remainder, augmented by a cypher, must be divided by five times the aforelaid biquadrate of the quotient, by seeking how many times 5 x 1048576, or 5242880, is contained in 2876388, 0, and there will come out the third figure, or the first decimal 5. And so by subtracting the quadrato-cube of the quotient 325 from the resolvend, and dividing the remainder by five times its biquadrate, the fourth figure may be obtained. And so on in infinitum.

In some cases, it is convenient only to indicate the *extraction* of a root; especially where it cannot be had exactly. Now, the sign, or character, whereby roots are denoted, is $\sqrt{\quad}$. To which is added the exponent of the power, if it be above a square, and even sometimes if it be not. *E.g.* $\sqrt{\quad}$ denotes the square root. $\sqrt[3]{\quad}$ the cube root &c. See ROOT.

When a biquadratic root is to be *extracted*, you may *extract* twice the square root, because $\sqrt[4]{\quad}$ is as much as $\sqrt[2]{\quad} \times \sqrt[2]{\quad}$. And when the cubo-cubic root is to be *extracted*, you may first *extract* the cube root, and then the square root of that cube root, because the $\sqrt[6]{\quad}$ is the same as $\sqrt[3]{\quad} \times \sqrt[2]{\quad}$; wherefore some have called these roots, not cubo-cubic ones, but quadrato-

EXT

diato-cubes. And the same is to be observed in other roots, whose indexes are not prime numbers.

To prove the extraction of roots—1°. For a square root: multiply the root found by it self, and to the product add the remainder, if there were any: if the sum be equal to the number given, the operation is just.

2°. For a cube root: multiply the root found by it self; and the product, again, by the same root. To the last product, add the remainder if there were any. If the sum come out the number first given, the work is just.

After the like manner may the extraction of the other roots be proved.

To extract the roots of equations, or algebraic quantities.—The extraction of roots out of simple algebraic quantities, is evident, even from the nature, or marks of notation it self; as that \sqrt{aa} is a , and that $\sqrt{aa\ cc}$ is $a\ c$, and that $\sqrt{9\ aa\ cc}$ is $3\ a\ c$; and that $\sqrt{49\ a^2\ xx}$ is $7\ a\ x$. And also that $\sqrt{\frac{a^2}{cc}}$ is $\frac{a}{c}$, and that $\sqrt{\frac{a^2\ bb}{cc}}$ is $\frac{a\ b}{c}$, and that $\sqrt{\frac{9\ aa\ zz}{25\ dd}}$ is $\frac{3\ a\ z}{5\ d}$, and that $\sqrt{\frac{8\ b^6}{27\ a^3}}$ is $\frac{2\ b^2}{3\ a}$, and that $\sqrt{a\ a\ b\ b}$ is \sqrt{ab} . Moreover, that $b\ \sqrt{a\ a\ c\ c}$, or b into $\sqrt{a\ a\ c\ c}$, is equivalent to b into ac , or abc . And that $3\ c\ \sqrt{\frac{9\ aa\ zz}{25\ dd}}$, is equivalent to $3\ c \times \frac{3\ a\ z}{5\ d}$, or $\frac{9\ a\ c\ z}{5\ d}$.

And that $\frac{a+3x}{c} \sqrt{\frac{4\ b\ b\ x^2}{81\ aa}}$ is equivalent to $\frac{a+3x}{c} \times \frac{2\ b\ x + 6\ b\ x^2}{9\ a\ c}$, or to $\frac{2\ a\ b\ x + 6\ b\ x^2}{9\ a\ c}$. I say these are all evident, because it will appear at first sight, that the proposed quantities are produced, by multiplying the root, into themselves (as aa from a into a ; $a\ a\ c\ c$ from $a\ c$ into $a\ c$; $9\ a\ a\ c\ c$ from $3\ a\ c$ into $3\ a\ c$, &c.) But when quantities consist of several terms, the business is performed as in numbers.

Thus to extract the square root out of $aa+2ab+bb$; in the first place, write the root of the first term a , viz. a in the quotient, and having subtracted its square $a \times a$, there will remain $2ab+bb$ to find the remainder of the root by. Say therefore, how many times is the double of the quotient, or $2a$, contained in the first term of the remainder $2ab$? I answer b [times] therefore write b in the quotient, and having subtracted the product of b into $2a+b$, or $2ab+bb$, there will remain nothing. Which shews that the work is finished, the root coming out $a+b$.

And thus to extract the root out of $a^2+6a^2b+5aabb-12ab^2+4b^4$, first set in the quotient the root of the first term a^2 , viz. a , and having subtracted its square $a \times a$, or a^2 , there will remain $6a^2b+5aabb-12ab^2+4b^4$ to find the remainder of the root. Say therefore, how many times is $2aa$ contained in $6a^2b$? Answer $3ab$; wherefore write $3ab$ in the quotient, and having subtracted the product of $3ab$, into $2aa+3ab$, or $6a^2b+9aabb$, there will yet remain $-4aabb-12ab^2+4b^4$ to carry on the work. Therefore, say again, how many times is the double of the quotient viz. $2aa+6ab$ contained in $-4aabb$? Answer $-2b$. Therefore having writ $-2b$ in the quotient, and subtracted the product $-2b$ into $2aa+6ab-2b$, or $-4aabb-12ab^2+4b^4$, there will remain nothing.

Whence it follows, that the root is $a+3ab-2b$.
 $a^2+6a^2b+5aabb-12ab^2+4b^4$ ($a+3ab-2b$)
 a^2
 $-6a^2b+9aabb-12ab^2+4b^4$
 $0+6a^2b+9aabb$
 0
 $-4aabb-12ab^2+4b^4$
 $-4aabb-12ab^2+4b^4$
 0

And thus the root of the quantity $xx-ax+\frac{1}{4}aa$ is $x-\frac{1}{2}a$; and the root of the quantity y^2+4y^2+8y+4 is $yy+2y-2$; and the root of the quantity $16a^2-24a^2xx+9x^2+12bxx-16aabb+4b^4$ is $3xx-4aa+2bb$, as may appear underneath.

$xx-ax+\frac{1}{4}aa$ ($x-\frac{1}{2}a$)
 xx
 $0-ax+\frac{1}{4}aa$
 0

yy^2+4y^2+8y+4 ($yy+2y-2$)
 yy^2
 $-4yy$
 $0-4yy$
 $-4yy-8y+4$
 0

$16a^2-24a^2xx+9x^2+12bxx-16aabb+4b^4$ ($3xx-4aa+2bb$)
 $16a^2$
 $+3aabb+3abb+b^2$ ($a+b$)
 a^3
 $3aa$ 0 + $3aabb$ (b)
 $a^2+3aabb+3abb+b^2$

Extrahit first the cube root of the first term a^3 , viz. a , and set it down in the quotient: then subtracting its cube a^3 , say, how many times is its triple square, or $3a^2$, contained in the next term of the remainder $3a^2b$; and there comes out b ; wherefore write b in the quotient, and subtracting the cube of the quotient $a+b$, there will remain 0; therefore $a+b$ is the root. After the same manner, if the cube root is to be extracted out of $z^3+6z^2-40z^2+96z-64$, it will come out $z+2z-4$. And so likewise in higher root.

EXTRAORDINARY Motion. See the article MOTION.

EXTRAORDINARY, something out of the common course.

EXTRAORDINARY Couriers, are those sent express on some urgent occasion.

Embassador, or Envoy EXTRAORDINARY, is such a one as is sent to treat, or negotiate some special and important affair, as a marriage, a treaty, confederacy, &c. or even on occasion of some ceremony, as condolance, congratulation, &c.

A Gazette, Journal, or other News-paper extraordinary, is that published after some great and notable event, containing the detail, or particulars thereof, which were not found in the ordinary papers.—Our news writers generally use postscripts, or supplements, instead of extraordinary.

EXTRAORDINARY Culverin. See the article Culverin.

EXTRAVAGANTES, a part of the canon law, containing diverse constitutions of the popes, not included in the body of the canon law.—Whence the nomination *extravagantes*: quasi extra corpus juris vagantes.

The *extravagantes* are divided into two parts: the first contains XX constitutions of John XXII: and the second, other later constitutions of the said John and his successors.

EXTRAVASATION *, in medicine, a motion of the blood, whereby it breaks out of its ordinary vessels, the veins or arteries, and either gathers, and stagnates in some soft part, or is thrown quite out of the body.

* The word is formed of the Latin, *extra*, without, and *vas* vessel.

The ordinary causes of *extravasations*, are unnatural rep lesions and distentions of the vessels; or lacerations, and erosions thereof. There is a necessity for bleeding, to prevent the blood's growing to such a head as to *extravasate*.

—In wounds of the head, particularly, bleeding is necessary, to prevent the *extravasation* of the blood in the brain.

EXTRAVASATIONS, is sometimes likewise used in speaking of other humours beside the blood; as the lymphæ, urine, &c. The gardeners use the term in speaking of gums, juices, &c. which ooze out of their trees either spontaneously, or at incisions.

EXTREAM, or EXTREME, is applied to the last and outermost part of any thing; or that which finishes, and terminates it on that side.

The *extremities* of a line are points.—There is no passing out of one *extream*, into the other, without going through the middle.—*Extream* remedies must only be had recourse to in *extream* necessity.

Some anatomists apply the denomination *extreams*, or *extremities*, to the arms and legs.

The arms, or upper EXTREMITIES, consist of sixty-two bones; thirty-one in each, viz. the omoplate, humerus, cubitus, radius, eight in the carpus, four in the metacarpus, and fifteen in the fingers.

The

EXT

$$9x^4 - 24a^2ax^2 + 16a^4 + 12bbx^2 - 16a^2bb + 4b^4 \left(3x^2 - 4aa + 2bb \right)$$

$$9x^4 - 24a^2ax^2 + 16a^4 + 12bbx^2 - 16a^2bb + 4b^4$$

$$y^4 + 4y^2 - 8y + 4 \left(yy + 2y - 2 \right)$$

$$4y^2 + 4yy - 4yy - 8y + 4$$

If you would extract the cube root out of $a^3+3a^2b+3abb+b^3$, the operation is performed thus:

$$a^3+3a^2b+3abb+b^3 \left(a+b \right)$$

$$3aa \ 0 + 3aabb \ (b)$$

Extrahit first the cube root of the first term a^3 , viz. a , and set it down in the quotient: then subtracting its cube a^3 , say, how many times is its triple square, or $3a^2$, contained in the next term of the remainder $3a^2b$; and there comes out b ; wherefore write b in the quotient, and subtracting the cube of the quotient $a+b$, there will remain 0; therefore $a+b$ is the root. After the same manner, if the cube root is to be extracted out of $z^3+6z^2-40z^2+96z-64$, it will come out $z+2z-4$. And so likewise in higher root.

EXTRAORDINARY Motion. See the article MOTION.

EXTRAORDINARY, something out of the common course.

EXTRAORDINARY Couriers, are those sent express on some urgent occasion.

Embassador, or Envoy EXTRAORDINARY, is such a one as is sent to treat, or negotiate some special and important affair, as a marriage, a treaty, confederacy, &c. or even on occasion of some ceremony, as condolance, congratulation, &c.

A Gazette, Journal, or other News-paper extraordinary, is that published after some great and notable event, containing the detail, or particulars thereof, which were not found in the ordinary papers.—Our news writers generally use postscripts, or supplements, instead of extraordinary.

EXTRAORDINARY Culverin. See the article Culverin.

EXTRAVAGANTES, a part of the canon law, containing diverse constitutions of the popes, not included in the body of the canon law.—Whence the nomination *extravagantes*: quasi extra corpus juris vagantes.

The *extravagantes* are divided into two parts: the first contains XX constitutions of John XXII: and the second, other later constitutions of the said John and his successors.

EXTRAVASATION *, in medicine, a motion of the blood, whereby it breaks out of its ordinary vessels, the veins or arteries, and either gathers, and stagnates in some soft part, or is thrown quite out of the body.

* The word is formed of the Latin, *extra*, without, and *vas* vessel.

The ordinary causes of *extravasations*, are unnatural rep lesions and distentions of the vessels; or lacerations, and erosions thereof. There is a necessity for bleeding, to prevent the blood's growing to such a head as to *extravasate*.

—In wounds of the head, particularly, bleeding is necessary, to prevent the *extravasation* of the blood in the brain.

EXTRAVASATIONS, is sometimes likewise used in speaking of other humours beside the blood; as the lymphæ, urine, &c. The gardeners use the term in speaking of gums, juices, &c. which ooze out of their trees either spontaneously, or at incisions.

EXTREAM, or EXTREME, is applied to the last and outermost part of any thing; or that which finishes, and terminates it on that side.

The *extremities* of a line are points.—There is no passing out of one *extream*, into the other, without going through the middle.—*Extream* remedies must only be had recourse to in *extream* necessity.

Some anatomists apply the denomination *extreams*, or *extremities*, to the arms and legs.

The arms, or upper EXTREMITIES, consist of sixty-two bones; thirty-one in each, viz. the omoplate, humerus, cubitus, radius, eight in the carpus, four in the metacarpus, and fifteen in the fingers.

The

The *lower* EXTREMITIES, or legs, consist of sixty; thirty in each, viz. the femur, rotula, tibia, fibula, seven in the tarsus, five in the metatarsus, and fourteen in the toes.

EXTREMS, in logic, denote the two *extrem* terms of the conclusion of a syllogism, viz. the predicate and subject.

They are called *extremes*, from their relation to another term, which is a medium, or mean between them.

The predicate, as being likewise had in the first proposition, is called the *major extremum*, greater *extremum*; and the subject, as being put in the second, or minor proposition, is called the *minus extremum*, lesser *extremum*.

Thus, in the syllogism, man is an animal, Peter is a man; therefore Peter is an animal: the word animal is the greater *extremum*; Peter the less *extremum*; and man the medium. See SYLLOGISM.

EXTREM and mean proportion, in geometry, is when a line is so divided, that the whole line is to the greater segment, as that segment is to the other.

Or, as Euclid expresseth it, when the line is so divided, that the rectangle under the whole line and the lesser segment, is equal to the square of the greater segment.

The invention of this division is thus: let the given line be $AB=a$, (*Tab. Geometry, fig. 64. N^o. 1.*) and for the greater segment put x , the lesser will be $a-x$. Then by the hypothesis, $a : x :: x : a-x$. Therefore $a \cdot x = x \cdot x$, consequently $a = x + a-x$. And by adding $\frac{1}{2}a$ a on each side, to make $x + \frac{1}{2}a + \frac{1}{2}a = a + \frac{1}{2}a$ a complete square, the equation will stand thus $\frac{3}{4}a^2 = x^2 + x \cdot a + \frac{1}{4}a^2$.

Now since the latter is exactly a square, its root $x + \frac{1}{2}a = \sqrt{\frac{3}{4}a^2}$, and by transposition it will be $\sqrt{\frac{3}{4}a^2} - \frac{1}{2}a = x$; which last equation is a canon to find x .

For at the foot of $AB=a$, set at right angles $CB = \frac{1}{2}a$: then draw CA , the square of which is equal, $AB \cdot q + CB \cdot q = \frac{3}{4}a^2$. And therefore $AC = \sqrt{\frac{3}{4}a^2}$; make $CD=CA$. From whence $CB = \frac{1}{2}a$ being taken, as the case requires, there remains $BD = x$; which transferred into AB , shall give the point E , where AB is cut according to *extrem and mean proportion*.

This cannot be exactly done in numbers; but if you would have it tolerably near, add together the square of any number, and the square of its half, and extract as near as you can, the square root of the sum; from whence taking half, the remainder is the greater part.

EXTREM-UNCTION, one of the sacraments of the Romish church, the fifth in order, administered to people dangerously sick, by anointing them with holy oils, and performing several prayers over them.

It is called *extremum unction*, as being only given to persons in *extremity*.—In the XIIIth century, it was called the *unction of the sick*, and not *extremum unction*: for in the earlier ages, it was given before the viaticum; which practice, according to Fa. Mabillon, was not changed till the XIIIth century.

The reasons he affigns for the change are, that in that age there arose diverse mistaken opinions, several of which we find mentioned and condemned in the English councils. Among the rest, it was held, that such as had received this sacrament, in case they recovered, might not make use of their wives, nor eat meat, nor go bare-footed: whence, they chose to forbear using it till the last extremity; which practice prevailed. See the councils of Worcester and Exeter, in the year 1287; that of Winchester in 1308; and Fa. Mabillon, *Acta. Sancti. Benedicti. Sæc. III. p. 1.*

The form of *extremum unction* is now deprecativæ, as the divines call it; formerly it was absolute and indicativæ.

This sacrament is not only in use in the Latin, but also in the Greek church, and throughout the east, though under another name, and with some difference in the circumstances; in that the orientals do not wait till their sick are come to extremity, in order to anoint them: but the sick generally go to church themselves; and it is administered to them as often as they are indisposed: the Greeks taking that direction of St. James, C. V. ver. 14. which is the foundation of the practice, in a general sense: *Is any sick among you? let him call for the elders of the church, and let them pray over him, anointing him with oil.* Fa. Dandini distinguishes two kinds of *unction* among the Maronites: the one called, *unction with the oil of the lamp*; but this, he suggests, is not the sacramental *unction*, ordinarily administered to such as are in extreme sickness; for that the oil is only consecrated by a priest, and that it is given to all who are present, not to the sick only, but also to the healthy: even the priest who officiates partakes of it. The other kind of *unction*, according to that father, is only for the sick; this is performed with oil consecrated by the bishop alone, on Holy Thursday. And this, it seems, is their sacramental *unction*.

The *unction* with lamp oil, is in use not only among the Maronites, but throughout all the eastern church, who use it

very religiously. The truth is, they do not seem to have any other sacrament of *extremum unction* beside this.—Yet Fa. Goar observes, though it be only a ceremony, with regard to those in health, it is a real sacrament to those that are sick.

In their great churches they have a lamp, wherein this oil for the sick is preserved: this lamp they call, *Kandela pro aegrotantibus*; that is, the lamp of oil joined with prayer: for what the Latins call *extremum unction*, the Greeks call, *εὐχισμὸς*, or *εὐχισμὸς αἰσίου*, that is, oil with prayer, or holy oil.

EXTREMUM Clausuli Dicitur. See the article DIEM.

EXTRINSIC, is applied in the schools in various senses.—

Sometimes it signifies a thing's not belonging to the essence of another: in which sense the efficient cause, and the end or scope of a thing, are said to be *extrinsic*, or *extrinsic causes*: Sometimes it implies a thing's not being contained within the capacity of another.—In which sense those causes are said to be *extrinsic*, which introduce something into a subject from without: as when fire introduces heat, &c.

Sometimes it denotes a thing added, or applied to another.—Thus, accidents and adherences are said to be *extrinsic* to the subject; and thus vision is *extrinsic* to the object seen.

EXTRINSIC Argument. } See ARGUMENT.

EXTRINSIC Service. } See SERVICE.

EXUBERANCE, in rhetoric, &c. a redundancy. See REDUNDANCE, and PLEONASM.

* The word is compounded of the Latin *ex* and *uber*, plentiful, of *uber*, udder.

EXUDATION, the act of sweating out.—In which manner, gums, balsams, &c. are usually produced from trees.

EXULCERATION, in medicine, the act of causing, or producing ulcers.

Thus, *arterie exulcerates* the intestines: corrosive humours *exulcerate* the skin.

EXULCERATION is sometimes also used for an ulcer itself; but more generally for those beginning erosions, which wear away the substance, and form ulcers.

Exulcerations in the intestines, are marks of poison. See POISON.

EXUSTION, the act of burning with fire; used in some operations by surgeons. See BURN.

EXUVIÆ, in physiology, transient parts of certain animals, which they put off, or lay down, and assume new ones.

* The word is Latin, formed from *exuvire*, to put off, to divest.

Such, especially are the skins, or sloughs of serpents; shells of lobsters, and the like, which are annually changed, and renewed in the spring.

EXUVIÆ is also used for some shells, and other marine bodies frequently found in the bowels of the earth: supposed to have been deposited there at the deluge; as being the real spoils of once living creatures. See SHELL, FOSSIL, and DELUGE.

EY E, the organ, or part of the body, whereby vision is effected, i. e. whereby visible objects are represented to the mind.

The eye, or organ of sight, is generally divided into *internal* and *external* parts; or into the eye properly so called, and the appendages thereof.

Under the latter class, come the orbit, or cavity wherein the eye is placed; the *supercilium*, or eye-brow, whereby sweat, and other nuisances, are prevented falling down into it: the *palpebræ*, or eye-lids, which cover and defend it in time of sleep; with their *cilia*, or fringes of hair, to break the too fierce impression of the light, and keep off flies and moats: and the *canthi*, or angles.

The eye properly so called, is of a globular form, and consists of tunics, humours, and vessels.

In some parts it is lined with fat; and it is moved with muscles; which two latter are by some anatomists, though somewhat inaccurately, reckoned among the constituent parts of the eye.

The *tunics*, coats, or *membranes* of the eye are six: viz. 1^o, The *adnata*, or conjunctiva, covering the whole ball of the eye, except the fore-part, called the *sight*; and making what we popularly call the *white of the eye*: though this is not reckoned as a proper tunic of the eye. 2^o, Immediately under the *adnata* is the *sclerotica*, which covers the whole globe of the eye; being opaque every where but in the fore-part, which covers the sight and is transparent like horn; which has occasioned anatomists to account this a distinct membrane, the 3^d in number, and to denominate it the *cornea*. The 4th is the choroides, situate immediately under the *sclerotica*. Its fore-part, like the former, is transparent, and therefore accounted a distinct, or 5th coat, and called the *uvea*. Of the duplicature of this part of the tunic, is formed a striped, variegated circle, called the *iris*, which, in different subjects, is of different colours, and gives the denomination of this or that colour to the eye. In its middle is an aperture, or perforation, called the *pupil*, or *apple of the eye*, about which the iris forms a ring. From the inside of this tunic, spring certain fibres, which spreading round the crystalline humour, form the ligamentum ciliare. The 6th tunic, which some only make the

3d, is the *retina*, so called, as resembling a net, and covering only the fund, or bottom of the *eye*, opposite to the sight.

Of the three proper tunics, the *sclerotica*, *choroides*, and *retina*, the first is derived from the dura mater, being detached from the brain as an outer coat, or cover of the optic nerve, till arriving at the ball of the *eye*, it is there expanded into a tunic: the second is derived from the pia mater, and transmitted likewise from the brain, along with the optic nerve; the third may be said to be derived from the brain, or medulla itself, as being an expansion of the medullary substance of the optic nerve. See each tunic described under its proper article, CONJUNCTIVA, SCLEROTICA, CORNEA, CHOROIDES, UVEA, and RETINA. See also IRIS, and PUPILLA.

The *humours* of the *eye*, inclosed between these tunics, are three: *viz.* 1°. The *aqueous*, a limpid, transparent humour, situate in the fore-part of the *eye*, immediately under the cornea, and occupying its protuberance. 2°. The *crystalline*, situate immediately under the aqueous, behind the uvea, opposite to the pupil. 3°. The *vitreous*, or glassy humour, which fills all the hind part of the cavity of the globe; and is that which gives the spherical figure to the *eye*. On its back part is the retina spread. See each humour under its proper article, AQUEOUS, CRYSTALLINE, and VITREOUS.

Some authors finding these humours covered with proper membranes, have given distinct names to them, as the *aqueous*, *crystalline*, and *vitreous tunics*; but these being only productions of the other coats abovementioned, the distinction is not much regarded.

The *vessels* of the *eye* are nerves, glands, arteries, and veins. 1°. The nerves are the optic pair, which issuing through a perforation in the skull, behind the orbit, enter the ball of the *eye*, and diffuse and lose themselves therein; the outer coat, as already observed, going to form the *sclerotica*, the inner to the *choroides*, and the medulla to the retina.

Besides which, the *motorii*, *pathetici*, the first branch of the fifth pair, called *eye nerves*, and the 6th pair are bestowed on the muscles of the *eye*.

2°. On the upper part of the ball of the *eye*, near the lesser or outer canthus, is the glandula innominata, or lachrymalis, which separates the matter of the tears, to be discharged, by the continual motion of the *eye-lid*, upon the cornea, to moisten it, and facilitate its motion. The tears falling down the cornea, are stopped by the edge of the *eye-lid*, along which they run, till they fall into two small holes in the great angle, one in each *eye-lid*, called *puncta lachrymalia*, which lead to a small bag, from the bottom of which a small tube arising, opens into the nose. Between the two puncta, is a caruncle, or eminence which serves to separate and keep them open, and which was anciently taken for the glandula lachrymalis.

3°. The *eye* receives arteries, both from the internal and external carotids, and returns the blood by veins that go to the jugulars.

The *muscles* of the *eye* are six; four of which are from their situation called *recti*, or straight muscles; and two, *obliqui*. The *recti* come from several points of the bottom of the orbit, and run immediately between the *sclerotica* and *adnata*: they derive several denominations from their several offices, *viz.* *attollens*, or *superbus*, which draws the *eye* upwards: *deprimens*, or *humilis*, which casts it down: *adducens*, and *petator*, which draws the *eye* towards the nose: and *abducens*, or *indignator*, which draws it the other way towards the lesser angle. The two oblique muscles are, the *superior*, called also *rotator*, and *trochlearis*; and the *inferior*. See each muscle in its proper place, ATTOLLENS, DEPRIMENS, ADDUCENS, ABDUCENS, OBLIQUUS, and TROCHLEARIS.

The whole structure and apparatus of the *eye* tends to this, that there be produced a distinct and vivid collection in the bottom of the *eye*, directly under the pupil, of all the rays, which proceeding from any point of an object, and entering the *eye*, penetrate the crystalline humour; and that so many points be painted in the bottom of the *eye*, as are conspicuous in an object, that so a small image like thereto, may be represented on the retina.

In order to this, the rays from any radiant or reflecting point, striking on the cornea, are refracted towards the perpendicular, and thus determined to proceed through the aperture of the pupil to the surface of the crystalline: while other rays, which entered so obliquely as to be thrown upon the iris, are reflected out again, that they may not disturb the distinctness of the sight: and others whose less obliquity threw them between the uvea and vitreous humour, are distinguished in the darkness thereof: that none can be propagated through the vitreous, but such as passing through the pupil, strike on the crystalline.

In the mean time the iris, contracting by its circular, or dilating by its right fibres, the pupilla of the *eye*; admits fewer or more rays, as the object is nearer or more vivid; or remoter and more languid. See PUPIL.

Now, the flatter the figure of the cornea is, the less does it collect the rays emitted from any lucid point; whence fewer arrive at the crystalline, and those more diverging: unless

when they come from a very remote object: on the contrary, the rounder it is, the more of the rays from any point does it collect, and throw on the crystalline; and those the more converging: whence one great cause of the defects in the *eyes* both of old men and myopes. Again, the rays transmitted through the pupil to the crystalline, are there refracted a-new, further collected, and rendered converging; so as that those which came from the same point of the object, are now thrown in one point through the vitreous, upon the retina; where they paint or exhibit that precise point of the object whence they flowed. Accordingly, if the crystalline be very dense, or spherical, the focus, or the point wherein they are united, will be too near; and if too flat, or rare, the point will be too remote: the effect of both which is confusion. And hence another cause of the defects of myopes and presbytes.

It is not, however, myopes and old men alone, that would labour under these defects, and have their vision, in most cases confused, as in objects very near, or very remote, very small, or very great: but those would be the common condition of vision. Distinct vision, depending absolutely on the union of all the rays coming from the same point of the object, on the same precise point of the retina; and rays from objects at different distances, being united at different distances behind the crystalline; it were impossible, *e. gr.* for the same *eye* to see distinctly any two objects differently distant from it. But nature has made a provision against these defects; and that principally, by bringing the crystalline nearer to the cornea, or further from it, occasionally; which is effected two ways, *viz.* either by compressing the bulb of the *eye* by the four muscles all strongly contracted at once, which changes the figure of the aqueous humour, and renders the *eye* oblong; or by the ligamentum ciliare, augmenting and diminishing the convexity of the crystalline, and setting it nearer or further from the retina.

As complex as the mechanism of the *eye* may seem, and as manifold as the parts are which have a relation hereto: the justness of vision seems to require an exact habitude in them all.—Thus, though the pupil be no substantial part of the *eye*, but only an aperture of the uvea almost perpetually changing its bigness according to the different degrees of light the *eye* chances to be exposed to; and therefore should seem, while this hole remains open, to perform its office, by giving entrance to the incident rays of light: yet Mr. Boyle saw a woman, who, after a fever, not being able to dilate the pupillæ of her *eyes*, as before, though they were little narrower than ordinary; yet had the thereby almost lost her sight.—And on the other side, though a competent wideness of the pupil be requisite to a clear and distinct vision, yet if its dilatation exceeds the due limits, there is thereby produced a considerable distemper of sight. It may seem also but a slight circumstance, that the transparent coats of the *eye* should be devoid of colour; and of as little moment, that the cornea should be very smooth, provided it remain transparent: yet when either of these circumstances is wanting, the sight is greatly vitiated.—Thus we see, that in the yellow jaundice, the adventitious colour wherewith the *eye* is tinged, makes the patient think he sees many objects yellow, which are of contrary colour.

It has of late been an opinion, that though both *eyes* be open, and turned towards an object, yet only one of them at a time is effectually employed in giving the representation of it: so that the having of two *eyes* should seem in some sort a redundancy.—But Mr. Boyle furnishes several considerations which invalidate this opinion, and shew that both the *eyes* are of use at the same time.—He assures us, he has found by frequent experiment, that his two *eyes* together, beheld an object in another situation, than either of them apart would do.—He adds, that he has met with a person, who had a cataract in his *eye*, for two or three years, without finding any impediment in his sight, though others had, during that time, taking notice of a white film that had crossed his *eye*: till, at length happening to rub his found *eye*, he was surprized to find himself in the dark: and that a very ingenious person, who by an accident had one of his *eyes* struck out, told him, that for some months after, he was apt to mistake the situation and distances of things; for having frequent occasion to pour liquors out of one vial into another, after this misfortune he often spilt them, and let them run quite besides the necks of the vials, which he thought he was pouring them directly into.

The like was related to him by another person, who had, by a wound, lost the use of one of his *eyes*; *viz.* that for some time after, he often, in pouring out his wine, mist the mouth of the bottle, or glass.

A yet more considerable instance of this kind, the same author gives us, of a noble person, who, in a fight, had one of his *eyes* strangely mangled by a musket ball, which came out at his mouth; after which accident, he could not well pour drink out of one vessel into another; but had broken many glasses by letting them fall out of his hand, when he thought he had given them to another, or set them down on the table: he added, that this aptness to misjudge of distances and situation, continued with him, though not in the same degree, for two years.

EYE

EYE

The comparative structure, and anatomy of the *eye*, is very curious: the situation, number, confirmation, &c. of this organ, in different animals, being finely and wonderfully adapted to their different circumstances, occasions, and manners of living.

In man, and some other creatures, an ingenious author observes, the *eye* is placed chiefly to look forward; but withal is so ordered, as to take in nearly the hemisphere before it.—In birds, and some other creatures, the *eyes* are so seated, as to take in near a whole sphere, that they may the better seek their food and escape danger.—In others they are seated so as to see behind them, or on each side, whereby to see the enemy profiting them: Thus, in hares and conies, the *eyes* are very protuberant, and placed so much towards the side of the head, that their two *eyes* take in nearly a whole sphere: whereas in dogs, that pursue them, the *eyes* are set more forward in the head, to look that way more than backward.

Generally, the head is contrived to turn this and that way, chiefly, for the occasions of the *eyes*; and generally the *eyes* themselves are moveable upwards, downwards, backwards, and sidewise, for the more commodious reception of the visual rays. Where nature deviates from these methods, she always makes use of very artful expedients to answer the same end.

Thus, in some creatures, the *eyes* are set out at a distance from the head, to be moved here and there, the one this way, and the other that; as in snails particularly, whose *eyes* are contained in their four protuberances, like atramentous spots fitted to the end of their horns, or rather to the ends of those black filaments, or optic nerves, sheathed in the horn. Power, *Exper. Phil. Obj. 31.*

And in other creatures, whose *eyes* or head is without motion, and in diverse insects, that defect is sometimes made up by their having more *eyes* than two; as in spiders, which having no neck, and consequently the head being immovable, the defect is supplied by the situation and multiplicity of their *eyes*; some having four, some six, and others eight, all placed in the fore-front of the head, which is round, like a locket of diamonds. The reason Dr. Power gives, is, that being to live by catching so nimble, and shy a prey as flies, they ought to see every way, and so take them *per saltum*, without any motion of the head to discover them.

Again, men, and most quadrupeds, are found to have several muscles belonging to their *eyes*, by help whereof they can turn them any way, and so obvert the organ of sense to the object.—But nature not having given that mobility to the *eyes* of flies, she in recompence furnishes them with a multitude of little protuberant parts, finely ranged upon the convex of their large bulging *eyes*; so that by means of these numerous little studs, numberless rays of light are deflected from objects placed on either hand, above, or beneath the level of the *eye*, and conveniently thrown upon that organ, to render the objects they come from, visible to the animal; and by the help of a good microscope, and a clear light, some hundreds of these little round protuberances may be discovered, curiously ranged on the convexity of a single *eye* of an ordinary flesh-fly.

So scorpions are found to have above an hundred *eyes*; and Swammerdam has observed no less than two thousand in the little insect called *ephemeron*.

In other creatures, the like deficiency is supplied by having their *eyes* nearly two protuberant hemispheres, each consisting of a prodigious number of other little segments of a sphere.

The *eyes* of a camelion, Dr. Goddard observes, resemble a lens, or convex glass, set in a versatile globular socket, which the turns backward and forward without stirring the head; and ordinarily the one a contrary way to the other.

Lastly, the mole, which the antients, Aristotle, Pliny, Alb. Magnus, &c. supposed to have no *eyes* at all, is now found to furnish a notable instance of the diversity of the apparatus of vision. For that animal living altogether underground, sight would generally be useless to it, and so tender a part as the *eye* troublesome. It has therefore *eyes*, but those so exceedingly small, and withal situate so far in the head, and covered so strongly over with hair, that they cannot ordinarily be either of service or disservice to it. Yet, to guide and secure it a little when it chances to be above ground, Borrichius, Blasius, Shenider, Mr. Derham, and others, observe, that it can pretend, or put them forth beyond the skin, and again draw them back at pleasure, somewhat after the manner of snails.

In the *eyes* of nocturnal animals is a part not yet mentioned, viz. a sort of tapetum at the bottom of the *eye*, which gives a kind of radiation on the pupil, enabling them to see and catch their prey in the dark. Thus, Dr. Willis: *bujus usus est oculi pupillam quasi jubere insto illuminare—quare in seculo plurimum illustris est, at omni, avibus & piscibus dest.* De Anima Brutor.

He adds, that in some persons the iris has a faculty also of darting out light: and instances in a man of a hot head, who after a plentiful drinking of generous wine, could see to read in the darkest night. *Ibid.*

VOL. I.

The like Pliny tells us of Tib. Cæsar, that upon his first waking in the night, he could see every thing for a little while, as if in broad day light. *Nat. Hist. L. XI. C. 37.* And, Dr. Briggs gives a parallel instance of a gentleman in Bedfordshire. *Ophthalm. C. 5. §. 12.*

Frogs, beside the parts of the *eye*, which they have in common with men, and most quadrupeds, have a peculiar membrane, or cartilage, which is not commonly perceived, where-with they can, at pleasure, cover the *eye*, without too much hindring the sight; because the membrane is both transparent and strong, so that it may pass for a kind of moveable cornea, or occasional safeguard to the *eye*.

In furnishing frogs with this strong membrane, the providence of nature seems very conspicuous; for they being amphibious creatures, designed to pass their lives in watery places, which for the most part abound in plants endowed with sharp edges, or points; and the progressive motion of this animal, being not by walking, but by leaping; if his *eyes* were not provided with such a case, he must either shut them, and so leap blind-folded, or by leaving them open, must run the risque of having the cornea cut, pricked, or otherwise offended: but this membrane, like a kind of a spectacle, covers the *eye*, without taking away the sight; and as soon as the occasion for it is over, the animal withdraws it into a little cell, where it rests, till its use be again required. This membrane becomes visible, by applying the point of a pin, or any such sharp thing, to the *eye* of a frog, whilst his head is held steady; for to screen his *eye*, he will presently cover it therewith, and afterwards withdraw it, upon a removal of the suspected danger.—And because many birds are destined to fly among the branches of trees and bushes, lest by this means the prickles, twigs, leaves, &c. should wound or offend the *eye*, nature has also given them such another kind of horny membrane as we see in frogs.

Naturalists relate wonders of the sharpness and accuracy of the *eye* of some animals, as the eagle, &c. beyond those of men.

Yet do those of men seem improveable to a surprising degree:—Mr. Boyle instances in a major of a regiment of King Charles I. who being afterwards forced abroad, ventured at Madrid, to do his king a piece of service of an extraordinary nature and consequence; which being there judged very irregular, he was committed to an uncommon prison, or rather dungeon; having no window belonging to it, only a hole in the wall, at which the keeper put in provisions, and presently closed it again on the out-side, but not perhaps very exactly.

—For some weeks this gentleman continued utterly in the dark, very disconsolate; but afterwards he began to think he saw some little glimmering of light, and this, from time to time, increased, so that he could not only discover the parts of his bed, and other such large objects, but at length, amidst this deep obscurity, could perceive the mice that frequented his chamber, to eat the crumbs of bread which fell upon the ground, and discern their motions very well.

The author just mentioned, in his *Observations on vitiated sight*, gives us some uncommon phenomena, that regard the *eyes*.—He furnishes several instances of nyctalopias, or people whose *eyes* in the day-time were quite dark, or at least so dim, that they could hardly discern their way; who yet, soon after sun-set, and during twi-light, saw very clearly.

This brings to mind an odd case of an old learned divine, who complained, that during the day-time, his right-hand thook so much, that he could not manage his pen; and therefore was forced to make use of it only by candle-light.

But, which is yet more strange, one of these patients who could only see by night, could distinguish some colours, viz. black and white, but not others, especially red and green. The meadows to this person did not appear green, but of an odd, darkish colour; and when she had a mind to gather violets, though she knecled in the place where they grew, she could not distinguish them by the colour from the grass about them, but only by their shape or touch.

Artificial Eye, is an optical machine, wherein objects are represented after the same manner as in the natural *eye*; of considerable use in illustrating the nature and manner of vision.

Its construction is thus: provide two hollow hemispheres of hard, dry wood, well cemented together, to represent the ball of the *eye*: Let the interior, or fore-hemisphere, be perforated with a round hole in C, (*Tab. Optics, fig. 9.*) to supply the place of a pupil; and therein fit a thin, plane glass, or, which amounts to the same, a convex-convex glass, to serve for the cornea. In the inside, have a short draw-tube G, with a lens convex on both sides, to do the office of the crystalline therein. In the hind, or posterior hemisphere, fit another draw-tube F F, with a plain glass therein, having its inner surface smooth, though not polished, representing the retina and optic nerve.

If now the aperture C, be turned towards any object; and the draw-tube F E be gradually pulled out; you will have the

the object beautifully and strongly represented, in all its colours, on the retina, only in an inverted order. See VISION.

It being of no consequence what the figure of the inner cavity is; any room, or chamber, so darkened as only to receive light from a single hole, with a glass convex on both sides fitted therein; will do the office of an *artificial eye*, and exhibit all the objects opposed to the aperture, on a wall, or a white cloth, stretched at a proper distance from the aperture: with this circumstance, that the less sphere the glass is a segment of, the larger will the figures appear. And this is the celebrated *camera obscura*. See CAMERA OBSCURA.

Eye in Perspective. See the article PERSPECTIVE.

Altitude of the Eye. See the article ALTITUDE.

Eye, in architecture, is used in any round window made in a pediment, an attic, the reins of a vault, or the like.

Bullack-eye, *Oeil de bœuf*, denotes a little sky-light in the covering, or roof, intended to illumine a granary, or the like.

The same term is applied to the little lutherns in a dome, as in that of St. Peter's at Rome, which has 48 in three rows. See LUTHERN.

Eye of a Dome, denotes an aperture at the top of the dome; as that of the Pantheon at Rome, or of St. Paul's at London.—It is usually covered with a lantern.

Eye of the Volute, in architecture, is the centre of the volute, or that point wherein the helix, or spiral, whereof it is formed, commences.—Or, it is the little circle in the middle of the volute, wherein are found the thirteen centres for describing the circumvolutions thereof. See *Tab. Archit. fig. 41. lit. b. and fig. 42.*

Eyes, in agriculture and gardening, denotes a little bud, or shoot, inserted into a tree by way of graft. See ENGRAFTORY. The term *eye*, *oculus*, is also used for a gem, or bud, as it stands on the parent tree.—A tree with fine, strong, healthy *eyes*. La Quintin. P. 1. C. 3. Art. 6. The good branches are those which come in the order of nature, and that have large *eyes* pretty near each other. *Id.* This branch must be cut off at the third *eye*. Liger. See BUD and PRUNING.

Eye, among naturalists, is sometimes also used for a hole, or aperture.—Whence it is that the first of the larger intestines is called *cæcum*, or the blind gut, as having no *eye*, or perforation.—For a like reason the chemists call a close vessel, used in distillation, a *blind head*.

Eye, in printing, is sometimes used for the thickness of the types, or characters, used in printing: or, more strictly, it is the graving in relieve, on the top of the letter; otherwise, called its *face*.

It is the *eye* or *face* that makes the impression; the rest, which they call the *body*, serving only to sustain it.

The *eye* of the *c*, is the little aperture at the head of that character, which distinguishes it from the *c*. See *E*.

Eyes, is also used among jewellers, for the lustre, and brilliance of pearls and precious stones; more usually called the *water*.

Eye-brow. } See { SUPERCILIUM.

Eye-lids. } See { PALPEBRÆ.

Eye-Water. } See { WATER.

White of the Eye. } See { WHITE.

Bull's-eye, in astronomy, a star of the first magnitude, in the constellation taurus; by the Arabs called *aldebaran*.

Its longitude, latitude &c. See among those of the other stars in the constellation TAURUS.

Cats-eye, *Oculus Cati*, in Nat. Hist. a precious stone; called also *sun's eye*, *oculus solis*: and taken by Dr. Woodward, for the asterias of the antients.

It is transparent, of a glittering grey, interchanged with a straw-colour: usually oblong as to figure, and not unlike the opal, only much harder.—It is found in diverse parts of the East-Indies, but those of the island of Ceylon are the most prized. See Supplement, ARTICLE, ASTERIAS.

Crabs-eye, *Oculus Cancrorum*. See CRABS-EYES.

Goats-eye, *Oculus Caprinus*, is when there is a white speck on the pupil of the eye, as is seen in the eye of goats. Physicians call it *Ægias*.

Hares-eye, *Oculus Leporinus**, in medicine, a disease arising from a contraction of the upper eye-lid, which prevents its being able to cover its part of the eye: so that the patient is obliged to sleep with the eye half open, after the manner of *hares*.

* Physicians call it *lagophthalmia*, a Greek word signifying the same thing; being compounded of *lagos*, *hare*, and *ophthalmos*, *eye*.

*EYRE**, or *EIRE*, in law, signifies the court of justices itinerant.

* The word seems formed of the old French, *irre*, *it. r.*, way, track.

Hence, justices in *eyre*, are those whom Bracton calls, *justiciarii itinerantes*.

Eyre of the forest, is otherwise called *justice seat*; which by the antient customs was to be held every three years, by the justices of the forest journeying up and down for that purpose.

EYRIE, or *AYRIE*, among falconers, the nest where hawks sit, and hatch, and feed their young.

Hence, a young hawk newly taken from the nest, is called an *eyrling*.

EZECHIEL's Reed, or *Rod*, a scripture measure, computed by late writers to amount to 1 English foot, 11 inches, $\frac{1}{4}$ of an inch.

EZRA, or *ESDRAS*, in divinity.—The Books of EZRA, are two books of holy scripture, composed by Ezra, or *Esdra*, the high-priest of the Jews during the captivity; and particularly about the time when they returned to Palestine, under the reign of Cyrus.

The original of the books of Ezra is in Hebrew; and the second is particularly called by the Hebrews, and from them by the English translators, *Nehemiah*.

The two contain the history of the return of that people from the Babylonish captivity, and their re-establishment in the holy land. They are canonical, and are allowed as such both by the church and the synagogue.

The third and fourth books of Ezra, called in the English version, the first and second books of *Esdra*; though held by some, particularly the Greeks, for canonical; are thrown by the English church into the number of apocryphal books: being only extant in Greek.

The Canon of Ezra, is the collection of the books of scripture made by that pontiff.—It appears, however, that the synagogue added other books to Ezra's canon; witness the book of Ezra itself, and that of Nehemiah.

F.

F

F, The sixth letter of the alphabet, and the fourth consonant.

The letter *F* may be either considered absolutely, and in itself, or with regard to the particular languages where it is found. In the first view, *F* is generally placed by grammarians among the mutes, like the *Q* among the Greek grammarians: though others give it the quality of a semi-vowel. Joh. Conrad. Amman. (in his dissertation *de Loquela*) divides the consonants into single, and double; and the single into hissing and explosive. Among those called hissing, there are some pronounced by the application of the upper teeth to the lower lip; and these are the *F* and the *ph*. — The reason why some account the *F* a semi-vowel, and Amman places it among the hissing, is, that one may pronounce a little sound, without any other motion of the organs, than what is necessary to the pronunciation of the *F*.

This letter is derived to us from the Romans, who borrowed it from the *Æolians*; among whom it is called digamma, or double gamma, as resembling two *Γ*'s, one over the other. Add, that the digamma seems in its origin to have been no other than the Greek *Q*, which being made at three strokes, degenerated at length into the figure *F*. For the letter *Q* being compounded of an omicron, with a perpendicular drawn through it, if that perpendicular be made first, and the *O* at two strokes afterwards, *viz.* first the upper, then the under part, it may happen, especially in writing fast, that the two parts shall not join; and even, instead of two arches of circles, haste and convenience may naturally enough make two straight lines.

Thus it is that the transverse stroke of the letter *ϕ*, is frequently seen straight; and the letter in the form of a cross †. And what confirms this transmutation of the *Q* into *F* still further, is, that on the medals of Philip, and the kings of Syria, in the words ΕΠΙΦΑΝΟΥΣ and ΦΙΛΑΔΕΛΦΟΥΣ, the *phi* *ϕ* is frequently seen in the form just mentioned, *i. e.* it has no circle or omicron; but a cross the middle of the perpendicular is a kind of right line, formed only of two dots, the one on the right side, and the other on the left, representing a cross, †. Such appears to be the origin of the letter *F*; which, of consequence, is no other than a corruption of the Greek *Q*: And accordingly, on the medals of the *Palici*, the *F* is ordinarily put in lieu of the Greek *Q*. But it must be added, that though the Greek and Latin letter were thus the same thing, yet the sound was much softer among the Latins, than among the Greeks; as was long ago observed by Terentianus.

The Romans, for some time, used an inverted *F*, *ƒ*, in lieu of an *V* consonant, which had no peculiar figure in their alphabet: thus in inscriptions we meet with TERMINAƒIT, DƒIƒI, &c. Lipsius (in his comment on the annals of Tacitus, l. xi.) Covarruvias, and Dauquius (in his treatise of orthography) hold that it was the Emperor Claudius who first introduced this use of the inverted digamma, or *ƒ*; which they call the invention of a letter, as being equivalent to the invention of the letter *V*. — In effect, Tacitus (in the 4th chapter of the said book) and Suetonius (in his life of Claudius, c. 41.) assure us, that the emperor invented three letters; one of which, Lipsius shews, must be the inverted *Æolic* digamma: But before Claudius, Varro made an attempt to introduce the same thing, but could not succeed. All the authority of an emperor was necessary to make it take; nor did it subsist long; for after Claudius's death it was thrown by again; as we are told by the same Tacitus: And Quintilian observes, it did not subsist in his time. So far is the custom of a language from being subject even to the masters of the world.

It may be added, that the pronunciation of the *F* is almost the same with that of the *V*; as will be evident by attending to the manner of pronouncing the following words, Favour, Vanity, Felicity, Vice, Foment, Vogue, &c. The French particularly, in borrowing words from other languages, usually turn the final *v* into an *ƒ*, as *chefif* of *cattivo*, *neuf* of *novus*, *neuf* of *navis*, &c.

In the later Roman writers we find the Latin *F* and Greek *Q*, *ph*, frequently confounded; as in *Falanx*, for *Phalanx*; *Filosophia*, for *Philosophia*, &c. Which abuse is still retained by many French writers, who write *Filosophie*, *Philipe*, *Epifane*, &c. and even sometimes by the English, as in *Fantasy*, *Filtre*, &c.

F, in the civil law. Two *ff*'s joined together, signify the *Pandects*: See the reason thereof under the article *PANDECT*.

VOL. I.

F A B

F, or **FA**, in music, denotes the *base-clef*; being placed on the fourth line upwards.

Indeed the character or sign by which the *f* and *c* clefs are marked, bear no resemblance to those letters. Mr. Malcolm thinks it were as well if we used the letters themselves, but custom has carried it otherwise. The ordinary character of the *F* or *base-clef* is *ƒ*: which Kepler takes a deal of pains to deduce, by corruption, from the letter *F* itself.

F, in our ancient customs, was a stigma or brand.

He that shall maliciously strike any person with a weapon in church or church-yard, or draw any weapon there with intent to strike, shall have one of his ears cut off; and if he have no ears, he shall be marked on the cheek with an hot iron, having the letter *F*, whereby he may be known for a fray-maker, or fighter.

F, in physical prescriptions, stands for *fiat*, let it be done; as *F. S. A.* denotes as much as *fiat secundum artem*.

F, among such as give us the numerical value of letters, signifies 40, according to the verse,

Sexta quaterdecus gerit quæ distat ab alpha.

And when a dash was added a-top, *F*, it signified 40 thousand.

FA is one of the notes of music; being the fourth, rising in the order of the gammut, *ut, re, mi, fa*. See *NOTE*.

FABIANS, **FABII**, in antiquity, a part of the *Luperci*. See *LUPERCI*.

Those priests consisted of two colleges, the first of which was called the *Fabii*, and the second the *Quintilii*, from their respective chiefs. — The *Fabii* were for Romulus, and the *Quintilii* for Remus.

FABLE, a tale, or feigned narration, designed either to instruct or divert: or, as *Mont. de la Motte* defines it, an instruction disguised under the allegory of an action.

Fable seems to be the most ancient way of teaching: The principle difference between the eloquence of the antients, and that of the moderns, consists, according to *Pere Bossu*, in this, that our manner of speaking is simple and proper; and theirs full of mysteries and allegories. With them, the truth was usually disguised under those ingenious inventions, called by way of excellence *μῦθοι*, *Fabulae*, *Fables*, that is, words; as intimating, that there was the same difference between these *fabulous* discourses of the learned, and the common language of the people, as between the words of men, and the voices of beasts.

At first, *Fables* were only employed in speaking of the divine nature, as then conceived: whence, the ancient theology was all *Fable*. The divine attributes were separated as into so many persons; and all the economy of the God-head laid down in the feigned relations and actions thereof: either by reason the human mind could not conceive so much power and action in a single and indivisible being; or, perhaps, because they thought such things too great and high for the knowledge of the vulgar. And as they could not well speak of the operations of this Almighty Cause, without speaking likewise of its effects; natural philosophy, and at length human nature and morality itself, came thus to be veiled under the same *fabulous* allegoric expression; and hence was the origin of poetry, and particularly of epic poetry.

The critics, after *Aphthonius* and *Theon*, reckon three kinds of *Fables*, rational, moral, and mixed.

Rational FABLES are called also *parables*; these are relations of things supposed to have been said and done by men; and which might possibly have been said, or done, though in reality they were not. — Such, in the sacred writings, as those of the ten virgins; of *Dives* and *Lazarus*; the prodigal son, &c. Of these rational *Fables*, we have likewise about a dozen in *Phædrus*.

Moral FABLES, called also *apologues*, are those wherein beasts are introduced as the actors, speakers, &c. These are also called *Æsopic Fables*: not that *Æsop* was their inventor, for they were in use long before him, *viz.* in the times of *Homer* and *Hesiod*; but because he excelled therein. In this kind, not only beasts, but even sometimes trees, instruments, &c. are supposed to speak.

The *rational* differs from the *moral Fable* in this; that the former, though it be feigned, might be true: but the latter is impossible; as it is impossible for brutes or flocks to speak.

Mixed FABLES, are those composed of both sorts, rational and moral; or wherein men and brutes are introduced conversing together. — Of these we have a fine instance, in *Justini*.

l. xxxiii. c. 4. made by a petty king, to alarm the antient Gauls against the Massilians, who arriving out of Asia, in Spain, charmed with the place, begged leave of the inhabitants to build a city. To this effect:

A bitch big with young, begged of a shepherd a place to lay her whelps in; which when she had obtained, she further begged for leave to rear them in the fame. At length, the whelps being now grown up, depending on the strength of her own family, she claimed the property of the place.—So the Massilians, who are now only strangers, will hereafter pretend to be masters of this country.

As to the laws of *Fable*; the principal are; 1st, that to every *Fable* there be some interpretation annexed, to shew the moral sense, or design thereof. This interpretation, if it be placed after the *Fable*, is called *επιμύθιον*, or *affabulatio*; if before it *προμύθιον*, *præfabulatio*.—2^{dly}, that the narration be clear, probable, short, and pleasant. To preserve this probability, the manners must be expressed, and closely kept to, as in poetry.

M. de la Motte has some fine remarks on the subject of *Fables*, at the beginning of his *Fables nouvelles, dédiées au Roi*, 1719. A *Fable*, according to this polite writer, is a little epic poem; differing in nothing from the great one, but in extent, and in that, being less confined as to the choice of its persons, it may take in all sorts at pleasure, as gods, men, beasts, or geni; or even, if occasion be, create persons, i. e. personify virtues, vices, rivers, trees, &c. Thus M. de la Motte very happily introduces virtue, talent, and reputation, as persons making a voyage together.

That author suggests two reasons why *Fables* have pleased in all ages and places. The first is, that self-love is spared in the instruction. The second, that the mind is exercised by the allegory. Men do not love direct precepts; too proud to condescend to those philosophers who seem to command what they teach, they will needs be instructed in a more humble manner: and they would never amend, if they thought, that to amend were to obey. Add, that there is a sort of activity in the mind, which must be humoured. It pleases itself in a penetration, which discovers more than is shewn; and in apprehending what was hid under a veil, fancies itself in some measure the author of it. The *Fable* must always imply or convey some truth: in other works, delight alone may suffice; but the *Fable* must instruct. Its essence is to be a symbol, and of consequence to signify somewhat more than is expressed by the letter. This truth should for the generality be a moral one; and a series of fictions conceived and composed in this view, would form a system of morality preferable to any more direct and methodical treatise: Accordingly, Socrates, we are told, had a design to compose a course of morality in this way. The truth should be concealed under the allegory; and in strictness, it ought not to be explained either at the beginning or end.

The truth, or idea intended, should arise up in the reader's mind from the *Fable* itself. However, for the convenience of the less discerning readers, it may be a good way to point out the truth or moral in precise terms. In this case, to have the moral at the end of the *Fable*, seems much better than at the beginning: The mind is apt to be foretold in the latter case; I carry the key all along with me, so that there is no room to exercise my mind, in finding any thing myself.

The image, M. de la Motte observes, must be just, and express the thing intended, directly and without any equivocation: It must be one, that is, all the parts must be visibly accessory to one principal end; and it must be natural, that is, founded on nature, or at least opinion.

The writers of *Fables* are not many. If there were any before *Æsop*, his success has quite effaced their memory; and even occasioned all the good things of that kind to be ascribed to him. His life, as wrote by Planudes, is itself a thorough *Fable*. It must be owned to be very happily imagined, to make the inventor of *Fables* a slave, and his master a philosopher. The slave has his master's pride and ill humour to deal with, throughout. His lessons were all contained in the *Fables* themselves; and the readers were left the pleasure of picking them out themselves.

It is generally allowed among the learned, that though the matter and invention of the *Fables* be *Æsop's*, the turn and expression is not. The Greek is of Planudes, and bad Greek it is, in the judgment of F. Vavafior, *de Ludicra Dict.* Some authors will have Socrates the author of the *Fables* of *Æsop*; others attribute them to Solomon; and others to Homer.

Phædrus was once a slave too, and afterwards a freed-man; but he had the advantage over *Æsop* in education. He is only a fabulist, as he translates and copies. Though his *Fables* be generally short, yet is he prolix, compared to his author. His style however is always florid, his descriptions concise, and his epithets suitable: He frequently adds graces never dreamt of by the inventor; and every where enriches the simplicity of *Æsop*, in the most delicate manner.

Pilpay, another fabulist, governed Indostan a long time under a powerful emperor: but he was not the less a slave; for the prime ministers of such princes are always more so than their meanest subjects. Pilpay comprized all his politicks in his *Fables*; and accordingly his work long continued the book of state, or the discipline of Indostan. It was translated into Persian and Arabic, and since into the European languages. His *Fables*, M. de la Motte observes, are rather famous than good: but he is an inventor, and the merit of invention will always compensate for a great many faults. His *Fables* are often wild, and artless; and the collection is a sort of romantic assemblage of men and geni, composed, in its kind, like *Cyrus* or *Orlando*; where the adventures are continually thwarting and clashing with each other.

We say nothing of the *Fables* of *Gabrias*, or *Babrius*, *Avienus*, *Abstemius*, &c.

Among the moderns, we have none that deserve to be seen in the company above mentioned, except, perhaps, *Mess. de la Fontaine*, and *de la Motte*. The first of whom has picked out all the best things in *Æsop*, *Phædrus*, and *Pilpay*, and given them a new in French with a delicacy and simplicity peculiar to himself; and which, in the judgment of his countrymen, sets him even above *Phædrus*.

The latter, rather than take up with what *de la Fontaine* had left, chose to be an inventor himself. He has succeeded. His *Fables* are many of them very happy, though some think them too full of thought and reasoning. His verification is infinitely more correct than that of *la Fontaine*; and more suitable to the subject than that of *le Noble*.

FABLE, is also used for the plot of an epic, or dramatic poem; or the action which makes the subject of such poem, or romance.

The *Fable*, according to Aristotle, is the principal part, and as it were the soul of a poem. It must be considered as the first foundation of the composition; or the principle, which gives life and motion to all the parts.—In this sense, the *Fable* is defined “A discourse invented with art, to form the manners by instructions disguised under the allegory of an action.”

The epic *Fable*, according to *Bossu*, is confined to the rational kind, i. e. the actors and persons are to be gods and men. And yet it admits of a great deal of latitude; it may be either grave, illustrious, and important; or low, and popular; either whole, or defective; in verse, or in prose; much episodical, or plain and brief; rehearsed by an author, or represented by actors on the scene: all which are only so many circumstances, which do not make any alteration in the nature and essence of the *Fable*.

The characters that specify the epic *Fable* are these: 1. It is rational and probable; it imitates a whole, and an important action; and it is long, and related in verse. None of which properties affect the nature of the *Fable*; or make it less a *Fable* than those of *Æsop*.

The *Fable*, according to Aristotle, consists of two essential parts, viz. truth, as its foundation; and fiction, which disguises the truth, and gives it the form of *Fable*. The truth is the point of morality intended to be inculcated; the fiction is the action, or words the instruction is covered under.

To make a plot or *Fable*; the first thing, according to the great critic just mentioned, is to pitch on some moral instruction to be exemplified.

E. gr. I would exhort two brothers, or other persons, who have some common interest, to live in amity, in order to preserve it. This is the end of the *Fable*, and the first thing I have in view. In order to this, I endeavour to impress this maxim on their minds, that “ill understanding ruins families, and all kinds of society.” This maxim is the moral, or truth which is to be the ground of the *Fable*: which moral truth is now to be reduced into action; and a general action is to be framed from several fiction, and real actions of such as were ruined by ill understanding.

Thus, e. gr. I say, that certain persons united together for the preservation of something that belonged to them in common, coming to disagree; their division left them open to an enemy, who ruined them.—Such is the first plan of a *Fable*. The action presented by this narration has four conditions: It is universal, imitated, feigned, and contains a moral truth under an allegory. The names given to the several persons, begin to specify the *Fable*. *Æsop* uses those of brutes. Two dogs, says he, appointed to watch a flock, fall out, fight and leave all open to the wolf, who carries off what he pleases.

If you would have the action more singular, and render the *Fable* rational, take the names of men. Pridamant and Orontes, brothers by a second venter, were left very rich by their father's will: but disagreeing about the partition of their effects, they enraged themselves so far against each other, that they took no care of their common interest, against Clitander, their eldest brother by the first venter; which last, artfully inflaming their quarrel, and feigning he had no view but to some moderate augmentation, which might be made him without pressing them; he, in the mean time, gets the judges on his side and the other persons intrusted with the affair, procures the will to be annulled, and becomes

Becomes entitled to the whole estate which the brothers were at variance about.

Now, this *Fable* is rational; but the names being feigned, as well as the things, and, besides, the persons being only of a private rank, it is neither epic, nor tragic. However, it may be employed in comedy: it being a rule laid down by Aristotle, that epic and tragic poets only invent things; but comic poets invent both names and things.

To accommodate this comic *Fable* more to the mode, and taste of the town, some Dorinda must be imagined to have been promised to Clitander; but her father, finding him disinherited by the will, changes his resolution, and will have her marry one of the rich, senseless, younger brothers, whom she despised, &c.

But to return. A fiction may be so disguised with the truth of history, that there shall not appear to be any fiction at all. To effect this, the poet looks back into history, for the names of some persons to whom the feigned action either really or probably did happen; and relates it under those known names, with circumstances which do not change any thing of the ground of the *Fable*.

Thus, in the war of 1302, between king Philip the fair, and the Flemish: The French army was under the command of Robert earl of Artois, as general, and Ralph de Nesle, his constable. Being in the plain of Courtray, in sight of the enemy, the constable was of opinion it were easy to starve them; and that it was not worth while to hazard so many of the nobles, against a base and desperate populace. This advice the earl rejected with scorn, taxing the constable with cowardice and infidelity. It shall be seen, answers the constable, which of us two is the bravest, and the most faithful; and clapping spurs to his horse, he led the whole French cavalry precipitately to the charge. This precipitation, with the dust they raised, prevented their seeing a large deep ditch, behind which the Flemish were posted. The cavalry therefore plunging into it, perished miserably; and the infantry, astonished with the loss, let themselves be cut in pieces by the enemy. Thus may fiction be made to consist with truth.

As for the *Fable*, it matters but little, whether the persons be called dogs; or Orontes and Pridamant; or Robert of Artois, and Ralph de Nesle; or Achilles and Agamemnon.

The epic *Fable* we shall now propose in its just extent, under these two names, last mentioned. It is too short for the epopee, in the two preceding ones. We chuse the *Fable* of the Iliad, as being the finest plan of an epic poem in the world, and at the same time the most useful system of the precepts of the art; it being hence that Aristotle was furnished with all his reflexions.

In every discrete undertaking, the end is the first thing proposed; and by this the whole work and all its parts are regulated: Consequently, the design of the epopee being to form the manners, it is with this first view that the poet must begin. Now, the philosopher dwelling on virtues and vices in general, the instructions he gives, serve equally for all states and all ages; but the poet has a more immediate regard to his countrymen, and the pressing occasions of his fellow citizens. On this view it is that he chuses his moral, which he is to inculcate into the people, by accommodating himself to their peculiar customs, genius, and inclinations. See how Homer has acquainted himself of all this.

He saw the Greeks, for whom he wrote, divided into as many states as cities; each whereof was a body apart, and had its government independent of the rest. Yet were these different states frequently obliged to unite into one body against their common enemies. Here then were two sorts of government, too different to be commodiously treated in one poem: the poet accordingly had recourse to two *Fables*; the one for all Greece, considered as confederated together, only consisting of independent parts; the other, for each particular state, such as they are in time of peace, and without the first relation. The first is the subject of the Iliad, the second of the Odyssey.

For the first kind of government, all experience agrees, that the only thing which can render it happy, and its design successful, is a good understanding, and due subordination among the several chiefs that compose it; and that misunderstandings, a desire of sway, &c. are the inevitable bane of such confederacies. The best instruction therefore that could be given them, was to set before their eyes the destruction of the people, and even of the princes themselves, through the ambition and discord of these latter. Homer therefore, for the ground or moral of his *Fable*, chose this great truth, That the misunderstandings of princes ruin their states. "I sing," says he, "the wrath of Achilles, so fatal to the Greeks, and which destroyed so many heroes, occasioned by a disagreement between king Agamemnon and that prince."

To enforce this truth, he represents divers confederate states first at variance, and unpropitious; then reconciled, and victorious. All which he thus includes in one universal action. Several independent princes league against a common enemy: He whom they chuse as their leader, affronts the bravest of

all the confederacy; upon which the offended prince withdraws, and refuses any longer to fight for the common cause. This misunderstanding gives the enemy so much advantage, that the confederates are ready to relinquish the enterprise. The disaffected person himself becomes a sharer in the calamities of his allies; one of his chief friends and favourites being killed by the chief of the enemies. Thus, both parties, grown wile at their own costs, are reconciled. Upon which the valiant prince again joining in the war, turns the scale to his own party, and kills the enemy's chief.

Such is the first general plan of the poem. To render this probable and more interesting, circumstances of time, place, persons, &c. are to be added; that is, the poet looks into history, or tradition, for persons, to whom such actions may with truth or probability be attributed.

He pitches on the siege of Troy, and supposes the action to have passed there. The brave, cholerick character he calls Achilles; the general is Agamemnon; the chief of the enemies, Hector, &c. To insinuate himself unto his readers, he accommodates himself to their manners, genius, views, &c. and, to render his *Fable* the more interesting, makes his chief persons, and those who remained at length victorious, to be Greeks, the fathers of those very people. The course of the work is filled up, and extended with other useful lessons and instructions.

That the epopee in all its glory is still justly and strictly a mere *Fable*, in the same sense as the fictions of Æsop are, is shewn by F. Boffu, in a parallel between the *Fable* of the Iliad, and that of Æsop already mentioned. The moral instruction is visibly the same in both: So is the fiction. All the difference lies in the names and qualities of the persons.

Homer's are kings; he calls them Achilles, Patroclus, &c. and the general good to be preserved, he calls the Greeks. Æsop, after this manner, gives his persons the names of beasts. The dogs are confederated, the wolf is their enemy; and what Homer calls the Greeks, Æsop calls sheep. One says, that while the confederate princes are at variance, Hector rushes on the Greeks, and makes them pay dear for the folly of their sovereigns (*delirant reges, plebsuntur Achivi*:). But that the allies, brought by misfortunes to themselves again, reunite, repulse Hector, and kill him. The other, that while the dogs are together by the ears, the wolf falls on the sheep; and that the dogs, seeing the havoc he makes, join together, drive him away, and kill him.

The two *Fables* were capable of a still nearer resemblance. Homer has extended his by long speeches, descriptions, comparisons, and particular actions; and that of Æsop might be amplified after the like manner, without corrupting or altering it.

There needs only to relate what cause set the dogs at variance, and shew the rise of the fatal wrath in all its circumstances; to make fine descriptions of the plain wherein the sheep fed, and of some neighbouring wood, where the wolf was sheltered: To give this enemy whelps to rear; make them follow their fire in search of prey; and describe the carnage they made at divers expeditions. Nor would the genealogy of the heroes be forgotten: The wolf should boast himself a descendant of Lycan; and one of the dogs be sprung in a direct line from Canicula. Which last would be the proper hero of the poem, as being hot, and apt to be enraged. He would represent the person of Achilles to admiration; and the folly of some Ajax his cousin, would afford a good proof of so divine an extraction. Nothing more were required to engage heaven in the cause, and divide the gods; which, no doubt, have as much right in Æsop's republic, as in the states of Homer. Witness Jupiter taking care to give a king to the nation of the frogs.

The reader has here field enough for an epopee; if he have any thing of fancy and expression, and do but take care to repeat, as often as Homer does,

Τὸν δ' ἀπεμύχεμεν ὅτι προσέφη ποδάρας ἀνέρι—

FABRICK*, the structure, or construction of any thing, particularly of a building.

* The word is formed of the Latin *fabrica*, which originally signifies a smith's shop, or forge.

In Italy, the word *Fabrick* is applied to any considerable building: In France it rather signifies the manner of building.

FABRICK Lands, are lands given towards the maintenance, rebuilding, or repair of cathedrals, or other churches; mentioned in the act of oblivion, 12 Car. II. cap. 8.

In antient time almost every one gave by his will more or less to the *Fabrick* of the cathedral, or parish-church where he lived.

FABULOUS, denotes something that has a relation to fable.

Varro divides the duration of the world into two earlier states, or periods. The first, *αἰὼν*, the obscure or dark, including all the time before the deluge: for the heathens had some faint idea of a deluge, and a sort of tradition founded thereon; but knew nothing of what had passed before.

The second period he calls *μυθικόν*, *fabulous* age, including the time from the deluge to the first olympiad; and making accord-

according to Petavius, 1552 years; or to the destruction of Troy, which was 1164 years after the deluge; or 308 after the delivery from Egypt.

This Period is called sometimes *Fabulous*, and sometimes heroic: The first on account of the fables wherein the history and learning of those ages are veiled: The second, from the heroes, or sons of the gods, whom the poets feign to have lived in those days.

FACE, the surface, or first side which a body presents to the eye. See **SURFACE**.

We say, the *Face* of the earth, of the waters, &c. Polyhedrons have several *Faces*.

A die, or cube, has six *Faces*.

FACE, is particularly used for the visage of an animal, and especially of a man; as being in him the only part of the body that ordinarily appears to the eye.

The Latins call it *facies*, *vultus*, *os*, &c.

The great variety observable in mens *Faces*, voices, and hand-writings, furnishes a noble argument of a providence.

The human *Face* is called the image of the soul, as being the seat of the principal organs of sense; and the place where the ideas, emotions, &c. of the soul are chiefly set to view. Pride and disdain are shewn in the eye-brows, modesty on the cheeks, majesty in the forehead, &c. It is the *Face* which shews the sex, age, temperament, health, or disease, &c.

The *Face*, considered as the index of the passions, habits, &c. of the person, makes the subject of physiognomy.

Anatomists usually divide the *Face* into two parts, the upper, and lower: The upper is the front, or forehead; the lower includes the eyes, nose, ears, mouth, and chin. See each part described under its respective article.

FACE, or **FACADE**, is sometimes used for the front of a building; or the side on which the chief entrance is: As also for the side it presents to a street, garden, court, &c. And sometimes for any side opposite to the eye.

FACE, **FACIA**, or **FASCIA**, in architecture, denotes a flat member, having a considerable breadth and but a small projection.

Such are the bands of an archdrave, larmier, &c.

FACE of a *stone*, is the surface or plain part, which is to lie in the front of the work.—The *Face* is easily known when the stone is squared, as being always opposite to the back; and the back going rough as it comes from the quarry.

The workmen generally chuse to make one of those sides the *Face*; which when in the quarry lay perpendicular to the horizon; and consequently the breaking, and not the cleaving way of the stone.

FACES of a *bastion*, are the two foremost sides, reaching from the flanks to the point of the bastion, where they meet.

These are commonly the first undermined, by reason they reach farthest out, and are the least flanked, and therefore weakest. They are represented by the lines BC, and SC, *Tab. Fortif. fig. 1.*

FACE of a *place*, denotes the interval between the points of two neighbouring bastions, containing the curtain, the two flanks, and the two *Faces* of the bastions that look towards one another.

This is otherwise called the *tenaille* of the place.

FACE *prolonged*, in fortification, is that part of a line of defence rampant, which is between the angle of the epaule, or shoulder of a bastion and the curtain: or the line of a defence rampant diminished by the *Face* of the bastion.

FACE, in astrology, is used for the third part of a sign. Each sign is supposed to be divided into three *Faces*: The ten first degrees compose the first *Face*; the ten following ones the second; and the last ten the third. Venus is in the third *Face* of Taurus, that is, in the last ten degrees thereof. See **SIGN**.

FACET, or **FACETTE**, a little face, or side of a body cut into a great number of angles.

Multiplying glasses are cut in *Facets*, or *Facet-wise*. Diamonds are also cut in *Facets*, or tables.

FACIA, in architecture. See the article **FASCIA**.

FACIES *Hippocratica*, in medicine, is when the nostrils are sharp, the eyes hollow, the temples low, the tips of the ears contracted, the forehead dry and wrinkled, and the complexion pale or livid.

The *Facies Hippocratica* is chiefly observed toward the period of phthises, and other consumptions: And is held a sure prognostic of death.

FACTION, a cabal, or party, formed in a state to disturb the public repose.

The most celebrated *Factions* are that of the Guelphs and Ghibelins, who kept Italy in alarm for many ages; and with us that of the Whigs and Tories.

FACTION was originally an appellation given the divers troops, or companies of combatants in the games of the Circus. See **CIRCUS**.

Of these there were four, viz. the green *Faction*, the blue *Faction*, the red *Faction*, and the white *Faction*.

These *Factions*, with their liveries and badges, were at length abolished. The emulation which was at first between them, growing to such a height, that in Justinian's time they came to blows about it.

FACTITIOUS signifies any thing made by art; in opposition to what is the produce of nature.

Distilled waters are *factitious* liquors. See **WATER**.

Cinnabar is divided into natural and *factitious*. See **CINNABAR**.

De FACTO, see the article **DE-FACTO**.

FACTOR, in commerce, an agent, or person who acts, and negotiates for a merchant, by commission; called also commissioner, and on some occasions broker, and throughout the Levant, *coagis*.

Factors are either charged with the buying, or the selling of goods; or with both.

Those of the first kind are usually established in places of considerable manufactories, or cities of great trade. Their office is to buy up commodities for merchants residing elsewhere; to see them packed, and send them to the persons for whom they were bought.

FACTORS of *sale*, are usually fixed in places where there is a great vent. To these, merchants and manufacturers send their goods to be sold for them according to the price, and other conditions expressed in the orders deliver'd them.

The wages, or allowances for selling, are usually clear of all expences of carriage, exchange, remittances, &c. excepting postage of letters, which are never put to account.

FACTORS, in arithmetic, is a name given to the two numbers which are multiplied into one another; that is, the multiplicand and multiplier: so called by reason they are to *facere productum*, make or constitute the product.

FACTORAGE,

The *Factorage*, or wages, called also commission, is different, at different places, and for different voyages: At a medium it may be fixed at about three *per cent.* of the value of the goods bought; beside the charge of package, which is paid over and above.

At Virginia, Barbadoes and Jamaica, the *Factorage* is from three to five *per cent.* and the like throughout the greatest part of the West-Indies. In Italy it is two and a half. In Holland one and a half. In Spain, Portugal, France, &c. it is two *per cent.*

FACTORY, a place where a considerable number of factors reside, to negotiate and officiate for their masters or principals.

The term is chiefly used in speaking of the East-Indies, and other parts of Asia, whither the European nations send their ships every year, and where they keep factors to buy the commodities of the country, and sell those brought from Europe. The greatest and noblest *Factory* in the world, is that of the English at Smyrna. It usually consists of 80 or 100 persons, most of them young gentlemen of the best families, and frequently younger sons of peers. It is a sort of seminary of merchants. As there is a necessity for serving an apprenticeship of seven years, to be entitled to trade to the Levant; the custom is for persons of fortune to bind their younger sons to some merchant, who, in consideration of 3 or 400 pounds sterling, agrees, after the three first years of their apprenticeship are expired, to send them to Smyrna: where they have not only the management of their masters affairs with very plentiful allowances, but are likewise permitted to trade for themselves; whereby they are enabled to live splendidly the rest of their apprenticeship, and at length come out the best qualified for business of any young persons in the world.

FACTUM, in arithmetic, the product of two quantities multiplied by each other.

FACULÆ in astronomy, a name given by Scheiner, and others after him, to certain spots on the Sun's disk, that appear brighter, and more lucid than the rest of the body.

* The word is pure Latin; being a diminutive of *fax*, torch; and supposed to be here applied from their appearing and dissipating by turns.

The *Facula* or bright spots differ very considerably from the maculae or dark spots, both in light, colour, figure, magnitude, and duration.

Hevelius assures us, that July the 20th, 1634, he observed a *Facula* that took up a third part of the sun's diameter. And from the observations of the same Hevelius, we learn, that the maculae frequently change into *Faculae*; but the *Facula* into maculae rarely, if ever. Some authors even contend that all the maculae degenerate into *Faculae*, before they quite disappear.

Huygens, however, declares he was never able to discover any *Faculae*; though the maculae occurred to him very frequently. All the foundation he could see for the notion of *Faculae*, he says, was, that in the darkish clouds which frequently surround the

maculæ, one sometimes discerns little points or sparks brighter than the rest.

Many authors, after Kircher and Scheiner, have generally represented the sun's body full of bright, fiery spots, which they conceive to be a sort of volcano's in the body of the sun. But Huygens, and others of the latest and best observers, finding that the best telescopes discover nothing of the matter, agree to explode the phenomena of *Facule*. Their cause, these authors attribute to the tremulous agitation of the vapours near our earth; the same as sometimes shews a little unevenness in the circumference of the sun's disk, when viewed through a telescope. Strictly then, the *Facule* are not eruptions of fire and flame, but refractions of the sun's rays in the rarer exhalations, which being condensed in the neighbourhood of that shade, seem to exhibit a light greater than that of the sun. See SUN.

FACULTY, a power, or ability, of performing an action.

The term is much used by the ancient philosophers, and still retained in the schools, to explain the actions of natural bodies by.

Thus to account for the act of digestion, they suppose a digestive *Faculty* in the stomach; to account for motion, they imagine a motive *Faculty* in the nerves, &c. which is only a substituting of one name of an unknown phenomenon for another.

Yet this practice of attributing effects to their respective virtues or *Faculties*, still obtains in divers things, which our philosophy has not yet afforded us a better account of. Thus, say our medicinal writers, fenna and rhubarb have a purgative *Faculty*; barberries a cooling *Faculty*, &c. which amounts just to this, that fenna purges, and barberries cool.

The human *Faculties* are divided into those of the soul, and of the body.

The *FACULTIES* or powers of the soul, are commonly reputed two, viz. understanding, and willing.

The *FACULTIES* of the body are usually distinguished with regard to their several functions, into *vegetative* and *animal*.

Under the *vegetative Faculty*, are comprehended the divers subaltern ones, whereby nutrition and generation are effected.

Under the *animal Faculties*, are comprehended those relating to sense and motion.

The *vegetative Faculty* is subdivided into *nutritive* and *generative*; and the nutritive is again subdivided into *natural* and *vital*.

To the first, belong the functions of the lower belly, relating to the preparation of the food; to the latter, the actions of the heart and lungs, wherein life is chiefly concerned.

Others subdivide the *vegetative Faculty* into *attractive*, *retentive*, *cohesive*, and *expulsive*.

The animal *Faculties* being those whereby an animal perceives and moves, become divided into *sensitive* and *locomotive*.

FACULTY is also applied in the schools to the divers parts or members of an university, divided according to the arts, or sciences taught, or professed therein.

There are four *Faculties* in most universities: That of Arts, which includes the humanities and philosophy, and is much the most ancient, and extensive: The second is that of Theology: The third, Medicine: And the fourth, Jurisprudence, or Laws. See each under its proper article.

The degrees in the several *Faculties* in our universities are, those of Bachelor, Master, and Doctor.

The *FACULTY* is frequently used absolutely, and by way of eminence, for that chiefly studied and taught in that place.

Thus, the *Faculty* of London and Montpellier, is Medicine: that of Paris, Theology: that of Orleans, Law, &c.

FACULTY, in law, denotes a privilege or special power granted to a man by favour, indulgence, and dispensation, to do that which regularly, and by law he cannot: As to eat flesh upon days prohibited; or to marry without banns first asked.

The court of *FACULTIES* in England belongs to the archbishop of Canterbury, and his officer is called *magister ad Facultates*. His power is to grant dispensations, as to marry, for the son to succeed his father in his benefice, one to have two or more benefices incompatible, &c.

The office where such dispensations are taken out, is also called the *Faculty-office*.

FÆCAL, or **FÆCAL** matter, a term used by physicians, particularly the French, for the *Fæces* or great excrements of a man, i. e. those discharged by stool.

The *Fæcal matter* is become famous for a chemical operation thereon, by M. Homberg, related at length in the *Mém. de l'Acad. R. An 1711*. He had a notion suggested to him, that the *Fæcal matter*, by distillation, yielded an oil clear as water, without any smell, and which had the property of fixing mercury into fine silver. Upon this, he went to work; and because he would have as laudable and pro-

milting a matter as he could, he hired four robust healthy young fellows, whom he shut up for three months, and agreed with them, that they should eat nothing but the finest bread, which he supplied them withal fresh every day, and drink the best Champagne wine as long as they would. After a long process, and numerous essays on the excrements they made, he at length got the clear, inodorous oil; but it had no effect at all on mercury, which was the great point aimed at.

However, missing of what he expected, he fell on something he never dreamt of, viz. a Phosphorus. The *caput mortuum* of the oil, he found to have a surprising property of taking fire without any motion, or the application of any other fire; in-fomuch, that it might deserve a place in the first rank of the known Phosphori.

The quantity of a pea of this taken out of the matrafs, and laid on a paper, or other combustible matter, begins to smoke immediately, and sets the paper on fire.

FÆCES, or **FECES**, the dregs, sediment, or impurities remaining of a mixt body, after the purer, more volatile and fluid have been separated therefrom by evaporation, distillation, decantation, derivation, or the like.

Thus we say the *Fæces* of wine, of oil, &c. Those of wines are properly called *lees*. Those of oil, *amara*; those of malt-liquors, *grounds*.

FÆCES, in chemistry, denotes the lees, refuse, dirt, mud, impurities, and heterogeneous matters remaining in the alembic after the distillation of any body. What remains in the retort, instead of *Fæces*, is properly denominated *caput mortuum*, or *terra damnata*.

FÆCES is particularly used in medicine, &c. for the gross, impure matters found at the bottom of the compositions and preparations of either pharmacy.

FÆCES is also used for the excrements of an animal, voided by stool. See EXCREMENT.

FÆCULA, or **FECULA**. See the article FECULA.

FÆTOR, stench. See the article FÆTOR.

FAGGOT*, or **FAGOT**, in fortification. See FASCINE.

* Menage derives the word from the Latin *facotus*, which was formed of the Greek *φακος*. Nicod borrows it from *faciculus*, a bundle: Du Cange from the base Latin *facatum*, and *facotum*.

FAGGOT of steel, expresses the quantity of 120 lb. weight.

FAGGOT, in the times of popery in these kingdoms, was a badge wore on the sleeve of the upper garment, by such as had abjured heresy; being put on after the person had carried a *Faggot*, by way of penance, to some appointed place of solemnity.—The leaving off this badge was sometimes construed apostasy.

FAGGOTS, among the military men, are ineffective persons, who receive no regular pay, nor do any regular duty, but are hired occasionally to appear at a muster, to fill up the companies, hide the real deficiencies thereof, and cheat the king of so much pay, which goes into the officers pocket.

FAGONA, in anatomy, a conglomerate gland, called also *thymus*. See THYMUS.

FAILLIS, in heraldry, a French term, denoting some failure or flaw in an ordinary, as if it were broke, and a splinter taken from it.

FAILURE, or **FAILING**, a species of bankruptcy; popularly called breaking, or stopping payment.

FAINT, or **FAINT-ACTION**, is as much as *feigned Action*; that is, such an action, as though the words of the writ be true, yet, for certain causes, the party has no title to recover thereby.

By which it differs from a false action, which is that where the words of the writ are false. Coke on Littl. fol. 361.

Yet sometimes the two are confounded. See ACTION.

FAIR*, a public place, where merchants, traders, and other persons from divers parts meet, on some fixed day of the year, to buy and sell commodities, and to partake of the diversions usually accompanying such assemblies.

* The Word *Fair* is formed of the French *foire*, which signifies the same thing: And *foire* some derive from the Latin *forum*, market: Others from the Latin *feria*, by reason *Fairs* were anciently always held in the places where the wakes, or feasts of the dedications of churches, called *feriæ*, were also held. The Romans called them *nundinæ*. Eric Puteanus has a pretty little treatise on the *Fairs* of the Romans, *De nundinis Romanorum*, which he calls *Nova fœforum facula*.

Fairs are either free, or charged with tolls and impositions. The privileges of free *Fairs* consist chiefly, 1^o In that all traders, &c. whether natives, or foreigners, are allowed to enter the place, and are under the royal safeguard and protection in coming and returning, and their agents, with their goods, &c. 2^o In that the said persons, and their effects, are exempt from all duties, impositions, tolls, and servitudes. 3^o That merchants in going to, or returning from the *Fair*, &c. cannot be arrested, or their goods stopped, &c.—It is the sovereign alone that has a right, by

his letters patent, to establish *Fairs*, whether free, or subject to duties, and the other ordinary laws and penalties.

Several *Fairs* are held in the open fields, or on heaths and common, under tents, booths, and barracks erected for the purpose: as *Sturbridge Fair, &c.* Other in places walled in for the purpose; and formed into regular streets, lanes, &c. for the occasion: as the *Fair* of St. Laurence at Paris. Lastly, others are held in the open places and streets of cities, as *Bartholomew Fair, Bristol Fair, the Fair* of St. Germain, &c. *Fairs*, particularly free *Fairs*, make a very considerable article in the commerce of Europe, especially that of the Mediterranean or inland parts, as Germany, &c. where the continual passage and repassage of vessels is impracticable.

The most celebrated *Fairs* in Europe are those, 1^o of *Frankfort*, held twice a year, in spring and autumn: the first commencing the Sunday before Palm-Sunday, and the other on the Sunday before the eighth of September. Each lasts fourteen days, or two weeks, the first of which is called the week of acceptance, and the second the week of payment. They are famous for the sale of all kinds of commodities, but particularly the immense quantity of curious books, no where else to be found, and whence the booksellers throughout all Europe used to furnish themselves. Before each *Fair* there is a catalogue of all the books to be sold thereat, printed and dispersed, to call together purchasers; though the learned have generally complain'd of divers unfair practices therein; as fictitious titles, names of books purely imaginary, &c. beside great frauds in the names of the authors, and the titles of the real books. — 2^o The *Fairs* of *Leipzig*, which are held thrice a year: one beginning on the first of January; another three weeks after Easter; and a third after Michaelmas. They hold twelve days apiece, and are at least as considerable as those of *Frankfort*. 3^o The *Fairs* of *Novi*, a little city in the Milanese, under the dominion of the republic of *Genoa*. There are four of these in the year, commencing on the second of February, the second of May, the first of August, and second of September. Though the commodities bought and sold here be very considerable; yet, what chiefly contributes to render them so famous, is the vast concourse of the most considerable merchants and negotiants of the neighbouring kingdoms for the transacting of affairs, and settling accounts.

4^o The *Fairs* of *Riga*, whereof there are two in the year; one in May, and the other in September. They are much frequented by the English, Dutch, and French ships, as also by others from all parts of the Baltic. The best time for the sale of goods at *Riga*, is during the *Fairs*. Since the building of the famous city of *Petersburg*, these *Fairs* have suffered some diminution. 5^o The *Fair* of *Archangel*, during which all the trade navigators have with that city, is managed. It holds a month, or six weeks at most, commencing from the middle of August. The Muscovite merchants attend here from all parts of that vast empire; and the English, Dutch, French, Swedish, Danish, and other ships in the port of that city, on this occasion, ordinarily amount to three hundred. But this is no free *Fair*, as the rest are: The duties of exportation and importation are very strictly paid, and on a very high footing. 6^o The *Fair* of *St. Germain*, one of the suburbs of Paris, commencing on the third of February, and holding till Easter; though it is only free for the first fifteen days. 7^o The *Fairs* of *Lyons*, which, *Monf. du Chesne*, in his antiquity of cities, would insinuate, from a passage in *Strabo*, were established by the Romans: though it is certain, the *Fairs*, as they now stand, are of a much later date. There are three in the year, each lasting twenty days, and free for ever. They begin on Easter Monday; the 26th of July; and the first of December. 8^o *Fair* of *Guibray*, a suburb of the city of *Falaïse*, in the lower Normandy. It is said to have been established by our William the conqueror, in consideration of his being born at *Falaïse*. It commences on the 16th of August, and holds fifteen days, free by charter, and longer by custom. 9^o *Fair* of *Beaucaire*, held partly in a city of that name, in *Languedoc*, and partly in the open country, under tents, &c. It commences on the 22^d of July, and only holds for three days; yet it is the greatest and most celebrated of all the *Fairs* in that part of Europe, both for the concourse of strangers from all parts of the world, and for the traffic of all kind of goods: the money returned in these three days amounting sometimes to above six millions of livres.

The *Fairs* of *Porto-bello*, *Vera-Cruz*, and the *Havana*, are the most considerable of all those in America. The two first last as long as the fleets and galleons continue in those parts; and the last is opened as soon as the fleets or galleons arrive there upon their return for Spain; this being the place where the two fleets join.

FAIR Pleading. See the article *BEAU-PLEADER*.

FAIRY, a term frequently occurring in ancient traditions and romances, denoting a kind of genii or imaginary deities, conversant on earth, and distinguished by abundance of fantastical actions and offices, either good or evil.

The *Fairies*, according to these Traditions, are a peculiar species of divinities, that have but little relation to any of those of the ancient Greeks and Romans; unless perhaps to the *Larvæ*. Though others, will not have them ranked among deities; but suppose them an intermediate kind of beings, neither gods, nor angels, nor men, nor devils.

They are of oriental extraction, and seem to have been invented by the Persians and Arabs, whose history and religion abound with tales of *Fairies* and dragons. The Persians call them *Peri*, and the Arabs *Ginn*, having a peculiar country, which they suppose them to inhabit, called *Ginnistan*, and by us *Fairy-land*.—Our famous countryman *Spencer's* masterpiece, the *Fairy-queen*, is an epic poem under the persons and characters of *Fairies*.

Naude, in his *Malcurat*, derives the origin of the fables of *Fairies*, from those of the *Parcæ* of the ancients; and supposes both the one and the other to have been a kind of envoys, or interpreters of the will of heaven to men. But then, by *Fairies* this author means a sort of witches, famed for foretelling future events, by means of some communication with the genii above-mentioned. The silly superstitious notions of the ancients, he observes, were not near so formidable as ours; nor their hell and furies any thing comparable to our devils. Accordingly, in lieu of our hags and witches, who do nothing but ill, and are employed in the lowest, and basest offices, they had a finer sort of goddesses, called by Latin authors *allas dominæ*, who scarce did any thing but good, and took pleasure in noble, and honourable deeds: Such were their *Lamia*, and nymph *Egeria*; from whom the later *Fairy* queens, *Morga*, *Alcina*, *Fata Manto* of *Ariosto*, *Gloriana* of *Spencer*, and other machines in English and French fable, were, no doubt, derived. Some of them are usually made to attend the births of young princes and cavaliers, to inform them of their destiny, as was anciently done by the *Parcæ*: witness *Hyginus*, c. 171, and 174. But, with *Naude's* leave, the ancients were not without witches, as wicked as our own; witness the *Canidia* of *Horace*, *od. v. &c. satyr. l. 5. l. 1. 10.* Nor did the *Fairies* succeed the *Parcæ*, or even *Veneficæ* of the ancients; but rather the *Nymphæ*; for such were *Lamia*, and *Egeria*.

FAIRY circle, or ring, is a phenomenon pretty frequent in the fields, &c. being a kind of round, supposed, by the vulgar, to be traced by the *Fairies* in their dances.

There are two kinds; one of them seven or eight yards in diameter, containing a round bare path, a foot broad, with green grass in the middle: the other of divers sizes; being incompassed with a circumference of grass, much fresher and greener than that in the middle.

Mr. Jessop and *Mr. Walker*, in the *Philos. Transf.* ascribe them to the lightning; which is confirmed by their being most frequently produced after storms of that kind; as well as by the colour and brittleness of the grass roots, when first observed. It is no wonder that lightning, like all other fires, moves round, and burns more in the extremity than the middle.

According to those gentlemen, the second kind of circle arises originally from the first: the grass burnt up by the lightning, using to grow the more plentifully afterwards.

Other authors have asserted, that these *Fairy* rings are formed by ants; by reason those insects are sometimes found travelling in troops therein. See Supplement article *FAIRY CIRCLE*.

FAITH, in philosophy, belief; or that assent which we give to a proposition advanced by another, the truth of which we do not immediately perceive from our own reason or experience, but believe it discovered and known by the other.

Faith is a judgment or assent of the mind, the motive whereof is not any intrinsic evidence, but the authority or testimony of some other, who reveals or relates it.

Hence, as there are two kinds of authorities and testimonies; the one of God, and the other of man; *Faith* becomes distinguished into *human* and *divine*.

DIVINE FAITH is that founded on the authority of God; or it is that assent we give to what is affirmed by God.

The objects of this *Faith* are matters of revelation. See *REVELATION*.

HUMAN FAITH is that whereby we believe what is told us by men.

The object hereof is matter of human testimony and evidence.

Faith again, may be distinguished into *implicit*, and *scientific*.

Implicit or blind FAITH is that whereby we give our assent to a proposition advanced by another, of whose knowledge and veracity we have no certain and evident reason or proof. This is only opinion, under another name.

Scientific or seeing FAITH, is that by which we give our assent to a proposition advanced by one who can neither deceive, nor be deceived; which may be properly referred to science and knowledge.

DIVINE Faith, *ceteris paribus*, is stronger than human. When we are fully convinced that any proposition comes from God, *Faith* becomes assurance, or science; it being an ingredient

ingredient in our idea of God, that he can neither deceive nor be deceived: But when there is any doubt, whether the proposition is declared by God, or whether he has commanded that we should believe such a thing; the *Faith* can be no stronger, or weaker, than the reasons on which it is founded: Divine *Faith*, therefore, may either be strong, weak, or none at all.—Again, the reasons or motives of believing men, may be of such weight and force, that being perfectly understood, they may equal a mathematical evidence: And then the human *Faith* is scarce inferior to the divine; there being, as it were, an equal necessity of giving our assent on each side.

Hence it is easily observed, that all our *Faith* or belief has its foundation on reason, which cannot deceive us, if we make a due use of our liberty, and do not acquiesce, till that necessarily compels us.

Strictly, and philosophically speaking, no man can have what we call a divine *Faith*, except a prophet, to whom God has immediately spoken.

All our present religious *Faith* is really human, as depending on the secondary testimony of men; of whose veracity, however, we have the strongest proofs. The prophets, or those to whom God immediately revealed his will, believed him, for that they knew he could not deceive. We, at this day, believe them, or rather their writings, for other reasons, viz. the fame which obliges us to believe all well attested histories.

FAITH, in theology, makes the first of the theological virtues, or graces.

Faith, in this sense, is a gift of God, whereby we are led to give a firm assent to the truths he has revealed to his church: or, *Faith* is a gift or impression, which leads us to give our assent to certain things relating to God, his nature, attributes, worship, &c. the evidence of which things, we do not see and understand clearly enough, to have given our assent on the common footing of reason, and conviction.

St. Paul defines *Faith* the substance or support of things hoped for, and the evidence of things not seen.—The life of *Faith* consists in serving God without knowing him in any sensible manner. Nicole.

Beside the two species of *Faith*, human and divine; the Ro manists make a third, or intermediate kind, called

Ecclesiastical FAITH, which is the assent orthodox persons give to certain events decided by the church, and enjoined to be believed by all.

As when the church declares that such a book contains heretical doctrine, that such a person is in heaven, &c.

This term, ecclesiastical *Faith*, was first introduced by Mr. Perreux, to distinguish the *Faith* whereby we believe matters of divine revelation, from that whereby we believe matters of ecclesiastical determination.

Confession of FAITH, is a creed or formula containing all those articles, the belief whereof is esteemed necessary to salvation. **FAITH and HONOR**, in the feudal law. See **FEALTY**.

FAKIR, or **FAQUIR**, a kind of dervise, or Mahometan religious, who travels the country, and lives on alms.

* The word *Fakir* is Arabic, and signifies a poor or needy person. It is formed of the word *Faqir*, *Fakara*, to be in need.

D'Herbelot makes *Fakir* and dervise the same thing. The Turks and Persians use the name dervise for any poor person, whether he be so out of necessity or choice: And the Arabs apply *Fakir* in the same sense. Whence, in some Mahometan countries, the religious are called dervises; and in others, particularly throughout the states of the great Mogul, *Fakir*.

The *Fakirs* sometimes travel singly, and sometimes in companies. When they go in companies, they have a superior, who is distinguished by his habit. Each *Fakir* bears a horn, which he blows at his arrival in any place, as also at his departure; and a kind of scraper or trowel, to scrape the earth in the place where he sits or lies down. When they go together, they divide their alms equally amongst them; give what is left every night to the poor, and never reserve any thing for the morrow.

There are also a kind of idolatrous *Fakirs*, who follow much the same trade. D'Herbelot reckons in the Indies eight hundred thousand Mahometan *Fakirs*; and twelve hundred thousand idolatrous ones: to say nothing of divers extraordinary species of *Faquirs*, particularly penitents, whose mortification and penance consists in very odd observances. Some, *v. gr.* remain night and day, for many years, in certain uneasy postures. Others never sit or lay down to sleep, but sustain themselves by a rope, hung down for that purpose. Others bury themselves in a ditch, or pit, for nine or ten days, without eating or drinking. Others keep their arms lifted up to heaven, so long, till they cannot let them down again, if they would. Others lay fire on their heads, and burn the scalp to the very bone. Others roll themselves naked on thorns. Tavernier, &c.

Another class of *Fakirs* retire unto mosques, live on alms, and devote themselves to the study of the law, the reading of

the Alcoran, &c. to fit themselves for moulas, or doctors. People of quality sometimes assume the character of *Fakirs*: The famous Aurangzeb himself, before he ascended the throne, gave out, that he intended to commence *Fakir*.

FALCATED, one of the phases of the planets, popularly called horned.

The astronomers say the moon, or any planet, is *Falcated*, when the enlightened part appears in form of a sickle, or reaping-hook, by the Latins called *falk*.

The moon is *Falcated*, whilst she moves from the conjunction to the opposition, or from new moon to full; from full to a new again, the enlightened part appears gibbous, and the dark *Falcated*. See **MOON**.

FALCON*, or **FAUCON**, a bird of prey, of the hawk-kind, superior to all others for courage, docility, gentleness, and nobleness of nature.

* Jo. de Janu, and several others, take the name *Falcon* to have been occasioned by its crooked talons, or pounces, which resemble a *falk* or sickle. Giraldus derives it a *falcando*, because it flies in a curve.

The *Falcon*, or *Falcon Gentle*, is both for the fist, and the lure: Its feet are yellow, its head black, and its back spotted. In the choice, observe that the head be round, the beak thick and short, the neck long, the shoulders broad, thighs long, legs short, feet large, the feathers of the wings slender, and the pounces black.

The *Falcon* is excellent at the river, brook, and even field; and flies chiefly at the larger game, as wild-geese, kite, crow, heron, crane, pyc, shoveler, &c.

It must be added, that the name *Falcon* is restrained to the female; for as to the male, it is much smaller, weaker, and less courageous than the female, and is denominated a *Tajfel*, or *Tirecellet*.

As in the course of this work, the several terms of falconry are explained, it may be here necessary to say something in the general, of the management and discipline of the *Falcon*, as being the foundation of the art of falconry. For the rest, the reader may have recourse to the Heads **HAWK**, and **HAWKING**.

When a young *Falcon* is first taken, she must be seced, and the feeling at length gradually slackened, that she may be able to see what provisions are brought her. Her furniture is to be jesses of leather, mailed leafless, with buttons at the end, and bewets. Beside a small round stick hanging in a string to stroke her frequently withal; which, the owner it is done, the sooner and better will she be manned: she must have two bells on her legs, that she may be the more readily found, or heard when she stirs, scratches, &c. and a hood raised, and bossed over her eyes. Her food is to be pigeons, larks, and other live birds, of which she is to eat twice or thrice a day, and till she be full gorged. When the falconer is about to feed her, he must hoop and lure, that she may know when to expect it. Then unhooding her gently, he gives her two or three bits, and putting her hood on again, gives her as much more; but takes care she be close seced, and after three or four days lessens her diet. At going to bed, he sets her on a perch by him, that he may awake her often in the night; continuing to do so till she grow tame and gentle. When she begins to feed eagerly, he gives her sheep's heart; and now he begins to unhood her by day, but it must be done far from company: feeds her and hoods her again, as before, but takes care not to fright her with any thing when he unhoods her, and, if he can, reclaims her without overwatching. The *Falcon* must be born continually on the fist, till she be thoroughly manned, and induced to feed in company: for two or three days give her washed meat, and then plumage, according as you esteem her foul within; if she cast, hood her again, and give her nothing till the gleam after her casting: but when she has gleamed and cast, give her a little hot meat in company; and towards evening let her plume a hen's wing, likewise in company: cleanse the feathers of her casting, if foul and slimy: if she be clean within, give her gentle casting; and when she is well reclaimed, manned, and made eager and sharp set, venture to feed her on the lure.

But three things are to be considered before your lure be shewed her. 1^o That she be bold and familiar in company, and not afraid of dogs and horses. 2^o Sharp-set and hungry, having regard to the hour of morning and evening when you would lure her. 3^o Clean within, and the lure well garnish'd with meat on both sides. When you intend to give her the length of a leaf, you must abscond yourself: she must also be unhooded, and have a bit or two given her on the lure, as she sits on your fist. That done, take the lure from her, and so hide it that she may not see it: when she is unseced, cast the lure so near her, that she may catch it within the length of her leath; and as soon as she has seized it, use your voice as falconers do, feeding her upon the lure on the ground.

After having lured your *Falcon*, in the evening give her but little meat, and let this luring be so timely, that you may give

FAL

give her plumage, &c. next morning on your fist: when she has calt and gleaned, give her a little beaching of warm meat: about noon, tie a creance to her leafe, go into the field, there give her a bit or two upon the lure, and unfel her. If you find she is sharp-set, and has eagerly seized on the lure, let a man hold her, to let her off to the lure; then unwind the creance, and draw it after you a good way, and let him who has the bird, hold his right hand on the tassel of her hood readily to unhood her as soon as you begin to lure; to which if she come well, stoop roundly upon it, and hastily seize it, let her cast two or three bits thereon. That done, take her off the lure, and deliver her again to the person that held her; and going further off the lure, feed her as before; and so daily farther and farther off the lure. Afterwards, you may lure her in company, but do not fright her: and having used her to the lure on foot, do it also on horseback; which may be sooner accomplished, by causing horsemen to be about you, when you lure her on foot; 'tis also sooner done, by rewarding her upon the lure on horseback among horsemen. And when she is grown familiar this way, let somebody a-foot hold her, and he that is on horseback must call, and cast the lure about his head, while the holder takes off the hood by the tassel; and if she seize eagerly on the lure, without fear of a man or horse, then take off the creance, and lure at a greater distance. Lastly, if you would have her love dogs as well as the lure, call dogs when you give her plumage.

FALCON, in gunnery. See **FAUCON**.

FALCONER, a person who brings up, tames, and makes, that is, tutors and manages birds of prey; as falcons, hawks, &c. The grand seignor usually keeps six thousand *Falconers* in his service.—The French king has a grand *Falconer*, which is an office dismembered from that of great hunt, grand veneur. Historians take notice of this post as early as the year 1250. One great business of the *Falconer*, is to consider the quality and mettle of the birds, to know which to fly early, and which late. He must also be busy and cleanly in freeing them of lice, nits, and vermin. Every night after flying, he should give his bird casting; nor must he forget to water her, unless she have been bathed. After this, she must be put in a warm room, having a perch, with a candle burning by her; where she is to sit unhooded, that she may prune and pick herself. Next morning she should be weathered, &c.

FALCONET, in gunnery. See **FAUCONET**.

FALCONRY, or **FAUCONRY**, the art of taming, managing, and tutoring birds of prey, particularly falcons and hawks; and employing them with advantage in the pursuit of game: called also hawking.

* The word is formed of *falco*, falcon, or faucon, the bird of most use and esteem in this kind of sport. See **FALCON**.

Falconry, as now practised, was unknown among the Greeks and Romans. All their writings do not furnish so much as a proper name to call it by; so far are they from teaching us the terms. It is the French language alone, that has particular words for all the parts of *Falconry* and hunting; and from them most of our terms, as well as what we know of the art itself, are borrowed.

The writers of reputation on *Falconry*, are Desparon, Franchiere, Tardiffe, Artelouche, Dalagone, Latham, &c. M. de S. Martha has put the principles of the art into fine Latin verses, in his *Hieracosphion, sive De re accipitraria, libri tres*.

FALDAGE*, an ancient privilege which several lords reserved to themselves of setting up sheep-folds, or pens, in any fields within their manors, the better to manure them; and this not only with their own, but with their tenants' sheep.

* This was also termed *setta Faldæ*; and in some old charters *Fold-foca*; in some place a fold-couric, or freefold.

FALL, *Descent*, in physics, the tendency of any heavy body towards the center of the earth.

Galileo first discovered the ratio of the acceleration of falling bodies, viz. That dividing the whole time of falling into equal parts, the body will fall thrice as far in the second moment, as in the first; five times as far in the third; seven times in the fourth, &c. and so on in the order of the uneven numbers. See **ACCELERATION**.

For the cause of the **FALL** of bodies, see **GRAVITY**.

For the laws of **FALLING** bodies, see **DESCENT**.

Water-FALL. See the article **CATARACT**.

FALL, is also used in a moral sense: as, the *Fall* of Adam; see **ORIGINAL SIN**: in the *Fall* of the Roman empire, &c.

Authors contend, that Plato had a notion of Adam's *Fall*, which he had learnt from Moses. Euseb. *De preparat. evangel.* l. xii. c. ii. quotes a fable from Plato's *Symposium*, wherein he thinks he finds the whole history allegorically related.

FALL, in music and poetry. See **CADENCE**.

FALLACY, **FALLACIA**, a deception, or false appearance, or report.

The Epicureans deny that there is any such thing as a *Fallacy* of the senses. According to them, all our sensations, and all our perceptions both of sense and phantasy, are true; they add, that sense itself is the first grand criterion of truth. That the senses are never deceived, they argue from their being incapable of all ratiocination and remembrance: hence they can

FAL

neither add, take away, couple, nor disjoin; they cannot, therefore, infer, conclude, or invent; and consequently they cannot deceive by any inference or invention. This the mind may do, but not the sense, whose business is only to apprehend what is present, *e. gr.* colours; not to discern or distinguish between this body and that. But a thing that barely apprehends, without pronouncing any thing, cannot deceive. Add, that there is nothing to convict our senses of falshood. The sight eye, *e. gr.* cannot convict the left; nor Plato's eyes, those of Socrates; since the reasons or pretensions of each are equal; and the pur-blind person sees what he sees as much as the Lynceus. Nor can a sense of one kind convict another; as the sight, the smell; by reason their objects are different; and consequently their reports or judgments are not of the same things. Thus again, if I see a stick straight when out of the water, but when in it, crooked; my perception is altogether as true in the latter, as in the former case, *i. e.* it is as true that I have the perception or idea of the crooked stick, as of the straight one. And this idea is all that the sense suggests, so that it does not deceive. Lastly, reason cannot fence our senses mistaken, since all reasoning depends on previous sensations, and the senses must first be true, before any reasoning founded thereon can be so.—Thus the Epicureans: whose system is strongly confirmed by what we have already laid down from Mr. Berkeley, concerning the **EXTERNAL world**.

The Cartesian, on the other hand, are continually crying out against the senses, as the great sources of all deception. Every thing which our external senses present us, they say, should be suspected as false, or at best dubious, till our reason has confirmed the report. They add, that our senses, as being fallacious, were never given us by nature, for the discovery of truth, but only to point out what things are convenient, or hurtful to our bodies.

The Peripatetics keep a middle course: they hold, that if a sensible object be taken in its common, or generic view, the sense cannot be deceived about it; for the sight can see nothing but what is visible, nor can it err in perceiving what is visible *quatenus* such. But they add, that if the object be taken under its specific view, the sense may be mistaken about it, viz. from a want of the dispositions necessary to a just sensation, as a disorder of the eye, or something uncommon in the medium, &c.

FALLACY, in logic, or *sylogistic* **FALLACY**, is a captious argument, called also a *sophism*. See **SOPHISM**.

Fallacies either arise from words, or things; the foundation of all illusion and *Fallacy* in words, is ambiguity, which is of two kinds, viz. simple homonymia and amphibology.

The kinds of *Fallacy* in things are very numerous, but they may be reduced to seven general heads, viz. *ignoratio elenchis*, *petitio principii*, *falsa causa*, *interrogatio multiplex*, *limitatio vitiosa*, *accidens*, & *consequens*.

FALLING-sickness*. See the article **EPILEPSY**.

* Dr. Tabernie, in the philosophical transactions, gives the history of a patient much troubled with the *Falling-sickness*, in whose urine he observed a great number of short worms, full of legs, and like millepeeds. While these continued lively, and full of motion, the fits returned daily; but upon prescribing her half an ounce of oxymel helleboratum in tany water, the worms and the distemper were both effectually destroyed.

FALLOPIAN tubes, in anatomy, two ducts arising from the womb, one on each side of the fundus thereof, and thence extended to the ovaries; having a considerable share in the affair of conception.

They are called *tubæ*, *i. e.* trumpets, in respect of their form; for that in their rise, or opening into the womb, they are exceeding small, so as scarce to admit a knitting-needle, but in their progress towards the ovaries they grow much bigger, and at length are capable to receive the finger; from whence they contract again, and at the extremity next the ovaries, are expanded into a sort of foliage, which is fringed round with innumerable little fibres, bearing some resemblance to the mouth of a trumpet.

The *Fallopiæ* tubes are four or five inches long; they consist of a double membrane, derived from the outer and inner membranes of the uterus. The extremity next the ovary, at the time of impregnation, at which time the whole tube is expanded, reaches to, and embraces the ovary; though at other times it meets to fall a little short of it, and is only slightly tied by the fringe to the under-side of the ovary.

The use of the tubes, is to convey the seed, or rather ova of women, and other animals, from the testicles or ovaries, i. e. to the uterus or womb. See **OVARY** and **UTERUS**.

Their inner substance is composed, in good measure, of ramifications of veins and arteries, which form a kind of reticular or cavernous body, not unlike that of the clitoris. This structure makes them capable of dilatation, and contraction, according to the quantity and stop of the blood; and consequently, of being, as it were, erected, *in coitu*, and of embracing the ovary at that time, which in their state of flaccidity they did not. See **GENERATION**.

They

They take their denomination, *Fallopiian*, from Gabriel Fallopius, a Modenese, who died in 1562, and who is commonly reputed their first observer of them; though we find them described long before him in Rufus of Ephesus.

The ova or embryos, are sometimes detained in the *tuba Fallopiiana*, and cannot make their way into the womb. Instances of this kind have been frequently met with in dissections. One of the most remarkable, is that related by Abraham Cyprianus, a celebrated physician of Amsterdam, in a letter, addressed to Sir Tho. Millington, wherein he describes the manner in which he drew a foetus, twenty one months old, out of the tuba of a woman, who lived and had several children after the operation. See *Tab. Anat.* (Myol.) fig. 9. *ec.* and fig. 11. *ec.*

FALLOW, a colour of a palish red, like that of a brick half burnt: as a *Fallow deer*, &c.

FALLOW field, or *Fallow ground*, is land laid up, or that has lain untill for a considerable time.

To **FALLOW**, is to prepare land by plowing, long before it be plowed for seed. To do this twice, is to *twifallow*, and thrice, to *trifallow*.

FALSE arms, in heraldry, are those wherein the fundamental rules of the art are not observed: as if metal be put on metal, or colour on colour. See **ARMS**.

FALSE attack, in war, a feigned attack, intended to draw all the enemy's force to one side, in order to favour a real attack, intended in another part. See **ATTACK**.

FALSE birth. See the Article **ABORTION**.

FALSE brigs, in fortification. See **FAUSSEBRAYE**.

FALSE claim, in the forest laws, is where a man claims more than his due, and is amerced or punished for the same.

FALSE conception. See **CONCEPTION**.

FALSE diamond, a diamond counterfeited with glass.

FALSE flower, a flower which does not seem to produce any fruit, as those of the hazel, mulberry-tree, &c.

A flower of this kind does not arise from any embryo, and does not knit; such are the male flowers of the melon, cucumber, &c. See **FLOWER**.

FALSE imprisonment, is a trespass committed against a man, by imprisoning him without lawful causes.

It is also used for the writ brought upon this trespass.

FALSE keel, in a ship, is a second keel, which is sometimes put under the first, to make the vessel deeper. See *Tab. Ship.* fig. 2. n. 54 and n. 118. See also the article **KEEL**.

FALSE money. See the article **MONEY**.

FALSE muster, is when such men pass in review, as are not actually listed as soldiers. See **FAGGOT**, &c.

FALSE, or *falsa positio*, in arithmetic. See **POSITION**.

FALSE prophecies. See **PROPHECIES**.

FALSE ribs. See *spurious RIBS*.

FALSE roof of a house, is that part between the upper rooms and the covering.

FALSE weights, &c. See **WEIGHT**, &c.

FALSEHOOD, *FALSITY*, in philosophy, an act of the understanding, representing a thing otherwise than it is, as to its accidents — Or a false enunciation, or judgment of any thing: as if a person should judge that the king of Spain is in America. The circumstance, as to its accidents, is of absolute necessity in the definition, inasmuch as a thing cannot be represented otherwise than it is to essentials; for in such case the essence of the thing would not be represented: and since the essence is the thing itself, it would not be that thing which is represented, but another.

There is no *Falsehood* in apprehension or sensation; our ideas of sense are all just and true so far as they go, and all our deductions arise from our reasonings and conclusions from them.

Crimes FALSE, in the civil law, is a fraudulent subornation or concealment, with design to darken or hide the truth, and make things appear otherwise than they are.

The *crimen Falsi* is committed three ways. By words, as when a witness swears falsely. By writing, as when a man frames or alters something, antedates a contract, or the like. And by deed, as when he sells by false weights and measures, debases the coin, &c.

FALSO judicio, a writ, which lies for false judgment, given in the county-court, court-baron, or other court, not of record.

FALSO retorno brevium, a writ, which lies against the sheriff, who has execution of process, for making false returns of writs.

FALX, in anatomy, a part of the dura mater, defending between the two hemispheres of the brain, and separating the fore-part from the hinder.

It is called *Falk*, i. e. *sickle*, by reason of its curvature, occasioned by the convexity of the brain. It divides the brain as low as the corpus callosum.

FAMES canina, by the Greeks called *Cynodes Orexis*, *g. d.* dog-appetite, is such an insatiable hunger, as is not to be satisfied with eating, but continues even when the stomach is full. This is a case much talked of by the ancients, and sometimes met with amongst us. It may be supposed to arise from sharp fretting juices in the stomach, which by their continual vellications excite a sense like that of hunger.

FAMILIA, FAMILY, commonly implies all the servants belonging to a particular master.

In another sense, *Family* is taken for a portion of land, viz. so much as is sufficient to maintain one *Family*.

The term *hide*, is by our writers sometimes rendered a *meise*, sometimes a *Family*, and sometimes *carucata*, or plough-land; containing as much as one plough and oxen could cultivate in a year. See **HIDE**.

FAMILY of curves, is a class of curves of different orders of kinds; all which are defined by the same indeterminate equation, but in a different manner, according to their different orders.

Suppose, e. gr. the indeterminate equation, $a^m - 1x = y^m$, If $m=2$, $ax=y^2$. If $m=3$, $a^3x=y^3$. If $m=4$, $a^4x=y^4$, &c. in *infinitum*. All which curves are said to be of the same *Family*. See **CURVE**.

FAN, a machine used to raise wind, and cool the air by agitating it.

The custom which now prevails among the ladies, of wearing *Fans*, was borrowed from the East, where the hot climate renders the use of *Fans* and umbrellas almost indispensable. It is not long since the European women first began to use a kind of *Fans* made of leather, in the summer-time; but they are now found of necessity even in winter.

In the East they chiefly use large *Fans*, made of feathers, to keep off the sun and the flies. In Italy and Spain they have a huge sort of square *Fans*, suspended in the middle of their apartments, and particularly over the tables: these, by a motion at first given them, and which they retain a long time, by reason of their perpendicular suspension, help to cool the air, and drive off flies.

In the Greek church, a *Fan* is put into the hands of the deacons in the ceremony of their ordination, in allusion to a part of the deacon's office in that church, which is to keep the flies off the priests during the celebration of the sacrament. —

Wicqufort, in his translation of the embassy of Garcias de Figueira, gives the name *Fans* to a kind of chimneys or ventiducts in use among the Persians, to furnish air, and wind, into their houses; without which the heats would be insupportable. See the description thereof in that author, p. 38.

At present what is called a *Fan* amongst us, and throughout the chief part of Europe, is a thin skin, or piece of paper, taffaty, or other light stuff, cut semicircularly, and mounted on several little sticks of wood, ivory, tortoise-shell, or the like. *Fans* are either made with a double or single paper.

If the paper be single, the sticks of the mounting are pasted on the least ornamental side; if double, the sticks, are placed betwixt them. Before they proceed to place the sticks, which they call *mounting the Fan*, the paper is to be plaited in such manner, as that the plaits may be alternately inward and outward.

It is in the middle of each plait, which is usually about half an inch broad, that the sticks are to be pasted; and these again are to be all joined and riveted together at the other end: they are very thin, and scarce exceed one third of an inch in breadth; and where they are pasted to the paper, are still narrower, continuing thus to the extremity of the paper. The two outer ones are bigger and stronger than the others. The number of sticks rarely exceeds twenty-two. The sticks are usually provided by the cabinet-makers or toy-men; the *Fan*-painters plait the papers, paint, and mount them. —

The common painting is either in colours or gold leaf, applied on a silvered ground, both prepared by the gold-beaters. Sometimes they paint on a gold ground, but it is rarely; true gold being too dear, and false too paltry. To apply the silver leaves on the paper, they use a composition, which they pretend is a great secret, but which appears to be no other than gum arabic, sugar-candy, and a little honey melted in common water, and mixed with a little brandy. This composition is laid on with a sponge; then laying the silver leaves thereon, and pressing them gently down with a linen ball stuffed with cotton, they catch hold, and grow together. When instead of silver, gold ground is laid, the same method is observed.

The ground being well dried, a number of the papers are well beaten together on a block, and by this means the silver, or gold get a lustre, as if they had been burnished.

FANATICK, a wild, extravagant, visionary, enthusiastic person; who pretends to revelation and inspiration, and believes himself possessed with a divine spirit.

Such were the Anabaptists, Quakers, &c. at their first rise, and such are still the modern prophets, Muggletonians, &c.

Weigelius and Behmen, were the leaders of the *Fanatics* of Germany, and both came out of the school of Paracelsus. Weigelius is held the father of the Rosycrucians.

The word is formed of the Latin *fanum*, a heathen temple; for which reason the Christians called all the Gentiles *Fanaticks*. And accordingly, the antient chronicles of France call Clovis, *Fanatic* and pagan. But the word is yet of higher original. Among the heathens themselves, there were a sort of prophetic priests, called *Fanatici*; from whom the denomination since passed

paid to all the rest. They had their name from the Latin *fanon*, temple, by reason they lived altogether in temples. Struv. *Antiq. Rom. Synt.* c. 6. p. 312.

Of this kind, particularly, were the priests of Isis, of the mother of the gods, of Bellona, and some others, who were called *Fanatici*. In Gruter, p. 312. n. vii. we have an inscription, wherein one L. Cornelius Januarius, is called *Fanaticus* AB ISIS. SERAPIS. ARAEDEM BELLONE. And p. 654. n. vii. *Fanaticus de ade Bellonae*.

What might give occasion to the appellation of *Fanaticus*, was, that they performed their sacrifices in a wild, enthusiastical manner. —

FANATIO, in our ancient customs, the fawning time, or fence-month in forests. See **FENCE**.

FANCY, see **PHANTASY**, and **IMAGINATION**.

FANTASTICAL colours, are the same with those called *emphatical colours*. See **EMPHATICAL colours**.

FAPESMO, in logic, one of the moods of syllogisms.

A syllogism in *Fapesmo*, has its first proposition an universal affirmative, the second an universal negative, and the third a particular negative.

FAQUIR. See the article **FAKIR**.

FARCE*, was originally a droll, petty shew, or entertainment, exhibited by charlatans, and their buffoons, in the open street, to gather the croud together.

* The word is French, and signifies literally, force-meat or stuffing. It was applied on this occasion, no doubt, on account of the variety of jests, gibes, tricks, &c. wherewith the entertainment was interlarded. Some authors derive *Farce* from the Latin *facere*; others from the Celtic *farce*, mockery; others from the Latin *farcire*, to stuff.

At present, *Farce* is of a little more dignity. It is removed from the street to the theatre; and instead of being performed by jack-puddings, to amuse the rabble, is now acted by our comedians, and become the entertainment of the poliest audiences.

The poets have reformed the wildness of the primitive *Farces*; and brought them to the taste and manner of comedy. The difference between the two on our stage, is, that the latter keeps to nature and probability; and, in order to that, is confined to certain laws, unities, &c. prescribed by the ancient critics.

The former disallows of all laws, or rather sets them all aside on occasion. Its end is purely to please, or to make merry; and it sticks at nothing, which may contribute thereto, however wild and extravagant. Hence the dialogue is usually low, the persons of inferior rank, and the fable or action, trivial or ridiculous; and nature, and truth are every where heightened and exaggerated, to afford the more palpable ridicule.

FARCIN*, **FARCY** or **FASHIONS**, a disease in horses, and sometimes in oxen, &c. somewhat of the nature of a scabies, or mange.

* *Fescer* derives the word from *varices*, by changing the *v* into a digamma or *f*.

The *Farcin* is infectious, and spreads like a true plague. Vegetius calls it *morbus farciniosus*. It consists in a corruption of the blood, which shews itself in eruptions of hard pustules, knots, or strings along the veins, and in ulcers, which are not cured without great difficulty, by running hot irons into them. — There is a *spreading Farcin*, which diffuses itself over the whole body; an *inner Farcy*; a *stringed Farcy*, &c.

The *Farcy* is ordinarily occasioned by over-heats and colds, sometimes by spur-galling with rusty spurs, snaffle-bit, or the like; or by the bite of another horse, infected with it; or if in the leg, by cutting, or interfering.

The *Water-Farcin* proceeds from a horse's feeding on low watery grounds, and in pits or holes, where the grass grows above the water; for the horse, in picking out the grass, licks up the water, which occasions him to swell under the belly or chaps. The best cure is by a red-hot iron.

FARDEL of land, is, according to some authors, the fourth, according to Noy, only the eighth part of a yard-land. See **YARD-LAND**.

FARDING-Deal, or **FARDING-LAND**, in our ancient customs, signifies the fourth part of an acre, now called a rood. In the register of writs, we have also *denariata*, *obolata*, *solidata*, and *librata terra**, which must probably rise in proportion of quantity from the *Farding-deal*, as an half-penny, penny, shilling, and pound rise in value; on which footing *obolata* must be half an acre; *denariata*, an acre; *solidata*, twelve acres; and *librata*, twelve score acres.

* Yet we find, *viginta librata terre, vel redditus. Reg. fol. 94. a.* and *284. b.* where *librata terra* should seem to be as much as yields *xxs. per annum*; and *centum solidatas terrarum tenementorum & reddituum, fol. 249. a.* Others hold *obolata* to be but half a perch; and *denariata*, a perch.

FARE, a voyage or passage, or the money paid for passing by water, &c.

For the *Fares* of hackney coachmen, watermen, &c. see **COACHMAN**, &c.

FARINA*, the flower or powder of some sort of grain, or pulvis ground, and sifted from the bran.

* The word is pure Latin, *farina*, formed of *far*, corn, wheat; and *far*, according to Guichard, comes from the Hebrew **באר**, signifying the same thing.

FARINA fecundans, among naturalists, is a fine dust prepared in the male flowers, or the male parts of flowers of plants; which being afterwards shed on the female, does the office of a sperm or semen, by impregnating the same.

The *Farina fecundans*, called also the *male-dust*, and *male-seed*, is formed and secreted in the apices or tops of the stamina; where, when it becomes mature, and copious enough, bursting its capsula, it is split on the head of the pistil, and thence conveyed to the matrix, or utericle thereof, to fecundify the ova, or female seed contained therein.

This dust, in any one plant, being viewed with a microscope, every particle thereof appears of the same size, and figure; but in different plants, the figure, size, colour, &c. of the dust are very different. Some *Farinae* are clear and transparent as crystal; as those of the maple, borrague, and hemlock; others are white and opaque, as those of henbane, and balsamins; others blue, as those of flax; others purple, as of some tulips; others flesh-coloured, as in some species of lychinis; and others red, as those of the geum.

It may be observed, however, that the colour of the *Farina* varies in the same species, according to the colour of the flower; and even sometimes the *Farina* of the same flower is of different colours, as is easily observed in the caryophyllus arvensis.

The figures of the divers kinds of *Farinae* are much harder to describe. The most general figure is the oval, more or less sharp at the ends, with one or more channels or furrows running length-wise; so that through the microscope they look not unlike the stone of a date, a grain of wheat, a coffee berry, or an olive: Such are those of the polygonatum, bugles, briony, titimal, &c. Those of the mellilot are cylinders; those of the pansley, are prisms with four irregular sides; those of the great consolida, represent two crystal globules closely fastened to each other; those of the fycamore, represent two cylinders placed across; those of the jonquille, are in form of a kidney; those of the campanule, passion-flower, &c. are nearly round, but unequal in their surfaces; those of caryophyllus sylvestris are round, and cut in facets; those of the geranium, and some other species, are round, with a kind of umbilicus, or indentation, as in an apple; Bradley says they are perforated quite through, like the bead of a necklace, which we doubt; those of the caltha, corona folis, &c. are little globes, set with prickles, &c.

Of these *Farinae*, some are very hard, others soft and easily broke. They all contain a great deal of sulphurous matter, more than the other parts; whence they are very odorous. Those of the lily are so full of oil, that they grease the paper they are put in, as if it had been oiled. The *Farina* of most aromatic plants swim in an essential oil, or sort of liquid turpentine; others are involved in a dry resin, as those of the lycopodium, or mulcus terrestris clavatus. Others, as those of fumitory, are inclosed in a little, viscid, musilaginous matter; and all, in effect, have something so glutinous, that they stick to any thing that touches them, so that it is difficult to separate the grains from each other.

Some have imagined, that these *Farinae* were only particles of wax or resin; but the contrary is easily proved; for they neither dissolve in water, nor spirit, nor oils, even when assiled with fire.

Mr. Bradley supposes a magnetic virtue lodged in the *Farina fecundans*, or male dust; by means whereof, when deposited in the utericle of the female, it draws the nourishment from the other parts of the plant into the ova, or rudiments of the fruit, and makes them swell. The reality of this virtue, he argues from the same being found in wax, which is chiefly or wholly gathered hence by the bees.

Some, against the great use of the *Farina fecundans* in generation, may object, that in flowers which hang downwards, as the cyclamen, &c. the *Farina fecundans* cannot be cast on the orifice of the pistil. — To which it may be answered, that the pistils of such flowers, hanging lower than the dusty apices which surround them, the glutinous matter, and the velvet covering the extremity of the pistil, may be capable of receiving and retaining some of the *Farina* as it falls; and without any intromission of the *Farina*, its lodgment on the mouth of the pistil, may by virtue of its attractive power fecundify the seed in the uterus.

FARM, or **FERM**, **FIRMA**, in law, signifies a little country messuage, or district; containing house, and land, with other conveniences; hired, or taken by lease, either in writing, or by word, under a certain yearly rent.

This in divers parts is called diversly: In the north, it is a *Fack*; in Lancashire, a *Fermholt*; in Essex, a *Wike*, &c. In the corrupted Latin, *firma* signified a place inclosed, or shut in: whence, in some provinces, Menage observes, they call closerie, or clozure, what in others they call *Farm*.

Add

Add, that we find *locare ad firmam*, to signify to let to farm; probably on account of the sure hold the tenant here has in comparison of tenants at will.

Spelman, and Skinner, however, chuse to derive the word *Farm*, from the Saxon *Fearme*, or *Feorme*, that is, *viduus*, or provision; by reason the country-people and tenants antiently paid their rents in victuals, and other necessaries; tho' this was afterwards converted into the payment of a sum of money. Whence a *Farm* was originally a place that furnished its owner or lord with provisions. And among the Normans, they still distinguish between *Farms* that pay in kind, i. e. provisions; and those which pay in money; calling the former simply *Ferme*, and the latter *blanche Ferme*, white *Ferm*.

Spelman shews, that the word *Firma* antiently signified not only what we now call a *Farm*, but also a feast, or entertainment, which the farmer gave the proprietor or landlord, for a certain number of days, and at a certain rate, in consideration of the lands, &c. he held of him.

Thus, *Fearn*, in the laws of king Canutus, is rendered by Mr. Lambard, *viduus*; and thus we read of *reddere firmam unius noctis*; and, *reddebat unam diem de firma*; which denote provision for a night, and day; the rents about the time of the conquest being all reserved in provisions: The custom whereof is said to have been first altered under Henry I.

We also say, to farm duties, imposts, &c. The duty of excise in Scotland was farmed, or let to farm, for 33500 l. per annum.

FARREATION, **FARREATIO**, in antiquity, the same with *confarreatio*. See **CONFARREATION**.

FARRIER, a person, whose office is to shoe horses, and cure them when diseased, or lame.

FARTHING, a small English copper coin, amounting to one fourth of a penny.

It was antiently called *Fourthing*; as being a fourth of the integer, or penny.

FASCE, *Fascia*, in heraldry. See the article **FESSE**.

FASCES, in antiquity, axes tied up together with rods, or slaves, and bore before the Roman magistrates, as a badge of their office, and authority.

Florus, l. i. c. 5. assures us, that the use of *Fasces* was introduced by the elder Tarquin, the fifth king of Rome; and that they were then the mark of the sovereign dignity. In after times, they were bore before the consuls, but by turns only, each his day; *ne si ambo fasces haberent duplicatus terror videretur*. Livy, l. ii. c. 1. They had each of them twelve, bore by so many ushers, called *Lictors*. See **LICTOR**. Dionys. Halicarn. l. iii. c. 84.

Others will have Romulus the author of the institution, and ascribe the number twelve, to the number of birds, which foretold him his kingdom. Others hold, that he borrowed it from the Hetrurians; and that the number twelve answered to the twelve nations of Hetruria, who in creating him king, gave him each an officer, to serve him as *Lictor*. Silius Italicus ascribes their first invention to a city of Hetruria called Vetulonia.

These *Fasces* consisted of branches of elm; in the middle whereof was a securis, or ax, the head whereof stood out beyond the rest. Plutarch relates the reasons of this disposition. Publicola took the ax out of the *Fasces*, as Plutarch assures us, to remove from the people all occasion of terror. After the consuls, the praetors assumed the *Fasces*. Censorin. *De die natali*. observes, that the praetors had only two; though Polybius and Plutarch give them six.

In the government of the Decemviri, it was the practice, at first, for only one of them to have the *Fasces*. Afterwards, each of them had twelve, in the same manner as the kings.

FASCIA, in architecture, by the workmen called **FACTIA**, **FACTIO**, or **FACE**, a broad list, fillet, or band; particularly used in architraves, and pedestals.

The architrave consists of three *Fasciae*, or bands; thus called by Vitruvius, as resembling swaths, called in Latin *Fasciae*.

That author admits no *Fasciae* in the Tuscan and Doric architrave, i. e. he makes it all plain, without any division, or cantoning into parts or *Fasciae*: But the modern architects take the liberty to differ from him herein. See *Tab. Archit.* fig. 28. lit. N.

In brick-buildings, the juttings out of the bricks, beyond the windows, in the several stories, except the highest, are called *Fasciae*; or *Fasciae*.

These are sometimes plain, and sometimes moulded; but the moulding is only a *cima reversa*, or an O G, at the bottom, with two plain courses of bricks over it; then an astragal; and lastly a boudine.

FASCIA lata, in anatomy, a muscle of the leg; called also *membranosus*. See **MEMBRANOSUS**.

FASCIAE, in astronomy, two rows of bright spots, observed on Jupiter's body; appearing like swaths, or belts.

The *Fasciae*, or belts of Jupiter, are more lucid than the rest of his disk, and are terminated by parallel lines. They are sometimes broader, and sometimes narrower; nor do they always possess the same part of the disk.

M. Huygens, likewise, observed a very large kind of *Fascia* in Mars; but it was darker than the rest of the disk, and took up the middle part thereof.

FASCIALIS, in anatomy, a muscle of the leg; called also *sartorius*. See **SARTORIUS**.

FASCICULUS, in medicine, a term sometimes used to express a certain quantity, or measure of herbs.

By *Fasciculus* is meant so much, as may be held in the arm when bent, and rested on the top of the hip. Physicians note it in prescription by *Fasc.*

FASCINATION*, **FASCINATIO**, denotes a sort of witchcraft, supposed to operate by the influence either of the eye, or the tongue. See **WITCHCRAFT**.

* The word is Latin, formed from the Greek *βασανισμός*, which signifies the same.

Antient writers distinguish two sorts of *Fascination*; one performed by lookings, or the efficacy of the eye. Such is that spoke of by Virgil, in his third eclogue:

Nescia, quis teneros oculus mihi fascinat agnos.

The second by words, and especially malignant praises: Such is that mentioned by the same poet, in his seventh eclogue:

Aut si ultra placitum laudarit baccare frontem

Cingite, ne vati noceat mala lingua futuro.

Horace touches on both kinds in his first book of epistles:

Non istis oblique oculo mea commoda quisquam

Limat, non odio obscuro, morisque venenat.

FASCINES, in fortification, *Faggots*; small branches of trees, or bawins, bound up in bundles, which being mixed with earth, serve to fill up ditches, to screen the men, make the parapets of trenches, &c. See *Tab. Fortif.* fig. 24.

Some of them are dipped in melted pitch or tar; and being set on fire, serve to burn the enemy's lodgments, or other works.

A pitched *Fascine* is a foot and a half about: a *Fascine* for defence, two or three foot.

In the corrupt Latin, they use *Fascenina*, *Fascennia*, and *Fascinata*, to signify the pales, *Fascines*, &c. used to enclose the antient castles, &c.

FASHION*.

* The word is French, *façon*, which signifies making.

FASHION is particularly used among artificers, for the trouble, time, and labour, employed in a piece of work; particularly any silver, or gold utensil, instrument, toy, or the like.

It is by the *Fashion*, that the workmens wages, or salary is regulated. We paid so much a-piece for the *Fashion* of these spoons, exclusive of the matter, or silver. That weaver has so much a-piece for the *Fashion* of the stuffs we give him to weave.

FASHION-Pieces, in the sea-language, two pieces of timber which form the breadth of a ship, at the stern; and are the outmost timbers of the stern, on each side, except aloft, where the counters are. See **STERN**.

FAST, a space of time, wherein a person takes little, or no food.

The advantages of *Fasting*, with regard to health, with extraordinary instances of long *Fasting*, see under the article **ABSTINENCE**.

The Bramins never bleed their sick, but make them *fast* in lieu thereof.

FAST, is peculiarly used for an abstinence on account of religion; or a space of time, wherein the church prohibits the use of food; or at least restrains it to certain kinds, and to certain hours.

The strict, canonical *Fast* only allows of one meal in twenty-four hours. F. Thomassin observes, that the antient *Fast* was, to sup, without dining, i. e. only to take one meal, and that not till after noon: Adding, that to dine, though without supping, was a breach of the *Fast*. The practice of the Latin church, was to *fast* thirty-six days in the year; which is, as it were, the tithe of the year.

Tertullian wrote an express treatise *de jejuniis*, of *Fasts*; to support the new laws of *Fasting*, which the Montanists were for imposing.

The antient catholics allowed of no obligatory or commanded *Fasts*, beside that preceding Easter, since called *Lent*; the terms of which were to forbear eating till the evening.

The other *Fasts* observed were only of devotion: Such were the fourth and sixth *Feriae*, i. e. Wednesdays, and Fridays.

This *Lent Fast* was called *Station*. Besides these there were occasional *Fasts*, enjoined by the bishops, &c.

In the book of Hermas, called the *Pastor*, the angel tells him, the day thou *fastest*, thou shalt take nothing but bread and water; and having computed the usual expenses of each day, thou shalt lay aside so much for the widow, the orphan, or the poor.

In the same passage, the *Fast* is called *Station*, and the person who *fasted*, is enjoined to begin early in the morning to retire to prayer.

St. Fructuosus, Fleury tells us, going to suffer, some people, out of a principle of charity, offered him drink, to support him; but he refused it, saying, It is not yet time to break *Fast*; for it was but ten in the morning, and it was Friday.

Station-

Station-day. Which shews the exactness of the primitive christians, in this point; and that drinking was held breaking of *Fasti*. Some introduced the xerophagy into *Fasti*; that is, the use of dried fruits for their meals; and made a practice of abstaining not only from all meats, and wines, but also from succulent fruits, for the whole twenty-four hours: and some reduced themselves to bread and water. But this was more than was commanded.

The practice of *Fasting* is more antient than christianity. The Israelites *fasted* often, and had their stated *fast-days*. The day of atonement, which they called *Kipparim*, was a day of *fasting*, enjoined in *Levit. xxiii. 27, &c.* Some will have this the day St. Paul refers to in *Act. xxvii. 9.* The Jews had likewise *Fasti*, instituted by precept of the synagogue: such were those of the fourth, fifth, and tenth of the month, mentioned by *Zechariah, vii. 3. and viii. 19.*

The heathens adopted the same custom, in all probability, from the people of God; though their religion inclined them more to feasting, than to *fasting*; as appears from the long list of *feasts*, enumerated under the article *FEAST*.

Yet they *fasted* in the Eleufinia; as appears from Arnobius, and Clemens Alexand. See Salmafius, p. 150. and Scaliger, *Poetic. l. i. c. 32.*

The *Fasti* of the Calogeri are so severe, that they remain seven days without eating at all. For the *Fasti* of the Greeks, see Spon. *Voyag. p. ii.*

The Turks are so scrupulous on the point of *fasting*, that they will not at those times so much as take the smell of any perfume, by the nose. They hold that odors themselves break *Fast*. If they bathe, it is forbid to put the head under water, for fear of swallowing any of it: and as for women, they are forbid to bathe at all on *Fast-days*, for a reason peculiar to the sex.

FASTERMANS, or **FASTING-MEN**, *q. d. homines habentes*, was used in our antient customs, for men of repute, and substance; or rather for pledges, sureties, or bonds-men, who, according to the Saxon polity, were *fast* bound to answer for one another's peaceable behaviour.

FASTI, in antiquity, the Roman calendar; wherein the several days of the year, with their feasts, games, and other ceremonies, were expressed. See *CALENDAR*.

The Romans had their *greater*, and *lesser Fasti*.—The *greater Fasti* were called, the *Fasti* of the magistrates; and the *lesser*, the *Fasti calendares*.

The *Fasti calendares*, which were, what was properly, and primarily called *Fasti*, are defined by Festus Pompeius to be books containing a description of the whole year; *i. e.* ephemerides, or diaries, distinguishing the several kinds of days, *Festi*, *Profesti*; *Fasti*, *Nefasti*, &c. See *FESTI*, &c. The author hereof was Numa, who committed the care and direction of the *Fasti* to the Pontifex Maximus; whom the people used to go and consult on every occasion. This custom held till the year of Rome 550. when C. Flavius, secretary of the pontifices, exposed in the forum a list of all the days, whereon it was lawful to work; which was so acceptable to the people, that they made him Curule Ædile. *Liv. l. ix. c. 46.*

These *lesser Fasti*, or *Fasti calendares*, were of two kinds: *urbani*, and *rustici*.—The *Fasti urbani*, or *Fasti* of the city, those, which obtained, or were observed in the city. Some will have them thus called, by reason they were exposed publicly in divers parts of the city; though by the divers inscriptions, or gravings thereof on antique stones, one would imagine, that private persons had them likewise in their houses. It was these *Fasti urbani* Ovid undertook to illustrate, and comment on, in his *Libri Fastorum*; whereof we have the six first books still remaining; the six last, if ever they were wrote, being lost. Beside Ovid, several other authors had undertaken the same subject, particularly L. Cincius Alimentatus, Fulvius Nobilior, Mafurius Sabinus, Cornelius Labeo, C. Licinianus, and Nisus: Of all whom Macrobius makes mention, in his *Saturn*, and preserves fragments of each; beside a work of one Bæbius Marcus, entitled, *De Fastis diebus*, quoted by Fulgentius, *De prisca sermone*.

In the *greater Fasti*, or *Fasti* of the magistrates, were expressed the several feasts, with every thing relating to the gods, religion, and the magistrates; the emperors, their birth-days, offices, days consecrated to them; and feasts, and ceremonies established in their honour, or for their prosperity, &c.

With a number of such circumstances, did flattery, at length, swell the *Fasti*! whence they became denominated *magni*, to distinguish them from the bare calendar, or *Fasti calendares*.

In the *Fasti rustici*, or country *Fasti*, were expressed, the several days, feasts, &c. to be observed by the country people; for as these were taken up in tilling the grounds, fewer feasts, sacrifices, ceremonies, and holidays were enjoined them, than the inhabitants of cities: and they had also some peculiar ones, not observed at Rome.

Those rustic *Fasti* contained little more than the ceremonies of the calends, nones, and ides; the fairs, signs of the zodiac, increase and decrease of the days; the tutelary

gods of each month, and certain directions for rural work; to be performed each month.

FASTI, was also a chronicle, or register of time, wherein the several years were denoted by the respective consuls, with the principal events that happened during their consulates: these were called also *Fasti consulares*, or *consular Fasti*.

Onuphrius Panvinus, Pighius, and Janfen d'Almeooven, have given us the *Fasti consulares*; the two first, with long, and learned comments, wherein are expressed, not only the consuls, but also the dictators, magistris equitum, triumphs, and ovations. Pighius even adds as many of the other officers, as he could find, *viz.* prætors, tribunes, &c. D'Almeooven confines himself to the consuls alone.

FASTI, is still applied to the archives, and public records, wherein are kept historical memoirs of public, and remarkable things befallen a people.

In the like sense, the martyrology is called the sacred *Fasti* of the church.

The jesuit Du Londel has compiled the *Fasti* of Louis le Grand, &c.

FASTI, or *dies Fasti*, also denoted court-days. See *DAY*.

The word *Fasti*, *fastorum*, is formed of the verb *fari*, to speak; by reason, during those days the courts were open, causes might be heard, and the prætor was allowed *fari*, to pronounce the three words, *do, dico, addico*: the other days, wherein this was prohibited, were called *Ne-fasti*. Thus Ovid:

*Ille Nefastus erit per quem tria verba silentur,
Fastus erit per quem lege licetis agi.*

These *dies Fasti* were noted in the calendar, by the letter *F*. But observe, that there were some days, *ex parte Fasti*, partly *Fasti*, partly *Nefasti*, *i. e.* justice might be distributed at certain seasons of the day; and at others not. These days were called *interfici*. They were marked in the calendar thus, *F. P. fastus primo*, where justice might be demanded during the first part of that day.

FASTIDIUM cibi. See the article *NAUSEA*.

FASTIGIUM, in architecture, the same with pediment. See *PEDIMENT*.

FAT, in an animal body, a white, oily, sulphurous substance, collected in little membranous loculi, or cells, in divers parts of the body; serving to keep the parts warm, and to soften and temper the sharp salts in the mass of blood.

Physicians distinguish two kinds of *Fat*; the first, called in Latin *pinguedo*, and in English, absolutely, and by way of eminence, *Fat*, is a soft, lax, whitish, or rather yellowish, oily matter, which is easily melted; found immediately under the cutis, inclosed in little bags, called *cellulæ adiposæ*, adhering to the outer surface of a membrane, called *adiposa*, all over the body, except on the forehead, eye-lids, penis, and scrotum.

This *Fat* is nothing but the oily part of the aliment, or chyle, separated from the arterial blood, by the adipose glands, and carried by peculiar ducts to the membranous cells; whence it is transmitted again to the blood by the veins. Dr. Grew takes it to be a coagulum of the oily parts of the blood, made, either by some of its own saline parts, or by the nitrous particles of the air mingled therewith in the lungs; which sentiment is confirmed by an experiment of that learned person, who made an artificial *Fat*, by only mixing oil of olives with spirit of nitre for some days.—And hence it is, that divers animals, as rabbits, hares, &c. grow *fat* in winter, and particularly in severe frosty weather; the air then abounding most in nitre. Hence also it is, that the *Fat* of land-animals is much firmer than that of fishes; the watery element containing less nitrous matter than the air.

In some subjects the cellulæ are so full and distended, that the *Fat* is above an inch thick; in others they are almost flat; and in emaciated subjects, instead of *Fat*, we find a sort of flaccid transparent substance; which is nothing but the bare membrane; the cells being all exhausted.

A second kind of *FAT*, called *adepe*, *sebum*, *sebum*, and sometimes *axungia*, is whiter, harder, more brittle, and less easy to liquify than the former; being found in the cavities of the abdomen, omentum, &c.

The *Fat* of both kinds serves as a natural balsam, to preserve the body; and by mixing with, and enveloping the salts wherewith the blood and serum are highly saturated, it keeps them from fretting and corroding the parts of the body through which they pass.

It is thought likewise, and not without probability, to make a considerable part of the nourishment of our bodies; whence, the *fattish* persons, falling into an atrophy, gradually lose all their *Fat*, which is always quiet expended in such cases, before the discase becomes fatal.

Too much *Fat* is usually attended with heaviness, and drowsiness, not only from the unwieldiness of an overgrown body, nor from the stuffing of the cavities and thorax alone, which sometimes obstructs the expansion of the diaphragm and lungs, and produces a dyspnœa, or an orthopnœa; but it is likewise probable, that the abundance of *fatty*, or oily particles

ticles, returned into the blood, and implicating the more subtle and active parts, may hinder the necessary secretions in the brain.

The *Fat* of animals, for the generality, is not reckoned good food; as being hard of digestion, and producing a thick, viscid chyle. But it is of good use in medicine.

Cabers Fat is used in pomatums, and unguents; being resolute, and emollient. — That of *hogs* and *bears*, has the same qualities, and is strengthening besides. — *Deers grease* is accounted good to fortify the nerves against the rheumatism, sciatica, gout, and fractures. — *Hares grease*, applied externally, promotes digestion, and a supuration of abscesses. — That of *rabbits*, is nervous and resolute. — That of *cats*, and *bens*, resolves and softens indurations. — That of *gerse* has the same qualities; and likewise abateth hemorrhoids, allays pains in the ear, being applied within the same; and opens the belly, being taken inwardly. — *Eels fat*, is esteemed good against the hemorrhoids and deafness; to take away pits of the small-pox, and to make the hair grow. — That of the *trout*, beside its being emollient, is said to be good in diseases of the anus, and in ulcers of the breast.

FAT, in the sea language, denotes the same with *broad*.

Thus, if the trusting in, or tuck of a ship's quarter under water be deep, they say, she hath a *fat* quarter.

FAT, see the article *VAT*.

FAT, or *vot*, also expresses a large wooden vessel, which among brewers and maltsters is used to measure malt for expedition; containing a quarter, or eight bushels. See *MALT*.

FAT is likewise a vessel, or pan of lead, used in the making salt, &c. See *SALT*.

FATE, *FATUM*, in a general sense, denotes an inevitable necessity, depending on some superior cause.

Fate is a term much used among the ancient philosophers. It is formed a *fando*, from speaking; and primarily implies the same with *effatum*, viz. a word, or decree, pronounced by God; or a fixed sentence, whereby the Deity has prescribed the order of things, and allotted every person, what shall befall him.

The Greeks call it, *αἰσχροτυχή*, *quasi æquus, nexus*, a chain, or necessary series of things, indissolubly linked together; and the moderns, *providente*.

But, beside this sense of the word, wherein it is used, sometimes to denote the connection of causes in nature, and sometimes in the divine appointment; the word *Fate* has a further intention, being used to express, I know not what necessity, or eternal designation of things, whereby all agents, both necessary and voluntary, are swayed, and directed to their ends. See *NECESSITY*.

Some authors divide *Fate* into *Astrological* and *Stoical*.

Astrological Fate, denotes a necessity of things and events, arising, as is supposed, from the influence and positions of the heavenly bodies, which give law, both to the elements, and mixed bodies, and to the wills of men.

In which sense the word is often used by Manilius: *Certum est & inevitabile fatum: materisque datum est cogi, sed cogere fletis*.

Stoical Fate, or *Fatality*, is defined by Cicero, an order, or series of causes, wherein cause being linked to cause, each produces other; and thus all things flow from the one prime cause. Chrysippus defines it a natural invariable succession of all things *ab æterno*, each involving other.

To this *Fate* they subject the very gods. Thus the poet: The parent of all things made laws at the beginning, by which he not only binds other things, but himself. So Seneca: *Eadem necessitas & deos alligat. Irruocabilis divina pariter & humana cursus vobis. — Ipse ille omnium conditor & rector scripsit quidem Fata, sed sequitur: semel scriptis, semper parat*.

This eternal series of causes, the poets call *moegi*, and *parcæ*, or destinies.

Fate is divided, by some later authors, into *physical* and *divine*.

Physical Fate is an order and series of natural causes, appropriated to their effects.

This series is necessary; and the necessity is natural. The principle, or foundation of this *Fate*, is nature, or the power and manner of acting, which God originally gave to the several bodies, elements, mixts, &c. By this *Fate* it is, that fire warms; bodies communicate motion to each other; the sun and moon occasion the tides, &c. And the effects of this *Fate* are all the events and phenomena in the universe; except such as arise from the human will. See *NATURE*.

Divine Fate, is what we more usually call *providence*. See *PROVIDENCE*.

Plato, in his *Phædo*, includes both these in one definition; as intimating, that they were one and the same thing actively and passively considered: Thus, *Fatum est ratio quedam divina, lingue nature comit, que transiri nequeat, quippe a causa pendens, que superior sit quibusvis impedimentis*. Though that of *Bæthius* seems the clearer and more just: *Fatum*, says he, *est inæmens rebus mobilibus dispositio, per quam Providentia suis quæque vult ordinibus*.

FATHER, *Pater*, a term of relation, denoting a person who beget a child, either male or female.

VOL. I.

Among the ancient Romans, the *Fathers* of three children had very considerable privileges allowed them, as such. By the law of Romulus, a *Father* had an absolute and unlimited power over his children.

Adoptive FATHER, is he who takes the children of some other, and owns them as his own.

Putative FATHER, is he who is only the reputed, or supposed *Father*; Joseph was *putative Father* of our Saviour.

Natural FATHER, is he who has illegitimate children.

FATHER-in-law, is a person married to a woman, who has children by a former husband, &c.

FATHER, is also used in theology, for the first person in the Trinity.

God *the Father*, is the proper *Father* of Jesus Christ; with regard to men, he is called *heavenly Father*.

FATHER, is also used in a figurative sense, on divers moral and spiritual occasions. Thus, it is applied to the patriarchs; as we say, Adam was the *Father* of all mankind; Abraham the *Father* of the faithful, &c.

In an ecclesiastical sense, *FATHERS*, denote the ancient prelates and doctors of the church.

The *Fathers* assembled at the council of Nice: Chrysostom, St. Basil, &c. were Greek *Fathers*; and St. Augustin, St. Ambrose, &c. were Latin *Fathers*.

The *Fathers*, say Messieurs de Port Royal, are the proper interpreters of the gospel; and are only honoured with that sacred appellation, as their works are, in some measure, a patrimony or inheritance, left to the faithful, as their proper children.

Scaliger observes, that the *Fathers* were good people, but not learned ones. To which St. Evremont subjoins, that when a man comes to look nearly at the *Fathers*, he loses a great part of that veneration, which time and opinion had procured them: the great distance between them and us, makes them appear much greater than they really are.

The *Fathers*, says the same author, had more imagination and vivacity of mind, than judgment and good sense. They gave altogether into allegories, and affected the brilliant to an excess. Justness of mind was a thing they valued themselves the least on.

FATHER, is also a title of honour, given to prelates and dignitaries of the church. The right reverend *Father* in God, Isaac, lord bishop of, &c.

FATHER, is also applied to the superiors of convents, &c. See *ABBOT*. The *Father* general; *Father* provincial, exprovincial;

Father prior, subprior; *Father* definitor, in the order of Benedictines; *Father* guardian, in that of the Franciscans; *Father* corrector among the Minims, &c.

FATHERS, is also applied plurally to all congregations of ecclesiastics, whether regular, or secular. — As, the *Fathers* Cordeliers, Capuchins, Augustins, Jacobins, &c. The *Fathers* Jesuits, *Fathers* of the oratory, Barnabites, Theatins, of the mission, &c. See each under the proper article.

FATHERS, is also used for persons venerable for their age, or quality, or the services they have done the public.

Thus, at Rome, the senators were called *conscript Fathers*, *pætres conscripti*, &c.

FATHIMITES, or *FATHEMITES*, the descendants of Mahomet, by *Fathima*, or *Fathema*, his daughter.

The dynasty of *Fathimites*, that is, of princes descending in a direct line from Ali, and *Fathima* his wife, Mahomet's daughter, commenced in Africa, in the year of the Hegira, 296; of Jesus Christ, 908.

The *Fathimites* afterwards conquered Egypt, and established themselves therein, in quality of caliphs.

The *Fathimites* of Egypt ended in Abed, in the year of the Hegira, 567; 268 years after their first establishment in Africa, and 208 after the conquest of Egypt.

FATHOM, a long measure, containing six feet; taken from the utmost extent of both arms, when stretched into a right line.

The *Fathom* is used at sea, in estimating the lengths of cables, and other ship-ropes, with the depths and soundings of the sea: as also in mines, quarries, wells, and works of fortification.

There are three kinds of *Fathoms*, accommodated to the different ranks of vessels. The *first*, which is that of men of war, contains six feet; the *middle*, or that of merchant ships, five feet and a half; and the *small Fathom*, used in sluicets, fly-boats, and other fishing vessels, only five feet.

FATHOM is also used in several countries, particularly Italy, for the common yard, or ell, whereby things are ordinarily measured, in commerce.

In this sense it is more commonly called *brace*, or *braccio*, *q. d.* arm.

FATNESS, in medicine, *Corpulency*; or the state of a person too much loaded with flesh and fat.

FATUARI, in antiquity, were persons, who appearing in fire, foretold things to come.

The word is formed of *Fatua*, wife of the god Faunus, who was supposed to inspire women with the knowledge of futurity;

as Faunus himself did the men. — *Fatua* had her name from *fari*, *q. d. vaticinari*, to prophesy.

FATUUS *Ignis*. See **IGNIS** *Fatuns*.

FAUCON, or **FALCON**, a small piece of cannon, whose diameter is 2½ inches; weight, 750 pound; length, 7 feet; load, 2½ pound; shot, 2½ inches diameter; and 2½ pound weight. See **CANNON**.

FAUCONET, or **FALCONET**, a very small piece of ordnance, whose diameter at the bore is 2½ inches; weight, 400 pounds; length, 6 feet; load, 1½ pound; shot, something more than 2 inches diameter; and 1½ pound weight. See **ORDNANCE**.

FAVISSA*, among antiquaries, a hole, pit, or vault, under ground, wherein is kept something of great value.

* The word seems formed of *fovisse*, a diminutive of *fovea*, a pit or ditch.

The *Favissa*, according to A. Gellius, and Varro, was much the same with what the ancient Greeks and Romans called, *Synœcus**, *thesaurus*; and what in some of the modern churches is called *archives* and *treasury*.

In the capitol there were divers *Favissæ*. They were subterraneous places, walled and vaulted; having no entrance, or light, but by a hole a-top, which was usually stopped up with a huge stone.

They were chiefly destined for keeping the old, worn statues, and other ancient moveables, formerly used in the temple; so religiously did that people respect, and preserve whatever was consecrated. Catullus would have lowered the floor of the capitol, but that the *Favissæ* prevented him.

Festus, however, gives us a different account of the *Favissæ*. According to that author, they were wells, or pits of water, near the temples, and for the use thereof: the same with what the Greeks called *ἀναθήκη**, *navel*, as being round, &c. Gellius likewise gives them the name of cisterns, as well as Festus; but it is apparently for no other reason, than that they bore a resemblance thereto in figure.

In effect, the two notions are pretty easily reconciled: It being certain, that the treasures of some of the ancient Greek temples were the cisterns or reservoirs of water, wherein people used also to wash themselves, before they entered the temple.

FAUNALIA*, in antiquity, feasts celebrated by the Romans, in honour of the god Faunus.

* The deity *Faunus*, to whom the solemnity was devoted, and from whom it was denominated, was the same among the Romans, with the Pan of the Greeks.

The *Faunalia* were held on the day of the nones of December, i. e. on the fifth day of that month. The principal sacrifice was a roe-buck; or rather, according to Horace, a kid, attended with libations of wine, and burning of incense.

It was properly a country festival; being performed in the fields and villages with peculiar joy and devotion.

Horace gives us a very gay description thereof, in the xviiith ode of his 1st book.

— Tener plexu cadit lævis anna:
Larga nec disjunct Veneris socioli
Vina crateræ: vetus ara multo
Fumat odore.

Struvius, in his Roman calendar, marks the feast of Faunus on the day of the ides of February, which is the 13th day of that month; and the *Faunalia* he places on the 5th of the ides of December, or the 9th of that month. And in c. ix. he shews, that there really were two *Faunalia*; the one in February, mentioned by Ovid, *Fest.* l. vi. § 246; the other, on the 9th of December, mentioned by Horace, in the place just cited.

FAUNS, **FAUNI**, among the antients, were a species of demigods, inhabiting the forests; called also *Silvans*, *silvani*.

They were represented as half men, half goats; having the horns, ears, feet, and tail of a goat, a very flat nose, and the rest human.

The Roman *Faunus*, we have observed, was the same with the Greek Pan. Now, in the poets we find frequent mention of *Fauns* and *Panes* in the plural number; in all probability, therefore, the *Fauns* were the same with the *Panes*. See **PANES**.

The reason was, that there were several *Faunus*'s and *Panes*; though all descended from one principal one. Thus Ovid:

Aut quas semides Dryades, Faunisque bicornes
Numine contactas attonuere suo.

The Romans called them *Fauni*, *Ficarii*, and *Fauni ficarii*. The denomination *ficarii* was derived, not from the Latin *ficus*, *figs*, as some have imagined; but from *ficus*, *figs*, a sort of fleshy tumor or excrescence, growing on the eyelids, and other parts of the body; with which the *Fauns* were represented.

Though the *Fauns* were held for demi-gods; yet were they supposed to die, after a long life. Anobis shews, that their father, or chief, *Faunus* himself, only lived 120 years.

FAVOUR, in commerce, see the article **GRACE**.

FAUSSE-BRAYE, in fortification, an elevation of earth, two or three fathoms broad, round the foot of the rampart on the outside, defended by a parapet which parts it from the berme, and the edge of the ditch: its use is for defence of the ditch.

The *Fausse-braye* is the same with what is otherwise called *Chemise des rades*, and *Basse excavée*.

It is of little use where ramparts are faced with wall, because of the rubbish which the cannon beats down into it. For this reason, engineers will have none before the faces of the bastions, where the breach is commonly made; because the ruins falling, the *Fausse-braye* makes the ascent to the breach the easier: besides, that what flies from the faces often kills the soldiers placed to defend it.

FAWN, among hunters, is a buck, or doe, of the first year; or the young one of the buck's breed, in its first year.

FEALTY, an oath taken at the admittance of every tenant, to be true to his lord, while he holds his land.

Fealty is usually mentioned as synonymous with homage; but it differs from it, as homage consists in taking an oath, when the tenant comes to his land; and is done but once; being an obligation, which is permanent, and binds for ever: which *Fealty* does not.

They differ also in the manner of the solemnity; for the oath of homage is taken by the tenant kneeling; but that of *Fealty* is taken standing, and includes six things, which are comprised in the words, *inclame, tutum, utile, honestum, facile, possibile*.

Inclame, that he do no bodily injury to the lord: *tutum*, that he do him no secret injury in any thing, which is for his defence; as in his house, or cattle: *honestum*, that he do him no injury in his reputation: *utile*, that he do not damage him in his possessions: *facile*, and *possibile*, that he make it easy, and not difficult for the lord to do any good, which otherwise he might do.—All which is likewise comprised in *Leg. Hen. I. cap. 5*.

He that holds land by this only oath of *Fealty*, holds in the freest manner; for all, even those that have fee, hold *per fidem* & *fiduciam*, that is, by *Fealty* at the least.

This *Fealty* is also used in other nations; as in Lombardy, and Burgundy.

Indeed, as the very first creation of this tenure grew from the love of the lord towards his followers; so did it bind the tenant to fidelity; as appears by the whole course of the feuds; and the breach thereof is loss of the fee.

Hottoman, in his commentaries *de verbis feudaliibus*, shews a double *Fealty*: the one *general*, to be performed by every subject to his prince; and the other *special*, required only of such, as in respect of their fee are tied by this oath towards their lords. We read of both also in the *Grand customary* of Normandy, &c.

Fealty special was with us performed, either by freemen, or vassals. The form of both in Ed. II.'s Time, was in these words: When a freeman shall do *Fealty* to his lord, he shall hold his right hand upon a book, and shall say thus: "Hear you, my lord R. that I, P. shall be to you, both faithful and true, and shall owe my *Fealty* to you, for the land that I hold of you, on the terms assigned. So help me God, and all his saints."—When a villain shall do *Fealty* to his lord, he shall hold his right hand over the book, and say thus: "Hear you, my lord A. that I, B. from this day forth, unto you shall be true and faithful, and shall owe you *Fealty*, for the land that I hold of you in villinage, and shall be justified by you in body and goods. So help me God, and all the saints."

FEAST, or **FESTIVAL**, a church-solemnity, or rejoicing, in honour of God, or a saint.

* The word is formed of the Latin *festum*, which some derive a *feriari*, to keep holiday; others from the Greek *ἑῡναι*, *I feast*, or entertain, of *ἑῡναι*, *heart*, *fire*.

Feasts, and the ceremonies thereof, have made great part of the religion of almost all nations, and sects: witness those of the Greeks, Romans, Hebrews, Christians, and Mahometans.

Feasts, among us, are either *immovable*, or *moveable*.

Immovable *FEASTS*, are those constantly celebrated on the same day of the year: The principal of these are, Christmas-day, or the Nativity; the Circumcision, Epiphany, Candlemas, or the Purification; Lady-Day, or the Annunciation, called also the Incarnation, and Conception; All Saints, and All Souls: besides the days of the several Apostles, St. Thomas, St. Paul, &c. which with us are *Feasts*, though not *feriæ*. See each *Feast* under its proper article.

Moveable *FEASTS*, are those which are not confined to the same day of the year. Of these the principal is Easter, which gives law to all the rest; all of them following, and keeping their proper distance therefrom: Such are, Palm-Sunday, Good-Friday, Ash-Wednesday, Sexagesima, Ascension

tion-day, Pentecost, and Trinity Sunday. See EASTER, SEXAGESIMA, PENTECOST, TRINITY, &c.

Beside these *Feasts*, which are general, and enjoined by the church, there are others, *Local* and *Occasional*, enjoined by the magistrate, or voluntarily set on foot by the people: Such are the days of thanksgiving for delivery from wars, plagues, &c. Such also are the vigils, or wakes, in commemoration of the dedications of particular churches. See VIGIL, &c.

The Romans had abundance of stated *Feasts*, in honour of their deities and heroes: Such were the Saturnalia, Cerealia, Lupercalia, Liberalia, Neptunalia, Consualia, Portumnalia, Vulcania, Palilia, Divalia, &c. See SATURNALIA, &c.

They had also *Feasts*, instituted occasionally, as Carmentalia, Quirinalia, Terminalia, Floralia, Compitalia, Lemuria, Vernalia: Beside other moveable, and occasional ones; as to give thanks to the gods for benefits received; to implore their assistance, or to appease their wrath, &c. as the Paganalia, Feralia, Bacchanalia, Ambarvalia, Amburbalia, Suovetaurilia; and divers others, particularly denominated *feriae*; as Semetinae, Latinae, &c. See each of these *Feasts* and *feriae*, in its proper place.

The *Feasts* were divided into days of sacrifice, and days of feasting or banqueting; days of games; and days of rest or *feriae*.

There being but little history wrote, or at least published in those days, one end of *Feasts* was to keep up the remembrance of things, in lieu of reading and books.

The principal *Feasts* of the Jews were, the *Feast* of trumpets, that of the expiation, of tabernacles, of the dedication, of the passover, and that of pentecost.

FEAST is also used for a banquet, or a sumptuous meal, without any immediate view to religion.

The use of the word in this sense, arises hence, that a part of the ceremony of many of the ancient festivals, both those of the Heathens, and the ages of the Christians, was good eating; though M. Huet chuses to derive the word from *festinare*, which in an ancient Latin version of Origen's comment on Matthew, signifies to *feast*. *Ut veniens illic Jesus festinet cum discipulis suis*.

In all antiquity, both sacred and prophane, sacrifices were little more than religious *Feasts*.

It has been often observed by authors, that there is no nation in the world comes near the English in the magnificence of their *Feasts*. Those made at our coronations, installments, consecrations, &c. transcend the belief of all foreigners: and yet it is allowed, that those now in use are no way comparable to those of our forefathers.

The Persians never discourse, and deliberate of their most important affairs, but in the middle of their *Feasts*.

FEATHER, *Pluma*, that part in birds which covers them, and by which they are enabled to fly.

Feathers make a considerable article in commerce, particularly those of the ostrich, heron, swan, peacock, goose, &c. for plumes, ornaments of the head, filling of beds, writings, pens, &c.

Some of our latest naturalists contend for *Feathers* being a species of plants, as having the two great characters of vegetables, &c. that they grow, and are not sensible. They add, that the growth of *Feathers* is not performed with less art or apparatus than that of plants; and that they have all the essential, or characteristic parts thereof, as a root, stem, branches, and leaves: but these authors forget, that they have not the flowers and parts of fructification of plants, which are the most essential parts of all.

Others take *Feathers* to be that on birds, which leaves are on trees.

Others seem to be nearer to nature, in making *Feathers* to be what hairs are on other animals.

Others will have *Feathers* a kind of zoophytes, or plant-animals; such as the fetus is in the womb. Accordingly, in *Feathers*, especially those of unfledged birds, the stem, or quill, is found full of blood; which argues, that there is some umbilical nodus, whereby the first rudiment of the *Feather* was connected to the extreme fibres, i. e. to the veins and arteries of the bird.

In effect, *Feathers* seem only productions and expansions of the last extreme fibrillæ of the cutis; and hence, upon stripping off the cutis, the *Feathers* are likewise always taken away: just as the leaves and fruit follow, upon peeling the bark off a tree. Add, that *Feathers*, as well as hairs, arise out of pores in the cutis; which pores are not mere apertures, or foramina, but a kind of vaginal, wove of the fibres of the skin; which terminate in the ocula or anastomoses of the internal fibres of the *Feather*.

Feathers, Mr. Derham observes, are a very commodious drels for the inhabitants of the air, being not only a guard against wet and cold, and a means for the hatching and brooding their young, but most commodious for flight; to which purpose, they are nicely placed over the body, to give an easy passage, and every where neatly poised from the head towards the tail in close uniform order: so that being pruned and dressed by an unctuous matter, secreted in a proper gland, and de-

posited in an oil-bag, placed therein for that purpose; they afford as easy a passage through the air, as a boat new cleaned and dressed, has through the waters. Without all this nicety, they would have been apt to be ruffled and discomposed; and would have gathered air, and proved an obstruction to the passage of the body.

Most of the *Feathers* tend backwards, and are laid over each other in exact method, armed with a warm and soft down next the body, and more strongly made, as well as more curiously clofed, next the air and weather. To which purpose the apparatus nature has made, and the instinct he has given them to prune or dress their *Feathers*, are admirable.

The mechanism of the *Feather* is wonderful: the shaft, or rib is exceeding strong, but hollow below, for strength and lightness sake, and above, not much less strong; and filled with a parenchyma, or pith, both strong and light.

But the vanes or webs in the flag part of the wing are incomparable; these are nicely gauged, broad on one side, and narrower on the other: the edges of the exterior vanes bending downwards, and those of the interior, or wider, upwards; by which means they catch hold, and lie close to each other, when the wing is spread; so that not one *Feather* may miss its full force and impulse upon the air: the tips are all made sloping; those of the interior vanes sloping to a point towards the outer part of the wing, and the exterior vanes towards the body; so that the wing, whether extended or shut, is as neatly sloped and formed, as it constantly trimmed with a pair of scissars.

Mr. Derham has several new observations on the mechanism of the vanes or webs of the *Feathers*, as they present themselves to the microscope, by which the wonderful care and accuracy of the Creator in so small a part, are excellently illustrated.

The vane consists not of one continued membrane (because, if once broken, it would then be scarce repairable); but of many laminae, admirably contrived to hook and hang together. On the under-side they are thin and smooth; but on their upper, outer edge (represented *Tab. Nat. Hist. fig. 3.*) they are parted into two hairy edges; each side having a different sort of hairs, laminated, or broader at bottom, and slender and bearded towards the top. Those bearded hairs on one side the laminae, have straight beards, as represented in *fig. 4.* Those on the other, have hooked beards on one side the slender part of the bristle, and straight ones on the other, as in *fig. 5.*

Both kinds are represented as they grow on the upper edge of the lamina, in *fig. 3.* In the vane, the hooked beards of one lamina always lie next the straight beards of the next lamina; by which means they lock, and lay hold of each other; and by a pretty mechanism, brace the laminae close to one another.

FEATHER-bed,

Dry-pulled FEATHERS,

Scalded FEATHERS,

FEATHER-edged boards and planks, are those which are thicker on one side, than on the other.

FEATHER, in a horse's forehead, &c. is a turning or parting of the hair; which in some resembles an ear of barley, and in others, a kind of coat-hole.

FEBRIFUGE*, in medicine, a remedy efficacious for the cure of fevers. See FEVER.

* The word is a compound of *febris* and *fugo*, I drive away.

The quinquina, or jesuit's bark, is the greatest and surest of all the cures of *Febrifuges*.

The little century is sometimes also called *Febrifugum*, on account of its virtues.

The Chinese ginseng is also particularly famed as a *Febrifuge*.

For such as cannot take the Peruvian bark in substance, Dr. Fuller prescribes a *Febrifuge* glyster, made of a decoction thereof. The inner bark of the ash-tree, with a little salt of wormwood, taken like the Peruvian bark, is said to equal, or even exceed it, as a *Febrifuge*.

The like is asserted of the bark of the elm near the root. The flowers of sal armoniac are held an excellent *Febrifuge*, especially in intermitting fevers. Cold water has been lately much extolled as a *Febrifuge*. Dr. Handcock gives it the emphatical denomination of *Febrifugum magnum*.

Mr. Reneaume, in the *Hist. de l'Academ. R. de sciences*, an 1711. proposes a new *Febrifuge* of his own discovery, viz. galls. From a great number of experiments he has learnt, that galls alone will frequently cure an intermitting fever, as well as the quinquina, over which this medicine has some advantages in other things; in that it is not so bitter, does not heat so much, is taken in a lesser dose, and seldom, and is cheaper. At his motion, several other physicians tried it with success, particularly Mr. Homberg; though it did not succeed so well with M. Boulduc, Lemery, and Geoffroy.

FEBRIS, in medicine. See the article FEVER.

FEBRUARY, in antiquity, a feast, held by the Romans, in the month of February; in behalf of the manes of the deceased. See MANES.

Macrobius tells us, that sacrifices were here performed; and the last offices paid the shades of the deceased: *Saturn.* l. i.

c. 13. And from this feast it was, that the month of Febru-
ary took its name.

The delign of these sacrifices is somewhat controverted: Pliny
says, they were performed to render the infernal gods propi-
tious to the deceased; though some of the moderns have ima-
gined, that they were intended to appease the deceased them-
selves, and were offered immediately to them, as a sort of de-
ities. What confirms the former sentiment, is, that Pluto him-
self is surnamed *Februus*. They lasted twelve days.

The word is of an antient standing in the Latin tongue:
from the very foundation of the city, we meet with *Februa*,
for purifications; and *Februare*, to purge or purify. Varro,
de Ling. l. v. derives it from the Sabins: Vossius and others,
from *ferens*, I am hot; by reason purifications were chiefly
performed with fire and hot water. Some go higher, and even
deduce the words from פֶּה *phur*, or *phavar*, which in Syriac
and Arabic has the same signification with *feruit*, or *effervuit*;
and might probably likewise signify, to purify: for *phavar* in
Arabic, denotes a preparation given to women in child-bed,
to bring away the after-birth, and other impurities remaining
after delivery; much as among the Romans, who gave the
name *Februa* to the goddess supposed to preside over the deli-
very of women. Ovid. *Fast.*

FECAL matter, and } See {FECAL Matter.
FECES, } {FECES.

FECIALES*, or FOECIALES, an order of priests or offi-
cers among the antient Romans, appointed to proclaim war,
negotiate peace, &c.

* Festus derives the word from *ferio*, I strike, as *ferire sedus*,
signifies to conclude a treaty: and accordingly, instead of *Fec-
iales*, he would have it wrote *feriales*. Others derive it from
sedus, which was antiently wrote *fidus*, or from *fides*, faith;
others from *facis*, *fecit*, I make, &c. because they made war
and peace. Vossius chuses to derive it from *fatu*, of the verb
fari, to speak; in which sense the *Feciales* should be the same
with *oratores*; which sentiment is also confirmed by the authority
of Varro, who says, they were called indifferently, *Feciales* and
oratores. *De Vita Popul. Roman. l. ii.*

The *Feciales* were a sort of heralds, or kings at arms, who,
when the Romans had any dispute with their neighbours,
were sent, first, to demand the thing pretended to be usurped,
or require satisfaction for the injury alleged to be done. If an
answer was not returned by them, that was satisfactory to the
people and the senate; they were dispatched again to declare
war: and the like in treating of peace, the *Feciales* being the
only persons appointed to negotiate between the senate, &c.
and the enemy.

Plutarch, in the life of Numa, and Halicarnassicus, l. ii. ob-
serve, that they were first instituted by that prince. The latter
adds, that they were chosen out of the best families in Rome;
that their office, which was reputed a sort of sacerdotium
or priesthood, only ended with their life; that their persons
were sacred and inviolable, as those of other priests; that
they were even charged to see the republic did not declare
war unjustly; that they were to receive the complaints and re-
monstrances of nations, who pretended to have been any way
injured by the Romans; that if those complaints were found
just, they were to seize the criminals, and deliver them up
to those they had offended; that they were invested with
the rights and privileges of ambassadors; that they concluded
treaties of peace, and alliance, and took care they were exe-
cuted, and, lastly, abolished them, if they were found not to
be equitable.

But Varro assures us, that in his time most of these functions
of the *Feciales* were set aside; as those of the antient heralds
at arms are among us at present: though Plutarch observes,
that they had still some authority in his time.

The *Feciales* were crowned with *verbenæ*, vervain, when they
went to declare war; their head was covered with a veil,
over which the crown was applied. In this equipage they pro-
ceeded to the frontiers of the new enemy's country, and threw
a bloody dart or javelin into the ground, within the same.
In Livy, and other antient authors, we have the formula used
in such declarations.

FECULA*, or FÆCULA, in pharmacy, a whit^e, mealy
substance, or powder, which subsides and gathers at the bot-
tom of the express'd juices of divers roots; as those of briony,
arum, iris, &c.

* The word *Fæcula* is a diminutive of *feces*. See FÆCES.

This substance, or sediment, they dry in the sun, after
having poured off the liquors, and it serves for divers reme-
dies, &c.

FECULENT, or FÆCULENT, is applied to the blood, and
other humours, when they abound in feces or dregs, or have
not the proper and usual degree of purity.—

FECUNDITY, or FOECUNDITY, Fertility; or that qua-
lity of a thing, which denominates it fruitful.

The *Fecundity* of divers plants is very extraordinary. M. Do-
dart has an express'd discourse thereof in the *Memoirs of the
academy of Sciences*; wherein, he shews, that at a moderate
computation, an elm, one year with another, yields 329000

grains or seeds, each of which, if properly lodged; would
grow up into a tree. Now, an elm ordinarily lives an 100
years; consequently, in the course of its life, it produces near
33000000 seeds, all which arise from one single seed.
He shews farther, that the same elm, by frequently cutting off
its head, &c. might be brought to produce 1584000000
seeds; and consequently that there are so many actually con-
tained in it.

FEE*, FEUD, FEUDUM, FEODUM, or FIEF, an estate,
land, tenement, lordship, or the like, held of a superior
lord, on condition of fealty, homage, or other acknowledge-
ment.

* The word is derived by some authors from *fedus*, as arising
from a treaty, or alliance, made with the lord; others, as
Cujas, &c. fetch it from *fides*, on account of the faith the
person is obliged to bear his lord; others derive it from the
Saxon *feh*, hire, or wages, *g. d. status beneficiarius*. Bodin
takes the Latin *fedus* to be formed by abbreviation of the
initial letters of *fedelis ero domino viro meo*, which is an antient
formula of fealty and homage. Hotoman derives it from *fiel*,
a German word, signifying war; Pontanus from the Danish
fielde, militia; others from the Hungarian *field*, land; others
from *fehen*, to feed. But the opinion of Selden seems the best
authorized, who brings it from the Saxon *feah*, *spendium*; the
Fee being a kind of prebend to live upon; and accordingly we
find, that in antient times it was used for the wages, and ap-
pointments of officers.

The term *Fee* is properly applied to lands and tenements,
which we hold in perpetual right, on condition of an ac-
knowledgegment of superiority in a higher lord. See TE-
NURE.

The writers on this subject, divide all lands and tenements,
wherein a man has a perpetual estate to him and his heirs, into
allodium, and *feudum*.

Allodium is defined to be a man's own land, which he possesses
merely in his own right, without acknowledgment of any ser-
vice, or payment of any rent, to another; and this is property
in the highest degree.

Feudum is that which we hold by the benefit of another, and
for which we do service, or pay rent, or both, to the chief
lord.

Originally, a *Feud* was only an estate for life; and those to
whom it was granted, were called *Vassalli*, who, by such
means, were brought to a stricter discipline and obedience to
the princes, and were bound to serve them in wars.

The origin of *Fees* or *Feuds*, is one of the darkest and most
intricate points in modern history: some attribute the inven-
tion to the Lombards, others find some appearance of the
duties of a vassal to his lord, in the antient relations between
the patron, and his client; and others look for its rise in the
Roman beneficia.

The emperors, it seems, distributed lands among the antient
legions, on condition of their holding themselves ready, at
all times, to take up arms, in defence of the frontiers of the
empire; which affords us a good image enough of *Feuds*; and
in all probability, their first origin was no otherwise: But in
process of time their nature was changed, and duties were an-
nexed to them, which originally were not.

Du Moulin makes no doubt, but that these distributions of
lands, called *benefices*, were the first matter of *Fees*; for which
reason he uses the terms *benefice* and *Feud* promiscuously, as if
they were the same thing: And yet, there was a good deal of
difference between them; as there was neither fealty, nor ho-
mage, nor the other feudal rights annexed to the *benefice*;
and that the *benefice* was not hereditary.

Probably, *benefices* began then to be called *Feuds*, when they
became hereditary; and when those, of whom the *benefices*
were held, began to demand faith, or fealty, from them.
This fealty seems to constitute the *Fee*; the word *Fee* itself
signifying, in the antient Norman language, *faith*.

There is no fixing the precise æra, when these changes com-
menced; for *Fees*, such as they now are, were not establish-
ed all at once; but in different countries they took place at
different times, and in different manners. The great lords,
after the destruction of the Roman empire, having in several
parts usurped the property of their *benefices*, laid likewise hold
of the jurisdiction; and made their vassals their subjects, so
that each became a sort of petty sovereign in his own terri-
tory.

Mezeray observes, that the donation of *Fees* to the noblesse of
France, commenced under the reign of Charles Martel.

Hugh Capet, when he came to the crown, was himself so
little established, that he durst not oppose those usurpations;
and was forced to suffer, what he could not redress. See Le
Fevre de l'origine des Fiefs, and Altieri's Origines Feudorum pro
moribus Gallie.

The origin of *Fees* in England, Camden carries as far back
as the time of Alexander Severus: that prince having built a
wall in the North of England, to prevent the incursions of
the Picts; he some time after began to neglect the defence
thereof, and gave, as Lampridius assures us, the lands con-
quered

quered from the enemy, to those of his captains and soldiers, whom that author calls *limitarios duces, & milites*, i. e. captains and soldiers of the frontiers; but it was on this condition, that their heirs should continue in the service; and that the lands should never descend to private persons, i. e. to such as did not bear arms. That prince's reason was, that people, who in serving defended their own, would serve with a great deal more zeal than any others. Such, according to Camden, was the rise of *Fees* in our nation, *Britan.* p. 651.

All our lands in England (the crown-land, which is in the king's own hand in right of his crown, excepted) are of the nature of *Fend*, or *Fee*. For though many have land by descent from their ancestors, and others have bought lands; yet cannot land come to any, either by descent or purchase, but with the burden that was laid on him who had the novel *Fee*, or who first received it as a benefice from his lord to him, and such as should descend from him, or to whom it should be otherwise conveyed and transferred: so that no man has *directum dominium*, i. e. the very property, or demain in any land, but the prince, in right of his crown. *Camb. Britan.* p. 93.

Though he who has *Fee*, has *ius perpetuum*, and *utile dominium*, yet he owes a duty for it; so that it is not strictly his own. Indeed, as much is imported by the terms in which we express our highest right in lands, &c. the most a man can say, is, "I am seized of this land, in my demain, as of *Fee*." In the stat. 37 Hen. VIII. c. 16. *Fee* is also used for lands vested in the crown: but it is from ignorance of the import of the word; for *Fee* cannot be without fealty sworn to a superior: but the king 'owns fealty to no superior, but God alone.

Fee is divided, in our laws, into *Fee absolute*, called also *Fee simple*; and *Fee conditional*, also called *Fee tail*.

Fee-Simple, *feudum simplex*, is that, whereof we are seized to us and our heirs for ever.

Fee-Tail, *feudum talitum*, is that, whereof we are seized with limitation to us and the heirs of our body. See *TAIL*.

Fee-Tail, is of two kinds, *general* and *special*.

Fee-Tail general is, where land is given to a man, and the heirs of his body. — So that if a man seized of such land by such gift, marry one or more wives, and have no issue by them, and at length marry another, by whom he hath issue, this issue shall inherit the land.

Fee-Tail special is, where a man and his wife are seized of lands to them, and the heirs of their two bodies. — Where, in case the wife die without issue, and he marry another by whom he have issue, this issue cannot inherit the land.

This *Fee-tail special* has its origin from the stat. of *Westm.* 2.

c. 1. Before that statute, all land given to a man, and his heirs, either general or special, was reputed in the nature of a *Fee*; and therefore so firmly held to him, that any limitation notwithstanding, he might alienate it at pleasure. For redress of which inconvenience, the statute provides, that if a man gives lands in *Fee*, limiting the heirs to whom it shall descend, with a reversion to himself, and his heirs, for default of such former heirs; that the form and meaning of the gift shall be observed. See *ENTAIL*.

Fee-Expectant, *feudum expectativum*. See *EXPECTANT*.

Fee-Farm, or *Fee-Ferm*, *feudi-firma*, or *feo-firma*, signifies lands holden to a man and his heirs for ever, under a certain yearly rent.

Fee-Farm arises, when the lord upon creation of a tenancy reserves to himself, and his heirs, either the rent for which it was before let to farm, or at least a fourth part of the rent; and that without homage, fealty, or other services more than are especially comprised in the seoffment.

Though, by Fitz-herbert, it appears, that the third part of the value may be appointed for the rent, or the finding of a chaplain to say divine service, &c. And the nature of it is this, that if the rent be behind, and unpaid for the space of two years, then the seoffor or his heirs have action, to recover the lands as their demesnes.

Fee is also used for the compass or circuit of a manor, or lordship: Thus Bracton, in *eadem villa, & de eodem feodo*. —

Fee is also used for a perpetual right incorporated: as to have the keeping of persons in *Fee*; rent granted in *Fee*; and office held in *Fee*, &c.

Fee also signifies a reward, or ordinary due, given a person for the execution of his office, or the performance of his part, in his respective art or science.

Thus, the lawyer, and physician, are said to have their *Fees*, i. e. considerations for the pains taken with the client, or patient. A barrister, and physician, are supposed to receive their *Fees* from time to time, as their service is performed; they cannot make a bill.

Fees also denote settled perquisites or allowances, paid to public officers, by persons who have business with them.

The smallness of the salaries of divers of the king's servants, is compensated by the perquisites, or *Fees* of honour.

The *Fees* paid to the several officers by every person, upon his being knighted, amount to 78*l.* 13*s.* 4*d.* And if it be done

VOL. I.

within the verge of the court, there is 3*l.* more to the fix pages of the bed-chamber: which brings it to 81*l.*

FEELING, *Touching*, one of the external senses, whereby we get the ideas of solid, hard, soft, rough, hot, cold, wet, dry, or other tangible qualities; as also of distance, itching, pain, &c.

Feeling is the grossest, but at the same time the most extensive of our senses, having more objects than all the rest taken together; and some even reduce all the other senses to this one of *Feeling*.

Aristotle is express, that all sensation is only *Feeling*; and that the other senses, as seeing, hearing, tasting, and smelling, are only the more exquisite species, or degrees thereof. *De Anim.* l. iv. c. 3. and l. iii. c. 12.

Naturalists are divided as to the organ, or instrument of *Feeling*. Aristotle takes this sense to reside in the flesh, quatenus flesh, in as much as all flesh is, in some measure, capable of *Feeling*; *Hist. Anim.* l. i. c. 4. Others will have it in all the parts that have nervous fibres, which extends it to the skin, flesh, muscles, membranes, and parenchyma's; others restrain it to the skin or cutis; it being observed, that only those parts covered with a cutis, have properly the faculty of touching or perceiving tangible qualities.

But what part of the cutis to assign immediately for this office, is again disputed. Some will have it the membranous parts; others the carnosus; and others the medullary part, derived from the nerves.

Malpighi, and, after him, all our latest and best authors, hold the immediate organ of the sense of *Feeling*, to be the pyramidal papillæ under the skin.

These papillæ are little, soft, medullary, nervous prominences, lodged every where immediately under the cuticle. They are formed of the subcutaneous nerves, which in order hereto, first lay aside their outer membrane, and are left exceedingly soft and sensible; are continually moistened by a thin subtle humour; and only covered over, and defended by the cuticle or scarf skin. They are largest and most conspicuous in those parts chiefly designed for the office of *Feeling*, viz. the tongue, the tips of the fingers, and toes; and are contractile, and again expansive at pleasure.

Feeling, then, is thus effected: the tip of the finger, for instance, being applied to an object to be examined; by that intention of the mind, the papillæ are emitted or elevated, and being lightly rubbed over the surface of the object, a motion is impressed on them; which being thence propagated by the nerves communicating with them, to the common sensory, excites the perception of heat, cold, hardness, or the like.

Hence we see, why *Feeling* becomes painful, when the cuticle is wore off, burnt, macerated, &c. And why, when the cuticle becomes thick, hard, callous, or cicatrized, &c. the sense of *Feeling* is lost: else whence the numbness impressed by the torpedo; why that exquisite painfulness under and at the roots of the nails, &c.

Feeling is, on many accounts, the most universal of our senses; there being no animal without it. Pliny observes, that all animals have the sense of *Feeling*; even those that are generally thought to have no other sense, as oysters and earth-worms. — That naturalist declares it his own opinion, that all have the sense of tasting likewise: *Existimaverim omnibus sensum & gustatus esse*. *Nat. Hist.* l. x. c. 71.

The other senses are confined to narrow bounds; *Feeling* only is co-extended with the body, as being necessary to the well-being of every part. Hence Cicero, *Feeling* is equally diffused throughout the whole frame, that we might be sensible of all impulses in every part, and feel all the degrees of heat, cold, &c. *De Nat. Deor.* l. ii. c. 56.

Naturalists observe, that spiders, flies, and ants have the sense of *Feeling* in a much greater perfection than men, though we have instances of persons, who could distinguish colours by their *Feeling*; and of others, who could perceive what people said, by the same sense.

FEINT, in music, a semi-tone; the same with what we also call *Diefs*. See *DIESIS*.

FEINT, in rhetoric, a figure whereby the speaker touches on something, in making a shew of passing it over in silence. The Latins call this *prætermisso*.

FEINT, in fencing, a false attack, or a shew of making a stroke, or push in one part, with design to bring the enemy to guard that part, and leave some other part unguarded, where the stroke is really intended.

Feints are either single or double, high or low, without or within, &c. in prime, in tierce, in quart, in demi, and in the whole circle; of one, two, or three measures.

The *simple Feint* is a mere motion of the wrist, without stirring the foot, &c.

FELAPTON, in logic, one of the moods of syllogisms.

In a syllogism in *Felapton*, the first proposition is a universal negative; the second, an universal affirmative; and the third, a particular negative.

FELLING of timber, see the article *TIMBER*.

FEL

FELLOWS, in fortification, are six pieces of wood, each of which forms an arch of a circle, and these joined all together by dulegges, make an entire circle; which with a nave and twelve spokes, form the wheel of a gun-carriage.

Their thickness is usually the diameter of the ball of the gun they serve for, and their breadth something more.

FELLOWSHIP, *Company*, or *Partnership*, in arithmetic, is a rule of great use in balancing accounts amongst merchants, and owners of ships; where a number of persons putting together a general stock, it is required to give every one his proportional share of his loss, or gain.

The *golden rule* several times repeated, is the basis of *Fellowship*, and fully answers all questions of that kind: for, as the whole stock is to the total thereby gained, or lost; so each man's particular share is to his proper share of loss, or gain. Wherefore, the several sums of money of every partner are to be gathered into one sum, for the first term; the common gain, or loss, for the second; and every man's particular share for the third; and the golden rule is then to be wrought so many times as there are partners.

There are two cases of this rule, the one *without*, the other *with time*.

FELLOWSHIP without time, is where the quantity of stock, contributed by each person, is alone considered; without any particular regard to the length of time that any of their monies were employed.—An example will make this process easy.

A. B. and C. freight a ship with 212 tun of wine; *A.* laying out 1342 *l.* *B.* 1178 *l.* and *C.* 630 *l.* towards the same; the whole cargo is sold at 32 *l.* per tun. Query, what shall each person receive?

Find the whole produce of the wine by multiplying 212 by 32, which yields 6784. Then, adding together the several stocks, 1342, 1178, and 630, which make 3150, the work will stand thus:

$$\begin{array}{r} 1342 - \text{Answ.} - 2890 \\ 1178 - \text{-----} - 2537 \\ 630 - \text{-----} - 1350 \\ \hline \text{Proof } 3150 \quad 6783 \end{array}$$

FELLOWSHIP with time, is where the time wherein the money, &c. was employed, enters into the account.—An example will make it clear.

A. B. C. commence a partnership the first of January, for a whole year. *A.* the same day disbursed 100 *l.* whereof he received back again, on the first of April, 20 *l.* *B.* pays, on the first of March, 60 *l.* and more, the first of August, 100 *l.* *C.* pays, the first of July, 140 *l.* and, the first of October, withdraws 40 *l.* At the year's end their clear gain is 142 *l.* Query, what is each person's due?

A.'s 100 *l.* multiplied by three months, the time it was in, makes 300 *l.* and the remaining 80, by nine months = 720, in all 1020 *l.* of *A.*'s contribution. For *B.* 60 into 10, gives 600; and 100 into 5, 500; in all 1100 *l.* for *B.* For *C.* 140 into 3, gives 420; and 100 into 3, is 300; in all 720 *l.* for *C.* Now, 1020, 1100, 720 = 2840 for the common antecedent, and the gain 142, is for the general consequent; then the rule will stand thus:

$$\begin{array}{r} 1020 - \text{Answ. } 51 \\ 1100 - \text{-----} 55 \\ 720 - \text{-----} 36 \\ \hline \text{Proof } 2840 \quad 142 \end{array}$$

FELON-de-se, is he that commits felony, by willingly and deliberately killing himself. The Saxons call him *Self-bane*.

A *felon-de-se* is to be interred without christian burial, with a stake driven through his corps; and is to forfeit his goods.

FELONY, *FELONIA* *, was antiently used for a violent and injurious action of a vassal, or tenant, against his lord.

* Menage derives the word from *felonia*, formed of *felo*, or *fello*, which occurs in the capitulars of Charles the Bald, and is supposed to come from the German *fehlen*, or Saxon *faelen*, to fail or be delinquent. Others derive it from the barbarous Latin *vilania*. My lord Coke, Nicod, &c. derive it a *falle*, gall, as being supposed to be done maliciously. Lastly, others derive it from the Greek *phron*, to deceive.

In this sense *Felony* was equivalent to petty treason, or it was a crime next below high-treason. The crime of *Felony* imported confiscation of the fee, to the profit of the lord.

FELONY was also applied to an injury of the lord to his vassal, which imported a forfeiture of the homage and service thereof, and made it revert to the sovereign.

Fidelity and *Felony* are reciprocal between the lord and the vassal. See **LORD**.

FELONY, is also used in common law, for any capital offence, perpetrated with an evil intention.

In a stricter sense, *Felony* denotes an offence next below that of petty treason.

Felony includes several species of crimes, whose punishment is the same, viz. death: such as murder, theft, suicide, sodomy, rape, wilful burning of houses, receiving of stolen goods; and divers others found in the statutes, which are daily making crimes *Felony*, that were not before.

Felony is easily distinguished from treason.

FEM

From lesser crimes, it is distinguished by this, that its punishment is death, though not universally; for petty-larceny, i. e. stealing of a thing under the value of twelve-pence, is *Felony*, according to Brook; though the crime be not capital, but only a loss of goods. The reason Brook gives for its being *Felony*, is that the indictment runs, *Felonia cepit*.

Till the reign of Henry I. *Felonies* were punished by pecuniary fines; that prince first ordered *Felonies* to be hanged, about the year 1108.

Felony is of two kinds; the one *lighter*, which for the first time is intitled to the benefit of the clergy; as manslaughter. The other more *craving*, is not allowed the privilege.

Felony is also punished by loss of all lands, not intailed; and all goods and chattels, both real and personal; though the statutes make a difference in some cases concerning lands, as appears by stat. 37 Hen. VIII.

Felony ordinarily works corruption of blood, unless the statute, ordaining the offence to be felony, provide otherwise; as the stat. 39 Eliz. c. 17.

FELT, a kind of stuff, either of wool alone, or of wool and hair; neither spun, crossed, nor woven, but deriving all its consistence from its being wrought, and filled with lees and size, and afterwards fashioned on a block or mould, by help of fire and water.

Castors, camels, and coney hair, lambs and sheeps wool, &c. are the most usual ingredients of *Felts*; and hits of all kinds, are the works they are chiefly employed in.

The *Felt* intended for a hat, being sufficiently filled, and prepared, is reduced into one piece, somewhat in the figure of a large funnel; in which state it remains ready to be put into form, and become a hat. See **HAT**.

FELUCCA *, or **FELUCCO**, a little vessel with six oars, not covered over, much used in the Mediterranean.

* The word is formed from the Arabic *Felkon*, a ship.

It has this peculiarity, that the rudder may be applied either in the head or stern; there being dispositions in both to receive it. For size, it may be compared to a sloop or shallop.

FEMALE, the sex that conceives, and bears fruit. An animal that generates within itself, is called *Female*; and that which generates in another, male. See **MALE**.

The *Female*, in quadrupeds, and even in birds, is usually smaller and weaker than the male; though in birds of prey, as the falcon, hawk, &c. it is otherwise; the *Female* being bigger, stronger, bolder, hardier, and more courageous.

The like is observed in most insects, particularly spiders; to that degree, that M. Homberg assures us, he has weighed five or six male garden-spiders against one *Female* of the same species, which has been equal to them all.

For the numeral proportion of males to *Females*, see **MARRIAGE**.

Naturalists also distinguish male and *Female* plants; male and *Female* flowers, &c.

FEMALE screw. See the article **SCREW**.

FEMME covert, in law, denotes a married woman; who is also said to be under covert-baron.

FEMININE, or **FOEMININE**, in grammar, one of the genders of nouns.

The *Feminine* gender is that which denotes the noun or name to belong to a female. In the Latin, the *Feminine* gender is formed of the masculine, by altering its termination; particularly by changing *us* into *a*. Thus, of the masculine *bonus equus*, a good horse, is formed the *Feminine*, *bona equa*, a good mare; so, of *parvus homo*, a little man, is formed, *parva femina*, a little woman, &c.

In French, the *Feminine* gender is expressed, not by a different termination; but a different article: thus, *le* is joined to a male, and *la* to a female.

In English, we are generally more strict, and express the difference of sex, not by different terminations, nor by different particles, but different words; as boar and sow, boy and girl, brother and sister, &c. — though sometimes the *Feminine* is formed by varying the termination of the male into *ess*; as in abbot, abbess, &c.

FEMININE Rimes, see the article **RIME**.

FEMUR *, or **OS FEMORIS**, in anatomy, the thigh-bone. See *Tab. Anat. (Myol.)* fig. 3. n. 20. and fig. 7. n. 22.

* Dionis derives the word *Femur* from *fero*, by reason it bears the whole weight of the body.

The *Femur* is the largest and strongest bone in the body, and its articulations are proportioned to its bulk and strength. Its upper part is jointed with the ischium, by enarthrosis, the head of the *Femur* being received into a cavity of the ischium; and the two kept together by a strong cartilage or bandage. The lower end is articulated with the tibia by ginglymus, two heads of the *Femur* being received into two cavities of the tibia; beside a cavity between the two heads, which receives a process of the tibia.

The *Femur* is pretty much incurvated, or bent, the convex part being before, and the concave behind. It is divided into three parts; the *upper*, the *middle*, and the *lower*.

The

FEN

The *upper* consists of a head and a neck, in which are contained three epiphyses, *viz.* the extremity or head, which is round and big, and received into the acetabulum of the coxendix, wherein it is tied by two ligaments; the one from the top, the other from the bottom of the acetabulum, but both inserted into the middle of the head. Immediately under the head, is the neck of the *Femur*, which is small, long, and a little oval, and makes an angle with the body of the bone; by means whereof the thighs and feet are kept at a due distance from each other, to make our standing the firmer; beside that the obliquity of the neck conduces to the strength of the muscles, which must otherwise have passed too near the centre of motion. The other two epiphyses are called the greater and less trochanters.

The middle part or shank of the *Femur*, is round, smooth, and polished on its fore-side, and rough on the hind-side; along which there runs a small ridge, the whole length of the bone, called *Linea aspera*, serving for the insertion of muscles.

The lower part of the *Femur* is divided by a sinus in the middle, into two heads or apophyses, called *Condylis*, which make the ginglymus abovementioned; being both received into the sinus of the tibia.

Between the hind-parts of the head is a space for the passage of the great vessels and nerves, which go to the leg.

The *Femur* has a very large cavity, running its whole length, filled, like the rest, with marrow. The curvity of the *Femur* makes it serve as a buttress to the body, to prevent its falling, or bearing too much forward.

Surgeons and bone-setters should take care, that in fractures of the *Femur*, they do not endeavour to set it straight, which is against nature.

FEN, in geography, a kind of wet land, or rather, morass.

Fens are of two sorts: The first of a boggy confistence, composed of water and earth intermixed; scarce firm enough to sustain the tread of a man.

The second are pools, or collections of waters, with pieces of dry land raised here and there, above the surface thereof.

The former kind neither receive, nor emit any river; but the latter are frequently the heads or springs of rivers; such is the head of the Tanais, &c.

FENCE-Month (*mensis prohibitionis*, or *mensis vetitus*) is a month wherein the female deer fawn; for which reason it is unlawful to hunt in the forest during that time.

It begins fifteen days before midsummer, and ends fifteen days after; being in all thirty days.

There are also certain *Fence*, or *defence* months, or seasons for fish, as well as wild beasts; as appears by *Stat. Westm.* 2. cap. 13. in these words:

"All waters, where salmon are taken, shall be in *defence* for taking of salmon, from the nativity of our lady, unto St. Martin's day. And likewise, young salmon shall not be taken or destroyed by nets, &c. from the midst of April, to the nativity of St. John Baptist, &c."

FENCE-Wall, are walls of brick, or stone, made around gardens, &c.

FENCING, the art of defence; or of using the sword, to wound an enemy, and preserve one's self from his attacks.

Fencing is one of the exercises learnt in the academics, &c.

The art of *Fencing* is acquired by practising with foils, called in Latin, *rudes*; whence *Fencing* is also denominated *gladiatura rudia*.

Pyrard assures us, that the art of *Fencing* is so highly esteemed in the East Indies, that none but princes and noblemen are allowed to teach it. These masters wear a badge or cognizance on their right arms, called in their language *Ejarsu*, which is put on with great ceremony, like the badges of our orders of knighthood, by the kings themselves.

Montaigne informs us, that when he was a youth, the nobility all shunned the reputation of being good *Fencers*; as something too subtle, and designing, and apt to corrupt virtuous manners.

Fencing is divided into two parts, *simple*, and *compound*.—

Simple is, that performed directly and nimbly, on the same line; and is either *offensive*, or *defensive*.—The principal object of the first is whatever may be attempted, in pushing or making passes from this or that point, to the most uncovered part of the enemy. The second consists in parrying, and repelling the thrusts aimed by the enemy.

The *Compound*, on the offensive side, includes all the possible arts and inventions to deceive the enemy, and make him leave that part we have a design on, bare, and ungarded, upon finding we cannot come at it by force, nor by the agility of the simple play.

The principal means hereof are feints, appeals, clashings, and intanglings of swords, half-thrusts, &c. and in the defensive, to push in parrying.

FEND, in the sea language, imports the same as *defend*.

Hence the phrase, *Fending the boat*, &c. that is, saving it from being dashed against the rocks, shore, or ship's side.

Hence also

FENDERS, any pieces of old cable ropes, or billets of wood,

FER

hung over the ship's side, to *send* or keep other ships from rubbing against her.

FENDUE en Pal, in heraldry, a French phrase, applied to a cross, to denote it cloven down from top to bottom, and the parts set at some distance from one another.

FENESTRA, in anatomy, a name applied to two holes, or apertures in the inner ear. See **EAR**.

The *Fenestræ* are two openings in the labyrinth; the first of them is inclosed by the basis of the stapes, and from its oval figure denominated *Fenestra ovalis*.

The latter, called *rotunda*, is inclosed with a transverse transparent membrane, placed a little within the surface of its aperture.

These *Fenestræ*, with the whole labyrinth, are comprehended in that part of the os temporum, properly called from its hardness *petrosum*.

FENNEL-seed, in commerce, &c. a longish, striated seed, flat on one side, and roundish on the other; of a sweetish taste, not unlike that of annis-feed: being the produce of an umbelliferous plant of the same name, well known as a Kitchen-herb; by botanists, called *Feniculum vulgare*, or common *Fennel*, or *finckle*.

Fennel-seed makes part of the commerce of the druggists and apothecaries. It is esteemed a carminative, and used like annis-feed, to dispel wind in the body; and correct fenna, and the rest of the vegetable purgatives.

There is also a strong water, or brandy, made of the seeds of *Fennel*, called *Fennel-water*. The ingredients are *Fennel*-seed, liquorice, brandy, and white wine, which are distilled together; and to the essence thereof are added spirit of wine, sugar, and sweet almonds; the whole is then strained, &c. The seed of the sweet *Fennel* is used in this and many other compositions, not that of the common *Fennel*.

FENUGREEK, *Fænum Græcum*, or **FENNIGREEK**, a medicinal plant, thus called, because antiently brought from Greece, though now cultivated in several parts of Europe.

Its stem is about a foot high; its leaves are small, and disposed somewhat like those of trefoil. It has a little white flower, from whence arises a long, pointed pod, shaped not unlike a bullock's horn.

The grain, or seed is inclosed in this pod, which bears the name of the plant itself; it is less than mustard-feed, very hard and solid, of a triangular form, and a strong disagreeable smell; when new, it is of a yellow gold colour, but when long kept, ruddy, or brown.

The farina or flower of these seeds is esteemed good to ripen and digest; and as such, is used in cataplasms of those intentions; as also in emollient clysters, decoctions, &c. It yields a mucilage used in inflammations of the eyes, and on other occasions.

FEODARY, FEUDARY, or FEUDATARY, an officer antiently made and authorized by the master of the court of wards.

His office was to be present with the escheator, at the finding any office; and to give evidence for the king, concerning the tenure and the value thereof; to survey the land of the ward after the office found, and rate it. He also assigned the kings widows their dowers, and received the rents of wards lands. This office is taken away by stat. 12 Car. II.

FEODER, a measure for liquids, used throughout Germany. See **MEASURE**.

FEODUM, or FEUDUM, the same with *fief* or *fee*. See **FEU**.

FEOFFMENT, in common law, signifies a gift or grant of honours, castles, manors, messuages, lands, or the like corporeal or immovable things, to another in fee-simple: that is, to him, and to his heirs for ever, by the delivery of seisin, and the possession of the thing given. See **FEU**.

When this is done by writing, it is called the *deed of Feoffment*.

In every *Feoffment*, the giver is called the *Feoffor*, or *Feoffator*; and he that receives, the *Feoffee*.

The proper difference in our law, between a *Feoffor*, and a donor, is, that the *Feoffor* gives in fee-simple; and the donor in fee-tail.

FERALIA*, in antiquity, a feast held by the Romans, on the twenty-first of February, in honour of the dead.

* Varro derives the word from *inferi*, or from *fero*: on account of a repast, carried to the sepulchres of such as the last offices were that day rendered to. Festus derives it from *feris*, on account of the victims sacrificed. Vossius observes, that the Romans called death *fera*, *cruel*, and that the word *Feralia* might arise thence.

Macrobius, *Saturn.* l. i. c. 13. refers the origin of the ceremony to Numa Pompilius. Ovid in his *Fasts*, goes back as far as *Æneas*, for its institution. He adds, that on the same day, a sacrifice was performed to the goddess Muta, or dumb; and that the persons who officiated, were an old woman, attended with a number of young girls.

FER de Fourchette, *Croix a Fer de Fourchette*, in heraldry, is a cross, having a forked iron at each end, like that formerly used by soldiers to rest their muskets on; by which it is distinguished

FER

guished from the cross *Furche*; the ends whereof turn forked: whereas in this, the fork is fixed on the square end; as represented in *Tab. Herald. fig. 20.*

FER de Moulin, *q. d.* iron of the mill, is a bearing in heraldry; supposed to represent the iron-ink, or ink of a mill, which sustains the moving mill-stone. See a representation of it in *Tab. Herald. fig. 21.*

FERD-wit*, or **FIRD-wits**, in our ancient customs, a formula, by which the king pardoned manslaughter, committed in the army.

* The word is formed of the Saxon *Fird*, army, and *quite* punishment.

FERENTARII*, or **FERENDARII**, among the Romans, were auxiliary troops, lightly armed; their weapons being a sword, bow and arrows, and a sling; which were much less cumbersome, than a buckler, battle-ax, pike, &c.

* The name seems to have been derived a *ferendo auxilio*; these being auxiliary forces: Though Varro thinks they might be so called, by reason, the sling and stones *ferantur*, non *teantur*.

We have also mention of another sort of *Ferentarii*, whose business was, to carry arms after the armies, and to be ready to supply the soldiers therewith in battle.

Lydius uses the name *Ferentarii* for the *cataphracti equites*, i. e. cavaliers, armed cap-a-pee.

FERIÆ, among the Romans, were holidays; or days wherein they abstained from work.

The word *Feriæ*, is usually derived a *ferendis victimis*, on account of the victims killed on these days. Martinius says, that *Feriæ* were so called *velut ieiunia*, *diebus sacris*, holy days. Others observe, that all days in general, though they were not feast-days, were antiently called *Festæ*, or as Vossius reads it, *Festæ*; whence, according to that author, was formed the word *Feriæ*.

The *Feriæ*, or *dies feriati*, were observed and distinguished chiefly by rest; whereas the *fasti*, or *dies festi*, beside a cessation from labour, were celebrated with sacrifices and games; so that there were *Feriæ*, which were not feast-days. Though authors frequently confound the *Feriæ*, and *Festæ*.

Others confound the *Feriæ* with the *dies nefasti*, or non-court-days.

The Latin *Feriæ*, amounts to the Sabbath of the Hebrews.

The Romans had divers kinds of *Feriæ*: Their names, at least the principal thereof, are, *Æstivales*, or summer *Feriæ*; *Annversaria*, yearly *Feriæ*; *Compitalia*, *Feriæ* of the streets, and cross-ways; *Conceptivæ*, votive *Feriæ*, which the magistrates promised every year; *Donicales*, for the expiation of a family polluted by the death of any one; *Imperativæ*, or *Indivivæ*, those decreed by the magistrate; *Latine*, the Latin *Feriæ*, instituted by Tarquin the proud, for all the Latin people, amounting to above fifty nations, being celebrated on M. Alba, in memory of the peace, concluded by Tarquin, with the people of Latium; *Messis Feriæ*, those of harvest; *Paganalia Feriæ*, or *Paganalia*, an account of which is given under *PAGANALIA*; *Prædicantæ*, which were, what we properly call the vigils, or eves of the feasts; *Privatæ*, or *Propria*, those peculiar to the several families; as the *Familie Claudie*, *Æmilie*, *Julie*, &c. *Publicæ*, those observed by all in general; for the public weal; *Sementinæ*, those held in seed-time; *Stativæ*, those kept constantly to the same day of the year; *Saturnales*, whereof we shall speak in their place; *Stultorum Feriæ*, or *Quirinalia*, the *Feriæ* of fools, held on the seventeenth of February; *Victoriæ Feriæ*, those of victory, in the month of August; *Vindemiales*, those of the vintage, from the twentieth of August, to the fifteenth of October; *Vulcani Feriæ*, those of Vulcan, which fell on the twenty-second of May.

FERIÆ was also used among the Romans for fair-days; by reason it was the custom to hold their fairs on the *dies feriati*, or holiday. *Struv. Synt. Antig. Rom. c. ix. p. 425, 443, &c.*

FERIA* is still retained in the Romish breviary, though in a sense somewhat different from the *Feriæ* of the antients; being applied to the several days of the week, beginning with Sunday; provided none of those days be a feast or fast day. Thus, Monday is the second *Feria*; Tuesday the third, &c.

* The word *Feria*, in this sense, is doubtless borrowed from the antient *Feria*, a day of rest. Accordingly, Sunday is the first *Feria*: For antiently, all the days of Easter-week were accounted festival days, by a decree of Constantine; whence those seven days were called *Feriæ*: Sunday being the first, Monday the second, &c. And this week being then accounted the first of the ecclesiastical year, they afterwards accustomed themselves to call the days of the other weeks after the same manner, *first, second, third, &c. Feriæ*. Though others will have it, that the days of the week were not called *Feriæ*, from the people's resting, that is, on account of being obliged to abstain from servile works; but to advertise the faithful, that they ought to abstain from sin. See Durand, *de Off. Div. l. viii. c. 1.*

These are the ordinary *Feriæ*: — But besides these, they have extraordinary, or greater *Feriæ*, viz. the three last days of pas-

FER

sion week; the two days following Easter-days, and Whit Sunday; and the second *Feria* of rogation.

FERIAL Days, *dies FERIALES*, or **FERIÆ**, among the antients, signify holidays, or days vacant from labour, and pleading.

But in the Stat. 27 Hen. VI. c. 5. and in Fortescue, *De Laudibus LL. Anglie*, *Ferial* days, they are taken for working days. S. Silvester ordained—*Sabbati & dominici dies nomine retento, reliquis hebdomadæ dies feriarum nomine distinctos, ut jam ante in ecclesiâ vocari cœperant, appellari.*

So that *Ferial* days are properly all the days of the week, except Saturday, and Sunday.

FERM, **FIRMA**, in law. See the article **FARM**.

FERMENT, in physics, any body, which being applied to another, produces a *fermentation* therein: or, any thing capable of exciting an intestine motion, in the parts of another; and of swelling, or dilating the same.

Thus, the acid in heaven is a *Ferment*, which makes bread rise or swell. And the moisture in hay is a *Ferment*, which heats, and makes it smoke. Thus also, rennet is a *Ferment*, which curdles and breaks milk: And barm, or yeast, is the *Ferment* that sets wort a working, &c. See Supplement, article **FERMENT**.

The force or effect of a *Ferment* arises hence, that by its more penetrative and moveable parts, it dissolves and breaks the texture or combination of the component parts or principles of the body, gives them a new motion, and disposes them to take a new arrangement, or to combine again in a new manner; and so to constitute a new species of body.

Thus, the bite of a mad dog excites a slow fermentation in the blood, whereby the divers liquors, or matters it consists of, lose that nexus, or union, necessary to a state of health; and occasion an irregularity in the spirits, from which arise the horrors, and other symptoms of the disease.

One way of accounting for digestion, is by supposing a certain *Ferment* in the stomach. But what this *Ferment* is, or whence it should be derived, is greatly disputed. Some will have it an acid, others alkalious, others sulphureous, others alcalin-sulphureous, others muriatic, &c. as their own fancies suggest to them.

FERMENTARIIL, or **FERMENTACEI**, a denomination which those of the Latin church have given to the Greeks, on account of their consecrating and using leavened, or fermented bread in the eucharist.

As the Greeks call the Latins *Azymites*, the Latins, in return, call them *Fermentarii*.

FERMENTATION, an intestine motion, or commotion of the small, insensible particles of a mixed body, arising without any apparent mechanical cause, and producing a considerable alteration therein.

Or, it is an easy, slow, gentle motion of the intestine particles of a body, arising usually from the operation of some active, acid matter; which rarifies and subtilizes the softer yielding particles thereof.

Fermentation differs from dissolution, as the latter is only a result, or effect of the former: *Fermentation* is frequently without dissolution, i. e. the fermentative motion frequently does not go so far as to dissolve the body; but dissolution always supposes an antecedent *Fermentation*.

Fermentation differs from ebullition and effervescence in this, that the motion, which in the first is slow, in the two latter is violent; and that in the first, the motion is restrained to the minute particles of the body; but in the latter it extends to large masses thereof.

Indeed it must be observed, that authors usually allow of divers kinds of *Fermentation*, viz. an insensible one, which is only known from its effects; and a sensible one; a violent and a moderate one; a hot, and a cold one; a natural, and an artificial one.

Plants bruised, and left a certain time in a close vessel, ferment of themselves; and if left alone, the *Fermentation* will proceed to putrefaction.

In order to *Fermentation*, it is necessary, the ferment have something acid and spirituous in it; that its motion be tumultuous; that it be an open, spacious place, and assisted by the air; and that it tend to exalt and purify the body, and produce vinous, or inflammable spirits.—These are the particular properties and conditions of *Fermentation*; though in the general, all required to effect a *Fermentation*, in a body, or liquor, which is not homogeneous, that is, which consists of different principles; is that there be a strong attraction between the particles of the *Ferment*, and the body; that the parts of this latter be moved and agitated irregularly; and that this motion produce some alteration in the mixt.

Fermentation is one of the most obscure processes in all nature. The generality of our later philosophers allows it in great measure a mystery, to which their principles will not fully reach. Dr. Morgan attempts to account for it, on the Newtonian system. His principle is, that the expansive force of air, rarified by the action of fire, or the mutual action

action of fire and air, is the universal natural cause of *Fermentation* and dissolution.

To shew this, he considers two great powers, or principles in bodies, viz. an attractive, cohesive power, in the small particles of matter, as the principle of all rest, concretion, &c. And the expansive force of heated air, as the principle of *Fermentation*. On the different proportion and adjustment of these two opposite forces, with respect to each other, the constitution, texture, and cohesion of bodies are said to depend.

By the attractive force, acting alone, the constituent parts of compound bodies, must be brought to their nearest and greatest contacts, and remain there in a degree of firmness, and cohesion, proportional to the quantities of contact.

On the other hand, by the repulsive, expansive force, acting alone, all bodies, even the most compact and solid, must be dissolved and diffused into one perfectly fluid, incoherent mass.

If both be found in the same body, and equal in degree, such a body must continue in its present state of fluidity, or cohesion; if the attractive power prevail, the quantity of contact, or degree of cohesion will be continually increased to a certain pitch, where it will rest: on the contrary, if the expansive force of the fire and air, included in any body, or mass of matter, prevail against the attractive power of the contiguous parts, the parts must necessarily recede from their points of contact.

And this happening through all the subdivisions of which the body or mass is capable, every small part must be divided and separated into other smaller parts; and these again into others, and so on, till we come to the first constituent particles or atoms, which are supposed to be perfectly solid, and indivisible.

This recedes of the parts of bodies from their points of contact, and the separation and division consequent thereon, is what we call *Rarefaction*; as, on the contrary, the approach of the parts nearer to the points of contact, is called *Condensation*. Now from the contrary effects of these two forces, there necessarily arises an intestine commotion, collision, and natural struggle of the parts among themselves, i. e. the parts acted on by two such opposite forces, will fly off, and recoil, recede and accede, in proportion to the strength and energy of the opposite powers, till one or the other prevail, either to fix and condense, or to dissolve and diffuse it; which alternate motion is what we call *Fermentation*.

If the attractive force prevail, the most fluid body will be consolidated, as water into ice.

On the contrary, if the expansive force prevail, the firmest body will be broke and dissolved.

Fermentation is a point of the utmost consequence in medicine; it is one of the principal means, or instruments we have for altering, exalting, or calling forth the properties and powers of bodies. To get an idea of these changes, we cannot consider it better, than in the procuring of a spirituous liquor from malt, by means thereof.

It is to be observed then, that the malt being made, as shewn under the article *MALT*; and then laid to infuse or mash in hot water, the rest of the process of brewing is nothing but a raising and directing of a *Fermentation*, or intestine motion.

How such motion is mechanically effected, and how it brings forth such a spirit, may be conceived from what follows; supposing the reader acquainted with these common propositions in hydrostatics; viz.

1^o That a body immersed in any fluid, specifically lighter than itself, will sink; otherwise, it will emerge and get to the top.

2^o That if two equal bodies of different specific gravities be immersed in a fluid, lighter than either of them, the celerities of their descents will be as their gravities.

3^o That if two unequal bodies of unequal specific gravities be immersed in a fluid, lighter than either, the celerities of their descents will be compounded of their gravities and dimensions together.

The same laws, by which bodies descend, hold good in the ascent of those specifically lighter than the fluid.

Hence in all heterogeneous fluids, the constituent parts of which are not fitted to associate and cohere, so as to form what is called an uniform homogeneous fluid, the heavier may be accounted as solid bodies immersed in a fluid specifically lighter; and the lighter parts, as such bodies in a fluid specifically heavier; since it may be demonstrated, that the component parts of all fluids, separately considered, are solid.

The liquor, therefore, called *wort*, which is a decoction of malt, may be considered as such an heterogeneous fluid, whose parts cannot be interchanged in their positions, till each has obtained such an elevation as corresponds to its proper gravity; but lest this alone should fail of the intention, by not being sufficient to break those molecule and viscidities, which entangle the spirituous parts, and likewise to prevent their flying off at the surface, some portion of an already fermented substance is mixed with it.

VOL. I.

This substance, termed *harm*, or *yeast*, consists of a great quantity of subtle spirituous particles, wrapped up in such as are viscid. Now, when this is mixed with such a liquor, it cannot but much contribute to that intestine motion which is occasioned by the intercourse, and occurrences of particles of different gravities; as the spirituous particles will be continually striving to get up to the surface, and the viscid ones continually retarding such an ascent, and preventing their escape.

So that by these two concurring causes the particles extracted from the grain, will by such frequent occurrences be so comminuted, as continually to increase the more subtiler and spirituous parts, until all that can be made so by attrition, be set loose from their former viscid confinements; and this appears by the warmth of the liquor, and the froth drove to the top; just at which time, if it be thrown into the still, it affords some quantity of an highly inflammable spirit.

Moderate warmth much hampers this process, as it assists in opening the viscidities, in which some of the spirituous parts may be entangled, and unbends the spring of the included air, which cannot but contribute to the rarefaction and comminution of the whole.

The viscid parts, which are raised to the top, not only on account of their own lightness, but by the continual efforts and occurrences of the spirit to get uppermost, both shew when the ferment is at the highest, and prevent the finer spirits making their escape; for if this intestine lucus be permitted to continue too long, a great deal will get away, and the remaining liquor will grow flat, and vapid, and raise little besides phlegm in the still.

The greatest use of this theory in medicine, will be in teaching what parts of the materia medica are most properly brought under this procedure; and how such intestine motion does, in some things, destroy their virtues: for by some medicines an intention is aimed at, which is not to be procured, but by their being spirituous; whereas in others the very contrary property is required: in such cases therefore, when by any adventitious cause those medicines get into a *Ferment*, they are destroyed, and should not be administered.

FERNAMBUC, see the article *BRASIL wood*.

FERRUGINOUS, denotes a thing to partake of the nature of iron, or to contain particles of that metal.

It is particularly applied to certain mineral springs, whose water in their passage along the strata of the earth meets with the ore of this metal, or with pyrites containing it, part of which they wash off, and carry with them; and thus become impregnated with the principles thereof. Such are what we call *chalybeate waters*.

The waters of Tunbridge, those of Forges, and of the iron spring at Bourges, and many others, are *ferruginous*.

FERRUGO, the rust of iron; or a kind of calx found on the surface thereof.

FERRUM, *Iron*, see the article *IRON*.

FERTILITY, FRUITFULNESS; that quality, which denominates a thing fertile, or prolific.

The Egyptian nitre, or natron, renders the ground exceedingly fertile. M. de la Chambre observes, that the plants grow in such abundance in Egypt, that they would choke one another, if they were not hindered, by throwing sand upon the fields; inasmuch that the Egyptians must take as much pains to lessen the richness of their soil, as other nations do to increase that of theirs. *Philos. Transact.* N^o 160.

Nothing is more fertile than wheat, which faculty was given it by the Creator, in regard that it was to be the principal food of men; thus a single measure of that grain, sown in a proper soil, will yield a hundred and fifty measures.—One of Augustus's procurators sent him four hundred ears, all produced from one seed. And Nero had three hundred and forty ears sent him, arising also from a single seed. *Plin. Nat. Hist.* l. xviii. c. 10.

FERULA*, a little wooden palle, or slice; reputed the schoolmaster's sceptre, wherewith he chastises the boys, by striking them on the palm of the hand.

* The word is pure Latin, and has also been used to denote the prelate's crozier and staff. It is supposed to be formed of the Latin *ferire*, to strike; or, perhaps, *Ferula* in this sense may be derived from the name of a plant, called in Latin *Ferula*, in English *Fennel-giant*; the stem whereof was antiently used to correct children with; though others think, the plant took its name from the instrument, or rather from its use, *ferire*.

Under the eastern empire, the *Ferula* was the emperor's sceptre, as is seen on divers medals; it consists of a long stem or shank, and a flat, square head. The use of the *Ferula* is very antient among the Greeks, who used to call their princes *βασιλεὺς*, q. d. *Ferula bearers*.

In the antient eastern church, *Ferula* or *Narthex*, signified a place separated from the church, wherein the penitents, or the catechumens of the second order, called *Aufculantes*, *αυγουλατικοί*, were kept; as not being allowed to enter the church. Whence the name of the place; the persons therein being under penance, or discipline: *sub Ferula erant ecclesie*.

FERULÆ, among churgeons, called also **SPLINTERS**; are little chips of different matter, as woods, barks, leather, paper, &c. applied to bones that have been disjoined, when they are set again.

The bark of the herb fennel-giant, called by some in Latin *Ferula*, was antiently much used on this occasion; whence the name *Ferula* became common to all.

FESCENNINE *, in antiquity, *FESCENNINE verses* were a kind of satyrical verses, full of wanton, and obscene expressions, sung or rehearsed by the company, at the solemnizing of a marriage among the Romans.

* The word is borrowed, according to Macrobius, from *Fescinnus*, a charm; the people taking such songs to be proper to drive away witches, or prevent their effect: But its more probable origin is from *Fescennium*, a city of Campania, where such verses were first used.

FESSE, one of the nine honourable ordinaries of the escutcheon, which it divides horizontally in the middle, and separates the chief from the point. It is supposed to represent a broad girdle, or belt of honour, such as knights at arms were antiently girded withal.

It possesses the centre of the escutcheon, and contains in breadth one third part thereof.—Thus, he beareth azure, a *Fesse* or, by the name of Elliott. See *Tab. Herald.* fig. 22. When the *Fesse* takes up less than its proper breadth, it is called a *Bar*.

FESSE-point, is the exact centre of the escutcheon.

It is thus called, as being the point, through which the *Fesse* line is drawn from the two sides; and accordingly it divides the escutcheon into two equal parts, when the escutcheon is parted *Per fesse*.

FESSE-ways, or in **FESSE**, denotes things borne after the manner of a *Fesse*, i. e. in a line, or range, a-crofs the middle of the shield; which the French call *en Fesse*.

Party per FESSE, implies parted a-crofs the middle of the shield from side to side, through the *Fesse* point.

This the French express by one word, *coupé*.

FESTI Dies, among the antients, were *Fest*-days, or holiday-days.

Numa distinguished the days of the year into *Festi*, *profesti*, and *interfesti*.—The first were those dedicated to the gods; the second were those allowed to men, for the management of their own affairs; the third were shared between the gods and men.

The *Festi dies*, again, were divided, according to Macrobius, *Saturn.* c. 16. into sacrifices; epule, or banquets; lud, or games; and terie; see **FERIÆ**, &c. and the *profesti* into *Festi*, *comitiales*, *comperendini*, *stati*, and *præliari*. See **FASTI**, &c.

FESTINO, in logic, one of the moods of syllogisms.

In a syllogism in *Festino*, the first proposition is an universal negative; the second, a particular affirmative; and the third, a particular negative.

FESTIVAL, see the articles **FEAST**, and **FESTUM**.

FESTOON, in a general sense. See **GARLAND**.

FESTOON *, in architecture, and sculpture, is a decoration in form of a garland, or cluster of flowers.

* The word is French, *Feston*, which signifies a garland, formed of the Latin *festum*, feast.

It consists of a string, or collar of flowers, fruits, and leaves tied together, somewhat biggest in the middle, and suspended by the two extremes; from which, beside the main part which falls down in an arch, two lesser parts hang perpendicularly.

This ornament is made in imitation of the *Festoons*, or long clusters of flowers, hung by the antients on the doors of their temples, &c. on festival occasions.

Festoons are now chiefly used in freezes, and other vacant places, required to be filled up and adorned.

FESTUM, in a general sense. See the article **FEAST**.

FESTUM, in our law books, is frequently used for a general court, or assembly; in regard such were antiently always kept on the great festivals of the year.

Thus, in our chronicles, we read, that in such a year the king kept his *Festum* at Winchester, &c. that is, he kept a court there at that time: *Rex apud Winton. maximum Festum & convivium celebravit, tempore natalis Domini, convocatis ibidem principibus & baronibus totius regni.*

FET-Lock, in the menage, a tuft of hair growing behind the pattern joint of horses.

Hence, the joint where it grows, is called the *Fetlock-joint*.

FETUS, see the article **FOETUS**.

FEUD, **FEODUM**, the same with **FEF**, or **fee**. See **FREE**.

FEUD is also used in our antient customs, for a capital quarrel, or enmity, not to be satisfied but with the death of the enemy.

Feud, called also *Feida*, and *Faida*, in the original German signifies *guerram*, i. e. *bellum*, war: Lambert writes it *Fetb*, and *faitb*, it signifies *capitales inimicitias*, or implacable hatred.

In Scotland, and the north of England, *Feud* is particularly used for a combination of kindred, to revenge the death of

any of their blood, against the killer and all his race, or any other great enemy.

FEUDAL, or **FEODAL**, of, or belonging to a *Feud*, or *Fee*. We say, a *Feudal* matter, *Feudal* jurisprudence, *Feudal* seizure, &c. A *Feudal* lord, in default of fealty and homage from his vassal, may seize the fruits of the fee. A Neapolitan lawyer, called *Caracitua*, has a Latin treatise of the *Feudal* law, entitled, *Prælectiones Feodales*.

When once the use of fees was thoroughly established in France, they would need extend it much further: and almost all the great offices of the crown thus became *Feudal*; even the courts of justice were drawn in; in order to which they were annexed to certain lands, or revenues.

The design of these infeudations was to render the offices hereditary, after the manner of fees, which were now become so. And thus the offices of the grand chamberlain, grand butler, &c. came to be held by hereditary right.

FEUDATARY, or **FEODATARY**, a vassal, or person who holds of a superior in fee, i. e. on condition of yielding him fealty, and homage, or other service.

The electors, princes, and free cities of Germany, are all *Feudataries* of the emperor.

F. Daniel observes, that Charles VII. forbade the count d'Armagnac to call himself in his titles, by the grace of God count d'Armagnac; such terms, which seem to exclude all dependence, except on God, being an innovation prejudicial to the right of the sovereign, and which had never been allowed to any duke, or count, who was a *Feudatary* of any crown. *Histoire de France*, t. ii. p. 1162.

FEUDBOTE, a recompence for engaging in a feud, or faction, and for the damages consequent thereon; it having been the custom of antient times for all the kindred to engage in their kinsmens quarrels, according to that of Tacitus de *Morib. Germanor.* *Suscipere tam inimicitias seu patris, seu propinqui quam amicitias necesse est.*

FEUDIST, a lawyer, or doctor learned, or much conversant in *Feuds*, or *fees*.—Du Moulin is reckoned a great *Feudist*.

FEVER, **FEBRIS**, in medicine, a disease, or rather class of diseases, whose characteristic is a præternatural heat felt through the whole body, or at least the principal parts thereof; attended with other symptoms.

Sydenham defines a *Fever* a strenuous endeavour or effort of nature, to throw off some morbid matter, that greatly incommodes the body.—Quincy defines it an augmented velocity of the blood: others, a fermentation of the blood accompanied with a quick pulse, and excessive heat.

The causes of *Fevers* are innumerable; and the disease even often arises in the foundest bodies, where there was no previous morbid apparatus; as *Cachymia*, *Pleurora*, &c. but merely from a change of air, food, or other alteration in the non-naturals.—A *Fever*, Boerhaave observes, is an inseparable companion of an inflammation.

The symptoms are many: every *Fever* arising from any internal cause, is attended with a quick pulse and an unusual heat, at different times, and in different degrees. Where these are intense, the *Fever* is acute; where remitt, it is call'd flow.

The disease begins almost always with a sense of chillness; and in its progress is chiefly distinguished by the velocity of the pulse: so that a too quick contraction of the heart, with an increased resistance or impulse against the capillaries, furnishes the proper idea of a *Fever*; and the health of the patient is the scope nature chiefly aims at in the disease.—Other attendant symptoms are usually a laborious and disturbed respiration; an uniform, high-coloured urine; a parchedness and dryness of the tongue, mouth, &c. a clamminess of the saliva; thirst; and wakefulness; and a nausea against every thing but thin diluting liquors.

From these symptoms, Dr. Morgan lays it down as a principle, that in every *Fever*, there is a general obstruction, and diminution of the glandular secretions; that is, a great part of the lymph, or serum of the blood, which ought to be continually drained off by the glands, is, during the *Fever*, so retained in, and closely united to, the mass, that it circulates together with it in the veins and arteries. This he endeavours to prove to be the state and condition of the blood in the production of a *Fever*, by accounting for all the above-mentioned phenomena from it, as the just and adequate effects of such a cause. How he does this, see in his *Philos. Princ. of Med.* p. 207, &c.

The general indication in the cure of *Fevers*, is, to restrain the commotion of the blood within the bounds agreeable to the end nature had in raising it, i. e. neither to let it rise too high, for fear of the consequence; nor yet keep it too low, for fear of frustrating the endeavour of nature. And hence is to be deduced the rule and measure of letting more, or less blood, or none at all.

The cure of *Fevers*, Boerhaave summarily comprehends in correcting the sharp, irritating *febrile* matter, dissolving the lentor, and mitigating the symptoms. If nature seem to carry the *Fever* too high, it must be moderated by abstinence, thin diet, drinking of water, bleeding, and cooling clysters:

If she bring it on too slowly, it must be excited by cardiacs, aromatics, volatiles, &c. The cause removed, the symptoms cease of course; and if they can be bore without much danger of life, it were best not to enter into any particular cure thereof; if they be unreasonable, or too severe, they are each to be abated with the proper remedies.

Sydenham recommends an emetic in the beginning of a *Fever*; or, if it have been omitted, in any other stage thereof; especially where there is a propensity to vomiting: for want of this, a diarrhoea frequently succeeds, which is often exceedingly dangerous. After this, he uses a paretic; and the following days, if there be no indication to repeat the venesection, nor any diarrhoea, he prescribes every other day an enema, till the twelfth day, when matters usually coming to a crisis, he has recourse to hotter medicines, in order to promote and accelerate it. He adds, that if the disease proceed well, and the fermentation be laudable, there is no occasion for any phytic at all. About the fifteenth day, if the urine be found to separate, and give a sediment; and the symptoms be abated, a cathartic is usually ordered, lest the sediment returning into the blood again, occasion a relapse. Nothing cools the patient, and abates the *Fever*, so much as a cathartic after venesection.

The more acute the *Fever*, the thinner, according to Etmüller, must be the diet. It is no matter, if the patient should fast for several days running; for never did *feverish* persons die of hunger: eating always exasperates the disease. Emetics, he allows the principal place in the cure of all *Fevers*; but, as a patron of the hot regimen, he assigns sudorifics the second. Spirit of sal ammoniac, or its sal volatile, he observes, is an universal sebrifuge, and rarely fails: all figured things are hurtful.

Hippocrates, in all *Fevers*, prescribes wines; Dr. Hancock, water.

So long as the urine remains crude, that is, does not give a sediment, the patient's case is dubious: but when once the coction commences, and the urine separates, the great danger is generally over.

Among the signs of death, the same author adds, there is none more certain, than a frequent blowing of the nose, without any discharge of matter. A strong, equable pulse, with deliria, tremors, twitches of the tendons, and other symptoms, fatal in diseases of the nervous kind, always preface well in *Fevers*: on the contrary, a quick, weak, faltering pulse, howsoever favourable the other symptoms may seem, infallibly proclaim death at hand. Morton.

It appears, by observation, that a frequent letting of blood, renders persons more inclinable to *Fevers*.

Fevers are of various kinds, denominated and distinguished from the particular causes that produce them; the time they continue; their accessions, and returns; and their different symptoms.—The most general and genuine division of *Fevers*, is into *essential*, and *symptomatic*.

Essential FEVER, is that whose primary cause is in the blood itself; and which does not arise as an effect, or symptom from any other disease in the solids, or other parts.

This is what we absolutely and properly call a *Fever*.

Symptomatic FEVER is that which arises as an accident, or symptom of some other antecedent disorder, as an inflammation, phlegmon, erysipelas, imposthume, small-pox, pleurisy, &c. Whence it is peculiarly denominated inflammatory, erysipelatous, purulent, variolous, or pleuritic *Fever*.

Essential Fevers are generally distinguished into *continued* and *intermitting*: others chuse to divide them into *diary*, *intermitting*, *continent*, and *continued*.

Continual FEVER is that which gives the patient no respite, or intermission; but sticks to him from its first seizure, to its final period.

This is subdivided into *putrid*, and *not putrid*.

Continual FEVER not putrid, is that wherein the parts of the blood are not so dissolved and broke, as to give occasion for the principal parts thereof to be secreted; or that, wherein there is not any discharge of putrid, purulent matter into the blood.

Of this there are two kinds, the *diary*, and *synochus*; to which some add the *hætic*.

Diary FEVER, is that, which does not ordinarily hold beyond twenty-four hours. It is the gentlest of all *Fevers*; is frequently got by too much exercise, or other external accidents. It is cured by rest alone, and keeping in bed: if it remain for several days, it is either called a continual *ephemera*, or simple *synochus*.

Hætic FEVER is a slow, durable *Fever*, which extenuates and emaciates the body by insensible degrees.

It has three stages; the first, while it consumes the juices of the body: the second, when it exhausts the fleshy substance of its humidity: and the third, when it lays hold of, and destroys the solids themselves; in which last stage it is reputed incurable. Its effect is somewhat like that of a flame; first consuming the oil of the lamp; then the moisture of the wick; and lastly the wick itself. But this *Fever* is frequently

considered as of the *symptomatic*, or *secondary* kind, arising in phthisis, &c.

Continual putrid FEVER, is that wherein the texture of the blood is rendered so lax, or even dissolved, that its parts or principles separating, some of the principal of them are secreted, and lost.

Putrid Fevers are frequently considered as *secondary* ones, arising from the discharge of putrid, purulent matter from some morbid part, as an ulcer in the lungs, &c. They are divided into *simple*, and *compound*, or *remitting*.

Simple continual putrid FEVER, or a *continent FEVER*, properly so called, by the Greeks, *Συνεχὺς*, is that which continues uniformly from first to last, without any fits or periods of exasperation and remission of heat, and the other symptoms.

Willis divides the *putrid Fever* into four stadia, or stages. The beginning, which is attended with a chilliness, shivering, weariness, thirst, wakefulness, pain in the head and loins, nausea, and vomiting. The increase, wherein the former symptoms are heightened, with the addition of deliria, convulsive motions, foulness of the mouth, and high turbid urine without any laudable sediment, or hypostasis. The state, which contains the crisis, which in this disease is much what the paroxysm in *intermittents*: for as that returns at certain hours, so do the critical motions in continued *Fevers* happen on the fourth, fifth, sixth, or seventh day.

The last stage is the declension, which ends either in recovery, or death.

These *Fevers* are subdivided into *burning* and *slow*.

Ardent, or *Burning FEVER*, called by the Greeks *καύρ*, is a very acute *Fever*, attended with a vehement heat, intolerable thirst, a dry cough, delirium, and other violent symptoms.

It frequently kills on the third, or fourth day; and rarely exceeds the seventh. It often goes off in a hæmorrhage, on the third, or fourth day; which, if it prove too sparing, is usually fatal. Sometimes it goes off by stool, vomiting, &c. and sometimes it ends in a peripneumony.

To the class of *burning Fevers* are reducible, the *Lipytia*, *Assides*, *Helodes*, &c.

The *Lipytia* is a burning *Fever*, wherein the heat is very intense within side, and at the same time the external parts are cold.

The *Assides* is a burning *Fever*, attended with great inquietudes, nausea, vomiting, &c.

The *Helodes* is a *Fever*, wherein the patient sweats continually.

The *Syncopeal Fever* is that attended with frequent swoonings.

The *Epiolos* is that wherein both heat and cold are felt in the same part at the same time.

Slow FEVERS are gentle, but durable ones, they consume the patients by degrees. They usually arise from disorders in the lymph, or pituita; whence Sylvius calls them *Lymphatic Fevers*.

The principal of these are the catarrhal, attended with a catarrh, cough, hoarseness, &c. And the scorbutic *Fever*, into which acute *Fevers*, and sometimes intermittent kinds degenerate. To this class are also reducible,

Colligative FEVERS, wherein the whole body is consumed and emaciated in no long time; the solid parts, with the fat, &c. melted down, and carried off by a diarrhoea, sweat, urine, &c.

Remitting FEVER, called also a *Continual Fever*, *Συνεχὺς*, and a *compound continual Fever*, is that which continues some time, without any gradual increase of heat; yet is liable to alternate fits of remission and aggravation; either stated and periodical, or irregular.

Of this there are divers kinds, denominated from the periods of returning; as the *Remitting*, *continual Quotidian*, *continual Tertian*, *continual Quartan*, &c. which are only a continued *Fever*, whose accessions or severer fits return every day, or every other day; or every third day; or every fourth day.

Some enumerate divers other more complicated continual *Fevers*; as the *double* or *triple Quotidian*, which has two or three paroxysms every day: the *double* or *triple Tertian*, or *Quartan*, which have two or three every third or fourth day: the *Semi-Tertian*, by the Greeks called *ἡμιστερὰς*, which consists of a *continual*, and two intermitting *Fevers*, of different kinds, viz. a *Quotidian*, and *Tertian*. The patient, beside a continual *Fever*, having an extraordinary fit every day; and every other day two.

Others divide the *remitting*, *Συνεχὺς*, or *compound continual Fever*, into *simple*, and *spurious*.

The *simple Remitter* returns regularly, and is only distinguished from an intermitter, in that the feverish heat in the intervals of this latter is never quite extinguished; and that the paroxysms do not begin with so much chilliness and horror; and go off in profuse sweats.

The *spurious Remitter* is attended with grievous symptoms in the nervous kind, resembling those of the rheumatism, cholic, pleurisy, and other inflammatory and spasmodic diseases; beside immoderate excretions, vomitings, diarrhoeas, &c. Whence its returns are uncertain, and variable.

FEV

The *simple* rarely, if ever, kills; the *spurious*, frequently. Sometimes it degenerates into a malignant *Evox*. The first is cured with the cortex peruv. almost as infallibly as an intermitter; the *febrile ferment* being much the same in both; and the same medicine is found almost a sure, though not so speedy a remedy of the *spurious*, if properly applied.

Intermitting FEVER, is that which ceases, and returns again alternately, at stated periods; and is called also an *Ague*.

In this kind, cold and heat, shivering and sweating, succeed each other. The paroxysms are attended with sickness, nausea, vomitings, head-ach, pain in the back and loins, &c. The paroxysms are acute, but the disease usually more or less chronic.

Nobody was ever killed by an *intermitting Fever*, except in the first stage of the paroxysm, during the shivering caused by the oppression of the spirits. But when the disease becomes of a very old standing, it sometimes degenerates into other fatal ones.

As to the cure, it is found by abundant observations, that neither bleeding, nor emetics, nor cathartics, nor any other remedy administered during the fit, avail any thing. A just dose of vinum benedictum, three hours before the paroxysm, Morton assures us, has often cured it: antimonium diaphoreticum, a little before the paroxysm, has sometimes had the like effect: and salt of wormwood is commended on the same occasion. Dolæus mentions lapis lazuli taken in spirit of wine before the fit, as admirable.

Several bitters, as carduus benedictus, gentian root, camomile flowers, the pulvis febrifugus, &c. were much valued before the invention of the cortex peruv. But that bark has almost thrown them all out of use; being by the general consent of physicians allowed a specific for *intermitting Fevers*, in all seasons, ages, and constitutions.

Intermitting Fevers are of divers kinds, as the

Quotidian FEVER, where the paroxysm returns every day.

Double Quotidian, which returns twice in twenty-four hours.

Tertian FEVER, which only returns every other day; which again is either *agminate*, or *spurious*.

The *legitimate Tertian* only holds twelve hours, and is followed by an absolute intermission.

The *spurious Tertian* exceeds twelve hours, and sometimes holds eighteen or twenty.

Double Tertian, is that which returns twice every other day.

The name *Double Tertian* is also used, where the *Fever* returns every day; like a quotidian; only at different times of the day; the third fit answering to the time of the first; the fourth to that of the second, &c.

Quartan FEVER, is that which only returns every third day, leaving two days intermission between every two fits.

Double Quartan, is that which has two fits every fourth day. The same name is also given to a *Fever*, which returns two days successively; only leaving one day's intermission.

Triple Quartan Fever, is that which has three fits every fourth day; or that which returns every day like a quotidian, only at different seasons of the day; the fourth fit answering to the time of the first; the fifth to the second, &c.

There are also *intermitting Fevers*, which only return every fifth day, or every sixth, or every seventh, and at other intervals.

Lastly, there are some extraordinary species of *Fevers*, not reducible to any of the forementioned classes; as *malignant*, *eruptive*, and *pestilential Fevers*.

Malignant FEVERS are those wherein the usual regular symptoms do not appear (nature being oppressed with the malignity of the *febrile matter*) but other foreign symptoms arise; as a pain about the stomach, and præcordia; a livid complexion, with the face much disfigured, &c. and sometimes efflorescences on the skin, &c.

Some authors, from microscopical observations affirm, that in all *malignant Fevers* the blood is so corrupted, that swarms of little worms are generated therein, which occasion most of the symptoms.

In all *malignant Fevers* the blood is too fluid. Blood-letting has here no place; emetics do well at first, afterwards sudorifics and alexipharmics; blisters are commended in the progress of the disease.

Eruptive FEVERS are those, which, beside the symptoms common to other *Fevers*, have their crises attended with cutaneous eruptions. Such are those of the small-pox, measles, the petechial, the purple or scarlet *Fever*, and the miliary *Fever*: the other symptoms are, a grievous oppression of the breast, laborious short breath, obstinate waking, spasms, sore throat, cough, &c.

Pestilential FEVERS, are acute, contagious, and mortal diseases. Some will have the *Fever* to be the disease or plague itself; others only account it a symptom of the plague. See *PLAGUE*.

Petechial FEVER is a malignant *Fever*, wherein, beside the other symptoms, on the fourth, or more frequently on the seventh day,

FIB

petechiæ, or red spots, like flea-bites, appear, chiefly on the breast, shoulders, and abdomen. The spots afterwards turn paler, then yellow, and so disappear. When they grow livid, or black, they usually prove fatal.

This *Fever* is contagious, and often epidemical. It is treated much as those just mentioned.

FEUILLANS, an order of religious, clothed in white, and going bare-foot; who live under the strict observance of the rule of St. Bernard.

The name was occasioned by a reform of the order of Bernardines, first made in the abbey of *Feuillans*, a village in France, five leagues distant from Thoulouse, by the Sieur Barriere, who was abbot thereof in 1589.

It was approved of by pope Sixtus V, and the popes Clement VIII, and Paul V, granted it its particular superiors. King Henry II. founded a convent of *Feuillans*, in the Fauxbourg St. Honore, at Paris.

There are also monasteries of nuns, who follow the same reform, called *Feuillantines*.

FEUILLE de siec, in heraldry, expresses that an ordinary, as a fesse, pale, or the like, is indented only on one side; in regard it then looks like the leaf of a saw, as the French phrase imports.

FEWEL, or *FUEL*, in philosophy, the pabulum of fire, or whatever receives and retains fire, and is consumed, or rendered insensible thereby.

Pure fire, if left to itself, would disperse and disappear; to preserve it, it is necessary there be some *Fuel*, to sustain and keep it together.

The only proper *Fuel* known in all nature, is oil, commonly called sulphur; and all bodies, whether vegetable, fossil, or animal, are only inflammable, as they contain oil in them.

Oil feeds and sustains fire by virtue of its ramose, tenacious particles, which are disposed to be put into a most vehement, rotatory motion, before they will let each other go. But, by this rotatory motion, the fire at length breaks and comminates the ramose particles of the *Fuel*; till, ceasing to cohere, they are no longer able to sustain the fire.

In the popular sense of the word, *Fuel* is any body, which contains this pabulum, or oil, in such quantity, as to fit it for culinary uses.

Such, 1^o, Are dry or green vegetables; especially those abounding in oil; as the resinous and balsamic woods.

2^o, Coals, whether vegetable, or animal; as being little else, but the oily part of the vegetable, or animal, purged of the salt, water, &c. so that the blacker they are, the better.

3^o, Fossil and bituminous earths, as turf and peat, which are a fatty earth, dug out of the ground.

4^o, All mineral sulphur, whether pure, or mixed with earth, stone, &c.

5^o, The fat and dungs of animals, dried.

And, 6^o, The productions of chemistry, which are either coals, or oil, or oily bodies; as inflammable spirits, produced by fermentation, putrefaction, &c.

FIBRA auris, see the article *EAR*.

FIBRE, in anatomy, a similar part of the animal body, called also *Filament*; and when very small, *Fibrilla*, or *Capillament*.

A *Fibre* is a long, slender, white thread; which being variously interwove, or wound up, forms the various solid parts of an animal body: so that the *Fibres* are the stamens, or matter of the animal.

Anatomists usually distinguish four kinds of fibres, viz. *carneus*, or *fleshy*, *nervous*, *tendinous*, and *osseous* or *bony*; of one or other of which all the other parts consist. See *FLESH*, *NERVE*, *TENDON*, *BONE*, *MUSCLE*, and *SENSATION*.

Fibres again are divided, with respect to their situation, into *direct* or *longitudinal*, which proceed in right lines; *transverse*, which cut, or go a-crofs the former, at right angles; and *oblique*, which intersect, or cross them at unequal angles. —

Some anatomists reduce the animal *Fibres* to two species, viz. *muscular* or *motive*, and *nervous* or *sensitive*.

Nervous FIBRES are the minute threads, whereof the nerves are composed. They arise from the medulla of the brain, as that does from the cortex, and that again from the last finest ramifications of the carotid and vertebral arteries; so that it is probable, these nerves are in reality only continuations of those arteries.

From every point of the cortex there arises a fine, medullary *Fibrilla*: these uniting in their progress, form the medulla of the cerebrum, cerebellum, and oblongata; and *Fibrillæ* arising from each point of these again, form the spinal marrow.

From the medullary substance of all these parts, arise nerves, which are combinations or assemblages of a number of these minute medullary *Fibres* inclosed, after they are got out of the cranium, in a common membrane, or coat from the pia mater: and it is probable, that to each nerve, there concur *Fibres* from all three; as also that these *Fibres* are so many fine hollow tubuli or canals, for the conveyance of a fine juice or spirit from the brain throughout the body. See *NERVE*.

Muscular

Muscular FIBRES are those whereof the muscles, or fleshy parts of the body are composed. Every muscle is divisible into other less ones; and these into others, still less, beyond all imagination. The last and smallest are the muscular *Fibres*; which whether or no they be vesicular, is some question.

Now, there are nerves propagated to every muscle, and distributed through the body thereof; so that there is no assignable point wherein there is not somewhat of a nerve. Add, that all the nerves here disappear; and that in other parts of the body, the extremities of the nerves are expanded into membranes. It is therefore probable, that the muscular *Fibres* are only continuations of the nervous ones.

The animal *Fibres* have different properties; some are soft, flexible, and a little elastic: and these are either hollow, like small pipes; or spongy, and full of little cells, as the nervous and fleshy *Fibres* above mentioned.

Others are more solid, flexible, and endowed with a strong elasticity, or spring; as the membranous and cartilaginous *Fibres*.

A third sort are hard, and inflexible; as the *Fibres* of the bones. Of all these, some again are very sensible, and others wholly destitute of sense: some so very small, as not to be easily perceived; and others, on the contrary, so big, as to be plainly seen: and most of them, when examined with a microscope, appear to be composed of still smaller *Fibrillæ*.

These *Fibres* first constitute the substance of the bones, cartilages, ligaments, membranes, nerves, veins, arteries, and muscles. And again, by the various texture, and different combination of some, or all of these parts, the more compound organs are framed; such as the lungs, stomach, liver, legs, and arms, the sum of all which make up the body.

The great property of *Fibres*, is elasticity, or a power of contraction, after the distensible force is removed; upon the knowledge of which that of the animal mechanism greatly depends.

To understand this, it may be observed, that any membrane or vessel may be divided into very small *Fibres*, or threads; and that these threads may be drawn out into a very considerable length, without breaking; and that when such external force is removed, they will again restore themselves to their proper dimensions. It is farther also manifest, that this property is preserved to them by a convenient moisture; because if one of those threads be dried, it immediately loses it; so that upon the application of any force to stretch it, it will break; its lying faked in liquor too much, will on the other hand, render it flaccid, and destroy all its power of restitution, when distended.

Now some hints of that configuration of parts, upon which this property depends, Dr. Quincy maintains, may be had from the contrivance and properties of a syringe; with the reason, why it is so difficult to draw back the embolus, when the pipe is stopped; and the necessity of any liquor's following it, wherein the pipe is immersed.

All that is necessary hereto, is, that the embolus be so exactly adapted to the inner surface of the barrel, as to prevent any air passing between them, when it is drawn up: it matters not what figure the barrel is of, so that the embolus be well fitted to it. A case of syringes therefore might be contrived, wherein every barrel may also serve as an embolus to the exterior one, which immediately includes it.

In this manner it is not difficult to imagine a continued series of particles, so put together, that they may be moved, and drawn upon one another, without suffering the air immediately to enter into the interstices made by their distraction; whereupon as soon as that force, which drew them, is removed, they will, for the very same reason as the embolus of a syringe, rush up again into their former contacts.

As suppose A B (*Tab. Nat. Hist.* fig. 23.) two particles touching one another in *e f*, and C D two others, covering the opposite sides of their contacts. It is also to be supposed, that on the other sides they are covered with other particles in the same manner, as by C D, so that the places of their contacts are on all sides covered from the air, or the insinuation of any fluid body.

If now A B by an external force, greater than that of their cohesion, be drawn from each other, as far as G I and H K (*fig. 24.*) as soon as that force is removed, they will again run into their former contacts in *e f* (*fig. 23.*) that is, if they be not so far separated as to bring their transverse surfaces to coincide with C and D; for then the air, or circumambient fluid will interpose and prevent their reunion: so that by this contrivance, so much of A and B as is inclosed by other surrounding particles, is as the embolus of a syringe, and the particle surrounding them as its barrel. And therefore when A and B are distracted from their contacts in *e f*, it will be with some difficulty; and when the distracting force is taken away, they will again run into their former contacts; just as the embolus of a syringe, and for the same reason.

It is not rigidly contended that this must exactly be the texture of a *Fibre*, but only something like this; whereby the interstices of the interior orders are covered by the exterior in such a manner, that when the thread is distended, that is, when its constituent parts are drawn from their

transverse contacts, neither the air, nor any other external fluid can get between them, so as to hinder their re-union as soon as such force is withdrawn; that is, if their distraction, as was before said, be not so far as to bring their transverse surfaces to a co-incidence with one another; for then the circumambient fluid will interpose, that is, the thread will be broke.

But besides this peculiar arrangement of a determinate set of particles to compose the main substance of an animal *Fibre*, endowed with the properties abovementioned; it seems not at all unreasonable to conjecture, that into their composition there also enters a common capsula, or covering, which assists in the wrapping up, and holding together those fasciculi, or assemblages of particles already described; not much unlike the periosium of the bones; the texture of which covering, resembling that of a net, cannot any ways hinder, either the transverse, or longitudinal distractions of the other parts.

Supposing this, then, the texture of a *Fibre*, it will be necessary to consider, what farther requisites are needful to put them into that state, which they are in, in a living body; to shew how they are maintained in continual motion; and what are the consequences of it.

And, 1^o It is necessary to take notice, that all the *Fibres* in a living body are in a state of distention; that is, they are drawn out into a greater length than they would be in, if separated from the part, and taken out of the body; which is demonstrable upon any solutio continui, as in the transverse division of a nerve, or artery; for immediately the divided parts run up, and leave a great distance between them; and the fluids contained between them, upon such contraction are squeezed out. This also shews, that their natural distractions are owing to some fluids being propelled into the vessels which they compose, with a force greater than their endeavours of restitution, so far as to obtain a close contact of all their transverse surfaces; but yet less than that which is necessary to distract them, so as to bring them into a co incidence; for then the vessels would break.

2^o This state of distraction must necessarily leave vacuola between all the transverse surfaces; as between G I and H K (*in fig. 24.*) which may be represented by the several series's of particles (*fig. 25.*) which vacuola will continue as long as the longitudinal surfaces of the component parts continue to close to one another, as to prevent the insinuation of any foreign matter, how subtle soever, between them.

For the same reason therefore, as when the embolus of a syringe is drawn, and the pipe is stopped; there must be continually a nilus restituendi, or an endeavour of contraction.

There is also this farther necessity of their being continued in a state of distraction; because if they were closely to touch one another in all parts, they could not be put into, and continue in those undulatory motions, which they are always in, in a living body, without being altered in their figures and textures.

3^o It being manifest, that all animal *Fibres* are continued by the perpetual successive impulse of the fluids, in such undulatory motions; besides this necessity of their distraction, they must also necessarily be continually moistened with some convenient fluid; because otherwise their continual attritions against one another would wear them out, as well as render it difficult to move them: the fluid also for this purpose, must be very soft and subtle, because otherwise it could not insinuate itself into all the interstices of the *Fibres*, without so far separating their parts, as is inconsistent with that texture and mechanism here laid down.

Upon this view there arises a very natural explication of several terms, much used by mechanical writers; such as *distractio*, *contraction*, *vibration*, *undulation*, *tonic motion*, *convulsion*, *relaxation*, *corrugation*, and *elasticity* of the solids; all which are but different ways of expressing the various modifications and dispositions of those machinulae whereof all the *Fibres* are composed.

Thus much being granted of the texture of a *Fibre*, and the requisites for its office, it is to be considered, how it comes first to be set in motion, and by what mechanism that motion is afterwards carried on. Suppose then the *Fibre* (*fig. 25.*) in such a state of distraction, as before-mentioned; it is certain by *reg. 2.* that in all its parts there is a nilus restituendi: where, then, any external impulse is made against it from R to S, successively, thrusting it from P towards Q, it is certain that against I for instance, the thread will be more distracted than in any other part; and thereby will there be a greater endeavour of restitution. And therefore the impulse passing on towards S, all the constituent machinulae, 1, 2, 3, 4, will successively move one after another.

To make this matter still more plain, let a portion of an artery be represented by *fig. 26.* though which the blood is continually propelled in a direction parallel to its axis: nothing is more certain, than that if it were not for the resistance of the sides of the artery at E, F, the blood setting out at A, B, would go on by the prickled lines C, D; and therefore it cannot but strike against the sides of the artery at E, F, and distract them there more, than any where else; whereby their endeavours of restitution will be there the greatest: and therefore, when the impulse of the blood has raised them to a certain measure, wherein their endea-

yours of restitution will exceed the impulse which raised or distracted them, their contractile powers will draw them again into the same dimensions; and consequently the blood will be thrust forward into the next section of the artery, and so on successively from one to another, through the whole course of its circulation; the contraction of one section of an artery being the true cause of the blood's impulse against, and raising the next.

FIBRE is also applied in physics, to those long, fine parts, or threads, whereof other natural bodies are composed, and which prevent their being friable or brittle.

Trees, plants, and fruits have their *Fibres*, or capillaments; which are modifications of their woody substance, penetrating and terminating in the parenchyma, or pith.

In the common sense, *Fibre* is chiefly applied to the slender capillary roots of plants.

Kepler even gives *Fibres* to the stars; and explains several of their motions from the situation of their *Fibres*.

FIBRILLA*, a little *Fibre*, or capillament. See **FIBRE**.

* The word is a diminutive of *Fibra*. Each *Fibre* is divisible into a number of lesser threads, called *Fibrille*.

FIBULA, in anatomy, one of the bones of the leg, called also *Perone*, *Sura*, and *Facile minus*.—See *Tab. Anat. (Osteol.)* fig. 3. n. 24. 24. fig. 7. n. 27. 27.

The *Fibula* is the outer, and slenderer of the two bones of the leg; and yet, notwithstanding its being more exposed, and its being much weaker than the inner bone, or tibia, it is not so often broken, as being more pliant and flexible; whence the tibia often breaks, leaving the *Fibula* entire.

The *Fibula* is joined or articulated with the tibia, at both ends, by a kind of close arthrodia. It is divided into three parts: the upper, which is a round head, terminating a little below the knee, and receiving a lateral protuberance of the tibia into a small sinus, by which the articulation of this part is effected. The middle is very slender, long, and triangular, like the tibia, but somewhat more irregular. The lower part is received into a sinus of the tibia, and then shoots out into a large process, called the *Malleolus internus*, or inner ankle: it is a little hollow on the inside, to give liberty for the astragalus to move; and a little convex on the out-side, that it may have the more strength, to retain the astragalus.

The tibia and *Fibula* only touch at the two extremes, like the radius, and ulna: the space between them is filled up with a strong membranous ligament, which ties them together, and strengthens the articulation.

FIBULA, in surgery, an instrument in use among the ancients, for the closing of gaping wounds.

Celsus speaks of the *Fibula*, as to be used when the wound was so patent as not easily to admit of being sewed.

Authors are somewhat at a loss as to the form of the ancient *Fibule*. Guido says, they were iron circles, or semicircles bent backwards both ways; the hooks whereof being fastened on both sides to the wound, answered exactly to each other: but, as this must have been an insupportable pain to the patient, this description is generally set aside.

Fallopian, Santorius, and others, take the word *Fibula* to have signified, in reality, no more than the sewing up of the wound with a needle and thread, as used at this day.

FIBULÆUS, in anatomy, a muscle of the leg, called also *Peronæus primus*. See **PERONÆUS**.

FICUS, a kind of fleshy excrescence, growing sometimes on the eye, or eyebrows, or chin; but more usually on the anus, or at the fingers ends.

It is also called *Sycosis*, *Sycoma*, *Ficatio*, *Ficofus tumor*, and *Marisca*. See Supplement, article **FICUS**.

FICHANT*, *Figens*, a French term, used in fortification: thus, a flank *Fichant*, or a line of defence *Fichant*, is a place, whence the shots made, do not only raze the opposite face to be defended, but also enter within it.

* The word is formed of *ficher*, to stick a thing in.

FICHE, in heraldry; see **FITCHEE**.

FICTION, see **FABLE**.

FIDDLE, see the article **VIOLIN**.

FIDE-JUSSOR, in the civil law, is a surety; or one that obliges himself in the same contract with a principal, for the greater security of the creditor, or stipulator.

FIDEI-COMMISSUM, in the Roman law, the appointing of an heir, or bequeathing a legacy to a person, on this condition, that he surrender the inheritance or legacy to another person, for whom the same is originally meant: or, it is an inheritance left in trust with any one, for the use of another.

Fidei-Commissa were much used among the Romans. In the French law the thing is become odious; as being, ordinarily, no other than an expedient in favour of persons to whom the laws forbid any thing to be given. In order to this some trusty friend is chosen to be made legal heir, under a tacit agreement, to deliver the inheritance to the person incapacitated by law. But of later times the same expedient has come in use with regard to persons capable of inheriting;

to whom the testator, for particular reasons, does not care to leave the inheritance directly.

As it happened that the *Fidei-commissioners* did not always faithfully restore what was trusted to them, Augustus took proper measures to oblige them thereto: to this end a prætor was erected, whose business was restrained to the single matter of *Fidei-commissiones*. *Inst. lib. ii. tit. 23.*

As a testament was null without the institution of an heir; and it frequently happening that the *Fidei-commissioner* refused to accept the trust, upon which the testament fell to the ground; to engage somebody to accept it out of the consideration of advantage, the Paganian senatus-consultum decreed, that the *Fidei-commissioner* should be at liberty to retain a fourth of the *Fidei-commissum*.

FIDICINALES, in anatomy, a name given to several muscles of the fingers, called also *Lumbricales*. See **LUMBRICALES manus**.

FIEF, the same with *Fend*, or *Fee*. See **FER**.

FIELD, in agriculture, a piece of land inclosed, and fit for tillage, to bear corn, hay, &c.

FIELD, *Campus*, in antiquity, is frequently used for a publick place, or square in a city, &c.

Such were the *Field of Mars*, *Campus Martius*; and *Field of Flora*, *Campus Floræ*, in Rome; and the *Field of May*, *Campus Maii*, among our ancestors, &c. See **CAMPUS**.

FIELD of Mars, was denominated from a temple of that deity, built therein: it was the scene, or place of the assemblies called *Comitia*. Tarquin the Proud at length appropriated it to his own uses:—But after the expulsion of the kings, the consuls Brutus and Collatinus restored it to the publick use again, for assemblies and elections.

Originally it was no more than a meadow on the banks of the Tiber, where horses grazed, and the Roman youth were exercised to war. But it was afterwards erected into a magnificent square, adorned with statues, &c.

FIELD of Flora, was the place, where the laws, edicts, and constitutions were published.—

For **FIELD of May**, see **CAMPUS Maii**.

FIELD, in heraldry, is the surface, or face of the shield, or escutcheon; thus called, as containing the achievements antiently acquired in the *Field of battle*.

The *Field* is the ground whereon the colours, bearings, metals, furs, charges, &c. are represented. In blazoning a coat, we always begin with the *Field*: he bears fable, &c.

Among the more modern heralds, *Field* is less frequently used than shield, or escutcheon.

FIELD of a painting, &c. is more usually called the *ground* thereof. See **GROUND**.

FIELD, in war, the place where a battle was fought.—The general remained master of the *Field of battle*.—

Close FIELD, was antiently a place inclosed, or railed in with a barrier, for jousts and tournaments to be performed in.

FIELD Colours, are small flags about a foot and a half square, which are carried along with the quarter-master-general for marking out the ground for the several squadrons and battalions of an army. See **FLAG**.

FIELD Pieces, are small cannon, usually carried along with an army in the *Field*: such as three pounders, minions, fakers, six pounders, demi-culverins, and twelve pounders; which being light, and small, are easily carried.

FIELD Staff, is a staff carried by the gunners: it is about the length of a halbert, having a spear at the end, which on each side has ears screwed on, like the cock of a match-lock.

In these the gunners screw lighted matches, when they are on command; which is called, arming the *Field Staffs*. See **LIN-STOCK**.

FIELD Works, in fortification, are those thrown up by an army, in the besieging of a fortress; or else by the besieged, in defence of the place. Such are the fortifications of camps, those of highways, &c.

Elysian FIELD, see **ELYSIAN Field**.

FIERI Facies a judicial writ, which lies at all times within the year and days, for him that hath recovered in an action of debt and damages: it is directed to the sheriff, commanding him to levy the debt, and damages on him, against whom the recovery was had.

FIFTEENTH, *Decima quinta*, or *Quinzième*, an antient tribute, or imposition of money, laid upon any city, borough, or other town through the realm; not by the poll, or upon this or that man, but in general upon the whole city, or town.

It is so called, because amounting to a *Fifteenth* part of that which the city hath been valued at of old; or to a *Fifteenth* part of every man's personal estate, according to a reasonable valuation.

This was imposed by parliament, and every town through the realm knew what a *Fifteenth* for themselves amounted to, because it is always the same: whereas the subsidy, which is raised of every particular man's lands, or goods, must needs be uncertain.

The *Fifteenth* seems to have been a rate, antiently laid upon every town, according to the land or circuit belonging to it.

FIG

it. Camden mentions many of these *Fifteenth* in his *Britan. viz.* pag. 171. *Bath geldabat pro viginti bidis, quando scihra geldabat, &c.* And p. 181. *Old Sarum pro quinquaginta bidis geldabat, &c.* Which rates are according to *Domesday*. But in after-times the *Fifteenth* came to be understood as imposed only on goods and chattels, not on lands. — It was first granted by parliament, 18 Edw. I. *viz. Computus quintæ decimæ Regis, an. 18. per archiepiscopos, episcopos, abbates, priores, comites, barones, & omnes alios de regno, de omnibus bonis mobilibus concessæ.* — The city of London paid that year for the *Fifteenth*, 2860 l. 13 s. 8 d. and the abbot of St. Edmund's 666 l. 13 s. 4 d. which was by composition; and thereupon had all the temporal goods of their district discharged of the *Fifteenth*.

The way of collecting it was by two assessors appointed in every county by the king, who appointed twelve more in every hundred to make a true valuation of every man's personal estate upon which the fifteenth part was levied.

FIFTH, in music, one of the harmonical intervals, or concords.

The *Fifth* is the third in order, of the concords. The ratio of the chords that produce it, is 3 : 2.

It is called *Fifth*, because containing five terms, or sounds between its extremes, and four degrees : so that in the natural scale of music, it comes in the *fifth* place, or order, from the fundamental.

The antients called this interval, *diapente*.

The imperfect, or defective *Fifth*, by the antients called *semi-diapente*, is less than the *Fifth* by a mean fine-tone.

FIG*, *Ficus*, a soft, sweet, delicious fruit; the produce of a tree of the same name.

* The word is formed of the Latin *Ficus*; and that of the Greek *φῖς*, I produce, by reason the *Fig-tree* is a great bearer.

There are *Figs* of divers kinds; chiefly denominated from their colours; pale, violet, black, purple, green, and ruddy. The pale are esteemed the best: the black and violet coloured are the worst.

They are gathered in autumn, and laid on a rack, or hurdle, to dry in the sun.

Figs contain a deal of phlegm, a little volatile, alcali salt, and a moderate quantity of oil.

They are very nourishing, and soften the asperities of the breast, &c. and accordingly are used in medicine, to make gargarisms against disorders of the throat and mouth. They are also applied externally, to soften, digest, and promote maturation.

Figs are dried, either by a furnace, or in the sun. The Latins call them *Coriceæ*, or *Ficus passæ*, when thus dried. In this condition they are used both as medicine and food; being both the wholesomer, and easier of digestion, being thus cleared of a deal of their aqueous and viscid parts.

The best *Figs* are the produce of Italy, Spain, Provence, &c. The islands of the Archipelago yield *Figs* in great abundance; but they are much inferior in goodness to those of Europe. Yet the Greeks in those islands cultivate them with wonderful care and attention; as making the principal food, and a considerable part of the riches of the country.

They have two kinds of *Fig-trees*; the first called *Ornæ*, or the wild *Fig-tree*; the second, the domestic *Fig-tree*.

The wild, called by the Latins *Caprificus*, yields successively three sorts of fruits, called *Fornitæ*, *Cratitiræ*, and *Orni*; none of which are of any use as foods; but all absolutely necessary in their manner of ripening the fruits of the domestic *Fig-tree*. The method of cultivating and ripening these *Figs*, makes a peculiar art, by the antients called *Caprificatio*; often spoke of among them in terms of admiration. Some of the modern naturalists have looked on it as a chimera; but Mons. Tournefort has assured us of the contrary, and given us that process, as he learned it upon the spot; which see under the article *CAPRIFICATION*.

The generation of the *Fig* is somewhat anomalous; the parts subservient to the office in other plants, i. e. the flower, not being here apparent. But the anatomy of the fruit helps us out of the difficulty.

Mons. de la Hire the younger, in the *Memoirs* of the French academy, shews that the *Fig* is a flower, as well as a fruit. By dissection, it discovers all the essentials of a flower, viz. stamina, apices, and farina fecundans.

To shew this, that ingenious author divides the length of the *Fig* into three parts or spaces, A, U, X, (*Tab. Nat. Hist. fig. 16.*) the first of which, A, being the next the pedicle, and much the greatest, contains the grains, or seeds of the *Fig*. These seeds are little stones, represented by A, (*fig. 17.*) within which are kernels. Each stone is half encompassed with a parenchyma, B, supported by a calyx laid on the parenchyma. This calyx is fixed to a pretty long pedicle, which grows to the inner rind of the *Fig*, as represented in the figure. — The division X of the *Fig*, (*fig. 16.*) is full of little leaves, like those represented in *fig. 18.* which are fastened by their bases to the rind or skin of the *Fig*. In this division there is a hole, B, (*fig. 16.*) called the *umbilicus*, or navel, whose outer, or

FIG

upper edge is furnished with little leaves, which close the aperture. — Lastly, the space V is full of little whitish bodies (represented *fig. 19.*) which arise from the internal parietes of the *Fig*, by a large pedicle A, at whose extremity is a calyx, B C; from the divisions whereof arise three other bodies, D, E, F. These bodies terminate in little eminencies in E, F, &c. which are capulæ, that include an infinite number of little grains, easily perceivable by the microscope, and all alike and of a size perfectly similar to the farina in the apices or capulæ of other flowers. Whence it follows, that the bodies contained in the space V (*fig. 16.*) of the *Fig*, are real *Fig* flowers; though several naturalists have taken these in the divisions A and X, for the flowers, which have no essential marks of flowers at all.

FIGURATE, or **FIGURATIVE**, that which has a relation to figure, or that teaches under some obscure resemblance.

Thus a *Figurative style* is that which abounds in figures.

The *figurative style*, F. Bouhours observes, is neither the most just, nor the best. For this reason Cicero directs us to the antients, who, not having yet bethought themselves to use *figurative* expressions, but keeping to the most proper and natural way, have almost all wrote well. *Sunt enim illi veteres, quia nondum ornare poterant ea, quæ dicebant, omnes prope præclare loquuti.*

Long use, say the grammarians, renders that proper in all languages, which at first was *figurative*. — The same thoughts appear more lively when expressed by a figure, than when in simple terms. The reason is, that *figurative* expressions denote not only the principal matter, but also the emotion and passion of the person who speaks.

FIGURATIVE is also much used in speaking of the mysteries and figures of the old law. In this sense manna is said to be figurative of the eucharist.

FIGURATIVE is also used in the Greek grammar for what we otherwise call characteristic, viz. a letter that characterizes certain tenses of the Greek verbs; or that distinguishes and specifies them.

In the first conjugation of the barytonous verbs, the ϕ is characteristic, or *figurative* of the præter tense; and the ψ of the future.

FIGURATIVE, or **FIGURATIVE Counter-point**, in music, is that wherein there is a mixture of discords along with the concords. See **COUNTER-POINT**.

Figurative Counter-point is of two kinds: that wherein the discords are introduced occasionally, to serve only as transitions from concord to concord; and that, wherein the discords bear a chief part in the harmony.

It is a rule in composition, that the harmony must always be full on the accented parts of the bar, or measure, i. e. nothing but concords are allowed in the beginning and middle; or the beginning of the first half of the bar, and the beginning of the latter half thereof in common time; and the beginning, and first three notes in triple time. But upon the unaccented parts, this is not so necessary: but discords may transiently pass there without any offence to the ear.

This the French call *Supposition*, because the transient discord supposes a concord immediately to follow it. See **SUPPOSITION**.

Where the discords are used as a solid and substantial part of the harmony, the *Counter-point* is properly called the harmony of discords.

FIGURE, **FIGURA**, in physics, denotes the surface or terminating extremes of a body.

All bodies have some *Figure*; whence, figurability is generally ranked among the essential properties of body, or matter. A body without *Figure*, would be an infinite body.

The corpuscular philosophers account for every thing from the *Figure*, bulks, and motions of the atoms, or primary corpuscles of bodies.

The earth is of a spherical, or rather a spheroidal *Figure*. Saturn sometimes appears of an elliptical, or oblong *Figure*. For the *Figures* of bodies, considered as objects of sight, see **VISION**.

The author of a collection of dissertations, printed at Paris, in 1715, shews, in the first dissertation on the Hebrew medals, p. 66. that the Jews were allowed to make any kind of *Figures*, or images of trees, plants, flowers, buildings, &c. but not those of animals, or of the sun, moon, and stars.

The schoolmen dispute, whether or no the quality of *Figure* be the same with that of form; and if they differ, what it is that constitutes the difference? Boethius will have *Figure* only predicated of inanimate bodies, and form of animate. Others extend *Figure* to all natural things, and form to all artificial ones: Whence the verse,

Formam viventis, pîsti dic esse figuram.

Others apply *Figure* indifferently to all kinds of bodies, but not in all relations. If only the bare circumference, or circumscription be considered, they call it *Figure*; but if the circumference be considered as endowed with colour, then they call it form. See **FORM**.

FIG

FIGURE is also applied to representations, or images of things, in prints, &c.

Such a book is printed with *Figures*. The *Figures*, or schemes in mathematical and physical writings, should be made to fold out of the book.

Some readers chuse to have the *Figures*, especially the mathematical ones, in wood, for the convenience of having them immediately annexed to the matter they refer to: others, rather chuse to be at the pains of turning over, and having recourse to another part of the book, that they may have the *Figures* more neat and accurate on copper.

FIGURE, in geometry, denotes a surface inclosed, or circumscribed with one or more lines.

Such are triangles, squares, polygons, circles, ellipses, &c.

Wolffius defines *Figure* a continuum terminated by a perimeter.

In which sense *Figure* is applicable both to superficies and solids.—In the former case, the perimeter is lines; in the second, surfaces.

Figures, are either rectilinear, curvilinear, or mixt, according as the perimeter consists of right lines, curve lines, or both.

The superficial parts of a *Figure* are called its *sides*; the lowest side, its *base*; and the angle opposite to the base, the *vertex*.

The height of a *Figure* is the distance of the vertex from the base.

EQUILATERAL FIGURE is that whose sides are equal.

FIGURE circumscribed, and inscribed, see **CIRCUMSCRIBED**, and **INSCRIBED**.

SIMILAR FIGURES, see **SIMILAR** *Figure*.

All similar *Figures*, both regular and irregular, are in a duplicate ratio of the homologous sides.

REGULAR FIGURE is that which is equilateral, and equiangular.

IRREGULAR FIGURE is that which is not both. See **REGULAR** and **IRREGULAR**.

FIGURE, in conics, denotes the rectangle, made under the latus rectum, and transversum in the hyperbola, and allipsis.

FIGURE of the diameter—The rectangle under any diameter, and its proper parameter, is in the ellipsis and hyperbola called the *Figure of that diameter*. See **DIAMETER**.

FIGURE, in painting and designing, denotes the lines and colours, which form the representation of a man, or other animal.

There are above an hundred *Figures* in such a piece; such a *Figure* is lame, &c.

But the term *Figure* is in a more immediate and peculiar manner understood of human personages; thus, a painting is said to be full of *Figures* when there are abundance of representations of men; and a landskip is said to be without *Figures*, when there is nothing but trees, plants, mountains, &c.

FIGURES, in architecture and sculpture, denote representations of things made in solid matters; such as statues, &c.

We say, *Figures* of brass, of marble, of stucco, of plaster, &c.

But in this sense too, the term is more usually applied to human representations, than to other things. Thus we say, an equestrian *Figure*, for a man on horseback.

Daviler observes, that those, either represented sitting, as popes, &c. or kneeling, as on monuments, &c. or laid all along, as rivers, &c. are more properly called *Figures* than statues.

FIGURE, in heraldry, a bearing in a shield, representing, or resembling a human face; as a sun, a wind, an angel, &c.

FIGURES among the masters of defence, are the divers guards, postures or dispositions of the body, arm, or sword.—

FIGURE of an eclipse, in astronomy, denotes a representation of the path or orbit of the sun and the moon, during the time of the eclipse, upon paper; with the number of digits eclipsed, and the beginning, middle, and end of darkness.

FIGURE, or *Delineation* of the full moon, such as viewed through a telescope with two convex glasses, is of considerable use in observations of eclipses, and conjunctions of the moon with other luminaries. In this *Figure* of the moon, are represented the macule, or spots of the moon, marked by numbers; beginning with the spots, which usually enter first within the shade at the time of the great eclipses, and also emerge the first.

FIGURE, in astrology, a description, or draught of the state and disposition of the heavens, at a certain hour; containing the places of the planets and stars, marked down in a *Figure* of twelve triangles, called *Houses*.

This is also called a *Horoscope* and *Theme*. See **HOROSCOPE**, &c.

FIGURE, in geomancy, is applied to the extremes of points, lines, or numbers, thrown, or cast at random; on the combinations or variations whereof the fates of this art found their fantastical divinations.

FIGURE, in fortification, is the plan of the fortified place; or the interior polygon. See **POLYGON**, &c.

When the sides and angles are equal, it is called a *regular*; when unequal, an *irregular Figure*.

FIG

FIGURE, in dancing, denotes the several steps which the dancers make in order, and cadence; considered as they mark certain *Figures* on the floor.

FIGURE, in the manufactures, is applied to the various designs represented or wrought on velvets, damasks, taffeties, satins, and other stuffs and cloths.

The most usual *Figures* for such designs are flowers, imitated from the life, or grotesques and compartments of pure fancy. Representations of men, beasts, birds, and landskips, have only been introduced since the taste for the *Chinese* stuffs, particularly those called *Furres*, began to prevail among us.

It is the woof of the stuff that forms the *Figures*; the warp only serves for the ground. In working figured stuffs, there is required a person to shew the workman how far he must raise the threads of the warp, to represent the *Figure* of the design with the woof, which is to be passed a-cross between the threads thus raised. This some call *reading the design*.

For the *Figures* on tapestry, braccades, &c. see **TAPESTRY**, &c.

For those given by the *calenders*, *printers*, &c. see **CALENDER**, &c.

FIGURES, in arithmetic, are the numeral characters; or the characters whereby numbers are expressed, or wrote.

Thus the number four hundred and fifty, is wrote, or expressed by three *Figures* 450.

For the antiquity, use, &c. of the numeral *Figures*, see **NUMERAL CHARACTER**.

The *Figures* in arithmetic, are the nine digits; 1, 2, 3, 4, 5, 6, 7, 8, 9, and 0.

FIGURE, in logic, denotes a certain disposition of the terms of a syllogism; particularly of the medium, with regard to the extremes.

Chavuin defines it, a proper placing or connecting of the middle term with the extremes, so as to have the force and effect of a proof, or conclusion. See **MODE**, and **EXTREME**.

Hence it follows, that there are as many *Figures* of syllogisms, as there are different connections of the extremes with the medium: so that, though the school-men ordinarily only reckon three, yet a fourth might be admitted.

For the medium may be either prefixed to both extremes, or subjoined to both; or it may be before the major, and after the minor, or before the minor, and behind the major.

If it be after the major, and before the minor, it is usually called the *first Figure*; this seeming the nearest way of arguing to the natural way.

If it be before the major, and after the minor, it is called the *fourth and last*; and by the Peripatetics, the *indirect*, and by others, the *galenical Figure*; as varying too far from the natural form.

If it precede both, it is called the *second Figure*.

And if it follow both, the *third Figure*; as in the following technical distich:

Prima infra, & supra: supraque bis altera: bisque

Tertia vult infra medium: supra, ultima, & infra.

A syllogism, therefore, of the *first Figure*, is that wherein the medium is severally joined with both extremes of the conclusion, so as to be predicated of the lesser; the conclusion being sometimes affirmative, and sometimes negative. In that of the *second Figure*, the medium is predicated of both; and the conclusion is always negative. In the *third Figure*, the conclusion, which in the former cases is sometimes general, sometimes special, is always special.

The *fourth*, called the *indirect Figure*, some prefer before all the others; by reason it is in this alone, that the medium or mean term has its natural situation, viz. in the middle, between the extremities; it being in the rest no more than a medium by office; but in the *fourth Figure*, the medium is in the middle place. See **MEDIUM**.

E. gr. Take the two terms, *man*, and *living*, for extremes, and *animal* for the medium. The mind argues thus, there is a connection between *man* and *animal*; and between *animal* and *living*; therefore the order is, *man*, *animal*, *living*, and by *animal*, as a medium, the two extremes are conjoined, as the extremes of a line are connected by the middle.

A C
B A B C

FIGURE, in rhetoric, is a phrase, or turn of speech or discourse, finer and nobler than what is used in common or ordinary speaking.

Figures, by the *Greeks* called *schemata*, are the enrichments of discourse, and we only use them when raised and moved with the consideration of something extraordinary.

There are two kinds of *Figures*; the one of *sentences*, and contained in the sense itself, without any immediate dependence on any particular words: the other are only in the words themselves.

Of the *FIGURES of sentences*, some are designed to move; others to teach; and others only to delight.

Of the first kind, the most considerable are, exclamation, imprecation, obsecration, interrogation, doubting, preterition, expolition, and epiphonema.

Those of the *second*, are the antithesis, correction, communication, and suspension.

Those of the *third*, the apostrophe, hypotyposis, profopopceia, ethopoeia, and profopographia. See each under its proper head, EXCLAMATION, &c.

Of FIGURES of words, some are *tropes*, i. e. translations of words from their proper signification, to some more remote and extraordinary one.

The principal of these are, the metaphor, allegory, metonymy, synecdoche, irony, and sarcasm, metalepsis, antonomasia, and syllepsis.

Others are *Figures of words*, more properly so called, and not tropes; being so inherent in the words, that upon changing of those, the *Figure* is destroyed: as in *amantes sunt amantes*, where the *Figure* would be lost, if instead of *amantes* you should put *fooli*.

Of these the principal are, repetition, conversion, complexion, gradation, synonymy, polyfyneton, and polyptoton, reticency, disjunction, similitude, paranomasy, and transition. See each *Figure* under its proper article, as METAPHOR, &c.

To FIGURES of *Prosy* belong the synalepha, ecclipsis, crasis, diaeresis, systole, and diafole.

FIGURE, in grammar, is an expression that deviates from the common and natural rules of grammar; either for the sake of elegance or brevity.

The best grammarians only reckon four *Figures*; the ellipsis, pleonasm, syllepsis, and hyperbaton. Others add two more, viz. antipthesis and enallage. See each in its place, ELLIPSIS, PLEONASM, &c.

FIGURE is also used among divines, for the mysteries represented or delivered obscurely to us under certain types or actions in the Old Testament.

Thus manna is held a *Figure* or type of the eucharist: and the death of Abel a *Figure* of the suffering of Christ.

Many divines and critics contend that all the actions, histories, ceremonies, &c. of the Old Testament are only *Figures*, types, and prophecies of what was to befall under the New. The Jews are supposed to have had the *Figures* or shadows, and we the substance.

FIGURE is also applied in a like sense to profane matters; as the emblems, enigmas, fables, symbols, and hieroglyphics of the antients.

FIGURED, in the manufactures. A *figured* camlet, stuff, tabby, &c. is that whereon there are divers designs of flowers, figures, branches, &c. impressed by means of hot irons. See CAMLET.

FIGURED Ribbands, first came into fashion about the year 1680. The method of performance was by successively applying steel plates engraven with divers ornaments, as flowers, birds, grotesques, &c.

But one Chandelier, a ribband-maker of Paris, invented a much better and readier way of doing it; by a machine not unlike the flatter used in coining to flatten the pieces of metal: only much simpler.

The principal parts thereof were two steel cylinders, engraven with the figures intended to be represented. These cylinders were placed over each other like the rolls of a rolling-press; having each of them, at one of its extremes, a little dented wheel, one of which catching into the other, the whole was put in motion, by means of a winch, or handle, fastened to the first. The machine thus prepared: the workman heats the cylinders, and places the ribband in the little place remaining between the two, which he contracts yet further by a screw, that presses the upper down upon the lower; then turning the rolls by the handle, a whole piece of ribband was *figured* in less time than a single yard could be done in the ordinary way. See RIBBAND.

FIGURED Velvet, see the article VELVET.

FILAMENT, in medicine, anatomy, natural history, &c. a term used in the same sense with *fibre*, for those fine threads, whereof flesh, nerves, skins, plants, roots, &c. are composed. See FIBRE.

FILANDERS*, in falconry, a disease in hawks, &c. consisting of filaments, or strings of blood, coagulated and dried; occasioned by a violent rupture of some vein, by which the blood extravasating, hardens into the figures abovementioned; to the great annoyance of the reins, hips, &c.

* The word is French, *Filander*, formed from *fil*, thread.

FILANDERS are also a sort of fine, small worms, which greatly incommode the hawk in the gorge and about the heart, livers, and lungs; but which, on some occasions, are supposed to be of service, and to feed on the superfluities of certain parts.

There are four kinds of these *Filanders*, or vermiculi. The first, in the gorge, or throat; the second, in the belly; the third in the reins; the fourth are called needles, on account of their exceeding fineness. The symptoms that discover the disease, are, the bird's gaping frequently; straining the flit or perch with her pounces; croaking in the night; ruffling her train;

Vol. I.

rubbing her eyes, wings, nostrils, &c. As the worms are very restless, the bird is frequently endeavouring to cast them up; and in opening its mouth you will readily discover them. From the throat, &c. they will ascend to the larynx, brain, &c. and finally over the whole body.

The ordinary cause is bad food. The proper remedy they say is, not by killing them, for fear of impositions from their corruption; but chiefly by stupifying them, that they may be offensive but seldom.

This is best effected by making the bird swallow a clove of garlick; after which she will feel nothing of the *Filanders* for forty days. Others use rue, worm-seed, aloes, vervain, saffron, &c.

FILAZER, or FILACER, an officer in the court of Common Pleas, so called, because he *files* the writs, whereon he makes out process.

Of these there are fourteen, in the several divisions and counties of England. They make out all writs, and process upon original writs, issuing out of the chancery, as well real, as personal and mixed, returnable in that court.

In actions merely personal, where the defendants are returned summoned, they make out pone's or attachments; which being returned and executed, if the defendant appears not, they make out a distringas, and so ad infinitum, or till he does appear.

If he be returned nihil, then process of capias infinite, if the plaintiff will; or after the third capias, the plaintiff may proceed to outlawry, in the county where his original is grounded, and may have an exigent with proclamation.

The *Filazers* likewise make out all writs of view in real actions, where the view is prayed; and upon replevins or recordari's, writs of retorno habendo, second deliverance, and writ of withernam. In real actions they make out writs of grand and petit cape before appearance.

They enter all appearances, and special bails, upon any process made by them. They make the first *scire facias* upon special bails, writs of habeas corpus, distringas nuper vice comitem vel balivum, and duces tecum; and all *superedeas*'s upon special bail or appearance, &c. Writs of habeas corpus cum causa upon the sheriff's return that the defendant is detained with other actions, and writs of adjournment of a term, in case of pestilence, war, or public disturbance.

Till an order of court made 14 Jac. I. which limited the *Filazers* to all matters and proceedings before appearance, and the prothonotaries to all after, they also entered declarations, impanelances, judgments, and pleas, whereto a serjeant's hand was not requisite, and made out writs of execution, and divers other judicial writs after appearance.

FILBERDS, or FILBUDS, the best-sort of small nuts, proper for planting in orchards, or gardens.

They are raised from nuts set in the earth, or suckers from the roots of an old tree; or they may be grafted on the common hazel nut.

They delight in a fine, mellow, light ground, but will grow almost any where, especially if defended from violent and cold winds.

The tree is easily propagated, bears well, and is of two sorts, the *white*, and the *red*; but the former is the best. See Supplement, article FILBERT.

FILE*, an instrument of steel, cut in little hatchets, or furrows, used by the workmen in metals, to smooth, polish, and otherwise fashion the same.

* The word is French, *file*, literally signifying a long series or succession of any kind of things; of *fil*, thread.

Files bear a near resemblance to rasps; the only difference between them, is, that the former are cut with edged tools; and the latter are punched with pointed ones. See RASP.

The *File* is a principal instrument in all the kinds and parts of smithery. It should be forged of the best steel; after which, rubbing it with grease, to make it more soft under the chisel; they cut it with chisels and a mallet, this and that way, and of this or that depth, according to the grain or tooth required.

After cutting the *File*, it remains to be tempered; which being the principal mystery in the making of *Files*, will deserve to be particularly described.

Files, then, are tempered with a composition of chimney soot, very dry and hard, diluted and worked up with urine and vinegar; to which is added common salt: the whole is to be reduced to the consistence of mustard.

The *Files* being cut, and rubbed over with vinegar and salt, to scour off the grease laid on for the cutting, they cover them over with this composition; and having laid several of them together in a packet, and covered them in loam, they put them in a charcoal fire: from which they are taken out again, by that time they have acquired a cherry-colour, which is known by a little rod of the same steel, put in along with them. Upon taking them out, they cast them into the coldest spring water they can get.

Iron *Files* require a more intense heat, than steel ones. When the *Files* are cold, they clean them with charcoal, a rag, &c.

F I L

to take away any of the foot or faeces left in the cuttings: Then drying them before the fire, they put them up carefully in a box of wheat bran, to keep them from rusting.

Files are of different forms, according to the different uses and occasions they are made for: Those in common use are the square, flat, triangular, half-round, round, thin file, &c. all which are made of different sizes, as well as different cuts, and degrees of fineness, to take place, according as the work is more or less advanced: some cutting faster, as the *rough tooth'd File*, &c. others more slowly, as the *fine tooth'd File*, &c.

FILE, is also a thread or wire, whereon writs, or other exhibits in courts, or offices, are fastened or filed, for the more safe keeping and ready turning to the same.

FILE, or *label*, in heraldry, a bearing represented in *Tab. Herald.* fig. 23. though sometimes of more, and sometimes of fewer points, being the difference or distinction of a second son. It is sometimes also born as a charge in a coat armour, of which Guillim gives many instances: but it is oftener the difference or mark of distinction, which the elder brother bears in his coat, during his father's life.

Some distinguish *File*, and *label*, calling the *File* the upper horizontal line, and the *label* the points which issue from it.

FILE of three or more labels. See **LABEL**.

FILE, in a military sense, is a row of men standing one behind, or below, another, from front to rear.

Or, *File* is a line, or series of soldiers, placed one before another; and thus composing the depth of a battalion or squadron, which in the infantry ordinarily consists of six soldiers in a *File*; and in the cavalry, of three.

They say, *close the Files*, that is, bring the men nearer each other: *double the Files*, i. e. double the depth of the battalion; and diminish its breadth or front, by one half. — The last or hindmost person is said to *bring up the File*.

FILIAL, something belonging to the relation of son.

The divines usually distinguish between a servile, and a *filial* fear. The most abandoned may have a servile fear of God, such as that of a slave to his master; but not a *filial* fear, i. e. a fear resulting from love and respect.

FILIGRANE *, or **FILIGREE** work, a kind of enrichment on gold, or silver, wrought delicately in manner of little threads, or grains, or both intermixed.

* The word is a compound of *fil*, or *filum*, thread, and *granum*, grain.

In Latin it is called *filatim elaboratum opus*, *argentum*, *aurum*. This cabinet is ornamented with divers fine pieces of *filigree* work.

We have vases, torches, &c. of *filigree* work.

FILING one of the principal operations in smithery, &c. succeeding to forging.

The coarser cut files are always to be succeeded by finer; and in all the kinds the rule is, to lean heavy on the file in thrusting it forward, because the teeth of the file are made to cut forwards; but in drawing the file back again for a second stroke, it is to be lightly lifted just above the work, by reason it cuts not coming back.

The rough or coarse-tooth'd file (which when large, is called a *rubber*) serves to take off the unevennesses of the work, left by the hammer in forging.

The bastard-toothed file is to take out the too deep cuts, and file strokes made by the rough file. The fine tooth'd file takes out the cuts or file strokes, the bastard file made. And lastly, the smooth file those left by the fine file.

In this order the files of several cuts are to succeed each other, till the work is as smooth as it can be filed. After which it may be made yet smoother with emery, tripoli, &c. See **POLISHING**.

FILIUS *ante patrem*, q. d. the son before the father, a denomination applied by botanists and florists, to plants, whose flowers come out before their leaves. Such are the several species of colchicum, or meadow saffron, the coltsfoot, butterbur, &c.

FILLET *, in anatomy, see the article **FRÆNUM**.

* The word is French, *Fillet*, formed of *fil*, thread.

FILLET, in botany, see the article **THREAD**.

FILLET, *Tenella*, in heraldry, a kind of orle, or bordure, containing only a third or fourth part of the breadth of the common bordure. See **BORDURE**.

It is supposed to be withdrawn inwards; and is of a different colour from the field. It runs quite round, near the edge, as a lace over a cloak.

FILLET is also used for an ordinary, drawn, like the bar, from the finister point of the chief a-cross the field; in manner of a scarf: though it is sometimes also seen in the situation of a bend, fess, cross, &c.

According to Guillim, the *Fillet* is a fourth part of the chief; and is placed in the chief point of the escutcheon.

FILLET, or **FILET**, in architecture, denotes a little square member or ornament, used in divers places, and on divers occasions; but generally as a sort of corona, over a greater moulding. — See *Tab. Archit.* fig. 1. and fig. 26. lit. *h*, *a*, *t*. fig. 28. lit. *h*, *P*. fig. 32. lit. *e*. fig. 24. lit. *c*, *e*.

The *Fillet* is the same with what the French call *Reglet*, *Bande*, and *Bandelette*; the Italians, *Listra*, or *Listella*.

F I M

FILLET is also used among painters, gilders, &c. for a little rule, or regel of leaf gold, drawn over certain mouldings; or on the edges of frames, panels, &c. especially when painted white; by way of enrichment.

FILLETS, in the manage, are the loins of an horse; which begin at the place where the hinder part of the saddle rests.

FILM, a thin skin, or pellicle.

In plants, it is often used for that thin woody skin, which separates the seeds in the pods, and keeps them apart.

FILTER, or **FILTRE**, in chemistry, &c. a piece of cloth, linen, paper, or other matter, used to filtrate or strain liquors through. The *Filtre* has the same use and effect, with regard to liquids, that the sieve, or searce, has in dry matters.

Filtres are of two sorts. — The first, are simple pieces of paper, or cloth, through which the liquor is passed without further ceremony.

The second are twisted up like a skain or wick, and first wetted, then squeezed, and one end put in the vessel that contains the liquor to be filtrated. The other end is to be out, and hang down below the surface of the liquor. By means hereof the purest part of the liquor distils drop by drop out of the vessel; leaving the coarser part behind.

This *Filter*, or *Philter*, acts as a siphon.

FILTER * is also a charm, supposed to have a virtue of inspiring love.

* The word is derived from the Greek *φίλος*, which signifies the same thing; of *φίλος*, *amo*, I love.

FILTRATION, the act of passing a thing through a filtre; called also *Calature*, *Percolation*, and *Transcolation*. See **FILTER**.

Filtration is a kind of separation; performed by straining a liquor through a cloth, bag, linen, or brown paper, in order to clarify, or purify it.

The most commodious way of *filtrating*, is by whitey-brown paper fastened over the mouth or aperture of a funnel; the smallness of the pores of this paper admits only the finer parts through, and keeps the rest behind.

There are also *Filtrations* through sand, pulverized glass, &c. Spirits of vitriol, salt, and nitre, are *filtrated* through a quantity of beaten glass, in the bottom of a funnel.

The secretion of the divers juices in the body, from the mass of blood, seem to be little else but *Filtration*. Pitcairn, and other late authors, hold that the diversity of *Filtrations* does not depend on the different configurations of pores, but on their different sizes or diameters.

Springs also seem to be raised from the ocean by the same principle of *Filtration*.

Filtration, in pharmacy, is chiefly concerned in tinctures; as when some portion is drawn from the ingredients, or suspended in the tincture, which is not necessary thereunto; but disturbs and renders the rest unpleasant, both to the palate, and sight.

Besides this, there is a *Filtration*, which has much tortured the philosophy of some ages to account for; this is that performed by the ascent of the finer parts of a liquor, up a cord, or skain of cotton, or such like matter, which is contrived to drop over another vessel, and leave the grosser behind.

Some say that the cause of this ascent is, because the liquor swells those parts of the filter, that touch it, by entering into the pores of the threads, which compose it, whereby they rise up, touch, and wet those next above them; and these again the next threads; and so on, to the brim of the vessel; when the liquor runs over, and descends in the other part of the filter, which hangs down, by its own natural gravity.

But this account is liable to many objections; especially as liquors rise after the like manner in glass tubes, much above the surface of the liquor they are immersed in; where the glass cannot be imagined thus to swell.

Others account for it, by considering every filter, as composed of a great number of long, small, solid bodies, which lie very close together; so that the air getting in between them, loses much of its pressure, and cannot gravitate so strongly as it doth on the fluid without them: The consequence is, that the parts of the water between the threads of the filter must be pressed upwards, and ascend till they come so high, as by their weight to counter balance the general pressure on the other parts of the surface of the water.

Lastly, the retainers to Sir Isaac Newton's philosophy deduce the phenomenon from the principle of attraction. According to them, the cause of this *Filtration* is doubtless the same with that whereby fluids ascend up heaps of ashes, sand, &c. the same with that, whereby water is raised in form of vapour; the sap rises in vegetables; and the blood circulates through the capillary arteries, and the extremely minute glandular strainers. See **ASCENT of liquors**.

FIMBRIÆ, fringes. The extremities or border of the tube fallopianæ were formerly thus called; the word signifying a fringed border, which that part resembles. See *Tab. Anat.* (Splanh.) fig. g. lit. *d*.

FIMBRIATED, a term in heraldry, signifying that an ordinary is edged round with another of a different colour.

Thus, he beareth, or, a cross pattee, gules, *fimbriated* sable.

FIN, a part of a fish, made in fashion of a feather.

The office of the *Fins* has commonly been supposed to be analogous to that of feathers in fowls; and to assist the fish in its progressive motion, or swimming: But the latter naturalists find this a mistake.

It is the tail that is the great instrument of swimming: The *Fins* only serve to keep the fish upright, and prevent vacillation, or wavering. See *Supplement* article *PINNÆ*.

Whale FINS are commonly taken for that part of the whale, which the populace call *whale-bone*; but whence the mistake should arise, is not easy to determine.

It is certain, that fibrous, flexible matter is not the *Fins* of that fish, but rather its teeth; that species of whales wherein these *Fins* are found, having no other teeth. They are taken out of the mouth, and are usually about a span broad, and fourteen or fifteen long. See *Whale-bone*.

These whale *Fins* are the most valuable part of the animal. See *Whale Fishery*.

FINAL, that which terminates, or comes last in any thing: as, a final judgment; final sentence, &c.

Divines call the impenitence of the reprobate *final*, as supposing it to continue to the end of their lives.

FINAL Cause, is the end for which any thing is done. The *final cause* is the first thing in the intention of a person who does a thing; and the last, in the execution.

Final Causes are of good use in ethics; but mischievous in physics, and by no means to be allowed: yet Mr. Boyle proposes some views and regulations, under which they may be admitted, in an *express inquiry into the Final Causes of natural things*.

FINAL Letters, are those which close words. The figure called *Apocope*, consists in retrenching final letters.

The Hebrews have five final letters; which, when at the end of a word, have a different figure from what they have at the beginning, or in the middle thereof. These are the *ך, ם, ן, ף, ץ*, caph, mem, nun, pe, tsade; which every where but at the ends of words are wrote *כ, מ, נ, פ, צ*.

FINANCES *, in the French polity, denote the revenues of the king, and state: Much the same with the treasury, or exchequer of the English, and the fiscus of the Romans.

* The word is derived from the German *Finantz*, scraping, usury. Though *Du Cange* chuses rather to deduce it from the barbarous Latin *financia*, *profectio pecuniaria*.

Council of the Finances, corresponds to our lords commissioners of the treasury: The comptroller general of the *Finances*, to our lord high treasurer, &c.

The French have a peculiar kind of figures, or numeral characters, which they call *Chiffre de Finance*. See *CHARACTER*.

FINE, that which is pure, and without mixture. The term is particularly used in speaking of gold, and silver.

Fine gold should be of twenty-four carats; but there is little, if any, that rises to such a degree of fineness.

Gold thus *fine*, is soft, and improper to work; for which reason they always mix a certain quantity of alloy of copper with it.

Fine silver is that of twelve-penny weights. See *SILVER*.

FINE, in law, denotes a covenant made before justices, and entered on record, for conveyance of lands, tenements, or any thing inheritable, being *in esse tempore finis*; in order to cut off all future controversies.

A *Fine*, then, appears to be a concord, acknowledged and recorded before a competent judge, touching some hereditament or thing immoveable, that was in controversy between the parties to the same concord; and for the better credit of the transaction, it is supposed to be made in the presence of the king, because levied in his court.

Hence it binds women covert, being parties, and others whom ordinarily the law disables to transact, only for this reason, That all presumption of deceit or evil-meaning is excluded, where the king and his court of justice are supposed to be privy to the act.

Originally this *final* concord was instituted and allowed, in regard that by the law and ancient course of proceedings, no plaintiff could agree or end the cause without licence of the court. So as *Fines* have been antiently levied in personal actions; and for no greater a sum of money than 11 l.

But time has produced other uses of *Fines*, viz. To cut off entails, and with more certainty to pass the interest or title of any land or tenement, though not controverted, to whom we think good, either for years, or in fee: Inasmuch that the passing a *Fine* in most cases now is but a fictio juris, supposing an action or controversy, where in truth none is; and so not only operating a present bar and conclusion against the cognizor or person who passes the *Fine*, and his heirs; but at five years end, against all others, not expressly excepted, and not claiming (if it be levied upon good consideration, and without covin) as women covert, persons under twenty-one years, prisoners, or such as are out of the realm at the time of its acknowledging.

This *Fine* hath it in five essential parts. 1° The original was taken out against the cognizor. 2° The king's licence giv-

ing the parties liberty to accord; for which he hath a *Fine*, called the *king's silver*; being accounted part of the crown revenue. 3° The concord itself, which begins thus, *Et est concordia talis*, &c. 4° The note or abstract of the *Fine*, beginning thus, *K. inter R. querentem, et S. et T. uxorem ejus deforciens*, &c. (where instead of *deforciens*, antiently *impedientes* was used.) 5° The foot of the *Fine* (*Hæc est finalis concordia facta in curia domini regis apud West. a die pasche in quindecim dies, anno*, &c.) concludes all, containing the day, year, and place, and before what justice the concord was made.

Fines are either *single*, or *double*.

Single FINE is that, by which nothing is granted or rendered back again by the cognizees to the cognizors, or any of them.

Double FINE contains a grant and render-back, either of some rent, common, or other thing out of the land, or of the land itself, to all or some of the cognizors for some estate, limiting thereby remainders to strangers not named in the writ of covenant.

Sometimes also a *double Fine* is, when the lands lie in several counties.

Fines with regard to their effect, are divided into *executed* and *executory*.

FINE executed, is such, as, of its own force, gives a present possession (at least in law) to a cognizee, so that he needs no writ of *habere facias seisinam*, for execution of the same: of which sort is a *Fine sur cognizance de droit come ceo*, &c. that is, upon acknowledgment that the thing mentioned in the concord is *jus ipsius cognizati, ut illa quæ idem habet de dono cognitoris*. West. sect. 51. K.

The reason is, because this *Fine* passeth by way of release of a thing which the cognizee hath already (at least by supposition) by virtue of a former gift of the cognizor; which is in truth the surest *Fine* of all.

FINES executory are such, as of their own force do not execute or give the possession to the cognizee without entry or action, but require a writ of *habere facias seisinam*: as a *Fine sur cognizance de droit tantum*.

Fines are now only levied in the court of common-pleas at Westminster, in regard of the solemnity thereof, ordained by the statute of 18 Edw. I. before which time they were sometimes levied in the country courts, court-barons, and in the exchequer; as may be seen in *Origines jurisdictionales*, &c. Plowden says, that there were *Fines* levied before the conquest: Fulbeck assures us also, that he has seen the exemplification of one of Henry the 1st's time: Though Dugdale affirms, there were none till Henry the 11d.

FINE also, according to Cowel, signifies a sum of money, paid as an income for lands or tenements let by lease; antiently called *gerfuma*.

FINE is also used to denote an amends, pecuniary punishment, or recompence, for an offence committed against the king, and his laws; or against a lord of a manor.

In which case a man is said, *facere Finem de transgressionem cum rege*, &c.

In all the diversities of the use of the word *Fine*, it hath but one signification; and that is, a final conclusion, or end of differences between parties.—In the last sense, where it denotes the ending and remission of an offence, it is used by Bracton, who speaks of a *common Fine* that the country pays to the king for false judgments, or other trespasses, which is to be assessed by the justices in eyre before their departure, by the oaths of knights, and other good men, upon such as ought to pay it.

There is also a *common Fine* in courts leet.

FINES for Alienation, are reasonable *Fines* formerly paid to the king by his tenants in chief, for licence to alienate their lands; according to the statute 1 Edw. III. cap. 12. but taken away by statute 12 Car. II. cap. 24.

FINE-drawing, or *rentering*, a very nice way of sewing up, or rejoining the parts of any cloth, stuff, or the like; torn or rent in the dressing, wearing, &c.

It is prohibited to *fine-draw* pieces of foreign manufacture, upon those of our own; as has formerly been practised.

FINERS of gold and silver, are those who purify, and part those metals from other coarser ones, by fire and acids.

They are also called *Parters* in our old law-books, and sometimes *Departers*.

FINESSE, a French term, of late current in English. Literally, it is of no further import than our English *Finesse*: But among us, it is chiefly used to denote that peculiar delicacy, or subtlety perceived in works of the mind; and the nicest and most secret and sublime parts of any science, or art.

A person of taste can never be fond of a pun, where all the *Finesse* lies in an equivocal, or in an ambiguity. This man understands all the *Finesse* of his art. The substance, and necessary part of a language is learnt at a little expence: It is the *Finesse* and delicacies that cost the most.

FINGERS, *Digit*i, the extreme part of the hand, divided into five members. See *HAND*.

F I R

The *Fingers* consist of fifteen bones, disposed in three rows, or ranks; each *Finger* having three bones.

The joints or jointures are called *Candylis*, and *Internodia*; and their arrangement or rows, *Phalanges*: The uppermost of which is the longest and largest; the second less, but yet longer and larger than the third.

The first *Finger* is called the *pollux*, or the thumb: the second, *index*, sometimes *salutaris digitus*, and sometimes *nummerans*: the third, the middle *Finger*, *infamis*, *abscenus*, *impudicus*, and *famosus*, because used in mocking and derision: the fourth, *annularis*, the ring *Finger*, *medio proximus*, and *medicus*, by reason the antients used to stir and mix their medicines therewith: the fifth, the little *Finger*, *auricularis*, by reason the ear is picked therewith.

FINGER's Breadth, a measure, of two barley-corns in length, or four laid side to side.

FINING, see REFINING.

FINISHING, in architecture, &c. is frequently applied to the crowning, or acroter over a piece of building; placed there to terminate, and finish it. See CROWNING.

FINITE, something bounded, or limited; in contradiction to infinite.

The school-men make two kinds of *Finite*:

The one as to *extension*, which is applied to things that have not all possible or conceivable extension.

The other as to *perfection*, applied to things, which have not the last perfection.—

To get an idea of a thing *finite* in point of perfection, we first conceive the thing as having certain perfections; and then conceive some other perfection, which it has not, or some perfection in a farther degree.

Thus, when I say that three is a *finite* number, I first conceive a number, consisting of three units; then conceive other units beyond these three. Thus it is I conceive my mind *finite*, by observing certain perfections beyond what I find in my mind.

After the same manner I conceive a room to be finite, by having an idea of extension beyond what is contained therein.

FINITOR, in astronomy, the horizon; thus called, by reason it finishes, or bounds the sight, or prospect. See HORIZON.

FIOL, or FIAL, see the article PHIAL.

FIRE, in physiology—The most universal and sensible character of *Fire*, and that which best defines and distinguishes it from every other thing, is its giving heat.

Fire, therefore, may be generally defined to be whatever warms, or heats bodies.

Again, as heat is something, whose presence we best perceive by the dilatation of the air or spirit in the thermometer; *Fire* may be defined to be that whose presence we perceive by the expansion of the air, or spirit in the thermometer.

Whence it follows, that *Fire* is a body, and a body in motion.—Its motion is argued from its expanding the air; which is not effected without communicating motion thereto: and its corporeity is proved by experiment. For pure mercury being inclosed in a phial with a long neck, and kept in a gentle heat for the space of a year, is reduced into a solid; and its weight is considerably increased; which increase can arise from nothing but the accession of *Fire*.

Fire makes one of the vulgar, or peripatetic elements, defined to be hot, and dry; or, it is that part, or ingredient in all bodies, which is hot in the highest degree, and dry in an inferior one.

What the school-philosophers add further, as to the nature of *Fire*, is, that it is a simple body; as not including any contrariety of qualities; and a body absolutely light, as tending naturally upward: for which reason they hold its natural place to be above all the other elements, between the extremity of our atmosphere and the moon; and the fund of *Fire* is supposed to reside in that sphere, which they call *elementary Fire*.

Fire, according to the Cartesians, is an assemblage of the more solid, earthy particles, which swimming in the rapidly fluid matter of the first element, become vehemently agitated thereby; and by this intense agitation or motion are disposed to give the sensation of heat, light, &c.

Fire, according to Sir I. Newton, is a body heated so hot, as to emit light copiously; for what else, says that philosopher, is red-hot iron, but *Fire*? And what else is a *fiery* coal, than red-hot wood? By which he suggests, that bodies which are not *Fire*, may be changed and converted into *Fire*.

It is a dispute of some standing among philosophers, whether *Fire* be any specific substance, originally distinct from all other; or whether it be of the common matter of other bodies, only under certain peculiar modifications: i. e. whether *Fire* be such by its own nature, or by motion?

F I R

According to some of the latest philosophers, *Fire* is a certain substance, or body sui generis, originally such; and not producible by any motion, or alteration of other bodies.

These authors describe *Fire* as a very subtle, moveable, penetrating body, the cause or instrument of heat and light. Some of them add, that when *Fire* enters the eye in right lines, it produces or excites the idea of light; which rectilinear motion they account absolutely necessary to the idea of light.

Whereas, to produce heat, and the other effects of *Fire*, such rectilinear motion is not required; but on the contrary, an irregular, various motion is fitter to produce the same. The nature of *Fire* is so wonderful, and abstruse, that the antients generally revered it as a God: among the moderns, we can scarce name one point in all philosophy of more importance, or one that is less understood.

Fire, in effect, is the universal instrument of all the motion, and action in the universe: without *Fire*, all bodies would become immovable; as in a severe winter we actually see our fluids become solid, for want thereof. Without *Fire*, a man would harden into a statue; and the very air would cohere into a firm, rigid mass.

Fire, then, is the universal cause of all mutation, or change; for all mutation is by motion; and all motion by *Fire*.

Several authors have laboured to set this grand agent in its just light; and particularly the excellent Boerhaave, in a new course of experiments, and lectures expressly on the subject, *De Igne*.

The sum of his doctrine we shall here subjoin.

Fire, then, is distinguished into two kinds: as it is in itself, called *Elementary Fire*; and as it is joined with other bodies, called *Culinary Fire*.

Pure, or *Elementary FIRE*, is such as exists in itself; which alone we properly call *Fire*.

Common, or *Ordinary FIRE*, is that existing in ignited bodies, or excited by the former in combustible matters, the minute particles whereof joining with those of the pure *Fire*, constitute pure flame.

This latter is improperly called *Fire*; in regard only a small part of it is real, or pure *Fire*.

Pure *Fire*, such as collected in a burning glass, yields no flame, smoke, ashes, or the like; consequently, in ignited bodies, that which flames, smokes, &c. is not simply *Fire*.

The effects, nature, properties, &c. of each shall be considered.

I. *Pure*, or *Elementary Fire*, of itself, is imperceptible; and only discovers itself by certain effects, which it produces in bodies; which effects are only learnt, by observing the changes that arise in those bodies.

The first effect of *elementary Fire* on bodies, is *heat*; which arises wholly from *Fire*; and in such manner as that the measure of heat is always the measure of *Fire*; and that of *Fire*, of heat. So the heat is inseparable from *Fire*.

The second is, *dilatation* in all solid bodies; and *rarefaction* in all fluids.

That both these are inseparable from heat, is evident from numerous experiments. An iron-rod, or bar, being heated, increases in all its dimensions; and the more so, as it is further and further heated: upon exposing it to the cold again, it contracts and returns successively through all the degrees of its dilatation, till it arrive at its first bulk; being never two minutes successively of the same magnitude.

The like is observed in the heaviness of all bodies, gold; which, when fused, takes up more space than before: so mercury, the heaviness of all fluids, we have known to ascend in a narrow tube over the *Fire*, to above thirty times its height.

The laws of this expansion, are 1^o That the same degree of *Fire* rarefies fluids sooner, and in a greater degree than it does solids. Without this, the thermometer would be of no use; since the cavity of the tube would then be dilated in the same proportion, as the fluid is rarefied. 2^o The lighter the fluid, the more it is dilated by *Fire*. Thus air, the lightest of all fluids, expands the most; and next after air, spirit of wine.

The third effect of *Fire* on bodies, is *motion*: for *Fire*, in warming and dilating bodies, must of necessity move their parts.

In effect, all the motion in nature arises from *Fire* alone; and taking this away, all things become immovable. Upon the absence of only a certain degree of *Fire*, all oils, fats, waters, wines, ales, spirits of wine, vegetables, animals, &c. become hard, rigid, and inert: and the less the degree of *Fire*, the sooner, and more violently is this induration made.

Hence, if there were the greatest degree of cold, and all *Fire* were absolutely taken away, all nature would grow into one concrete body, solid as gold, and hard as diamond. But upon the application of *Fire*, it would recover its former mobility.

Consequently, every diminution of *Fire* is attended with a proportionable diminution of motion: and vice versa.

F I R

This *Fire*, whose effects we have been relating, needs no air, or pabulum to sustain or preserve it.

For putting some calx of tin or lead, in the exhausted receiver of an air pump; and applying a burning glass so as the focus shall fall on the calx; the consequence will be a vehement dilatation of the calx, from the centre towards the circumference, whereby the receiver will be broke into a thousand pieces. And if a quantity of any essential aromatic oil be poured in vacuo, upon spirit of nitre, there will immediately arise a violent *Fire*, to the great danger of the bystanders.

All the above mentioned effects of *elementary Fire* may be increased divers ways, *viz.*

1^o. By *Attrition*, or a swift agitation, or rubbing of one body against another. This is apparent in solids: a vehement attrition of a flint, and steel, every body knows, will produce sparks. So also in fluids, cream, by long churning to separate the butter, will grow sensibly warm; the barometer renders this effect still more discernable.

In effect, all the heat of an animal is owing to the agitation and attrition of the parts of its juices against each other, and against the sides of the vessels.

The more solid, hard, and elastic the bodies thus agitated are, the more points of contact they have: the more intense the force whereby they are struck against each other, is, the greater is their motion: and the quicker the returns of the strokes, and the longer they are continued, the greater is the heat produced.

Thus, a piece of sponge rubbed lightly, and for a little while against another, acquires no sensible heat: but a large, heavy piece of iron briskly rubbed against another in a cold season (when bodies are the densest) will presently acquire an intense heat, sufficient to fire sulphur, gun-powder, or the like.

So a knife whetted briskly on a dry rough stone, shall yield sparks of *Fire*; but if oil, or any other fatty matter be interposed, no sensible heat shall arise: and the points of two needles rubbed against each other ever so strongly, or so long, will never grow warm; as only touching in a few parts.

Hence, 1^o. The globules of the cruor, or red blood, drove by the force of the heart against each other, or against the sides of the arteries, excite more heat than the globules of the serum, or any other humour in the animal. Hence, 2^o. Those parts abounding most with these globules thus agitated, as the heart, liver, and head, will be the hottest of all others: and the denser the blood, cæteris paribus, the greater the heat, &c. 3^o. The quicker the contractions of the heart are repeated, the greater will the heat be.

The second manner of increasing the effect of *elemental Fire*, is by throwing a quantity of moist or green vegetables, cut down while full of sap, into a large heap, and pressing them close down; the result of which, is, that they grow warm, hot, smoke, and finally will break out into flame.

The third way is, by the mixture of certain cold bodies. Thus, water and spirit of wine, first warmed, grow much hotter by the mixture: so, any of the heavy aromatic oils, as of cloves, cinnamon, saffras, guaiacum, &c. mixed with spirit of nitre, grow exceedingly hot, and burst forth like vulcano's. And the same may be said of spirit of nitre, and steel filings.

The like effect may be had from dry bodies. Thus, pure sulphur and steel filings, well ground and mixed in equal quantities, with water enough to make them into a dry paste, and laid an hour or two any where, even under ground, will smoke and emit flame; and that with the greater vehemence, as it is more strongly pressed down.

The fourth is by phosphorus, which is a kind of fire magnet prepared from the parts of animals, that imbibes and retains *Fire* for many years.

But in all these manners, it does not appear, that any *Fire* is excited, or generated of what was not *Fire* before: for, if in a severe winter's day you rub a plate of gold briskly against another, they will both grow hotter and hotter by degrees, till at length they become red hot, and at the point of melting: and yet all this time the plates lose nothing of their weight, but swell and grow bigger in all their dimensions.

Hence it follows, that the particles of the gold are not converted by the friction, into *Fire*; but that the *Fire* existed before; and all the effect of the friction, &c. is to collect, or bring together a quantity thereof before dispersed throughout the atmosphere.

In effect, there is no making or producing of *Fire* de novo. All we can do, is, of intensible, to render it sensible, *i. e.* to collect it out of a greater space into a lesser; and to direct and determine it to certain places. This is effected, as above-mentioned, by motion, attrition, &c.

The sun also contributes very much to the bringing of *Fire* to light, by means of his rapid motion round his axis; whereby the fiery particles, every where diffused, are directed and determined in parallel lines towards certain places, where their effect becomes apparent.

F I R

Whence is it that we perceive the *Fire* or heat when the sun is above the horizon; but that, when he disappears, his impulse or pressure being then taken away, the *Fire* continues dispersed at large through the ethereal space?

In effect, there is not less *Fire* in our hemisphere in the night time, than by day; only it wants the proper determination to make it perceived.

Another way of rendering it sensible, is, by collecting the parallel rays into a less compass, by means of convex glasses, or concave specula.

This *elementary Fire* is present every where, in all bodies, in all space, and at all times; and that in equal quantities: for, go where you will, to the top of the highest mountain, or descend into the lowest cavern; whether the sun shine, or not; in the coldest winter, or the most scorching summer; by one or other, or all of the means above-mentioned may *Fire* be collected. In a word, there is no assignable physical point without *Fire*; no place in nature, where the attrition of two sticks will not render it sensible.

So long as *Fire* remains equably, and undetermined in any place, it does not discover itself by any effect. In the severest weather we perceive no influence or effect of *Fire*, when, at the same time being collected and determined by attrition, it becomes manifest.

By changing *Fire* out of its indeterminate state, and impelling it in converging lines, its momentum is increased. Witness the phenomena of burning glasses.

But, how attrition, crude vegetables, &c. contribute towards altering the direction, &c. of *Fire*, does not easily appear.

On this *Fire*, and the effects thereof abovementioned, depends all fluidity of humours, juices, &c. also all vegetation, putrefaction, fermentation, animal heat, and a thousand other things.

II. But in what manner soever *Fire* is collected in bodies; upon a cessation of the collecting cause, it soon disappears again, unless it be supplied with a *Pabulum*, or *Fuel*. And in this case it becomes *Culinary Fire*.

By *Pabulum*, or *Fuel* of *Fire*, we mean whatever receives, and retains *Fire*; and is consumed, or at least rendered insensible thereby.

The only pabulum of *Fire*, in all nature, is the oil, sulphur, or fat of bodies: and bodies are only fuel, on account of the oil they contain.

Hence, 1^o. All vegetables, not too moist, nor too dry, afford such a pabulum; particularly those, which contain the greatest quantity of oil; as balsamic and resinous woods, &c. 2^o. All vegetable and animal coals are a proper pabulum for maintaining of *Fire*; as being only the parts of vegetables and animals, which have exhaled their water and salt, and retained the oil alone inhering, in a black form, in their earth.

3^o. All fossil and bituminous earths, turfs, &c. 4^o. All mineral sulphur, whether pure or joined with earth, stone, or metals; as pit-coal, &c. 5^o. The fat and dung of animals. And 6^o. Several productions of chemistry; as oils, inflammable spirits, &c. afford also a pabulum for *Fire*.

This *Fire*, which burns combustible bodies, requires air, to sustain it: which taken away, the *Fire* is immediately diffused: as appears from the experiments in vacuo.

And yet, *Fire* does not immediately bear, or endure the air; but always repels it: and by that means forms a kind of vault, or aerial furnace all round; which by its weight, and the pressure of the incumbent air, acts on all the particles, or corpuscles that would make their way through it; and thus retains the *Fire*, and applies it to the combustible matter.

Hence, the heavier the air, the more vehement the *Fire*: and accordingly, in still cold weather we observe the *Fire* to act with more violence than in warm weather.

But whether the air retains *Fire* by its weight alone (which water itself would do) may be questioned: and whether its elasticity does not contribute something thereto; as also, whether there be not some further unknown property in the air, that has a share in this effect, may be doubted. Something of this kind one would suspect from hence, that all air is not proper to maintain flame.

This *Fire*, in burning a combustible matter, affords a *shining Fire*, or a flame, or both, according to the diversity of fuel; and frequently also, smoke, soot, and ashes.

Shining, or *luminous Fire*, seems to be *elementary Fire*, attracted towards the parts of the sulphur, or oil, with such force and velocity, as to move, and shake them very violently, whirl them about, divide, and attenuate them, and thus render them volatile, and ready to be expelled: while, in the mean time, the air, making its vault all round, restrains and keeps them in, directs them to the sulphur, and keeps them still collected in their place or pabulum, while the combustible matter is diffused all round.

Flame seems to be nothing but a thick sulphur agitated, as before, by *elementary Fire*; so as the *Fire* is driven with a great motion around the revolving particles of the sulphur.

F I R

Soot, seems to be produced, when *Fire* and sulphur cannot break into a flame; being a sort of coal, consisting of a thick sulphur, and an attenuated oil with earth and salt.

Smoke seems to be the combustible matter, when it begins to be relinquished by the elementary *Fire*: for, if this smoke be afterwards passed through a flame, it will itself become flame, as before.

Lastly, ashes are the earth, and salt; which the *Fire* leaves untouched.

Fire may be distinguished into *shining*, and *not shining*: for, that there is *Fire* which does not emit light, is evident hence, that a piece of iron taken out of the *Fire*, before it be red-hot, shall yet give *Fire* to sulphur.

Shining Fire again may be subdivided into two kinds: that which *warm*s, as red-hot iron; and that which does *not warm*, as that observed in putrid fishes, rotten wood, &c. the oil whereof beginning to be agitated, and attenuated, produces light, without any heat, so far as the thermometer may be a rule of judging.

Of *shining*, and at the same time *warming Fires*, the principal is that of the sun, as it is called; though, whether the *Fire* be really emitted from the body of the sun; or whether it be only the common, vague, universal *Fire*, determined by the sun, is not easy to say. This *Fire* we more usually consider under the denomination of light.

This solar *Fire*, in calcining certain bodies, makes some addition to the weight thereof.

Thus, antimony exposed in the focus of a burning glass, will smoke a considerable time; and the greatest part of it will seem to evaporate in fumes: but, if afterwards tried by the balance, it will be found to have gained in weight. And if it be again applied in the focus of a larger glass, it will again emit fumes; and yet still be increased in weight.

Beside the solar, there is likewise a subterraneous *Fire*.

This appears in digging under ground: for the first glebe, next to the surface, is warmed by the heat of the sun; and as you go deeper, you will find it colder; whence even in hot countries they have conservatories of ice at some depth under ground; till, arriving at a certain depth, viz. forty or fifty foot, it begins to grow warmer, so that no ice can there subsist: and at a yet greater depth, it is so hot, as to take away respiration, extinguish candles, &c. And if the miner will venture further, and carry a candle along with him, he frequently sets the whole place in a flame, the sulphurous fumes, rendered volatile by the subterraneous *Fire*, catching flame from the candle.

Whence it appears, that there is another source of *Fire*, or as it were another sun, in the bosom of the earth, which gives motion and life to every thing growing in, or upon the globe; and even, that the centre of the earth is mere *Fire*; which *Fire* is likewise argued to be perpetual, from volcano's, or burning mountains, which have been known to cast up *Fire* from the earliest account of time. See VOLCANO.

There are two great *Fires* therefore, the higher, or solar; and the lower, or subterraneous; and these are in every other respect perfectly alike.

FIRE, in chemistry, is the great instrument, by which most of the operations of that art are performed.

The kind, degree, direction, &c. of *Fire*, are things the chemist is principally to attend to. The diversity of *Fire* makes a great difference in the result of the experiment; so as, the same effect, *e. gr.* shall not arise, if an experiment be made with the *Fire* of spirit of wine, and that of pitcoal.

And to this cause, Mr. Boyle, in his treatise of the unexpected failure of experiments, attributes it, that a great many experiments successfully tried by some, have not succeeded to others.

The *Fires* chiefly required by the chemists, are such as yield no fæces or remains; no salt, or smoke: and such alone are those of the sun, and of spirit of wine. Those which come next in purity, are oils distilled per vesicam; which lose their earth and salt, by their boiling and agitation in the water; so that the oftener the distillation is repeated, the purer they are rendered: after these the best is turf.

Indeed, the very manner wherein the *Fire* is blown, is found to have some effect: Thus, Acofta, lib. iv. c. 5. relates, that in Peru, when they would melt and separate their silver from the earth, &c. if the *Fire* be blown up with bellows, the fusion will not succeed: nor will any other *Fire* do but that blown by the wind raised from the fall of some water; so that they are forced to have recourse to large tubes laid to the feet of large mountains, where there are cataracls to convey the wind generated by the fall of water to their works.

The degree of *Fire*, or the collection and direction of *Fire*, to the degree proper for each operation, is almost the whole art of chemistry: the *Fire*, *e. gr.* requisite to melt metals, is by no means proper for the distilling of spirit of wine.

Now, the greater or less force of *Fire* depends altogether on a greater or less quantity thereof collected into a focus: for,

F I R

as to its motion, it does not seem in our power to alter it; or to make any increase or diminution of the force of the *Fire* on that account.

The chemists use four principal degrees of *Fire* in their operations.

The first is equal to the natural heat of the human body; or rather to that of a hen, brooding on her eggs; which is the standard: and accordingly this first degree is best measured by applying a thermometer to a hen; and some chemists by keeping a *Fire* continually to this degree, by means of a thermometer, have hatched chickens.

By this degree all their digestions, easy separations, and solution, and gentle distillations, with all fermentations and putrefactions are performed.

The second degree of *Fire* is that which gives a man pain, but does not destroy, or consume the parts: like the heat of a scorching summer's sun, which chafes and inflames the skin; and even sometimes raises blisters.

A fire of this degree is used in making separations of the more ponderous bodies, which the first degree is not equal to; as also in some fixations, particularly that of mercury, which is rendered fixed by a gradual introduction of such *Fire* among the parts of the mercury.

This degree makes the serum of the blood, and white of an egg coalesce, and so occasions deadly inflammations; and is too intense for any digestion, putrefaction, or fermentation to be effected by it.

The third degree of *Fire* is that of boiling water, which separates and destroys the parts of bodies. This degree is perfectly stable; for water, when once it boils, is at its utmost degree of heat, and cannot be raised a whit further, by any augmentation of *Fire*, or fuel; as was first observed by M. Amontons.

This degree serves to attenuate, separate, fix and perform other operations, where the two former would not be effectual.

The fourth degree is that which melts metals, and destroys every thing else.

This degree is too vehement to be estimated by the thermometer; that instrument not being able to endure it: so that it is only determinable by its effect in the fusion of metals: as the heat of boiling water cannot be increased, so neither can that of melted metals.

This degree is used in abundance of operations, and particularly about minerals, where the three preceding degrees are insufficient. This is the last degree known to the ancient chemists.

The latest chemists reckon a fifth degree of *Fire*, viz. that whereby gold is made to emit fumes, and evaporate.

This was first discovered in the year 1690, by Mr. Tschirnhausen, whose burning glass rendered every thing, even gold itself volatile.

Besides these five degrees, the chemists have several intermediate ones; all which however may be easily reduced to the former.

As, the *digesting Fire*, or venter equi, which is the heat of a dunghill.

The *Balneum Mariae*, *Arenosum*, &c. explained under the article BALNEUM.

The *naked*, or *immediate Fire*, which is the common *Fire* applied under a vessel.

The *Fire of a Lamp*, which is moderate and equal, and may be increased by the addition of more wick; used by enamellers, &c.

The *Wheel Fire*, which is lighted all round a crucible, or other vessel, to heat it all alike.

That called by *Suppression*, which is when the vessel is not only encompassed round, but covered over with *Fire*.

The *Reverberatory Fire*, when it is in a furnace close a-top, by which the *Fire* is reflected back, and all round upon the vessel.

The *melting*, or *fusing Fire*, for the solution and calcination of metals and minerals.

The *Glasf-heufe Fire*, for the vitrifying of the ashes of vegetables.

And the *Olympick Fire*, which is that of the sun collected in the focus of a burning mirror, &c.

To the several degrees of *Fire* required, several forms of furnaces are accommodated; which see under the article FURNACE.

There are five principal ways of altering the degree of *Fire*. For *Fire* differs, 1^o According to the weight of the pabulum, or fuel; it being a rule, that the heavier the fuel or combustible matter is, the more vehement, cæteris paribus, is the *Fire*. Thus, spirit of wine affords a weaker and less destructive *Fire* than oil; and this, than pitch, and so on; the heavier and grosser, still the fiercer.

2^o According to the quantity of the pabulum, or fuel.

3^o According to the distance of the *Fire* from the object; it being a rule, that the heat of the *Fire* at different distances is reciprocally, as the squares of those distances.

F I R

4° By the introducing or blowing of air into the *Fire*; it being a rule, that the stronger the current of air, or wind is, provided it be not so strong as to break the aerial fornix or vault incumbent on the *Fire*, the more is the *Fire* encreased. For a brisk blowing puts the minute parts of the pabulum into a greater motion, whence the greater attrition arises, and of consequence, more *Fire* is collected.

5° According to the solidity, or resistance of the medium between the *Fire* and the object; for the more solid the medium, the greater quantity of heat, *ceteris paribus*, does it receive from the *Fire*, and communicate to the object.

Thus, a vapour-bath communicates much less heat to the bodies distilled by it, than a water-bath; and this, less than a sand-bath; and this again less than a bath of steel-filings: for all bodies exposed to the *Fire*, grow hot in proportion to their specific gravities.

Thus, if a piece of metal be put in water, and both set over the *Fire*; while the water only grows lukewarm, the metal shall be so hot, as to be past touching: and thus a key in a person's pocket sitting near the *Fire*, shall frequently be very hot, while his clothes themselves have not any sensible warmth—Indeed, this rule admits of some exceptions; for we have oils, lighter than water, which yet admit of triple its degree of heat, before they boil.

It is a great controversy in chemistry, whether *Fire*, when applied to bodies, only separates and dissolves them; or whether it does not also really and absolutely change them.

Mr. Boyle, in his *Sceptical Chymist*, we think, has abundantly proved, that *Fire* really alters bodies; and that the parts or elements procured from bodies by *Fire*, did not exist such in the bodies themselves.

Add, that *Fire* does not only separate and decompound; but it also compounds and mixes bodies. This no body can doubt of, who knows that *Fire* in acting on many bodies, insinuates and fixes itself among them, and so constitutes one body together with them.

This is the case in dissolving of lead by *Fire*; as is evident from the increase of the weight of the lead: The like is observable in salt of tartar, which when first melted, loses somewhat of its weight; but as it is calcined further and further, it grows still heavier and heavier. In like manner, antimony calcined by a burning glass, as before observed, receives a notable accession of weight.

To say no more, the phosphorus must derive its shining matter from the fiery particles it imbibes in the distillation: For no body will imagine that any of that shining matter before existed in the human body.

FIRE, in medicine and chirurgery, is used in the same sense with cautery; and is distinguished into *actual*, and *potential*.

Actual FIRE is a hot iron.—There are several diseases, only to be cured by the application of *actual FIRE*; which method of cure is practised with great success in the East-Indies. See **BURNING**.

Potential FIRE is that contained in caustic medicines. See **CAUSTIC**.

Fire also gives the denomination to divers diseases, as

St. Anthony's FIRE, by physicians more usually called *erysipelas*. See **ERYSIPELAS**.

St. Anthony's FIRE is also called *holy Fire*, or *sacer Ignis*; and in an ancient instrument, belonging to the hospital in the church of St. Anthony at Marcellis, it is called *Fire of hell*, or *Ignis infernalis*.

This distemper made great ravages in France, in the XIth and XIIth century; and it was for the relief of persons labouring under it, that the religious order of St. Anthony was founded, in the year 1093, under the pontificate of Urban II.

Walking FIRE, called also *Will-with-a-whisk*, *Jack-in-a-lantern*, *Ignis fatuus*, &c. See **IGNIS FATUUS**.

FIRE, in theology, is frequently understood of the punishment of the wicked after death.

It is supposed the world will perish at last by *Fire*.

God has made several revelations of himself, under the appearance of *Fire*: He appeared to Moses under the form of a *Fire* burning in a bush: The Holy Ghost descended on the apostles in tongues of *Fire*; and the camp of the Israelites was guided and conducted in the night-time by a pillar of *Fire*.

The Persians adored God under the image or representation of *Fire*; by reason it is *Fire*, that gives motion to every thing in nature. They are said to have in that empire *Fires* still subsisting, which have burnt above a thousand years.

The Hebrews kept up the *holy Fire* in the temple; and the vestals were appointed express, to keep up the sacred *Fire* of the Romans.

Vulcan was worshipped among the antients, and particularly the Egyptians, as the inventor of *Fire*: And Boerhaave has made it highly probable, that the Vulcan of the heathens was the Tubal Cain of the Hebrews, the first who appears to have known the use of *Fire*, and to have applied it in the fusion of metals, and other preparations of chemistry.

F I R

FIRE, in the military language, is sometimes applied to the *Fires* lighted in an army in the night-time.

Thus, the enemy's *Fires* were seen on the top of the mountains.

But, the term *Fire* or *Firing*, is more frequently used for the discharge of the *Fire-arms*; or the shot made on the enemy from the artillery, &c.

The horse suffered extremely from the *Fire* of the foot, which took them in flank: the trench was exposed to the *Fire* of the place: In this assault the curtain was all on *Fire*.

In fortification, the *Fire of the place* denotes the flank; or that part of the curtain where the line of defence terminates; from whence they *fire*, to defend the opposite face of the bastion.

The best way of fortifying is that which gives the most *Fire*.

FIRE-ARMS are those charged with powder and ball: Such are canons, mortars, and other ordnance; musquets, carabines, pistols, and even bombs, granado's, carcasses, &c.

For the rebound or refilition of *Fire-arms*, see **REBOUND**.

In the history of the Royal Academy for the year 1707, we have an account of some experiments made with *Fire-arms* differently loaded, by M. Caffini. Among other things he observes, that by loading the piece with a ball which is somewhat less than the calibre; and only laying a little gunpowder below the ball, and a good deal above it, it will yield a vehement noise, but have no sensible effect or impulse on the ball.

This he takes to have been all the secret of those people who pretended to sell the art of rendering one's self invulnerable, or shot proof.

FIRE-BOTE, fuel for necessary firing, which by the common law, tenants may take out of the lands granted to them.

FIRE-EATER.—We have a great number of charlatans, who have procured the attention and wonder of the public, by eating of *Fire*, walking on *Fire*, washing their hands in melted lead, and the like tricks.

The most celebrated of these was our countryman Richardson, much talked of abroad. His secret, as related in the *Journal des Savans*, of the year 1680, consisted in a pure spirit of sulphur wherewith he rubbed his hands, and the parts that were to touch the *Fire*; which burning and cauterizing the epidermis, hardened and enabled the skin to resist the *Fire*.

Indeed this is no new thing: Amb. Paré assures us he had tried on himself, that after washing the hands in one's own urine, and with unguentum aureum, one may safely wash them in melted lead.

He adds also, that by washing his hands in the juice of onions, he could bear a hot shovel on them, while it melted lard.

FIRE-MASTER, in our train of artillery, is an officer who gives the directions, and the proportions of the ingredients, for all the compositions of *Fire-works*, whether for service in war, or for rejoicings and recreations.

His orders are given to the *Fire-workers*, and bombardiers, who are obliged to execute them.

FIRE-OFFICE, an office of insurance from *fire*. See **ASSURANCE**.

FIRE-STONE, a kind of stone, called also *Rygate-stone*, from the place whence it is chiefly brought; it is very good, and much used for chimneys, hearths, ovens, stoves, &c.

Wild FIRE, is a kind of artificial or factitious *Fire*, which burns even under water; and that with greater violence than out of it.

It is composed of sulphur, naphtha, pitch, gum, and bitumen; and is only extinguishable by vinegar, mixed with sand and urine; or by covering it with raw hides.

Its motion or tendency is said to be contrary to that of natural *Fire*, and that always follows the direction in which it is thrown; whether it be downwards, sideways, or otherwise.

The French call it *Greek Fire*, or *Feu Gregeois*, because first used by the Greeks, about the year 660; as is observed by the jesuit Petavius, on the authority of Nicetas, Theophanes, Cedrenus, &c.

The inventor, according to the same jesuit, was an engineer of Heliopolis, in Syria, named Callinicus, who first applied it in the sea-fight commanded by Constantine Pogonates against the Saracens, near Cyzicus, in the Hellespont; and with such effect, that he burnt the whole fleet therewith, wherein there were thirty thousand men.

But others will have it of a much older date; and hold Marcus Gracchus the inventor; which opinion is supported by several passages, both in the Greek and Roman writers, which shew it to have been antiently used by both those nations in the wars. See Scaliger against Cardan.

Constantine's successors used it on divers occasions, with equal advantage, as himself; and what is remarkable enough is, that they were so happy as to keep the secret of the composition to themselves; so that no other nation knew it in the year 960.

F I R

Hugh, king of Burgundy, demanding ships of the emperor Leo, for the siege of Fréine, desired likewise the *Greek Fire*. Chorier, *Hist. de dauph.*

F. Daniel gives us a good description of the *Greek Fire*, in his account of the siege of Damietta, under St. Louis. Every body, says that author, was astonished with the *Greek Fire* which the Turks then prepared; and the secret whereof is now lost. They threw it out of a kind of mortar; and sometimes shot it with an odd sort of cross-bow, which was strongly bent by means of a handle, or which, of much greater force than the bare arm. That thrown with the mortar, sometimes appeared in the air of the size of a tun, with a long tail, and a noise like that of thunder. The French by degrees got the secret of extinguishing it; in which they succeeded several times.

FIRE-WORKS, or artificial FIRES, are preparations made of gunpowder, sulphur, and other inflammable and combustible ingredients, used on occasion of public rejoicings, and other solemnities.

The principal of these are rockets, serpents, stars, hail, mines, bombs, garlands, letters, and other devices. See **ROCKET**, **STAR**, **BOMB**, &c.

The art of preparing and managing *Fire-works*, is called *pyrotechnia*.

FIRE-WORKERS, are subordinate officers to the *Fire-masters*, who command the bombardiers.

These receive the orders from the *Fire-masters*, and see that the bombardiers execute them.

FIRKIN, an English measure of capacity, for things liquid; containing the fourth part of the barrel.

The *Firkin of Ale* contains eight gallons; and that of *Beer*, nine: Two *Firkins* of beer make the kilderkin; two kilderkins the barrel; and two barrels the hoghead.

The *Firkins of Soap and Butter* are on the footing of the *Firkin of ale*, viz. a gallon per *Firkin*, less than that of beer.

FIRMAMENT, in the ancient astronomy, the eighth heaven, or sphere; being that wherein the fixed stars were supposed to be placed.

It is called the *eighth*, with respect to the seven heavens or spheres of the planets, which it surrounds.

It is supposed to have two motions: A diurnal motion, given it by the primum mobile, from east to west, about the poles of the ecliptic: And another opposite motion from west to east; which last it finishes, according to Tycho, in 25412 years; according to Ptolemy, in 36000; and according to Copernicus, in 258000: In which time the fixed stars return to the same precise points wherein they were at the beginning. This period is commonly called *Plato's year*, or the great year. See *PRECESSION of the equinox*.

In divers places of scripture the word *Firmament* is used for the middle region of the air. Many of the ancients allowed, with the moderns, that the *Firmament* is a fluid matter; though they, who gave it the denomination of *Firmament*, must have taken it for a solid one.

FIRMAN, in the East-Indies, and particularly in the territories of the Great Mogul, is the passport, or permit, granted to foreign vessels, to trade within their jurisdiction.

FIRMNESS, FIRMITAS, in philosophy, denotes the consistence of a body; or that state, wherein its sensible parts cohere, or are united together, so that the motion of one part induces a motion of the rest.—In which sense, *Firmness* stands opposed to fluidity.

Some authors confound *Firmness* with density; as thinking the same state or property of body implied by both; or at least, that *Firmness* follows density: But this is a mistake. For mercury, the densest body in nature excepting gold, is yet one of the most fluid: And even gold itself, with all its density, when fused, wants *Firmness*, or cohesion.

Many of the Cartesians and others, hold *Firmness* to consist in the mere quiet of the particles of the body, and their mutual immediate contact; urging, that a separation of parts can only arise from some matter interposed between them, which is excluded by the notion of contiguity.

But the insufficiency of this hypothesis is evident: For mere simple rest has no force, either to act or resist; and consequently two particles only joined by rest and contiguity, would never cohere so as that a motion of the one should induce a motion of the other. This is obvious in the case of two grains of sand, which however contiguous, and at rest, will never constitute a *firm* coherent body.

The *Firmness* of bodies, then, depends on the connection or cohesion of their particles. Now, the cause of cohesion, Sir I. Newton and his followers hold to be an attractive force, inherent in bodies, which binds the small particles thereof together; exerting itself only at, or extremely near, the points of contact, and vanishing at greater distances.

The *Firmness* of bodies, therefore, follows the laws of the cohesion of bodies; which see under **COHESION**.

Hence, *Firmness* in all bodies must be as the surfaces, and contacts of the component parts: Thus a body, whose parts

F I S

are by their peculiar shapes capable of the greatest contacts, is most *firm*; and that, whose parts are capable of the least contact, will be most soft.

In the former, the greatest requisite is to be as near to cubes as possible, and in the latter to spheres. And in the same manner are to be accounted for, not only all the intermediate degrees between the most *firm*, and the most soft bodies, but those different consistences, which are distinguished by other names, as friable, tenacious, glutinous, and the like: For the greater are the solidities of the component parts of any body, in proportion to their surfaces, though that body, by the aptitude of the contacts, may be what we call *very hard*; yet it will be most friable or brittle. And where the surfaces of the component particles are much extended upon a small quantity of matter, the bodies they compose, though they may be light and soft, yet they will be tenacious or glutinous: For although the flexibility of their compounding parts admits of their easy changing of figure by any external force, yet by their touching one another in so many points, they are very difficultly separated.

The former is the case in crystalized salts, resins, and the like; the latter in turpentine, gums, and all of that sort.

FIRST-FRUITS, Annates or Primities, the profits of a benefice for the first year after avoidance.

The *First-Fruits* were originally reserved for the pope's benefit, and were accordingly, before the reformation, paid to him; but the parliament under king Henry VIII. translated them to the crown, 25 Hen. VIII. c. 20.

Queen Anne, in the third year of her reign, made a grant of the whole revenue of *First-Fruits* and tenths, to settle a fund for the augmentation of the maintenance of the poor clergy.

By the act 25 Henry VIII. he, who enters on any spiritual living, before he pays, or compounds for the *First-Fruits*; on conviction, forfeits double the value thereof.

Every clergyman therefore before his induction, or soon after, should go himself with one friend, or send two friends for him, to the *First-Fruits* office, and there enter into bond to pay the *First-Fruits* of his benefice, within two years next ensuing, at four equal half-yearly payments. Only, one tenth of the whole yearly sum, entered in the king's books, is to be deducted; because that must be paid by itself the first year.

Formerly, four bonds were given for the four several payments; but by statute 2 and 3 of queen Anne, one bond only is appointed to be given; and the rates of all benefices, according to the king's books, are declared unalterable.

The successor is chargeable with arrears of tenths, due from his predecessor; and consequently, by 27 Henry VIII. c. 8. is empowered to distrain his predecessor's goods, being upon the benefice; and hath likewise a good action at law against him or his executors.

FISCUS, in the civil law, the treasury of a prince, or state; or that to which all things due to the public, do fall.

* The word is derived from the Greek *φισκος*, a great basket, used when they went to market.

By the civil law, none but a sovereign prince has a right to have a *Fiscus*, or public treasury.

At Rome, under the emperors, the term *ararium* was used for the revenues destined for support of the charges of the empire; and *Fiscus* for those of the emperor's own family.—Thus the treasury, in effect, belonged to the people, and the *Fiscus* to the prince.

FISCAL, something relating to the pecuniary interest of the king, the public, or a private person.

The emperor Adrian erected the office of *Fiscal* advocate in the Roman empire.

FISH, in natural history, an animal that has scales, and fins, and that lives in the waters, as its proper place of abode. See *Supplement* article **PISCIS**.

Naturalists observe a world of wisdom, and design in the structure of *Fishes*, and their conformation to the element they are to reside in.

Their bodies are clothed and guarded in the best manner, with scales, &c. suitable to their respective circumstances, the dangers they are exposed to, and the motion and business they are to perform.

The centre of gravity is placed in the fittest part of the body for swimming; and their shape is the most commodious for making way through the water, and most agreeable to geometrical rules.

They have several parts peculiar to themselves; as fins, to balance and keep them upright. See **FIN**.

And an air-bladder, or swim, to enable them to rise and sink to any height and depth of water, at pleasure.

They have also gills or branchiae, whereby they respire; as land animals do by the lungs.

The tail is the instrument of progressive motion, and serves to row them forward.

Their

Their eyes are peculiarly formed to enable them to correspond to all the convergences and divergencies of rays, which the variations of the watery medium, and the refractions thereof, may occasion; in which respect they bear a near resemblance to those of birds.

Fishes are distinguished into *sea*, or *salt-water fish*, *piscis marini*; as the whale, herring, mackerel, &c. — *river*, or *fresh-water fish*, *piscis fluviatilis*; as the pike, trout, &c. — and *panda*, or *lake-fish*; as the carp, tench, &c. to which may be added, others which abide indifferently in fresh water or salt; as salmon, shad-fish, &c.

Aristotle, and after him Mr. Willoughby, more accurately distinguish *Fishes* into *cetaceous*, *cartilaginous*, and *spinous*.

The *cetaceous* kind, called also *belluæ marinæ*, have lungs and breathe like quadrupeds; they copulate also like them, and conceive and bring forth their young alive, which they afterwards suckle with their milk.

The *cartilaginous* sort are produced from large eggs, like those of birds; which are also excluded the womb, like those of birds.

The *spinous* kind are also oviparous; but their eggs are smaller, and they have spinæ up and down in their flesh, to strengthen it.

Willoughby thinks it would be yet more proper to divide *Fishes* into such as *breathe with lungs*, and such as *breathe with gills*; and then to subdivide those that breathe with gills, not into cartilaginous and spinous, but into *oviparous* and *viviparous*.

The *viviparous* kind that breathe with gills, he subdivides into *long*; such as the *galei* and *cætes*, or sharks and dog-fish; and *bread*; such as the *passinaca*, *raja*, &c. the subdivisions of each whereof, he gives in his chapter of cartilaginous *Fishes* in general.

The *oviparous* kind that breathe with gills, are the most numerous; and these he subdivides into such as are what we usually call *Flat-Fish*; and such as swim with their back upright, or at right angles to the horizon.

The *plain* or *flat-fish* kind, called usually *plani spinosi*, are either *quadrati*, as the rhombi and passeres; or *longiusculi*, as the soleæ.

Such as swim with their backs erect, are either long and smooth, and without visible scales, as the eel-kind, or shorter and less smooth; and these have either but one pair of fins at their gills, or else another pair of fins also on their bellies; which latter kind he subdivides into two kinds. — 1^o, Such as have *no prickly fins on their backs*, but soft and flexible ones. 2^o, Such as have *prickly fins* upon their backs.

Those *Fishes* which have only soft and flexible fins on their backs, may be divided into such as have *three*, *two*, or but *one* single fin there.

No *Fish* but the *aselli* have *three fins* on their backs. See Supplement, article FINS.

Fishes with *two fins* on their backs, are either the *truttaceous*, trout kind; or the *gobionites*, loch, or gudgeon kind.

Fishes with but *one soft back fin*, are of three sorts. — The first kind have one long continued fin, from head to tail, as the hippocampus of Rondeletius, &c.

The second have their fins but short, and placed just in the middle of their back: and these are either *marine*, as the herring kind; or *fluviatilis*, as those which we call *leather-mouthed Fishes*; such as carp, tench, &c.

Fishes which have *prickly fins on their backs*, are of two kinds. — 1^o, Such as have *two prickly fins on their backs*; and in these the anterior radii of their fins are always prickly. — 2^o, Such as have but *one prickly fin* there.

The *English Fishes*, according to Willoughby's catalogue, are as follow —

I. Of the *long cartilaginous* kind we have, 1. The *Canis varcharias*, or *lamia*, the white shark. 2. *Galeus glaucus* Rondeletii, the blue shark. 3. *Canis galeus* Rondeletii, called a *tope* in Cornwall. 4. *Galeus acanthias* sive *spinax*, the prickled dog, or hound-fish. 5. *Galeus seu mustela levis*, the smooth, or unprickled hound-fish. 6. *Catulus major*, vulgo *canicula Aristotelis*, the rough hound, called in Cornwall the *bonace*. 7. *Catulus minor*, the lesser hound fish, or moray.

II. Of the *plain cartilaginous* kind, we have, 1. The *Raja levis undulata*, the skate or flare. 2. *Raja clavata*, the thorn-back. 3. *Raja aspera nostras*, the white-horse. 4. *Squatina*, the angel, or monk-fish. 5. *Rana piscatrix*, the toad-fish, or sea-devil.

III. Of the *plain spinous* kind, 1. *Rhombus maximus asper squammosus*, called the turbot, or brett. 2. *Rhombus non aculeatus squammosus*, in Cornwall called the *Lug-alef*. 3. *Passer Bellonii*, the plaice. 4. *Passer asper sive squammosus*, the dab. 5. *Passer fluviatilis sive amphibius*, the flounder, fluke, or butt. 6. *Hippoglossus Rondeletii*, the holy butt, called in the north, the turbot. 7. *Buglossus*, or *solea*, the sole.

IV. Of the *Eel* kind we have, 1. *Lampetra major*, the lamprey, or lamprey-eel. 2. *Lampetra parva*, and *fluviatilis*, the lampern. 3. *Anguilla*, the common eel. 4. *Conger*, the conger, or sea-eel. 5. *Ammodytes Gessneri*, the sand-eel, or lance. 6. *Gunnellus cornubiensis*, the butter-fish. 7. *Mustela vulgaris* Ron-

deletii, the sea-loach, or whistle-fish. 8. *Mustela fluviatilis*, the eel-pout, or turbou. 9. *Lupus marinus*, the wolf-fish, or sea-wolf. 10. *Alauda non cristata*, the sea-lark, called in Cornwall *mulgranock*, and *bulcard*. 11. *Alauda cristata*, the crested sea-lark. 12. *Liparis Rondeletii*, Rondeletius's butter-fish. 13. *Gobio fluviatilis*, the bull-head, or miller's-thumb. 14. *Storpaneæ Bellonii similis*, the dutch pots-hog; the Cornish boys call it *father-lasher*.

V. Of the kind of fishes wanting the belly pair of fins, we have:

1. *Mola Salviani*, the sun-fish. 2. *Acus Aristotelis species major*, the tobacco pipe fish. 3. *Acus Aristotelis congener*, the sea-adder. 4. *Xiphias seu gladius piscis*, the sword-fish.

VI. Of the *non-spinous* kind of fishes, with three unprickly soft fins on their backs, we have, 1. *Asellus vulgaris major*, the cod-fish, or kaling. 2. *Huitingo-Pollacæ*, the whiting pollack. 3. *Asellus niger*, the coal-fish, or rawling pollack. 4. *Ucellus luscus*, the bib, or blinds. 5. *Asinus antiquorum*, the haddock. 6. *Asellus mollis major*, the whiting.

VII. Of the *non-spinous* kind, with only two soft fins on their backs, are found with us, 1. *Merluccius*, the hake. 2. *Asellus longus*, the ling. 3. *Thynnus*, or *thunnus*, the tunny, or Spanish mackerel. 4. *Scomber*, the mackerel. 5. *Thymallus*, the gragling, or umber. 6. *Albula salmoni similis*, the guinnadi. 7. *Albula harengi formis*, the schelly. 8. *Salmo*, the salmon. 9. *Salmulus*, the samlet, or bramin. 10. *Salmo griseus*, the gray. 11. *Trutta salmasnata*, the salmon trout. 12. *Trutta lacustris*, the scurf, or bull-trout. 13. *Trutta fluviatilis ædam generum*, the trout. 14. *Umbla minor Gessn.*, the red charr, or Welch torgoch. 15. *Carpio lacus Benaci*, the gilt, or gilt charr. 16. *Eperlanus seu viola*, the smelt. 17. *Gobius niger*, the rock-fish, or sea-gudgeon. 18. *Lumpus Anglorum*, the lump, or sea-owl. 19. *Cataphractus Schonfeldii*, in the west of England, a poggæ.

VIII. Of the *non-spinous* kind, with only one fin on the back, there are, 1. *Harengus*, the Herring. 2. *Harengus minor*, the pilchard, called also *calchis*. 3. *Encrasischelus*, the anchovy. 4. *Aloja seu clupea*, the shad, or mother of herrings. 5. *Sardina*, the sprat or sparleng, which is nothing else but the young herring. 6. *Acus vulgaris*, the gar-fish, or horn-fish. 7. *Sturio*, the sturgeon. 8. *Lucius*, the pike, or pickrel. 9. *Cyprinus*, the carp. 10. *Cyprinus latus*, the bread. 11. *Tinca*, the tench. 12. *Orfus Germanorum*, the tudd, oerve, or nerfling. 13. *Capito seu cephalus*, the chubb, or chevin. 14. *Barbus*, the barbel. 15. *Leuciscus*, the dace, or dore. 16. *Rutilus*, seu *rubellus*, the roach. 17. *Alburnus*, the bleak or bley. 18. *Gobius fluviatilis*, the gudgeon. 19. *Cobites fluviatilis barbatula*, the loche. 20. *Varius*, seu *phoxinus levis*, the pink, or minnow.

The last twelve of these are called *Malacostomi*, or *leather-mouthed fishes*; because they have no teeth in their jaws, but only deep down in their mouths.

IX. Of the *spinous* kind, with two fins on their backs, of which the foremost is *aculeate*, we have, 1. *Lupus*, the balie. 2. *Mugil*, the mullet. 3. *Gurnarnus griseus*, the grey gurnard. 4. *Hirundo Aldrovandi*, the tub-fish. 5. *Cuculus Aldrovandi*, the red gurnard, or rochet. 6. *Lyra prior Rondeletii*, the piper. 7. *Mullus major*, the sur-mullet. 8. *Draco sive araneus Plinii*, the spider. 9. *Trachurus*, the scad. 10. *Perca fluviatilis*, the perch. 11. *Faber piscis*, the dory, or doree.

X. Of the *aculeate* kind, with only one fin on the back, whose radii are some prickly, and some soft, there are, 1. *Aurata*, the gilt-head, or gilt-poll. 2. *Pagrus*, the sea-bream. 3. *Turdus*, vulg., the old-wife, or wrals. 4. *Perca fluviatilis minor*, seu *aurata*, the ruff. 5. *Piscis aculeatus vulgaris*, seu *pungitius Alberti*, the common prickle-back, or sharpling, or banfickle. 6. *Piscis aculeatus minor*, the lesser prickleback.

XI. Of the *cetaceous* kind, we reckon only, 1. *Balaena Britannica antiquorum*, which seems now to be gone from our seas, and we scarce know what kind of fish it was. 2. *Balaena vulgaris*, Rondeletii, the common whale, which is sometimes found stranded on our coasts, or rambles up our rivers. 3. *Delphinus antiquorum*, the dolphin, very rarely, but sometimes seen here. 4. *Phocæna*, the porpoise, called by Schonfeld, the northern dolphin. See Supplement, under each of these several heads, CANIS, GALEUS, &c.

FISH, with regard to commerce, is distinguished into *dry*, *pickled*, *green*, and *red*.

Dry, or *salt FISH*, is that which is salted and dried, either by the heat of the sun, or by fire. Such principally are the cod, stock-fish, herring, and pilchard.

Green FISH is that lately salted, and which yet remains moist; as green cod, &c.

Pickled FISH is that boiled and steeped in a pickle made of salt, vinegar, &c. as salmon, cod, herring, mackerel, pilchard, anchovy, and oysters.

Red FISH is some fresh *Fish* broiled on the gridiron, then fried in oil of olives, and barrelled up with a proper liquor, as new olive oil, vinegar, salt, pepper, cloves, and laurel leaves, or other herbs. The best *Fish* thus prepared are sturgeon and tunny.

FISH, considered as a food, makes a considerable article in the furniture of the table; and the breeding, feeding, catching, &c. thereof, make a peculiar art of no small moment in the economy of a gentleman's house and garden.

To this relate the ponds, flets, &c. described in their proper places. See FISH-pond, STREW, &c.

Some general rules and observations on the same subject may not here be unacceptable.

For the breeding of FISH, the quality of the pond, water, &c. proper for this end, is scarce determinable by any certain symptom, or rule: for some very promising ponds do not prove serviceable that way. One of the best indications of a breeding pond, is when there is good store of ruff and grazing about it, with gravelly shoals; such as horseponds usually have: and when a water takes thus to breeding, with a few millets and spawners, that is, males and females, two or three of each, a whole country may be stocked in a short time.

Eels and perch are of very good use to keep down the stock of FISH; for they prey much upon the spawn and fry of bred FISH, and will probably destroy the superfluity of them.

As for pike, perch, tench, roach, &c. they are observed to breed almost in any waters, and very numerously; only eels never breed in standing waters that are without springs; and in such are neither found, nor increase, but by putting in: Yet where springs are, they are never wanting though not put in. And, which is most strange of all, many say there is not in an eel the least token of propagation, either by milt, or spawn; so that how they are produced is a question very mysterious.

See Supplement, article EEL.

For the feeding of FISH, take the following remarks:

1. In a few, thirty or forty carps may be kept from October to March, without feeding; and by fishing with trawls or flets in March, or April, you may take from your great waters, to recruit the flets: but you must not fail to feed all summer, from March to October again, as constantly as cooped chickens are fed; and it will turn to as good an account.

2. The constancy and regularity of serving the FISH, conduces very much to their well eating and thriving.

3. Any sort of grain boiled, is good to feed with, especially peas and malt, coarse ground: the grains after brewing, while fresh and sweet, are also very proper; but one bushel of malt, not brewed, will go as far as two of grains: chippings of bread, and orts of a table, steeped in tap-droppings of strong beer, or ale, are excellent food for carps.

Of these the quantity of two quarts to thirty carps, every day, is sufficient: and to be so fed morning and evening, is better than once a day only. There is a sort of food for FISH, that may be called accidental, and is no less improving than the best that can be provided; and this is, when the pools happen to receive the wash of commons, where many sheep have pasture, the water is thus enriched by the soil, and will feed a much greater number of carps than otherwise it would do: and farther, the dung that falls from cattle standing in water in hot weather, is also a very great nourishment to FISH.

The best food to raise pikes to an extraordinary fatness is eels; and without them it is not to be done, but in a long time. Setting these aside, small perches are the best meat. Breems put into a pike pond, breed exceedingly, and are fit to maintain pikes; which will take care they do not increase overmuch: The numerous fry of roaches and rudds, which come from the greater pools into the pike-quarters, will likewise be good diet for them.

Pikes in all streams, and carps in hungry-springing waters, being fed at certain times, will come up, and take their meat almost from your hand.

The best feeding-place is toward the mouth of the pond, at the depth of about half a yard; for by that means the deep will be kept clean and neat; the meat thrown into the water, without other trouble, will be picked up by the FISH, and nothing will be lost: yet there are several devices for giving them food, especially peas; as a square board let down with meat upon it.

When FISH are fed in the larger pools or ponds, where their numbers are great, malt boiled, or fresh grains, is the best food. Thus carps may be fed and raised like capons, and tench will feed as well; but perch are not for a stew in feeding-time.

As to the benefits that redound from the keeping of FISH, besides furnishing the table, and raising money, your land will be vastly improved, so as to be really worth, and yield more this way, than by any other employment whatsoever: For suppose a meadow of 2 l. per acre; four acres in pond, will return every year a thousand fed carps, from the least size to fourteen or fifteen inches long; beside pikes, perch, tench, and other fry: the carps are saleable, and will bring six-pence, nine-pence, and perhaps twelve-pence a-piece, amounting in all to twenty-five pounds, which is six pounds five shillings per acre.

Royal FISHES, see the article ROYAL FISHES.

FISHES in astronomy, see the article PISCES.

FISH-days; see the article ABSTINENCE.

FISHES, in heraldry, are of themselves of less esteem in a coat of arms, than beasts and fowls, as being posterior thereto in the

order of creation: but they sometimes become so dignified by the persons or families who bear them, as to be preferable to many birds and beasts.

Fishes are born divers ways; upright, embowed, extended, endoried, surmounted of each other, fretted, triangled, &c.

All FISHES born feeding, should be termed *decurving*.

Those born directly upright, should be termed *hauriant*.

And those born traverse the escutcheon, *naiant*.

FISHERY, a commodious place for FISHING; or a place wherein great quantities of FISH are caught.

The principal FISHERIES of Europe, for salmon, herring, cod, and mackarel, are along the coasts of England, Scotland, and Ireland: for whales, about Greenland: for pearls, in the East and West-Indies, &c.

FISHERY, also denotes the commerce of FISH; more especially the catching them for sale. The FISHERY makes a principal branch of the British commerce. A great quantity of vessels and fishermen are employed therein; and besides what is spent at home, above 200,000 l. sterling is yearly returned, merely for herring and cod, exported to Spain, Italy, and several parts of the Mediterranean, and the islands of the Archipelago.

Yet are our countrymen reproached, and with a good deal of justice, for their remissness in this branch of trade. The advantageous situation of our coasts might be of immense benefit to us, did not we let our neighbours over-reach us therein. The Dutch, French, Hamburgers, &c. come yearly in large shoals, and not only take the fish from our own doors, but sell them to us for our money, when they have done.

Scotland suffers incredibly on this score: no country in Europe can pretend to rival it in the abundance of the finest fish, where-with its numerous harbours, lagoons, rivers, &c. are stored. In the river Dee, it is said, an hundred and seventy head of salmon is not very extraordinary for a single draught of a net: and the pickled salmon sent hence, is allowed the best in Europe. The Scottish islands, especially those on the western side, do certainly lie most commodiously for carrying on the fishing trade to perfection.

King Charles the first began the experiment, in conjunction with a company of merchants; but the civil wars soon set it aside. King Charles the second made a like attempt; but having preferring occasion for money, he was persuaded to withdraw what he had employed in the FISHERY; at which the merchants, joined with him, being displeased, did the like themselves.

Since the Union, several efforts have been made to retrieve it: and there has been long a corporation settled on that footing; and the Scotch FISHERY is now likely to be put on a very advantageous footing.

COD FISHERY. — The COD is a fish of passage, pretty large, with a great head; and teeth in the bottom of the throat; its flesh white; its skin brownish on the back, white under the belly, and covered with a few thin transparent scales.

It eats excellently, when fresh; and, if well prepared and salted, will keep a long time. This fish, thus prepared, is commonly eaten among us in lent, &c. under the denomination of Salt-fish or Stock-fish.

There are two kinds of salt cod; the one called *green*, or *white*; and the other *dried*, or *cured*: though it is all the same fish, only differently prepared. —

GREEN COD. — The chief FISHERIES for green COD are in the bay of Canada, on the great and little Bank, near the coast of Newfoundland, the island of St. Peter, and the isle of Sable: and higher vessels are yearly sent from divers parts both of America and Europe.

The vessels used herein are from an hundred to an hundred and fifty tons burthen; and these will bring thirty, or thirty-five thousand fish a-piece.

The most essential articles in this FISHERY are the persons who know how to open the fish, to cut off the heads, and to salt them; upon the ability of which last the success of the voyage chiefly depends.

Several authors will have it, that the Biscayans, in pursuing their whales, made the first discovery of the great and little Banks of COD, at Newfoundland, Canada, &c. a hundred years before Columbus's time; and that it was a Biscayan Newfoundland-lander, that gave the first intimation thereof to Columbus.

Others say, that the great Bank was discovered by a native of St. Malo's, named Cartier. But, be the inventor of what name or nation he will, the invention is certainly highly valuable: there is not a trading nation in Europe, but allows the commerce of COD-fish one of the most secure and gainful that is known.

The best, largest, and fattest COD, are those taken on the south side of the great Bank, which is a kind of submarine mountain, one hundred and fifty miles long, and fifty broad, and at the distance of twenty five from Newfoundland: those on the north side are generally much smaller.

The best season is from the beginning of February, to the end of April; at which time COD, which during the winter had retired to the deepest parts of the sea, return to the Bank, and grow very fat.

Those

Those caught from March, to June, keep well enough; but those in July, August, and September, soon spoil.

The fishing is sometimes done in a month, or six weeks; and sometimes it holds six months. As lent draws on, if the fishermen have but half their cargo, they strive who shall make homeward the first; the market being then the best.

Some will thus make a second voyage, before others have got loading for the first. Each fisher only takes one cod at a time; and yet the more experienced will take from three hundred and fifty to four hundred per day: but this is the most; for it is very fatiguing work, both on account of the weightiness of the fish, and of the extreme cold which reigns on the bank.

The salary usually allowed the captain and sailors, is one third of the *Cod* they bring home found.

They salt the *Cod* on board. The head being cut off, the belly opened, and the guts taken out; the salter ranges them in the bottom of the vessel, head to tail; and having thus made a layer thereof, a fathom or two square, he covers it with salt: over this he lays another layer of fish, which he covers as before; and thus he disposes all the fish of that day, taking care never to mix the fish of different days together.

By that time the *Cod* has lain thus to drain three or four days, they are moved into another part of the vessel, and salted a-fresh. After this, they are no more to be touched, till the vessel have its burden.

Sometimes they put them up in barrels, for the convenience of carriage.

Dry Cod—In the fishing of dry *Cod*, vessels of all sizes are used; though such are generally chose, as have large holds, by reason this sort of fish incumbers more than it burdens.

As *Cod* is only to be dried by the sun, the European vessels are obliged to put out in March, or April, to have the benefit of the summer for drying. Indeed, we send vessels for *Cod* in June, and July; but those only buy what had been fished and prepared by the inhabitants of the English colonies of Newfoundland, and the neighbouring parts; in exchange for which, we carry them meal, brandies, biscuits, pulse, molasses, linen, &c.

The principal *Fishery* for dry *Cod* is along the coast of Placentia, from Cape-Rose, to the Bay des Experts; in which compass there are divers commodious ports for the fish to be dried in.

The fish intended for this use, though of the same kind with the green cod, is yet much smaller; whence it is the fitter to keep, as the salt takes more hold.

The method of fishing is much the same in both; only this latter is the more expensive, as it takes up more time, and employs more hands; and yet scarce half so much salt is spent in this, as in the other.

When several fishing vessels meet, and intend to fish in the same port; he whose sloop first touches ground, becomes entitled to the quality and privileges of admiral; he has the choice of his station, and the refusal of all the wood on the coast at his arrival.

As fast as the captains arrive, they unrig all their vessels, leaving nothing but the shrouds, to sustain the masts; and in the mean time the mates provide a tent on shore, covered with branches of fir, and sails over them; with a scaffold, fifty, or sixty foot long; and one third as much broad.

While the scaffold is making ready, the crew are a fishing; and as fast as they catch, they bring their fish, open them, and salt them on moveable benches: but the main salting is performed on the scaffold.

When the fish have taken salt, they wash them; and to drain them again, lay them in piles on the galleries of the scaffold: when drained, they range them on hurdles, a fish thick, head against tail, with the back uppermost; observing, while they lie thus, to turn, and shift them four times every twenty four hours.

When they begin to dry they lay them in heaps, of ten or twelve a-piece, to retain their warmth; and continue to enlarge the heap every day, till it becomes double its first bulk: at length they join two of these heaps into one, which they turn every day, as before. Lastly, they salt them over again; beginning with those that had been salted first; and thus lay them in huge piles, as big as hay-stacks.

In this manner they rest: till they are carried a shipboard, where they are laid on branches of trees, disposed for that purpose in the bottom of the vessel, with mats all around, to prevent their contracting any moisture.

There are four kinds of commodities drawn from *Cod*, viz. the tripes, and tongues, which are salted at the same time with the fish, and barrelled up: the rows, or eggs, which being salted and barrelled up, serve to cast into the sea, to draw fish together, and particularly pilchards: and lastly, the oil, which is used in dressing of leather, &c.

The Scots catch a small kind of *Cod* on the coasts of Buchan, which is highly prized, though very much like ling. They salt it, and dry it in the sun, upon rocks; and sometimes in the chimney: but the greatest part of it is spent at home.

Herring Fishery.—The *Herring* is a small salt-water fish, with a bluish back, and a white silvered belly, not unlike

a little shad fish; whence it is called in Latin *Alsa minor*. Rondeletius calls it *Harengus*.

It is a popular error to believe the *Herring* to be the *Halec* of the Romans. The *Halec* was no particular fish, but a kind of sauce, made of any sort of salt fish. The modern *Herring* seems to have been unknown to the antients: it is neither the *Halec*, nor *Halex*, nor *Mænis*, nor *Lencemenis*, nor the *Gerres* of Pliny. See Rondelet. *De Piscib. marin.* l. v. c. 13. and Vossius *De Idolol.*

Herrings are chiefly found in the north sea. It is true, there are *Fishes* elsewhere, but none so copious.

They usually make two fishing seasons for *Herrings*; the first in June, July, and August; the second in autumn: the latter of these is the more considerable, on account of the fogs, which are very favourable to this kind of fishing.

It is commonly said, that no body ever saw a *Herring* alive; and that they die the minute they are taken out of the water: but there are instances to the contrary.

The *Herring* is a fish of passage; so that 'tis allowed to catch them on holidays, and Sundays: in the *Deccretal* there is an express chapter to this effect. They go chiefly in shoals, and are fond of following any fire, or light; and in their passage they resemble a kind of lightning themselves.

The Hollanders were the first who began the *Herring Fishery*, and observed the several seasons of their passage. Their first regular fishing is fixed to the year 1163.

The method of salting and barrelled them; was not discovered till the year 1416. tho' others date it from the year 1397. Willoughby, in his history of *Fishes*, observes, that Will. Buckelz, or Bachalen, a native of Bier Uliet, rendered his name immortal, by the discovery of the secret of curing and pickling *Herring*: He adds, that the emperor Charles V. coming into the Low Countries, made a journey to the isle of Bier Uliet, with the queen of Hungary, on purpose to view the tomb of this first barreller of *Herring*.

The Dutch begin their *Herring Fishing* on the 24th of June, and employ no less than two thousand vessels therein. These vessels are a kind of barks, called *Busses*, carrying from forty-five to sixty tun, and two or three small cannon.

None of them are allowed to stir out of port without a convoy; unless there be enough of them together, to make eighteen or twenty pieces of cannon: in which case they are allowed to go in company. Before they set out, they make a verbal convention; which has the same force, as if it were in writing.

These regulations of the admiralty of Holland are partly followed by the French, and other nations; and partly improved, and augmented with new ones: as, that no fisher shall cast his net within a hundred fathoms of another boat: that while the nets are cast, a light shall be kept on the hind part of the vessel: that when a boat is by any accident obliged to leave off fishing, the light shall be cast into the sea: that when the greater part of a fleet leaves off fishing, and casts anchor, the rest shall do the same, &c.

The manner of fishing has nothing particular in it. The nets wherein the fish is drawn, should, regularly, have their meshes an inch square, that none of the lesser fry may be taken.

The commerce of *Herring*, both white, i. e. pickled, and red, is very considerable; but there are so many different sorts prepared, in such different ways, and different places, that it is hard to say any thing precise thereupon.

The white herrings cured by the Dutch are in the greatest repute: they are distinguished into four kinds, according to their sizes. The goodness of this commodity consists in its being fat, fleshy, firm, white; salted the same day it is taken, and with good salt, and well barrelled.

The Irish *Herring* are the next in value after those of Holland; and principally those of Dublin, which are scarce inferior to the best *Herring* of Rotterdam or Enkuyzen. The Scotch *Herring* is not so well prepared, gutted, salted, nor barrelled as the Dutch; and yet its taste is excellent: nor is it doubted, but that if the Scots were as careful in these circumstances as their neighbours, their *Herring* would be the best in the world. The *Herring* fished in England is inconsiderable; the fish being too dry for the market.

Curing and preparing Herring.—1^o For *White* or *Pickled Herring*: As soon as the *Herring* are taken out of the sea, one of the crew, appointed for this office, cuts them open, and takes out the guts, and every thing but the milts and roes, which are always to be left in the body of the fish. Then, washing them in fresh water, they are left the space of twelve or fifteen hours in a tub full of strong brine made of fresh water, and sea salt.

When they are taken out, they drain them; and when well drained, put them up in barrels; taking care to dispose and range them evenly, in rows, or layers; pressing them well down; and strewing a layer of salt both at top, and bottom.

When the barrel is full, they stop it up very close; that no air may get in, nor any brine out; either of which is very prejudicial to the fish.

2^o For *Red-Herrings*: The fish being caught, they proceed

to wash, gut, and lay them in brine, as for pickled-herring; only they let them lie double the time in brine, viz. twenty-four hours; inasmuch as they are to take all their salt here, whereas the other kind takes half its salt in the barrel.

When the *Herrings* are taken out of the brine, they spit them, i. e. string them by the head on little wooden spits, and thus hang them in a kind of chimney, made for the purpose; and when the chimney is as full as it will hold, which less than ten or twelve thousand feldom effects, they make a little fire underneath of brush-wood, which yields a deal of smoke, but no flame.

Here the *Herring* remain, till sufficiently smoked, and dried; which ordinarily is in twenty-four hours. Then they are taken down, and barrelled up for keeping.

Their goodness consists in their being large, fresh, fat, oily, soft, and pliable; their outside of a yellow, golden colour; their having roes, or milt, within them, and being well salted and barrelled.

Mackarel FISHERY.—The *Mackarel* is a salt-water fish, without scales. Its body is round, and fleshy; terminating almost in a point, at each extreme.

Some persons well skilled in the naval architecture, hold its figure the most commodious for swimming of all others, and propose it as a model for the building of ships.

It is ordinarily about a foot long: when in the water, it appears yellow: and when out of it, of a silver white, excepting for streaks, or speckles of a deep blue, on the back, and sides.

The *Mackarel* is found in large shoals, in divers parts of the ocean; but especially on the French and English coasts.

The fishing is usually in the months of April, May, and June, and even July, according to the place. They enter the English channel in April, and proceed up to the streights of Dover, as the summer advances; so that by June they are on the coasts of Cornwall, Sussex, Normandy, Picardy, &c. where the *Fishery* is most considerable. They are an excellent food, fresh; and not to be despised, when well prepared, pickled, and put up in barrels.

Naturalists have observed, that the water wherein *Mackarel* has been boiled, often yields a light, after stirring it a little.—

The fish is taken two ways; either with a line, or nets: the latter is the more considerable; and is usually performed in the night-time. The rules observed in the fishing for *Mackarel* are much the same as those already mentioned in the fishery of herrings.

There are two ways of pickling them: The first is, by opening and gutting them, and filling the belly with salt, crammed in as hard as possible with a stick: Which done, they range them in frata or rows, at the bottom of the vessel, strewing salt between the layers.

In the second way, they put them immediately into tubs full of brine, made of fresh water, and salt: and leave them to steep, till they have imbibed salt enough to make them keep: After which they are taken out, and barrelled up; taking care to press them close down.

Pearl FISHERY.—See the article *PEARL Fishery*.

Pilchard FISHERY.—The *Pilchard* is a small salt-water fish, bigger than the anchovy; but less than the herring, which in other respects it resembles. Its head is yellow; its belly white; and its back a sea-green. It eats admirably, fresh, or lightly salted.

There are certain seasons for fishing the *Pilchard*; which, like the herring and anchovy, is a fish of passage. They are prepared and salted much as the anchovy is; with this difference, that the head is cut off the latter: But the *Pilchard* were distinguishable from the anchovy, even though its head were off likewise; the *Pilchard* having a very flat back, and the anchovy a round one.

The chief *Pilchard Fisheries* are along the coasts of Dalmatia, to the south of the island Istria; on the coasts of Bretagne, from Bell-island as far as Brest; and along the coasts of Cornwall and Devonshire.

That on the coasts of Dalmatia is so plentiful, that it not only furnishes all Greece; but a great part of Italy. That on the coasts of Bretagne, employs yearly above three hundred sloops, and most of the seamen of the country.

The fish caught on our own coasts, though bigger, are not so much valued, as those on the coasts of France; owing principally to their not being so thoroughly cured. The season is from June to September.

The *Pilchards* naturally follow the light; and will gather about a boat that bears a light in the night-time; which contributes much to the facility of the *Fishery*.

On the coasts of France they make use of the roes of cod-fish, as a bait; which, thrown into the sea, makes them rise from the bottom, and run into the nets, placed for that purpose.

On our coasts, there are persons posted a-shore, who spying by the colour of the water where the shoals are, make signs to the boats, to get among them, to cast their nets.

When taken, the fish are brought to a warehouse on shore, where they are laid up in broad piles, supported by backs and sides.

As they pile them, they salt them with bay-salt; in which lying

soaking twenty or thirty days, they run out a deal of blood, with dirty pickle, and bitter; which last draws a deal of the oil from the fish, to the great loss of the owners. When taken out of the pile, there remains a deal of salt, blood, scales, &c. at bottom, which, with fresh salt, serves for another pile.

They now proceed to wash them in sea-water to clear off the dirt, and blood; and when dry, they put them up in barrels, and press them hard down, to squeeze out the oil, which issues away at an hole in the bottom of the cask: And in this state they are fit for sale, or use.

Salmon FISHERY.—The *Salmon*, according to some, breeds in the sea; but the opinion of others seems better warranted, that it breeds in the clear sandy parts of rivers, not far from the mouths thereof. They commonly spawn in October, and the young becomes a *Samlet* the following year, and in a few months after a large *Salmon*. The milt and spawner having performed their office, betake themselves to the sea; and if their return be prevented by weas, or the like, they become sick, lean, and pine away, and die in two years time. If they spawn in the mean time, the produce is a diminutive *Salmon*, called *Skegger*, which will never arrive at the natural bulk; it being the sea that makes them grow big, and the rivers fat. The female is distinguished from the male, in that its nose is longer and more hooked, its scales not so bright, and its body speckled over with dark brown spots; its belly flatter, and its flesh not so red; more dry, and less delicious to the taste. In spawning time, when they repair from the sea up to the rivers, scarce any thing can stop their progress. Many have seen them leap up cataracts and precipices, many yards high.

The chief *Salmon Fisheries* in Europe, are along the coasts of England, Scotland, and Ireland. The fishing usually begins about the first of January, and ends by the last of September. It is performed with nets, in the places where the rivers empty themselves into the sea; and along the sea-coasts thereabout.

The fish are seen to crowd thither frequently in shoals from all parts, in search of the fresh water: They also fish for them higher up in the rivers; sometimes with nets; and sometimes with a kind of locks, or weas, made for the purpose, with iron grates therein, so disposed, as that the fish, in going up the river, open them with their head; but are no sooner entered, than the gate claps to. Thus the *Salmon* are inclosed as in a reservoir, where it is easy taking them. In some places they fish for *Salmon* in the night-time, by the light of torches, or kindled straw. The fishermen watch when the fish draws towards the light, whereof he is naturally a great lover, and strikes him with a spear, or lifter. In some parts of Scotland, it is said, they ride a-fishing up the rivers, and when they spy them in the shallow parts, shoot them with fire-arms.

When the fish are taken, they open them; take out the guts and gills, and salt them, in large tubs for the purpose: Out of which they are not taken before October, to be packed up in casks from three to four hundred and fifty pound weight.

Salmon is also fished for in rivers, after the manner of trout, with a line and hook. He bites best in the afternoon, about three, in May, June, July, and August; the water being clear, and a little breeze of wind stirring; especially if the wind and stream set contrary-ways. The *Salmon* is caught like a trout, with worm, fly, and minnim; and especially the garden-worm, if well scoured, and kept twenty days in moss. The *Salmon* never stays long in a place, but is continually shifting to be as near the spring head as possible, and swimming generally in the deepest and broadest parts of the rivers, near the ground. Put two, or three garden-worms well scoured on your hook at once, as if you were baiting for trout; and be sure to give him time to gorge his bait, before you strike. Some use a wire-ring on the top of the rod, through which the line may be let run to any length at pleasure, by a reel near the hand.

Sturgeon FISHERY.—The *Sturgeon* is a large sea-fish, which at its season runs up the rivers; having a sharp-pointed snout, a flat belly, and bluish back. *Sturgeons* are reckoned among the number of royal fishes; and when left on shore, they belong to the king: but when taken out at sea, they are the property of the person who takes them.

There are *Sturgeons* of all sizes; and we even read of some twenty-foot long: but the middle size are reckoned the best. Tho' some prefer the smaller.

It is of the roe, or eggs of this fish that the *Cavear*, or *Kavia*, so much prized by the Italians, &c. is prepared.

Sturgeon, when fresh, eats deliciously. To make it keep, they salt or pickle it in large pieces, and put them up in cags, from twenty-five to fifty pounds.

The greatest *Sturgeon Fishery* in the world, is in the mouth of the Volga, in the Caspian sea; where the Muscovites find employment for a great number of men.

They are not caught in nets, but in a kind of inclosure, formed by huge stakes, disposed in triangles, representing the letter Z, several times repeated. These sort of *Fisheries* are open on the side towards the sea, and close on the other; by which means the fish, ascending in its season up the river, embarralles itself in these narrow, angular retreats, and not being

FIS

ing able to turn itself, to go back again, by reason of its balk, is easily struck, and killed with a fort of harping iron. The chief object of this *Fishery* is the roe or spaw; which is a commodity as much used in Mulcovy, as butter in Holland; and there are some *Sturgeons* that furnish each four hundred pounds thereof. It is only the lesser and younger *Sturgeon* that they pickle for eating.

Whale Fishery, or Greenland Fishery.—This huge fish, we have elsewhere observed, is chiefly caught in the north sea. The largest fort are found about Spitzberg, some of them being there two hundred foot in length. Those on the coasts of America are about ninety, or an hundred; and those on the coasts of Guyenne, and the Mediterranean, are the smallest of all.

The Dutch have, upwards of these hundred years, had the *Whale Fishery* almost to themselves; and it is now esteemed one of the principal branches of their flourishing trade. The chief merchants of the several provinces associate themselves into a body, for the carrying it on; and send every year a great fleet of vessels to the north seas for that purpose. They attempted to make their first establishments in Greenland; but not succeeding, they have since fixed their *Fishery* about the western coast of Spitzberg, from the latitude of 76 deg. 40 min. to 80 deg.

In the year 1725, the English South-Sea company began to share it with them; and by the extraordinary success they met withal in their first attempt, beyond any of their neighbours, have been induced to persist in it.

To give some idea of the manner and importance of this trade, we shall here subjoin the discipline of a long time observed in the *Whale Fishery*; the method of fishing; the cargo and equipage of a vessel; and the produce thereof.

The discipline is adjusted by a standing regulation, consisting of twelve articles; the principal whereof, are:

That in case a fishing vessel be shipwreck'd, and the captain and crew saved, the next vessel they meet shall take them in; and the second vessel take half of them from the first: but that no vessel shall be obliged to take any of the loading of a vessel shipwreck'd: that what effects of a shipwreck'd vessel, which are absolutely relinquished, another captain shall find, and take up, upon his arrival in Holland he shall account for one half of them to the proprietors of the shipwreck'd vessel, clear of all expences: that if the crew desert a shipwreck'd vessel, they shall have no claim to any of the effects saved; but the whole shall go to the proprietor; but if they be present, when the effects are saved, and assist therein, they shall have one fourth thereof: that if a person kill a fish on the ice, it shall be reputed his own, so long as he leaves any person with it; but the minute he leaves it, it becomes the due of the first captain that comes that way; but that if a fish be tied to an anchor, or a rope fastened to the shore, it shall remain to its first proprietor, though he leave it alone: that if any person be wounded, or lamed in the service, the commissioners of the *Fishery* undertake to procure him a reasonable satisfaction; to which the whole fleet shall contribute.

Beside this general regulation, which all the captains, pilots, and masters of vessels are obliged to swear to be observed, before they put to sea; there is also a particular one for each ship's crew, which they are all sworn to execute, in presence of one of the commissioners, who goes aboard every ship, to receive the oath.

This regulation is a kind of charter-party, importing, that they will attend prayers morning and evening, on pain of an amercement, at the discretion of the captain: that they will not get drunk; nor draw their knives, on forfeiture of half their wages; nor fight, on forfeiture of the whole: that no body shall lay wagers, on the good or ill success of the fishing; nor buy, or sell, on these conditions, in case we take one or more *Fish*, on penalty of twenty-five florins: that they will be contented with the provisions allowed them: and that they will never light fire, candle, or match, by night or day, without the captain's leave, on the like penalty.

After the reading of this regulation, the crew are all called, to receive the customary gratuity before their setting out, with an assurance of another sum at their return, in proportion to the success of the fishing.

The captain, on this occasion, receives from an hundred, to an hundred and fifty florins; the pilot, from forty, to sixty; each harpiner, from forty, to fifty florins; the other officers, from twenty-six, to thirty-six florins; the elder sailors twenty; and the younger twelve.

The fleet, which consists mostly of *fluyts*, from two, to three hundred tons, and from thirty-five men to forty-one, usually sets sail about the beginning of April, and takes its course by the isles of Iceland, from 60 to 61 degrees of latitude; after which, leaving them to the west, it steers north ward, through 73, 74, and 75 deg. of lat. where they begin to find the ice.

It is among these huge heaps of ice, wherewith the whole quarter is filled, that they first begin to spy the *Whales*; and there most of the vessels fix their abode for the fishing.—But,

FIS

as the fish are larger and fatter, the further north they go; some captains will venture as far as 80, or 82 deg. of north lat. Each vessel of three hundred tons has six shalloops; and each shallop has six harpineers, with five seamen to row it. To every shallop there are seven lines, of three inches circumference; five of them in the hind-part of the vessel, and two before. The hind lines together make six hundred fathoms, and with the addition of the other two, eight hundred and eighty. If the *whale* dive deeper, or run further underneath the ice than this line, the line must be cut, lest the shallop be drawn after it.

The instrument, wherewith the whale is struck, is a harping iron, or javelin, five or six foot long, pointed with steel, in a triangular shape, like the barb of an arrow.

The harpiner, upon sight of the fish, from one end of the shallop, where he is placed, flings the harping iron with all his might against its back; and if he be so happy as to make it penetrate the skin and fat, into the flesh, he lets go a string fastened to the harping iron, at the end whereof is a dry gourd, which swimming on the water, discovers whereabouts the *whale* is; who, the minute he is struck, always plunges to the bottom.

If the *whale* return to breathe in the air, the harpiner takes occasion to give him a fresh wound; till, fainting by the loss of blood, the men have an opportunity of approaching him; and thrusting a long Steele lance under his gills into his breast, and through the intestines, which soon dispatches him: and when the carcass begins to float, they cut off the fins and tail; and tying a rope to the place where the tail was, they swim to the vessel, where he is taken in.

When they have got their quota of *whales*, they begin to take the blubber, or fat, and the fins, as they are call'd, or *whale-bone*.

In order to this, the *whale* is hoisted over-board, and kept suspended above the water, by two ropes, the one tied around his neck, the other about his tail; and under the carcass are two shalloops, placed to receive what may chance to drop.

This done, three or four men go down upon the *whale*, with a kind of calkers, or irons on their feet, to prevent their slipping. They begin to open him on the side, and proceed downwards to the belly; cutting off all the lard or fat, in pieces of about three foot broad, and eight long: beside the fat on the sides, they likewise cut off that of the throat, and the under lip, leaving all the lean behind.—They next proceed to the *whale-bone*, which they cut off with a hatchet, made for the purpose, from the upper jaw of the fish, and make it up in packets. The fat and bone thus procured, what remains of the *whale*, they leave for the bears, who are very fond of it.

In proportion as the large pieces of fat are cut off, the rest of the crew are employed in slicing them smaller, and picking out all the lean. When this is prepared, they stow it under the deck, where it lies, till the fat of all the *whales* is on board: then, cutting it still smaller, they put it up in tubs, in the hold, or bottom of the vessel, cramming them very full and close.

Nothing now remains, but to sail homewards, where the fat is to be boiled, and melted down into train oil.

Produce of one year's *Whale Fishery*.—To state the produce, we make choice of the *Fishery* of 1697, as being one of the greatest, and most fortunate, that ever was known: to which we shall add that of the year 1725.

In the year 1697. there were an hundred and ninety-seven vessels of divers nations; whereof an hundred twenty-nine were Dutch; forty-seven Hamburgers; two Swedish; four Danish, twelve of Bremen; two of Embden; and one of Lubek.

In the year 1725. there were two hundred and twenty-six vessels; whereof one hundred and forty-four were Dutch; twelve English; forty-three Hamburgers; twenty-three of Bremen; two of Berghen; two of Flensburg. Their captures each year were as follow.

In 1697.		
129 Dutch vessels took	—	1255 whales.
47 Hamburgers	—	449
2 Swedes	—	113
4 Danes	—	52
12 Bremen	—	96
2 Embden	—	2
1 Lubek	—	1
In all, 197 vessels took	—	1968
In 1725.		
144 Dutch vessels took	—	2481 whales
12 English	—	257
43 Hamburgers	—	46
23 Bremen	—	29
2 Berghen	—	0
2 Flensburg	—	0
In all, 226 vessels took	—	349

F I S

The Dutch captures	in 1697. produced	41344	puncheons of
The Hamburgers	—	16414	(blubber
The Swedes	—	540	—
The Danes	—	1710	—
The Bremeners	—	3790	—
The Embdeners	—	28	—

The English captures in 1725. produced 1000 puncheons of blubber, and 20 tons of whale-bone.

Now, estimating the puncheon of blubber at thirty florins Dutch, or 2*l.* 15*s.* English, the current price in the year 1697. the total produce of the year's *fish*ing amounts to 175521 *l.* 10*s.* sterling.—As to fins, or *Whale-bones*, setting them at two thousand weight per *Whale*; and an hundred weight at 4 *l.* 4*s.* they will yield 171233 *l.* which, added to the former sum, amounts to 346754 *l.* 10*s.* whereof the share belonging to the Dutch was 228737 *l.*

On the same footing might the produce of the *Fishery* of the other year be easily stated. It will come far short of that of 1697; which indeed vastly transcends what has ever been known: each vessel, taking one with another, caught that year ten *Whales* $\frac{1}{2}$, and the other year only one *Whale* $\frac{1}{2}$; though the English, more happy than the rest, caught above two a-piece. But it may be added, that the *Whales* of that year being larger and fatter than those of 1697. produced one with another forty puncheons of blubber; and those others only thirty three puncheons.

FISH-GARTH, according to Skinner, signifies an engine to take *Fish*; but it should rather seem to denote the dam or wear in a river, where these engines are laid and used.

FISH-GLUE; see the article **ICHTHYCOLLA**.

FISHING, the act, or art of catching *Fish*.

Fishing, is distinguished, with regard to its instrument, into that performed with the net, for fish that go in shoals; and that with the hook, for solitary fish: Which latter is properly called *Angling*.

Fishing again, is distinguished, with regard to its object, into that performed in salt-water; and that in fresh. The first practised for whales, herring, cod, salmon, pearls, mackerel, and other sea fish. The latter practised for pike, trout, carp, tench, perch, dace, eels, &c.

The instruments principally used in *Angling*, or *Fishing* with the hook, are the rod, line, hook, and fly.

The points on which the art of *Fishing* chiefly turns, are the proper season, place, bait, and manner of application. What relates to each hereof, we shall here entertain the reader withal, in the several kinds of *Fishing*, chiefly practised among us.

Carp FISHING—The *Carp* is generally held the queen of fresh-water fish. It is exceedingly subtle, and of all others, the eel only excepted, lives longest out of water. Mr. Ray assures us, that in Holland they have a speedy way of fattening them, by hanging them up in a net in a cellar, and feeding them with white bread and milk. They breed several times in the year; for which reason we seldom meet with male or female, without either milt or spawn. Their natural place is some still water; in running waters they rarely, if ever, breed. To make them fat and large, it is a good way, when the pond is low, in April, to rake all the sides thereof with an iron rake, and sow hay-seeds thereon. By autumn there will be a crop of grass; which coming to be overflowed, as the pond rises, will be a fine feeding place for them.

A world of patience is required to angle for *Carp*, on account of their incredible policy. They always chule to lie in the deepest places: They seldom bite in cold weather; and in hot a man cannot be too early, or too late for them. When they do bite, there is no fear of the hold. The baits are, the red-worm, in March; the cadew, in June; and the grasshopper in July, August, and September. Proper pastes may also be prepared for them; as honey and sugar, wrought together with flour, and thrown in pieces into the water, some hours before you begin to angle. Honey and white crumbs of bread mixed together do also make a good paste.

Chub FISHING—The *Chubin*, or *Chub*, is a fresh-water fish, with a large head. It spawns in March, and is very strong, though inactive, yielding in a very little time, after it is struck; and the larger it is, the quieter. His bait is any kind of worm, or fly, particularly the large yellow moth; also grains, cheese, the pith in the bone of an ox's back, &c. He affects a large bait, and variety of them at the same hook. Early in the morning angle for him with snails; but in the heat of the day chule some other bait; and in the afternoon, fish for him at ground, or fly.

Dace, or Dore FISHING—These fish bite at any fly; but especially the stone cadew fly, or May fly, in the latter end of April, and most part of May; and the ant fly in June, July, August, &c. They rarely refuse a fly a-top of the water, in a warm day; but when you fish under water for them, it is best to be within a hand's breadth of the ground. To catch *Dace* in winter, the best bait is a white worm, with a large

F I S

red head, gathered after the plough in heaths or sandy grounds.—The nostrils for roaches are also commended for *Dace*.

Eel FISHING—The *Eel* is a fresh-water fish, much in shape of a serpent: Naturalists have long been divided, as to the manner how it is produced; whether as they express it, by generation, or by corruption, as some suppose worms are,* or by certain glutinous dew drops, which falling in May and June on the banks of some ponds and rivers, are by the heat of the sun suppoled to be turned into eels. This is certain, that there is not any obvious appearance of sex or difference therein. Abr. Mylius, in a treatise of the origin of animals, describes a method of producing them by art. He says, that if you cut up two turfs, covered with May dew, and lay one on the other, the grassy side inwards, and thus expose them to the heat of the sun, on the banks of a water, in a few hours time there will spring from them an infinite quantity of *Eels*: But this is absurd and erroneous.—The kinds of *Eels* are various: Some reduce them to four; the *silver Eel*; a *greenish*, called the *grey Eel*; a *blackish* *Eel*, with a broad flat head; and an *Eel with reddish fins*. The first is allowed to generate: It is viviparous, and the young, when it comes from the female, is no bigger than a small needle.

The *silver Eel* may be caught with divers baits; particularly powdered beef, garden-worms, or lob, minnows, hen's guts, fish, garbage, &c. But as they hide themselves in winter in the mud, without stirring out for six months, and in the summer they take no flight to be abroad in the day, the most proper time to take them, is in the night, by fastening a line to the bank-side, with a hook in the water. Or a line may be thrown at large with a good store of hooks baited, and plumbed with a float, to discover where the line lies, in the morning. A small roach does here well for a bait, the hook being laid in his mouth.—Another usual way of catching *Eels*, called *snigging*, is performed in the day time, by taking a strong line, with a hook baited with a lob, or garden-worm, and resorting to such holes and places, as *Eels* use to abscond in, near mills, weirs, or flood-gates; where, the bait being gently put into the hole, by help of a cleft stick, the *Eel* will certainly bite.—*Bobbing for Eels* is another method: In order to this, four some large lob, and with a needle run a twisted silk through them, from end to end, taking so many as may be wrapped a dozen times round a board. Tie them fast with the two ends of the silk, that they may hang in so many links. This done, fasten all to a strong cord, and about an handful and half above the worms fix a plummet, three quarters of a pound weight; and make the cord fast to a strong pole: Fishing with these in muddy water, the *Eels* will bite hastily at the bait. When you think they have swallowed it, gently draw up the line, and bring them ashore as soon as may be.—Others use an *Eel spear*, with three or four forks, or jagged teeth, which they strike at random into the mud.

Flounder FISHING—The *Flounder* is a flat sea or river fish; caught in April, May, June, and July, in any time of the day; in a swift stream, and sometimes also in the full deep. The best bait is red worms, wasps, and gentles.

Gudgeon FISHING—The *Gudgeon* is a small fish, of a very delicious taste. It spawns three or four times in the summer season, and feeds in streams, and on gravel; slighting all kind of flies: But is easily taken with a small red worm, *fishing* near the ground: and being a leather-mouthed fish, will not easily get off the hook, when struck. The *Gudgeon*, may either be fished for with a float, the hook being on the ground; or by hand, with a running line on the ground, without cork or float. He will bite well at wasps, gentles, and cadworms, and one may even fish him with two or three hooks at the same time; which makes good sport. When you angle for *Gudgeons*, stir up the sand or gravel with a long pole, which will make them gather to the place, and bite the faster.

Perch or Perch FISHING—The *Perch* or *Perch* is hook-back'd, not unlike a hog; armed with stiff prickles, and his sides with dry thick scales: He is voracious, and will venture on his own kind; even with greater courage than the pike. He seldom grows much about a foot long: He spawns in February, or March, and bites best when the spring is far spent. The proper baits are, the brandling, minnow, and small frog; as also the lob-worm, bob, oak-worm, gentle, wasp, and cad-bait. The minnow yields the best sport, which is to be alive, and stuck on the hook through the upper lip, or back fin, and kept swimming about mid-water. If the frog be used, he is to be fastened to the hook by the skin of his leg. When the fish bites, as he is none of the leather-mouthed kind, he must have time to pouch his bait. The best place to fish for him, is in the turning of the water eddy, in a good gravel bottom.

Pike FISHING—The *Pike* is reputed the tyrant of the fresh waters: By the common consent of naturalists, he is the longest lived of all fishes. The larger he is found, the coarser is his flesh; and so vice versa. This fish never swims in shoals, but always single; being very rapacious, and preying even on his own kind. The *Pike* spawns in February, and March.

March. The best fort is in rivers: The worst in meres and ponds. His ordinary food is frogs, and what fish he can lay hold on.

There are two ways of fishing for the *Pike*; by the *ledger-bait*, and the *walking-bait*. 1^o The *ledger-bait* is that, fixed in one certain place, and which the angler may leave behind him. Of this kind, the best is some living bait, as a dace, roach, gudgeon, or a living frog. To apply it, if a fish, stick the hook through his upper lip; then fastening it to a strong line, ten or twelve yards long, tie the other end of the line to some stake on the ground, or bough of a tree, near the *Pike's* usual haunt; letting the line pass over the fork of a stick, placed for the purpose, suspending the hook, and about a yard of line in the water; but so, as that when the *Pike* bites, the fork may give way, and let him have line enough to go to his hold and paunch. If the bait be a frog, the arming wire is to be put in at his mouth, and out at his vent, and one of the legs to be stitched, or tied over the upper joint of the wire.—2^o The *walking-bait*, is that which the fisher casts in, and conducts with a rod, &c. This is performed by a troll, with a winch to wind it up withal. At the top of the rod is to be placed a ring for the line to be run through. The line, for two yards and a quarter next the hook to be of silk double, and armed with wire, the length of seven inches: On the flank of the hook is to be fastened a smooth piece of lead, so as to sink the fish bait, which is to be a gudgeon with its head downwards. Thus disposed, the bait is to be cast up, and down; and if you feel the fish at the hook, give him length enough to run away with the bait, and paunch it: Then strike him with a smart jerk.—To fish with a dead bait, use a yellow frog, dace, or roach, anointed in gum of ivy, dissolved in oil of spike; and cast it where the *Pike* frequents. After it has lain a little while at the bottom, draw it to the top, and so up the stream, and you will quickly perceive a *Pike* in earnest pursuit thereof. This fish bites best about three in the afternoon, in clear water, with a gentle gale, from the middle of summer, to the end of autumn; but in winter all day long; and in the spring he bites best early in the morning, and late at night.—Another method of fishing for *Pike*, see under HUXING.

Roach Fishing.—The *Roach*, or *Rechet*, is no delicate, but a very silly fish. Those in rivers are more valued, than those in ponds; though the latter are much the larger. They spawn about the middle of May.

To angle for this fish in April, cads or worms are proper baits; so are small white snails or flies in summer. The bait is always to be under water; for this fish will not bite a-top. Others use a May fly, in that season, with good success. In autumn a paste must be used, made of the crumb of white bread, moulded with a little water, laboured with the hands into a tough paste, and coloured, not very deep, with red-lead. In winter, gentles are the best bait.—Sprouted malt; the young brood of wasps, and bees, dipt in blood; and the thick blood of sheep, half dried, are nostrums in this sort of Fishing.

Tench Fishing.—The *Tench* is a fine fresh-water fish, having very small scales, but large, smooth fins, with a red circle about the eyes, and a little barb hanging at each corner of the mouth. It takes more delight among weeds in ponds, than in clear rivers; and covets to feed in foul water. His slime is said to have a healing quality for wounded fish; upon which he is commonly called the *Fishes Physician*. When the carp, pike, &c. are hurt, it is said they find relief by rubbing themselves against the *Tench*.

The season for catching this fish, is in June, July, and August, very early, and late, or even all night, in the still part of rivers. His bait is a large red worm, at which he bites very eagerly, especially if first dipt in tar. He also delights in all sorts of pastes, made up of strong scented oils, or with tar: or a paste of brown bread and honey. Nor does he refuse the cad-worm, lob-worm, flag-worm, green gentles, codbait, or soft boiled bread grain.

Trout Fishing. The *Trout* is a delicious fresh-water fish, speckled with red and yellow; coming in, and going out of season with the buck, and spawning in the cold months of October and November; whereas all the other species spawn in hot summer weather. There are divers kinds of this fish, all valuable; but the best are the red and yellow *Trouts*; and of these the female, distinguished by a less head and deeper body, is preferred. They are known to be in season by their large back; which may serve also as a rule for other fish. All winter long they are sick, lean, and unwholesome, and frequently lousy. As the spring comes on, deserting the still, deep waters, they repair to the gravelly ground, against which they continue to rub till they have got rid of their lice, which are a kind of worms, with large heads. From that time they delight to be in the sharp streams, and such as are swift; where they lie in wait for minnows and May flies. At the latter end of May they are in their prime.

The usual baits whereby the *Trout* is caught, are the worm, minnow, and fly, either natural, or artificial. The proper worms are the brandling, lob-worm, earth-worm, dung-

worm, and maggot, or gentle, especially the two first: but whatever worms are used, they are the better for keeping, which is to be done in an earthen pot, with moss frequently changed. For the minnow, flip the hook through his mouth, and the point and beard out at the tail, so as it may lie almost straight on the hook. Then try against the stream, whether it will turn. In defect of a minnow, a small loach may serve the turn; or for want of either, an artificial one may be made of cloth, by the life, which is found every whit as good a bait as the natural one.

FISHING-FLY, a bait used in angling for divers kinds of fish. See FISH and FISHING.

The *Fly* is either natural or artificial.

Natural Flies are innumerable: The more usual on this occasion are the *Dun-Fly*, the *Stone* or *Mio-Fly*, the *Red-Fly*, the *Moss-Fly*, the *Tawny-Fly*, the *Vine-Fly*, the *Shell-Fly*, the *Cloudy* and *Black-Fly*, the *Flag-Fly*; also *Caterpillars*, *Cater-Flies*, *Ear-Flies*, &c. all which appear sooner or later, according to the forwardness or backwardness of the spring.—To know the particular *Fly* the fish most covets, when you come in the morning to the river-side, beat the bushes with your rod, and take up what variety you can of all sorts of *Flies*; try them all, and you will quickly know which are in greatest esteem: Not but that fish will sometimes change their *Fly*; but it is only when they have glutted themselves therewith.

There are two ways to *fish* with natural *Flies*, either on the surface of the water, or a little underneath it.

In angling for club, roach, or dace, move not your natural *Fly* swiftly, when you see the fish make at it; but rather let it glide freely towards him with the stream: But if it be in a still and flow water, draw the *Fly* slowly sideways by him, which will make him eagerly pursue.

The artificial *Fly* is most successfully used in blustering weather, when the waters are so troubled by the winds, that the natural *Fly* cannot be seen, nor rest upon them.

Of this artificial *Fly*, there are reckoned ten principal sorts.

1. The *Dun-Fly*, in March, made of dun wool, and the feathers of a partridge wing.
2. A *Dun-Fly*, made of black wool, and the feathers of a black drake; the body made of the first, and the wings of the latter.
3. The *Stone-Fly*, in April, the body made of black wool dyed yellow under the wings, and tail.
4. The *Ruddy-Fly*, in the beginning of May; the body made of red wool, and bound about with black silk, with the feathers of a black capon, which hang dangling on his sides, next his tail.
5. The *yellow*, or *greenish-Fly*, in June; the body made of black wool, with a yellow list on either side, and the wings taken off the wings of a buzzard, bound with black broken hemp.
6. The *moorish-Fly*, the body made of dulkish wool, and the wings with the blackish mail of a drake.
7. The *Tawny-Fly*, till the middle of June; the body made of tawny wool, the wings made contrary one against the other, of the whitish mail of a white drake.
8. The *Wasp-Fly*, in July; the body made of black wool, cast about with yellow silk, and the wings of drakes feathers.
9. The *Steel-Fly*, in the middle of July; the body made of greenish wool, cast about with the feathers of a peacock's tail, and the wings made of buzzards wings.
10. The *Drake-Fly*, in August; the body made of black wool, cast about with black silk, his wings of the mail of a black drake, with a black head.

The best rules for artificial fly-fishing, are,

1^o To fish in a river somewhat disturbed with rain; or in a cloudy day, when the waters are moved by a gentle breeze: The south-wind is best; and if the wind blow high, yet not so, but that you may conveniently guard your tackle, the fish will rise in plain deeps; but if the wind be small, the best angling is in swift streams.

2^o Keep as far from the water-side as may be; fish down the stream, with the sun at your back, and touch not the water with your line.

3^o Ever angle in clear rivers with a small *Fly*, and slender wings; but in muddy places use larger.

4^o When, after rain, the water becomes brownish, use an orange *Fly*; in a clear day, a light coloured *Fly*; a dark *Fly* for dark waters, &c.

5^o Let the line be twice as long as the rod, unless the river be incumbered with trees.

6^o For every sort of *Fly*, have several of the same, differing in colour, to suit with the different complexions of several waters and weathers.

7^o Have a nimble eye, and active hand, to strike presently with the rising of the fish; or else he will be apt to spew out the hook.

8^o Let the *Fly* fall first into the water, and not the line, which will scare the fish.

9^o In slow rivers, or still places, cast the *Fly* cros over the river, and let it sink a little in the water, and draw it gently back with the current.

Salmon Flies should be made with their wings standing one behind the other, whether two, or four. That fish delights

in the gawdiest colours that can be; chiefly in the wings, which must be long, as well as the tail

FISHING-FLOATS, are little appendages to the line, serving to keep the hook and bait suspended at the proper depth to discover when the fish has hold of them, &c.

Of these there are divers kinds; some made of Muscovy duck quills, which are the best for slow waters; but for strong streams found cork, without flaws or holes, bored through with an hot iron, into which is put a quill of a fit proportion, is preferable: Pare the cork to a pyramidal form, and grind it smooth.

FISHING-HOOK, a little engine of steel wire, of a proper form to catch and retain fish.

The *Fishing-hook*, in general, ought to be long in the shank, somewhat thick in the circumference, the point even, and straight; let the bending be in the shank.

For setting the *Hook* on, use strong, but small silk, laying the hair on the inside of your *Hook*; for if it be on the outside, the silk will fret and cut it asunder.

There are several sizes of these *Fishing-hooks*, some big, some little, and of these some have peculiar names; as,

1^o, *Single-Hooks*. 2^o, *Double-Hooks*, which have two bendings, one contrary to the other. 3^o, *Snappers*, or *Gorgers*, which are hooks to whip the artificial fly upon, or to bait with the natural fly. 4^o, *Springers*, or *Spring Hooks*, a kind of double *Hook*, with a spring which flies open, being struck into any fish, and so keeps its mouth open.

FISHING-ROD, a long, slender rod, or wand, to which the line is fastened, for angling.

Of these there are several sorts; as,

1^o, A *Troller*, or *Trolling Rod*, which has a ring at the end of the rod, for the line to go through, when it runs off a reel. 2^o, A *Whipper*, or *Whipping Rod*, a top-rod, that is weak in the middle, and top-heavy, but all slender and fine. 3^o, A *Depper*, which is a strong rod, and very light. 4^o, A *Snapper*, or *Snop Rod*, that is a strong pole, peculiarly used for the pike. 5^o, A *Bottom Rod*, being the same as the *Depper*, but somewhat more pliable. 6^o, A *Sniggling*, or *Poking Stick*; a forked stick, having a short strong line, with a needle, baited with a lob-worm: this is only for eels in their holes.

FISHING-VESSELS, or those used in the several fisheries at sea, or on the coasts, are the *Buffa*, *Cable*, *Cock*, *Dogger*, *Driver*, *Eel Boat*, *Fly Boat*, *Fluit*, *Hooker*, *Peter Boat*, *Smack*, *Sirana Boat*, *Trawler*, *Trinker*, &c. which see

FISH-PONDS, reservoirs of water, for the breeding, feeding and preserving of *Fish*.

For *Fish-ponds*, it is agreed, those grounds are best, which are full of springs, and apt to be moorish: the one breeds them well, and the other preserves them from being stolen. The situation of the pond is also to be considered, and the nature of the currents that fall into it; likewise, that it be refreshed with a little brook, or with the rain-water that falls from the adjacent hilly ground. Add, that those ponds which receive the stale and dung of horses, and other cattle, breed the largest and fattest *Fish*.

In making the pond, observe that the head be at the lowest part of the ground; and that the trench of the flood-gate, or sluice have a good swift fall, that it may not be too long in emptying on occasion.

If the pond carry six foot of water, it is enough; but it must be made eight foot deep, to receive the freshes and rains that may fall into it.

It would also be advantageous to have shoals on the sides, for the fish to sun themselves in, and lay their spawn on; beside, in other places, certain holes, hollow banks, shelves, roots of trees, islands, &c. to serve as their retiring places. Consider farther, whether your pond be a breeder; if so, never expect any large carps from thence; the greatness of the number of spawn over-flocking the pond.

For large carps a store-pond is ever accounted the best; and to make a breeding-pond become a store-pond, see what quantity of carps it will contain: then put in all milners, or all spawners; whereby in a little time you may have carps that are both large, and exceeding fat. Thus, by putting in but one sex, there is an impossibility of the increase of them.

Reserve some great waters for the head-quarters of the fish, whence you may take, or wherein you may put any quantity thereof. And be sure have stews and other auxiliary waters, so as you may convey any part of the stock from one to the other; so, to lose no time in the growth of the fish, but employ the waters as you do your land, to the best advantage. View the grounds, and find out some fall between the hills, as near flat as may be, so as to leave a proper current for the water: if there be any difficulty in judging of such, take an opportunity, after some sudden rain, or the breaking up of a great snow in winter, and you will plainly see which way the ground falls; for the water will take the true fall, and run accordingly.

The condition of the place must determine the quantity of ground to be covered with water. For example, we may propose in all fifteen acres, in three ponds; or eight acres in two,

and not less: and these ponds should be placed one above another, so as the point of the lower may almost reach the head or bank of the upper; which contrivance is no less beautiful than advantageous.

The head, or bank, which by stopping the current is to raise the water, and so make a pond, must be built with the clay and earth taken out of the pan, or hollow, dug in the lowest ground above the bank: the shape of the pan is to be an half oval, whereof the flat is to come to the bank, and the longer diameter to run square from it.

FISSURE, *FISSURA*, in chirurgery, a longitudinal fracture of a bone: or, a solution of the continuity of a bone, whereby it is only cloven or crack'd.

Fissures are of two kinds: the one apparent, by the Greeks called *ῥήγμα*, or *ῥήξις*; and by the Latins, *Scissura*: the other so small, as not to be visible, called *καρσινος*, or capillary; as resembling a thread.

The causes of *Fissures* are falls, leaps, and contusions of the parts against hard bodies.

Fissures, especially in the cranium, either happen on the part where the stroke was given; or on the opposite part: that on the opposite part is called *Counter-Fissure*, or *Counter-cleft*, by the Greeks *αντιρρημα*; and the Latins, *Resonitus*.

Old men are more subject to *Fissures* than young ones; by reason that their bones are drier.

Fissures are difficult to find; but they are the easiest cured of all fractures: though if they be not known, or be neglected, they bring on ulcers and caries's; and in such case become very dangerous: so that there is frequently a necessity of having recourse to the severest operations.

The signs of a *Fissure* of the cranium, are bilious vomitings; vertigo's; fluxes of blood at the mouth, or nose; dumbness, delirium, &c. If there be any *Fissure* in the skull, the patient will feel a pain in the place, upon holding a string between his teeth, while the chirurgeon pulls it strongly.

In such cases it is frequently necessary to perforate the cranium, to give a vent for the blood and fumes.

FISTULA, in the antient music, an instrument of the wind kind, resembling our flute, or flageolet.

The principal wind instruments of the antients, were the *Tibia*, and *Fistula*: though how these were constituted, or wherein they differed, or how they were played on, does not at present appear. All we know, is, that the *Fistula* was at first made of reeds, and afterwards of other matters. Some had holes, some none; some again were single pipes; others a combination of several; witness the *tyranga* of Pan.

FISTULA, in medicine, a deep, winding, callous, cavernous ulcer, with a narrow entrance, but opening thence into a spacious bottom; and generally yielding a sharp, and virulent matter.

Fistula's differ from simple sinus's in this, that the former are callous, and the latter not.

They attack all parts of the body without exception; but particularly the anus, foramen lachrymale, thorax, &c. The general cause of *Fistula's*, is some abscess, or ulcer, which either being inveterate, or having been ill treated, comes to be callous; the orifice being at first lined or incrustated therewith, and at length the whole sinus.

The cure consists in consuming the callous, and healing and consolidating the ulcer with cleansing medicines, and farcotics.

The antients gave the name *Fistula* to this sort of ulcers, from the resemblance they bear, on account of their depth, to a flute or pipe, called by the Latins *Fistula*.

FISTULA in ano, is a *Fistula* formed in the anus, or fundament.

Of this some authors reckon four kinds, viz. the *Cecum internum*, which is open outwards, but not into the rectum: the *Cecum externum*, which has an aperture into the rectum, but none outwards: the *Compleat*, which opens both ways: and the *Cuniculatus*, or that with several sinus's, which discharge themselves into one common cavity, which is the fund, and, as it were, reservoir of them all.

Others, as Wiseman, reduce *Fistula's in ano* to two classes. The first are those, arising from a phyma: these are very painful, and difficult to cure; as entering deep amongst the interstices of the muscles, and forming various cuniculi, or sinus's; which, the more remote they are from the anus, the worse they are, by reason they do not allow of being cut.

The second owe their origin to an internal hemorrhage, or extravasation between the coats of the rectum; and have a small perforation, near the circumference of the anus, whence they yield a thin sanies, or ichor, without pain; they in time bringing on itching and excoriations; and the orifices at length become callous, and are sometimes closed, and sometimes open again.

Some *Fistulae*, if they do no harm by the copiousness of the flux, the stench, or the like accidents, are a benefit to nature, as carrying off cachectic humours; and ought not to be cured but kept open. The fresh, simple *Fistula* may be cured without danger.

The chief way is by cutting; where that may be done without

out damage to the muscle of the anus, which might occasion an involuntary discharge of the excrements.
The cutting is either performed with a thread, or with a cutting instrument.

FISTULA Lachrymalis, is a *Fistula* in the greater canthus of the eye; this is frequently confounded with *Ægilops*. See *Ægilops*.

It is a little deep callous ulcer, in the greater caruncle, or the place of the glandula lachrymalis. It usually begins with an abscess, called *Anchilops*, which in time produces an ulcer, called *Ægilops*, which afterwards degenerates into a *Fistula*. When pressed with the finger, it yields a stinking matter, not unlike the yolk of an egg; and the corrosive humour finding, or making itself a passage, there ensues a perpetual oozing.

Sometimes the os ethmoides itself is corroded, and rendered carious by it; in which condition it is supposed to be only curable by an actual cautery: sometimes it becomes cancerous; and then, Riverius directs all medicines to be laid aside.

The cure of the *Fistula lachrymalis* is wholly external and surgical; except that evacuations and mercurials may be given internally; as also decoctions of the woods. Some in this case perforate the os nasi, to give room for the matter to be evacuated that way.

A French surgeon, named Anel, found out a new way, by putting a probe and syringe of an inconceivable fineness, through the puncta lachrymalia into the sacculus lachrymalis.

FISTULA * also denotes the pipe put into the cup, out of which the communicants sippingly sucked the wine.

* *Divisa ecclesie cruce, altaria, scrinia, — fistulas, Fistulas, & ornamenta varia.* Flor. Wigorn, Anno 1087.

FISTULAR, or **FISTULOUS**, is applied by the chirurgeons to wounds and ulcers, which degenerate into fistula's.

Care must be taken, not to leave the tent too long in the wound, lest it render it callous and *fistulous*. Dionis.

FISTULAR is also applied to the leaves of plants, which are round and hollow within; as the leaves of leeks, &c.

FISTULAR Flower, among herbalists, are those made up of many small, long, hollow flowers, like pipes.

FIT, in medicine, an access, or paroxysm. See *PAROXYSM*.

FITS of easy reflexion, and **easy transmission**. See *LIGHT*.

FITS of the Mother, see *HYSTERIC affection*.

FITCHEE, or **FICHEE**, in heraldry, is when the lower part of any cross is sharpened into a point, fit to fix into the ground. Thus, he bears, azure, a cross potent *fitchee*. See *Tab. Herald. fig. 24*.

The origin hereof, Mackenzey ascribes to the primitive Christians, who used to carry their crosses with them, wherever they went; and when they stopped at any place in a journey, fixed them in the ground.

FITZ, a French term, literally denoting *Son*; sometimes given by way of addition to the natural sons of the kings of England: as James *Fitz-roy*, duke of Grafton, &c.

FIVE-leaved grass, cinque-foil, in heraldry, is used by such as would introduce a blazon by herbs and flowers, instead of metals and colours, to signify *vert* or *green*. See *VERT*.

FIXATION, the act of fixing, or of rendering a thing firm and fixed.

FIXATION is applied in the general to any process that fixes and binds together what of its own nature is volatile; and enables it to sustain the force of fire, for some considerable time.

Geber defines *Fixation* an operation whereby a volatile thing, i. e. a thing that cannot endure the fire, is rendered capable of enduring it. In the general, *Fixation* is the changing of a volatile body into a fixed one.

FIXATION, among alchemists, denotes a peculiar preparation of mercury, whereby it is to be put in a condition to bear the fire without evaporating; or the hammer without flying, or separating.

The alchemists hold, that if they had the true secret of *fixing* mercury, without the addition of any foreign less heavy and solid ingredient, they could make gold, or at least silver.

M. Homberg had a long process of many months, to prepare an oil from the faecal matter, or human excrements, which he imagined would have *fixed* mercury into silver; but it failed. See *FACAL Matter*.

FIXING Sulphur, see *SULPHUR*.

FIXITY, or **FIXEDNESS**, in philosophy, the quality of a body, which denominates and renders it fixed; or, a property which enables it to endure the fire and other violent agents.

According to Chauvin, *Fixity* consists in this, that the component principles of the body are so closely united, or cohere so strongly, and are mixed in such proportion, that they cannot easily be divided either by fire, or any other corrosive menstruum; or their integral parts separated, and carried off
VOL. I.

in vapour. For a body may be said to be *fixed* in two respects.

First, when on being exposed to the fire, or a corrosive menstruum, its particles are indeed separated, and the body rendered fluid, but without being resolved into its first elements: the second, when the body sustains the active force of the fire, or menstrua, without its integral parts being carried off in fumes. Each kind of *Fixity* is the result of a strong or intimate cohesion between the particles of the mixed.

FIXITY, or **FIXEDNESS**, in chemistry, is in a peculiar manner used for the affection opposite to volatility, i. e. the property whereby bodies bear the action of the fire, without being dissipated in fumes. See *VOLATILITY*.

The principal causes of *Fixity*, or the qualifications that contribute most to the rendering a body fixed, according to Mr. Boyle, are, 1^o, That its corpuscles be singly of a certain proportionable bulk, too big and unwieldy to be carried up by heat, or buoyed up in the air. 2^o, That they have also a proper degree of weight, or solidity. 3^o, That their figure be such as unfits them for evaporation, or flying off; some being branched, others hooked, &c. so that being entangled with one another, they cannot easily be extricated, loosened, and separated. To these may be added a fourth circumstance, viz. the nearness of the particles, and their being contiguous in a great many points, or a deal of their surface, which produces a stronger force of attraction and cohesion.

FIXT, or **FIXED Bodies**, in the general, are those which neither the fire, nor any corrosive, has such effect on, as to reduce or resolve them into their component elements, i. e. absolutely to destroy them.

Chauvin holds it not sufficient to denominate a body *fixt*, that it can withstand the fire, or any one agent; but it should withstand all. He contends, that *Fixity* should not be restrained, as it usually is, to an exemption from evaporation; but from destruction, or resolution into primary elements: in this sense, gold, precious stones, and glass, and even sulphur and mercury itself, are properly *fixed* bodies; for mercury and sulphur retain their nature, notwithstanding all their evaporation.

FIXT, or **FIXED Bodies**, among chemists, are such as bear the violence of the fire, without evaporating.

The chemists divide all natural bodies into *fixed* and *volatile*, i. e. such as bear the utmost force of the fire, without dissipating, or spending themselves in fume, and such as do not.

Of *fixed* bodies, the principal are gold, silver, precious stones, particularly the diamond, salts, &c.

Of all metals, gold and silver alone are *fixed*; i. e. on remaining a long time exposed to the most intense flame, they alone lose nothing of their weight.

Whence this property should arise, is difficult to say. If the reader is not contented with the causes enumerated under *FIXITY*, he may add the following one from Boerhaave, viz. the homogeneity and equality of the parts.

The parts, e. gr. of gold being all homogeneous and equal, will equally sustain each other, and leave equal pores between them; through which pores, when fused, the fire finding an easy, equal passage, goes off, without carrying any thing of the metal with it: or rather, the particles of gold being of all others the most solid and heavy (as appears from the weight of that metal) and of all others the most strongly united, or bound together (as appears from the immense ductility of that metal) the force of the fire is not sufficient to overcome so powerful a resistance: the solidity of the particles, and their freedom from air prevents their being rarefied, or set further apart; which might lessen their specific gravity, and diminish their vis cohesionis; so that what has the chief effect in the raising of fumes and vapours, viz. the rarefaction, or expansion of the body, being here precluded; the metal maintains its natural weight and tendency to the centre.

Mr. Boyle, the prince of Mirandola, M. Homberg, and others have made numerous experiments on gold, silver, &c. to see how far their *Fixity* extended. In these, pure gold, kept in an intense heat for two months, lost nothing sensible of its weight. Silver, under the like circumstances, and in the like time, lost one twelfth part of its weight; but Mr. Boyle attributes this to the metal's not being fine and pure. See *SILVER*.

Indeed, by the great burning glasses of Mess. Tschirnhausen and Villette, the most *fixed* bodies, as gold itself, are rendered volatile, and lose of their weight; so that there is no body in all nature absolutely *fixed*.

FIXT Nitre, a preparation of salt-petre, made by fusing it in a crucible, and then inflaming it with throwing in a few coals; and this again and again, till no more flame, or detonation arise: then letting it cool, they pulverise and dissolve it in water; and afterwards evaporate it into a fine white salt, which serves to draw the tinctures out of vegetables. This salt, per deliquium, yields, what they call, the *Liquor of fixed Nitre*.

FLA

Fixt Salts, are those extracted or gained from bodies by calcination and lotion.

They are called *fixt*, in that the fire was not able to sublime or raise them; as those carried off in the course of calcination, by the vehemence of the fire, are called *volatile*.

The ashes of all plants yield *fixed Salts*. See **LIXIVIUM**. Chemists give the appellation *fixed* to certain of their preparations, as *fixt nitre*, &c.

Fixt Signs of the zodiac, according to some, are the *Signs* Taurus, Leo, Scorpio, and Aquarius.

They are so called, because the sun passes them respectively in the middle of each quarter, when that season is more settled and fixed, than under the *Sign*, which begins and ends it.

Fixt Stars are such, as constantly retain the same position, and distance with respect to each other.

By which they are contra-distinguished from erratic or wandering *Stars*, which are continually shifting their situation and distance.

The *fixed Stars* are, what we properly and absolutely call *Stars*: the rest have their peculiar denomination of *Planet*, and *Comet*. See **STAR**, **PLANET**, and **COMET**.

FLACCIDITY, in medicine, &c. a disorder of the fibres, or solid parts of the body, opposite to *rigidity*.

The too great *Flaccidity* of the parts is cured by cardiacs, exercise, friction, a dry warm air, proper food, &c.

FLAG, a general name, including colours, standards, antients, banners, ensigns, &c. which authors frequently confound with each other.

The fashion of bearing the *Flags* pointed, or triangular, which now obtains, Roderic. Toletanus assures us, came from the Mahometan Arabs, or Saracens, upon their seizing of Spain; before which time all the ensigns of war were square, stretched or extended on cross pieces of wood, like church banners; on which account they were called in Latin, *Vexilla*, q. d. *Vexilla, a veli diminutione*, as is remarked by Isidore.

The pirates of Algiers, and those throughout the coasts of Barbary, are the only people that bear an hexagonal *Flag*. It is gules, charged with a morek head, coiled with its turban. &c. though this be expressly contrary to their law, which prohibits the making any image, or representation of a man; founded on an opinion, that they who make them, shall be obliged at the day of judgment to find souls for them; and, that in defect hereof they shall be damned. But this portrait which they carry is that of Hali, Mahomet's son-in-law, to whose party the Africans all retain; who ordered that his effigy should be expressed on their *Flags* and standards, believing himself so formidable to the Christians, that the bare sight of his image would carry undoubted victory over them. Leon clavus.

FLAG is more particularly used at sea, for the colours, antients, standards, &c. bore on the top of the masts of vessels, to notify the quality of the person who commands the ship, of what nation it is, and whether it be equipped for war, or trade.

The admiral, or commander in chief, carries his *Flag* on the main-top, or top of the main-mast.

The vice-admiral carries his on the fore-top; and the rear-admiral his on the mizzen-top, or top of the mizzen-mast.

The commanders of squadrons bear their *Flag* on the mizzen-mast, when in the body of a fleet; and on the main-mast, when they command a party. It should be cleft two thirds of its height, and terminate in a point.

The *Flags* bore on the mizzen, are particularly called *Gallants*. See **MAST**, &c.

The *Flag* of the French nation is blue, charged with a white cross, and the arms of France.

Beside the national *Flag*, merchant-ships frequently bear lesser *Flags*, on the mizzen-mast, with the arms of the city, where the master ordinarily resides; and on the fore-mast with the arms of the place, where the person who freights them lives.

To *hang out the white FLAG*, is to ask quarter: or, it shews, when a vessel is arrived on a coast, that it has no hostile intention, but comes to trade, or the like.—The *red Flag* is a signal of defiance and battle.

To *lower, or strike the FLAG*, is to pull it down, or take it in, out of respect or submission, when a weaker party meets a more powerful one.

By an ordinance of Philip II. king of Spain, 1565. the captains are peremptorily commanded to perish, rather than lower their royal *Flag*, when once hung out.

The way of leading vanquished ships in triumph, is to tie the *Flags* to the shrouds, or the gallery in the hind-part of the ship, and let them hang down towards the water: and to tow the vessels by the stern. It was thus the Romans used those of Carthage, as Livy relates.

FLAG-OFFICERS, those who command the several squadrons of a fleet: as, admirals, vice-admirals, and rear-admirals.

FLA

The *Flag-officers* in our sea-pay are the admiral, vice-admiral, and rear-admiral, of the white, red, and blue.

FLAG-SHIP, a ship commanded by a general, or *Flag-officer*, who has a right to carry a *Flag*; in contra-distinction to the secondary vessels, under the command thereof.

FLAG-STAVES, are staves set on the heads of the top-gallant masts, serving to let fly, and unfurl the *Flag*.

FLAGS, in falconry, are the feathers in a hawk's wing, near the principal ones.

FLAGELLANTES, a sect of hereticks, who chastised and disciplined themselves with whips, in publick.

The sect of the *Flagellantes* had its rise at Perugia, in the year 1260. Its author was one Rainier, a hermit. It was in all probability no more than the effect of an indiscreet zeal. A great number of persons of all ages made processions, walking two by two, with their shoulders bare, which they whipped, till the blood ran down, in order to obtain mercy from God, and appease his indignation against the wickedness of the age. They were then called the *devout*; and having established a superior, he was called the *general* of the devotion.

Women did not appear in these publick assemblies; though they practised the same severities: but it was in private, and in their own houses.

In the middle of the fourteenth century, the sect of the *Flagellantes* was restored, on occasion of a great mortality; and spread itself into all parts of Europe.

The bishops and magistrates at length found it necessary to put a stop to their excess. The writers and preachers disputed against it; but the *Flagellantes* remained unshaken against all they could say: so that of a number of perhaps innocent well-meaning zealots, pride, obstinacy, and schism converted them into a dangerous sect. They held, that the blood they thus spilt, was mixed with that of Jesus Christ; and that by a *Flagellation* of twenty-four days they gained the pardon of all their sins.

Clement VI. forbade all publick *Flagellations*. And Gerson wrote an express treatise against publick *Flagellations*.

FLAGELLATION, *whipping*, a voluntary discipline, or penance, frequently practised by the antient penitents. See **DISCIPLINE**.

The parliament of Paris prohibited all publick *Flagellations*, by an arrest of 1601. See **FLAGELLANTES**.

FLAGELLATION, is a term more peculiarly appropriated to the sufferings of Jesus Christ, when whipped and scourged by the Jews.—From the Latin *flagellum*, a scourge, or whip.

We say, a painting of the *Flagellation*; or simply, a *Flagellation*, to denote a picture, or print, representing this torment inflicted on the Saviour of the world.

In this sense we say, the *Flagellation* of such a painter, &c.

FLAGEOLET, or **FLAJOLET**, a kind of little flute; or a musical instrument of the flute kind, used chiefly by shepherds and country people.

It is usually made of box, or some other hard wood; sometimes of ivory. It has six holes, or stops, beside that at bottom, the mouth-piece, and that behind the neck.

FLAIL, see the article **THRASHING**.

FLAMBEAU, or **FLAMBOY**, a luminary, made of several thick wicks, covered over with wax; serving to burn at nights in the streets; as also at funeral processions, illuminations, &c.

Flambeaux differ from links, torches, and tapers. See **TORCH**.

They are made square; sometimes of white wax, and sometimes of yellow. They usually consist of four wicks, or branches, near an inch thick, and about three foot long; made of a sort of coarse hempen yarn, half twisted.

They are made with the ladle, much as torches, or tapers are; viz. by first pouring the melted wax on the top of the several suspended wicks, and letting it run down to the bottom: this they repeat twice. After each wick has thus got its several cover of wax, they lay them to dry; then roll them on a table, and so join four of them together, by folding them with a red-hot iron.

When joined, they pour on more wax, till the *Flambeau* is brought to the size required; which is usually from a pound and half, to three pounds.

The last thing is to finish their form, or out-side, which they do with a kind of polishing instrument of wood, by running it along all the angles, formed by the union of the branches.

The *Flambeaux* of the antients were different from ours. They were made of woods, dried in furnaces, or otherwise. They used divers kinds of wood for this purpose: the most usual was pine. Pliny says, that in his time they frequently also burnt oak, elm, and hazle. In the seventh book of the *Æneid*, mention is made of a *Flambeau* of pine: and Servius on that passage remarks, that they also made them of the cornel tree.

FLAME,

FLAME, the brightest and subtilest part of fire, ascending above the fewel in a pyramidal, or conical figure.

Flame seems to be the smoke, *i. e.* the fumes, or volatile parts of the fewel, greatly rarefied, and at last kindled, or heated red-hot. By this great rarefaction, the matter becomes so light, as to be raised with great velocity, in the air: and by the pressure of the incumbent atmospheric fluid, it is kept for some time together; the air forming a sort of arch, or sphere around it, that prevents its immediate diffusion and dissipation, and by its contiguity and fixation sustains and feeds the fire of the *Flame*: the aqueous and earthy parts of the fume being naturally incapable of being ignited, are only rarefied, and so impelled upwards in a dusky cloud without flaming.

Flame is defined by Sir I. Newton, in his little piece *De Acido*, to be *fumus candens*, red-hot smoke. The same author argues, Is not *Flame* a vapour, fume, or exhalation heated red-hot, that is, so hot as to shine? For bodies do not *flame* without emitting a copious fume; and this fume burns in the *Flame*. The ignis fatuus is a vapour shining without heat; and is there not the same difference between this vapour, and *Flame*, as between rotten wood shining without heat; and burning coals of fire? In distilling hot spirits, if the head of the still be taken off, the vapour which ascends, will take fire at the *Flame* of a candle, and turn into *Flame*. Some bodies, heated by motion or fermentation, if the heat grow intense, fume copiously; and if the heat be great enough, the fumes will shine, and become *Flame*. Metals in fusion do not *flame*, for want of a copious fume. All *flaming* bodies, as oil, tallow, wax, wood, fossil coal, pitch, sulphur, &c. by burning, waste in smoke, which at first is lucid; but at a little distance from the body, ceases to be so, and only continues hot. When the *Flame* is put out, the smoke is thick, and frequently smells strongly; but in the *Flame* it loses its smell, and according to the nature of the fewel, the *Flame* is of divers colours. That of sulphur, *e. gr.* is blue; that of copper opened with sublimate, green; that of tallow, yellow; of camphire, white, &c. We find that when gunpowder takes fire, it goes off in a *flaming* smoke. The manner we conceive to be this: the charcoal and sulphur easily take fire, and set fire to the nitre; by which the spirit of the nitre being rarefied into vapour, rushes out, like the vapour of water out of an æolipile. Then the acid spirit of the sulphur entering violently into the fixed body of the nitre, sets loose the spirit of the nitre, and excites a greater fermentation, whereby the heat is increased, and the fixed body of the nitre rarefied into fume; and thus is a vehement explosion effected. The *Flame* of gunpowder arises from a violent action, whereby the mixt being quickly and vehemently heated, is rarefied and converted into fume and vapour: Which vapour by the violence of the action becoming so hot as to shine, appears in the form of *Flame*. Newt. Optics, p. 318.

It is a remarkable phenomenon of the *Flame* of a candle, torch, or the like, that in the dark it appears bigger at a distance than near at hand. The reason is, that at a distance, *e. gr.* of six feet, the eye can readily distinguish between the *Flame*, and the contiguous air illuminated by it; and sees precisely where the *Flame* terminates: But at the distance, *e. gr.* of thirty foot, though the angle subtended by the *Flame*, be much smaller than before; yet the eye not being able to distinguish the precise bound of the *Flame*, takes part of the sphere of air illuminated by it, for the *Flame* itself.

We have several instances of actual *Flame* being produced by the mixture of two cold liquors. Dr. Sars gives us a list of the oils which burst into *Flame* upon mixing them with compound spirit of nitre: such are those of carraways, cloves, fassifras, guaiacum, box, camphire, pepper, hartshorn, blood, &c. Phil. Transact. N° 213. See Supplement, article SPIRITUS NITRI.

Vital FLAME, FLAMMA or FLAMMULA vitalis, a fine, warm, igneous substance, supposed by many both of the ancients and moderns, to reside in the hearts of animals, as necessary to life, or rather, as that which constitutes life itself.

To the preservation of this *Flame*, they suppose air as necessary, as it is to the conservation of common *Flame*; and hence they ascribe the necessity of respiration to animal life.

Mr. Boyle, by experiments in an exhausted receiver, found that the *vital Flame* of animals, if life may be so called, survives or outlasts the *Flame* of spirit of wine, or of a wax or tallow candle, &c. Some animals would remain alive and well in vacuo, for three or four minutes, whereas no common *Flame* would last there one minute. The light of glow-worms he found would presently be destroyed by exhauing the air; and retrieved again upon its re-admission.

Dr. Quincy could find nothing more in the notion of *vital Flame*, than the natural warmth, which is the effect of a circulating blood; and which is always as its velocity.

FLAMEN, among the antient Romans, was a priest, or minister of sacrifice.

There were as many kinds of *Flamens* at Rome, as there were Gods who had priests and sacrifices offered them.

Numa, at first, only instituted three: One for Jupiter, called *Flamen dialis*; another for Mars, called *Flamen martialis*; and a third for Romulus or Quirinus, called *Flamen quirinalis*. In after-times twelve more were added; which made the number of *Flamens* fifteen.

The three first were taken from among the patricians, and were held of a rank and distinction superior to the rest. They were called *greater Flamens, Flamines majores*; in contradistinction to the other twelve, who were chose from among the plebeians, and were therefore called *lesser Flamens, Flamines minores*. The *Flamen dialis*, or of Jupiter, was the first instituted, and held in the greatest repute. He bore a peculiar ornament on his head, called *Albugalerus*, which was made of the skin of a white victim, sacrificed to Jupiter.

The cap wore by the rest, was called *Flamma*, or *Apex*. It was made of a sheep's skin, with the wool on: To which was fastened a little branch of an olive tree. That of the *Flamen* of Jupiter ended in a point called *Tutulus*. It was tied under the chin with strings. But in the summer time it was only a woollen thread tied round the head; it being prohibited them ever to appear quite bare-headed. And hence, according to Festus, came their denomination of *Flamen, viz.* from *Filamen*, of *filum*, thread.

Though the *Flamens* bore one common appellation; yet did not they constitute any company or college. Each god had his several sacrifices, feasts, and ceremonies a-part: Nor had one *Flamen* any relation to another; only they were all subordinate to the pontifex maximus. Aulus Gellius assures us, that they were created by the people in the comitia curiata; but the pontifex maximus afterwards consecrated them. Their priesthood, called *Flaminatus*, was perpetual; though on some occasions they might be deposed.

The names of the several *Flamens* are as follow. The three great *Flamens*, as already observed, were the *Flamen aialis*; *Flamen martialis*, and *Flamen quirinalis*. The twelve lesser were, the *Flamen carmentalis*, or priest of the goddess Carmenta: *Flamen falacer*, or priest of the god Falacer; a name, whose origin, Varro observes, is not known: *Flamen foralilis*, or of the goddess Flora: *Flamen furrinalis*, whose etymology is not known: *Flamen levinalis*: *Flamen lucularis*: *Flamen palatualis*, whom some moderns will have to be the priest of the goddess that presided over the palatium; though Varro owns himself at a loss for its original: *Flamen pumonalis*, or of Pomona, goddess of fruits: *Flamen viribalis*, or of the god Virbius, whom some take for the same with Hippolytus: *Flamen vulcanalis*, or of Vulcan; and *Flamen volturnalis*, or of the god Voltumnus.

They had also their *Flamina* or *Flaminice*, who were wives of the *Flamens*, or the priestesses of the deities. In an antient marble, quoted by Gruter, p. cccclix. n. 9. the word *Flamina* is used for priestess: And in the same author, p. cccviii. n. 3. the priestess of the goddess Feronia is called *FLAM FERON*, that is, *Flamina*, or *Flaminicia Feronia*.

The *Flamina* bore the same ornament on her head with the *Flamen*. She had also the same surname of office with her husband; as *Flamina dialis, martialis*, &c.

FLAMMULA, or **FLAMULA**, under the eastern empire, was a kind of flag, terminating in a point somewhat like a flame, serving as a mark, or badge, to distinguish the soldiers of the several companies, battalions, regiments, &c.

In Greek it was called *φλαμμουλον*: It was sometimes placed on the cask; sometimes on the cuirass, and sometimes at the end or tip of the pike, &c.

The emperor Maurice ordered, that the *Flammula* of each division should be of a particular colour, to distinguish them from the other battalions, or brigades: *φλαμμουλα ἐκαστης μοιρας ἰδιοχροα ειναι*.

They used to lay aside the *Flammula* before an engagement, lest it should prove an incumbrance. The cavalry had also *Flammula* on their horses, to distinguish the troops they belonged to.

FLANCH, FLANQUE, or FLASQUE, an ordinary in heraldry, formed by an arched line, which begins at the corners of the chief, and ends in the base of the escutcheon.—

He beareth ermin two *Flanches* vert. See Tab. Herald. fig. 25.

Flanches are always born by pairs.

Leigh makes *Flanque* and *Flask* two distinct bearings, whereof the former is more bent in than the latter; but Gibbon judiciously makes them but one, which he calls *Flanque*.

FLANEL, or FLANNEL, a kind of slight, loose, woollen stuff, not quilted, but very warm; composed of a wool, and warp, and wove on a loom, with two treddles, after the manner of bays, &c. See BAYS.

FLANK, or FLANC, in the manage, is applied to the sides of a horse's buttocks, &c.

In a strict sense, the *Flanks* of a horse are the extremes of the belly, where the ribs are wanting, and are below the loins.

The *Flanks* of a horse should be full; and at the top of each a feather. The distance between the last rib, and haunch bone, which is properly the *Flank*, should be short; which they

FLA

they term *well coupled*: Such horses being most hardy, and fit to endure labour.

A horse is said to have no *Flank*, if the last of the short ribs be at a considerable distance from the haunch-bone; as also when his ribs are too much frightened in their compass.

FLANK, in war, is used by way of analogy, for the side of a battalion, army, &c. in contra-distinction to the *Front* and *Rear*.

To attack the enemy in *Flank*, is to discover, and fire upon them on one side.

The enemy took us in *Flank*: the *Flank* of the infantry must be covered with the wings of the cavalry.

FLANK, in fortification, is a line, drawn from the extremity of the face, towards the inside of the work.—Such is the line BA, *tab. fortification*, fig. 1.

Or, *Flank* is that part of the bastion, which reaches from the curtain to the face, and defends the opposite face, the *Flank*, and the curtain.

Oblique, or *second FLANK*, is that part of the curtain, EI, intercepted, between the greater line of defence, EC, and the lesser, IC: and from which they can see to scour the face of the opposite bastion.

Low, covered, or retired FLANK, is the platform of the casemate, which lies hid in the bastion; otherwise called the *avillon*. See ORILLON.

FLANK Fitchant is that from whence a cannon playing, fireth its bullets directly in the face of the opposite bastion.

FLANK Razant is the point, from whence the line of defence begins, from the conjunction of which with the curtain, the shot only rareth the face of the next bastion; which happens when the face cannot be discovered but from the *Flank* alone.

Simple FLANKS, are lines, going from the angle of the shoulder, to the curtain; whose chief office is for defence of the moat, and place.

FLANKED, FLANQUE, is used by the French heralds, to express our party per saltier; that is, when the field is divided into four parts, after the manner of an X.

Though Colombiere uses the term in another sense, which appears more natural, *viz.* for the taking of flanches, or rounding sections out of the sides of the escutcheons; the first from the angles of it, the latter in straight lines, forming an angle at the fess, without making any saltier.

FLANKED Angle, in fortification, is the angle formed by the two faces of the bastion, and which of course forms the point of the bastion.

FLANKED Tenaille, called also *Tenaille*. See TENAILLE.

FLANKING, in the general, is the act of discovering, and firing upon, the side of a place, body, battalion, &c.

To *flank* a place, is to dispose a bastion, or other work in such manner, as that there shall be no part of the place, but what may be played on, both in front, and rear.

Thus we say to *flank* a wall with towers. This bastion is *flanked* by the opposite flank, and a half-moon. This horn-work is *flanked* by the curtain.

Any fortification that has no defence but just right forwards is faulty: and to render it complete, one part ought to be made to *flank* the other. Hence the curtain is always the strongest part of any place, because it is *flanked* at each end.

Battalions also are said to be *flanked* by the wings of the cavalry.—A house is sometimes said to be *flanked* with two pavillions, or two galleries; meaning it has a gallery, &c. on each side.

FLANKING line, of Defence, see RASANT, and LINE of Defence.

FLASK, FLASQUE, a bearing, more properly called *Flanch*, or *Flanque*. See FLANCH.

FLATS, in music, a kind of additional or half notes, contrived, together with *Sharps*, to remedy the defects of musical instruments.

The natural scale of music being limited to fixed sounds, and adjusted to an instrument, the instrument will be found defective in several points: As particularly, in that we can only proceed from any note, by one particular order of degrees; that for this reason we cannot find any interval required from any note, or letter upwards and downwards; and that a song may be so contrived, as that if it be begun by any particular note or letter, all the intervals or other notes, shall be justly found on the instrument, or in the fixed series; yet were the song begun with any other note, we could not proceed.

To remove, or supply this defect, musicians have recourse to a scale proceeding by twelve degrees, that is thirteen notes, including the extremes, to an octave; which makes the instruments so perfect, that there is but little to complain of. This, therefore, is the present system or scale for instruments, *viz.* betwixt the extremes of every tone of the natural scale is put a note, which divides it into two unequal parts, called *Semi-tones*; and the whole may be called the *Semitonic Scale*, containing twelve *Semi-tones* betwixt thirteen notes, in the compass of the octave.

Now, to preserve the diatonic series distinct, these inserted notes either take the name of the natural note next below,

FLE

with a character called a *Sharp*; or they take the name of the natural note next above, with a mark called a *Flat*. Thus D *Flat* signifies a Semi-tone below the D natural. And it is indifferent in the main, whether the inserted note be accounted as a *Flat*, or a *Sharp*.

This semitonic series or scale is very exactly represented by the keys of a spinner: The foremost range of keys being the natural notes; and keys behind, the artificial notes, or the *Flats* and *Sharps*.

FLATULENT, something that has a relation to *Flatul*'s, or blasts of wind.

Peas, and most kinds of pulse, onions, &c. are *flatulent* foods.

FLATUS, or **FLATULENCY**, wind gathered in the bowels, or other cavity of the body, by means of indigestion, &c. It is diffused by warm aromatics, which rarely it enough to break away wherever a vent can be found.

FLATTER, or **FLATTENER**, } see COINING.

FLATTING, or **FLATTENING**, }
FLAX, or *Line*, *Linum*, a plant with a slender hollow stem, usually about three foot high; whose bark consists of fibres, or threads, much like those of hemp; which being dressed and worked in due manner, makes that noble commodity, linen-cloth.

Flax thrives best in a soil that has long lain fallow. To bear *Flax*, it must be well plowed, laid flat and even, and the seed sown thick, in a warm season, about the middle of March, or beginning of April. The best seed is that brought from the East; which, though dear, repays the charges with abundance. One sowing of *flax* will produce two or three crops, before it need be renewed.

Flax pulled up in the bloom, proves whiter and stronger, than if left standing till the seed is ripe; but then the seed is lost.

For the preparations *Flax* must undergo, to fit it for spinning, as pulling, drying, and singeing, see HEMP.

The seed of *Flax*, called *Linseed*, has several considerable properties. It enters the composition of divers medicines, and yields an oil by expression, which has most of the properties of nut-oil; and which is frequently used, in defect thereof, in painting, to burn in lamps, &c. That drawn cold, is also reputed good in divers diseases.

FLEA, in natural history.—The generation of this familiar vermin affords something very curious, first discovered by Sig. Diacinto Cestone.

Fleas bring forth eggs, or nits, which they deposit on animals that afford them a proper food: These eggs being very round and smooth, usually slip straight down; unless detained by the piles, or other inequalities of the clothes, hairs, &c.

Of these eggs are hatched white worms, of a shining pearl colour, which feed on the scurfy substance of the cuticle, the downy matter gathered in the piles of clothes, or other the like substances.

In a fortnight they come to a tolerable size, and are very lively and active; and if at any time disturbed, they suddenly roll themselves into a kind of ball.

Soon after this they come to creep, after the manner of silk-worms, with a very twist motion. When arrived at their size, they hide themselves as much as possible, and spin a silken thread out of their mouth, wherewith they form themselves a small round bag or case, white within, as paper, but without always dirty, and fouled with dust.

Here, after a fortnight's rest, the animalcule bursts out, transformed into a perfect *Flax*; leaving its exuvie in the bag. While it remains in the bag, it is milk white; till the second day before its eruption, when it becomes coloured, grows hard, and gets strength; so that upon its first delivery, it springs nimbly away. *Philosop. Transact.* N^o 249.

FLEA-BITTEN Colour of a horse is white spotted all over with dark reddish spots.

FLEAM, a small instrument of pure steel, composed of two or three moveable lancets for bleeding a horse or the like.

FLEDWITE, or **FLIGHT-WITE**, in our antient laws, a discharge or freedom from amercements, when one, having been an outlawed fugitive, comes to the peace of our lord the king, on his own accord, or with licence. *Rassal*. Others rather take it to denote a mulct, or fine, set upon a fugitive to be restored to the king's peace.

FLEECE, the covering of wool thorn off the bodies of sheep. The golden **FLEECE** is famous among the antient writers. It was this that the Argonauts, under the command of Jason, went in pursuit of to Colchis, a province of Asia, now called Mingrelia.

The mystery of the golden *Fleece* is variously explained,—either of the profit of the wool trade of Colchis; or of the gold that they commonly gathered there with fleeces, in the rivers. *Arbuth. Diff.* p. 224. See ARGONAUTS.

Order of the golden **FLEECE**. See GOLDEN FLEECE.

FLEET, a number of vessels, going in company, whether on a design of war, or commerce.

In times of peace, merchant-ships go in *Fleets*, for their mutual aid and assistance: In times of war, besides this security, they likewise procure convoys of men of war; either to escort them to the places whither they are bound, or only

a part of the way, to a certain point or latitude, beyond which they are judged out of danger of privateers, &c.

The Spanish *Fleet* sent against England, by Philip II. consisted of a thousand vessels. In the East there have been *Fleets* seen of three thousand vessels.

Merchant *Fleets* generally take their denomination from the place they are bound to; as the Turkey *Fleet*, East-India *Fleet*, &c.

The Spaniards call simply the *Fleet*, or *Flota*, a certain number of vessels, belonging partly to the king, and partly to merchants, sent every year to Vera Cruz, a port of New Spain.

The *Flota* consists of the captain, admiral, and patach or pinace, which go on the king's account; and about sixteen ships, from four hundred to a thousand tons, belonging to particular persons. They are all so heavy laden, both going and coming, that they have much ado to defend themselves when attacked. The *Fleet* puts out from Cadix about the month of August, and makes it eighteen or twenty months before its return.

The *Fleet* sent annually from the same port to Peru, they call the *Galleons*. See *GALLEON*.

When the two *Fleets* put out together, they go in company as far as the Antilles, where they separate; the *Galleons* for Carthagena, and Porto-Bello; and the *Flota* for Vera Cruz: At their return they join at the Havanna.

Of the two *Fleets* the *Galleons* are the most richly laden; not but the cargo of the *Flota* is also very considerable.

FLEET is also a famous prison in London, thus called from the river Fleet, on the border whereof it stands.

To this prison persons are usually committed for contempt of the king and his laws; or upon absolute command of the king, or some of his courts, particularly that of chancery; and lastly, for debt.

FLEGM, **FLEGMAIC**, **FLEGMAGOGUE**, &c. See **PHLEGM**, **PHLEGMAIC**, &c.

FLEMISH, or the **FLEMISH tongue**, is that which we otherwise call *Low Dutch*, to distinguish it from the German, whereof it is a corruption, and a kind of dialect.

The *Flemish* is the language used throughout all the provinces of the Netherlands. It differs considerably from the Walloon; which is a corrupt French.

There are several *Flemish* translations of the Bible. In the year 1618. it was decreed by the synod of Dort, that a new *Flemish* version should be made of the whole Scriptures; by reason the old translation, which had been taken from that of Luther, was full of faults. Accordingly, several persons, learned in the Greek and Hebrew languages, undertook the work; which was published with notes in 1637. This Bible is highly valued by the Reformed in Holland, &c. though M. Simon censures it as being far from the perfection of a just translation.

FLEMISH Bricks, a neat, strong kind of bricks, of a yellowish colour, brought from Flanders, and much used for paving. See **BRICK**.

FLESH, *Caro*, in anatomy, a simlar, fibrous part of an animal body, soft and bloody; being that whereof most of the other parts are composed, and whereby they are connected together.

Flesh is properly understood of such parts of the body where the blood-vessels are so small, as only to retain blood enough to preserve their colour red.

The antients accounted five different kinds of *Flesh*: the first *muscular*, *fibrous*, or *fibular*; as the substance of the heart, and other muscles. The second, *parenchymous*, as that of the lungs, liver, and spleen. The third *viscerous*, as the *Flesh* of the stomach and intestines. The fourth *glandulous*, as that of the breasts, pancreas, tonsils, &c. And the fifth *spurious*, as that of the gums, glans of the penis, the lips, &c.

The moderns only admit of one kind of *Flesh*, viz. the muscular, consisting of little tubes and vessels with blood therein; so that *fleshy* and muscular parts of the body with them are the same thing.

Sometimes, however, they apply the term to the glands; which they call, by way of distinction, *glandulous Flesh*.

As to the parenchyma's, they are now found to be quite other things than the antients imagined. The lungs are only an assemblage of membranous vessels, inflated with air. The liver a collection of glands, wherein the bile is separated. The spleen, a heap of vessels, full of blood. And the kidneys, like the liver, a mass of glands, for separating of the urine.

FLESH is also used in theology, in speaking of the mysteries of the incarnation and eucharist.

The word was made *Flesh*, *verbum caro factum est*. See **INCARNATION**.

The Romanists hold, that the bread in the sacrament of the supper is turned into the real *Flesh* of Jesus Christ. See **TRANSUBSTANTIATION**.

The resurrection of the *Flesh* is an article of faith.

VOL. I.

The Anthropophagi, or Cannibals, are said to feed upon human *Flesh*.

FUNGUS FLESH. See the article **FUNGUS**.

FLESH is sometimes also used by botanists, for the soft pulpy substance of any fruit, inclosed between the outer rind or skin, and the seeds, or stone: or for that part of a root, fruit, &c. fit to be eaten.

FLESH-COLOUR. See the article **CARNATION**.

FLEUR-DE-LISEE, **FLEURETTEE**, **FLEURONNEE**, and **FLEURY**, in heraldry. See **FLORY**.

FLEXIBLE, in physics, is applied to bodies that are capable of being bent, or changed from their natural form and direction.

Trees that grow near waters, as the willow, poplar, &c. are more *flexible* than others. The fibres being finer and more *flexible* in women than in men, they have generally a greater degree of delicacy of thought and imagination. A *flexible* voice succeeds best in music.

A body is not capable of being inflected or bent, unless the whole thereof be at rest. In bending a body, it constitutes, as it were, two levers; and the point it is to be bent in, is a fulcrum: hence, as a moving power, the further it is from the fulcrum, the greater is its force; the longer the *flexible* body is, the easier it is bent.

FLEXION, in anatomy, &c. is applied to the motion of an arm, or other member, whereby it is bent.

The arm has a motion of *Flexion*, and another of extension.

The motion of *Flexion* is, when the radius and humerus approach each other, and form an angle at the elbow.

FLEXION, or **FLEXURE of Curves**. See **POINT of contrary Flexion**.

FLEXOR, in anatomy, a name given to several muscles, in respect of their action, viz. the bending of the members, or joints, in opposition to the extensors, which open or stretch them.

FLEXOR Capitis, is a muscle of the head, called also *Rectus major anticus*. See **RECTUS major**, &c.

FLEXOR Carpi radialis, called also *Radialis internus*, rises from the inner protuberance of the humerus; and running along the radius, is inserted into the upper part of the bone of the metacarpus, which is joined with the fore-finger.

FLEXOR Carpi ulnaris, called also *Cubitus internus*, arises tendinous from the inner protuberance of the humerus, and upper part of the ulna, upon which it runs along, till passing under the ligamentum annulare, it is inserted by a short strong tendon into the fourth bone of the first row of the carpus. See *Tab. Anat. (Myol.) fig. 2. n. 24.*

Both these muscles bend the wrist.

FLEXOR Pollicis pedis brevis, arises from the middle of the cuneiform bone. It is short, thick, and fleshy, seemingly two, and running over the termination of the peroneus, has a double insertion into the ossa sesamoidea.

FLEXOR Pollicis pedis longus; this is a muscle of the toe. It is derived from the back part of the fibula, with a double order of fibres, and runs tendinous under the inner ankle, and through the channel in the inner part of the bone of the heel, to its insertion at the extremity of the great toe, on the under side.

FLEXOR primi internodii digitorum pedis. See **LUMBRICALES pedis**.

FLEXOR secundi internodii digitorum manus. See **PERFORATUS manus**.

FLEXOR tertii internodii digitorum manus. See **PERFORANS manus**.

FLEXOR tertii internodii digitorum pedis. See **PERFORANS pedis**.

FLEXORES primi internodii digitorum manus, are muscles of the fingers, called also *lumbricales manus*. See **LUMBRICALES**.

FLEXORES pollicis manus, are two muscles serving to bend the thumb.

The first, called *Flexor tertii internodii*, &c. arises from the internal protuberance of the humerus, and part of the radius, by different orders of fibres, and passing under the ligamentum annulare, is inserted into the third bone of the thumb.—The second, called *Flexor secundi internodii*, &c. arises from the bones of the carpus, and annular ligament, and is inserted into the second bone of the thumb.

FLEXORES secundi internodii digitorum pedis. See **PERFORATUS pedis**.

FLIE, or **FLY**, that part of the mariner's compass, on which the thirty two winds are drawn, and over which the needle is fastened underneath.

FLIGHT, the act of a bird in flying; or the manner, duration, &c. thereof. See **FLYING**.

The feathers of birds are admirably contrived and fitted for the ease and convenience of *Flight*.

Almost every kind of bird has its particular *Flight*: The eagles

FLO

eagle's *Flight* is the highest: the *Flight* of the sparrow hawk and vultur are noble, and are fit for high enterprise and combat. The *Flight* of some birds is low, weak, transient, and, as they call it, *terra a terra*: the *Flight* of the partridge and pheasant is but of short continuance: that of the dove is laboured: that of the sparrow, undulatory, &c. The augurs pretended to foretell future events from the *Flight* of birds.

FLIGHT.—In melting the lead-ore in the works at Mendip, there is a substance which flies away in the smoke, which they call the *Flight*.

They find it sweetish upon their lips, if their faces happen to be in the way of the smoke, which they avoid all they can. This, falling on the grass, kills cattle that feed thereon: and being gathered and carried home, kills rats and mice in their houses: That which falls on the sand, they gather and melt upon a flag-hearth, into shot and sheet-lead.

Capons FLIGHT, in some customs, is a compass of ground, such as a capon might fly over, due to the eldest born of several brothers, in making partition of the father's effects with them, when there is no principal manor in a lordship. It is usually estimated by a bow-shot.

FLIGHT of a Stair-case. See the article STAIR-CASE.

FLIGHT, in heraldry. See the article VOL.

FLINT, *Silex*, a small, hard, livid, or black pebble; chiefly used for yielding sparks of fire by collision against steel.

The Indians, instead of *Flint* and steel, use two pieces of green wood, which they rub violently against each other. In the East, they use the wood candan; and in Peru, that called reyaca, for this purpose.

Flints are also one of the principal ingredients in the making of glass. See Supplement, article SILEX.

FLINT-Wall. See the article WALLS.

FLIP, a sort of sailors drink, made of malt liquor, brandy, and sugar, mixed.

FLOAT, or **FLEET**. See **FLOTA**, and **FLOTILLA**.

FLOAT of a fishing line, a cork, or quill, swimming on the water, to discover what becomes of the hook, whether any thing bites, &c. See **FISHING-FLOAT**.

FLOAT also denotes a certain quantity of pieces of timber joined together with rafters a-thwart, thrown into a river, to be conveyed down the stream; and even sometimes to carry burdens down a river with the stream. The invention of *Floats* is of great use; it is said to have been first put in execution at Paris, in the year 1618.

FLOATING-Vessels. See the articles **BOAT**, **VESSELS**, &c.

FLOATING, in husbandry, is the drowning or watering of meadows.

FLOOD, a deluge, or inundation of waters. See **DELUGE**.

FLOOD is also used in speaking of the tides. See **TIDE**.

When the water is at lowest, it is called *Flood*; when rising, *young*, or *old Flood*; when at highest, and beginning to fall, *ebb water*.

FLOOK, or **FLUKE** of an anchor. See **ANCHOR**.

FLOOR, in building, the under-side of a room, or that part we walk on.

Floors are of divers sorts; some of earth, some of brick, others of stone, others of boards, &c.

Carpenters, by the word *Floor*, understand as well the framed work of timber, as the boarding over it.

For brick and stone *Floors*, see the article **PAVEMENT**.

For boarded *Floors*, it is observable, that the carpenters never *floor* their rooms with boards, till the carcass is set up, and also inclosed with walls; lest the weather should injure the *Flooring*. Yet they generally rough plane their boards for the *Flooring*, before they begin any thing else about the building, that they may set them by to dry and season; which is done in the most careful manner.

Earthen FLOORS are commonly made of loame, and sometimes, especially to make malt on, of lime, and brook-sand, and gun-dust, or anvil dust from the forge.

Ox-blood and fine clay, tempered together, Sir Hugh Plat says, makes the finest *Floor* in the world.

FLOOR of a ship, strictly taken, is only so much of her bottom, as the keels on, when a-ground.

Such ships as have long, and withal broad *Floors*, lie on the ground with most security, and are not apt to feel, or tilt on one side; whereas others, which are narrow in the *Floor*, or, in the sea-phrafe, *cranked by the ground*, cannot be grounded without danger of being overturned.

FLORALES Ludi, or **FLORAL Games**, in antiquity, were games held in honour of Flora, the goddess of flowers.

They were celebrated with horrible debaucheries. The most licentious discourses were not enough; but the courtiers were called together by the sound of a trumpet, and made their appearance naked, and entertained the people with abominable shews and postures: the comedians appeared after the same manner on the stage. Val. Maximus relates, that Cato being once present in the theatre on this occasion, the people were ashamed to ask for the infamous pleasure in his presence; till

FLO

Cato, apprized of the reservedness and respect he inspired them withal, withdrew, that the people might not be balked of their accustomed diversion.

There were divers other sorts of shews exhibited on this occasion; and if we may believe Suetonius in Galba, c. vi. and Vopiscus in Carinus, these princes presented elephants dancing on ropes, on these occasions.

The *Ludi Florales*, according to Pliny, lib. xviii. c. 29. were instituted by order of an oracle of the Sybils, on the 28th of April; not in the year of Rome 1301, as we commonly read it in the ancient editions of that author; nor in 1304. as F. Hardouin has corrected it; but, as Vossius reads it, in 513. They were chiefly held in the night-time, in the Patian-street: some will have it, there was a circus for the purpose, on the hill called *Horatulum*.

The goddess Flora is by some held to be the same with the Chloris of the Greeks. Others maintain, that this Flora was a famous courtesan at Rome, who having enriched herself by prostitution, made the people of Rome her heir, on condition that they should celebrate the anniversary of her birth-day, by the games and feasts above-mentioned. Some time afterward, the senate judging such a foundation unworthy the majesty of the Roman people, to ennoble the ceremony converted Flora into a goddess, whom they supposed to preside over flowers; and so made it a piece of religion to render her propitious, that it might be well with their gardens, vineyards, &c.

This is the common account: but Vossius de *Idolol.* lib. i. c. 12. can by no means allow the goddess Flora to have been the courtesan above-mentioned: he will rather have her a Sabine deity, and thinks her worship might have commenced under Romulus. His reason is, that Varro, in his fourth book of the Latin tongue, ranks Flora among the deities, to whom Tatius, king of the Sabines, offered up vows, before he joined battle with the Romans. Add, that from another passage in Varro it appears, that there were priests of Flora, with sacrifices, &c. as early as the times of Romulus and Numa.

FLORAL Games.—There are also a kind of *Floral Games* observed at this day in France; first instituted in 1324.

The design and establishment is owing to seven persons of condition, lovers of poetry, who about All-faints-day, in 1323, sent a circular letter to all the provincial poets, called *Tranhadours*, to meet at Thoulouze on May-day following, there to rehearse their poems; promising a prize of a violet of gold to the person whose piece should be judged the best.

The capitious found the design so good, that it was afterwards resolved, at a council of the city, to continue it at the city charge; which is still done in a manner that does honour to the place.

In 1325, a chancellor and secretary of the new academy were chose; and the seven institutors took the quality of maintainers thereof. Two other prizes were afterwards added to the violet, viz. an eglantine for the second prize, and a pansy for the third. It was also decreed, that the person who bore away the first prize, might demand to be made bachelor; and that whoever bore away all three, should be created doctor in the *Gay Science*, that is, in poetry.

There is a register of these games kept at Thoulouze, which gives this account of their origin; though others give the thing another turn. It was an ancient custom, they say, for the poets of Provence, to meet yearly at Thoulouze, to confer together, rehearse their verses, and receive a prize allotted to the best performance. This held till about the year 1540. when a lady of quality left the best part of her fortune, to eternize the custom, and bear the expence of prizes; the number of which the increased, ordering an eglantine, a pansy, a violet, and a pink: the three first a cubit high; and worth fifteen pistoles a-piece. The ceremony begins on May-day, with a solemn mass, music, &c. The corporation attend; and poems are rehearsed every day: the third day a magnificent treat is given by the magistracy, &c. and that day the prizes are adjudged. The three prizes are the rewards of three different kinds of compositions, viz. a poem, an eclogue, and an ode.

FLORALIA, in antiquity, a general name for the feasts, games, and other ceremonies, held in honour of the goddess Flora.

The *Floralia* were also called *Amibiteses*: they were held at the latter end of the month of April, as Ovid witnesses,

Exit, & in Majasfylum Florale calendæ.

In effect, the *Floralia* began on the 28th of April, and lasted six days.

They who assisted at the ceremony were crowned with ivy, and committed a world of indecencies; which indeed was no extraordinary thing in the heathen feasts.

Some apply the word *Floralia* indifferently to the feasts, and games of this goddess; but others restrain it to the feasts alone; calling the games, *Ludi Florales*. See **FLORALES Ludi**.

FLORID Style, is that enriched and heightened with figures, and flowers of rhetoric. See **STYLE**.

Longinus uses the terms *florid* and *affected* style, indifferently, and lays them down as quite contrary to the true sublime.

FLORILEGIUM, **FLORILEGE**, a name the Latins have given

given to what the Greeks call *ἀνθολογία*, *anthology*, viz. a collection of choice pieces, containing the finest and brightest things in their kind. See *ANTHOLOGY*.

FLORILEGE, is also particularly used for a kind of breviary, in the eastern church, compiled by Arcadius, for the convenience of the Greek priests and monks, who cannot carry with them, in their travels and pilgrimages, all the volumes wherein their office is dispersed.

The *Florilegium* contains the general rubrics, psalter, canticles, the horologium, and the office of the feria, &c.

FLORIN, is sometimes used for a coin, or real money; and sometimes for an imaginary money, or money of account.

FLORIN, as a *Coin*, is of divers values, according to the divers metals, and divers countries where it is struck. Pieces under this denomination were antiently very frequent in commerce, at present they are less common, though there were abundance of them struck in Holland, of English silver, during the war which was terminated by the treaty of Ryfwick. In all appearance they took their name from the place where they were first struck, viz. the city of Florence. Their era is about the year 1251. Though others ascribe the name to a flower-de-lis, which was struck on one side.

The gold *Florins* are most of them of a very coarse alloy; some of them not exceeding thirteen or fourteen carats, and none seventeen and a half. They weigh about two penny weights, and thirteen grains.

Villani observes, that there were gold *Florins* in the year 1067; from which time the names *Frank* or *Florin* became applied to the gold coins, which till that time had been called *Soldi*, shillings. See *FRANK*, &c.

As to silver *Florins*, those of Holland are worth about 40 French sols, or 1 s. 10½ d. sterling. Those of Genoa, &c. were worth about 8½ d. sterling.

Pieces of three *Florins* are called *Ducatoons*.

FLORIN, as a *money of account*, is used by the Italian, Dutch, and German merchants and bankers, in keeping their books, and making up their accounts. But this *Florin* is very diverse, and admits of different divisions. In Holland it is on the foot of the Dutch coin of that name, containing twenty-four Deniers Grofch, and is divided into Pacards and Penins.

At Francfort, Nuremberg, &c. it is equivalent to three shillings sterling, and is divided into Creutzers and Pfennings. At Liege it is equivalent to 2 s. 3 d. At Strafbourg to 1 s. 8 d. In Savoy to 11 d. At Genoa to 8½ d. And at Geneva to 6½ d.

FLORIN, or **FLORENCE**, was also a gold coin, struck in England in the 18th year of Edw. III. of the value of six shillings.

Camden says, it was so called, because made by Florentines. Fabian observes, the *Florins* were not of so fine gold as the nobles and half-nobles of that prince.

But what is most observable is, that Fabian calls the *Florin* a penny, value 6 s. 8 d. the half *Florin*, an half-penny, value 3 s. 4 d. the quarter *Florin*, a farthing, value 1 s. 8 d.

These words we often meet with in old histories and accounts, applied to several coins, as royals, angels, &c. where we are therefore only to understand by *penny* or *denarius* the whole, by *obolus* the half, and by *quadrans* the fourth part, or farthing.

By indenture of the mint, in 18 Edw. III. every pound weight of old standard gold, was to be coined into fifty *Florines*, or *Florins*, to be currant at six shillings a-piece; all which made in tale fifteen pounds; or into a proportionable number of half or quarter *Florins*.

FLORINIANI, or **FLORIANI**, a sect of heretics, of the second century, denominated from its author Florinus, or Florianus, a priest of the Roman church, deposed along with Blasius, for his errors.

Florinus had been a disciple of St. Polycarp, along with Irenæus. He made God the author of evil, or rather asserted that the things forbidden by God are not evil, but of his own appointing.—In which he followed the errors of Valentinus, and joined himself with the Carpocratians.

Irenæus relates, that they called their own sect *spirituales*, as having a perfect knowledge of God: and other Christians in respect of them were only *Psychici*, i. e. animales, as having only a gross apprehension and faith, and not a perfect knowledge of divine things.

According to Philastrius, the *Florinians* likewise denied a future judgment and resurrection; and held that Jesus Christ was not born of a virgin; and taught that the resurrection was in effect a new generation. They are also charged with holding criminal assemblies in the night-time, and giving into Judaism and Paganism. Some even deduce the origin of the Adamites from them.

They had also other names given them: Philastrius says, they were the same with the *Carpophorians*. He adds, that they were also called *soldiers*, *milites*, *quia de militibus fuerunt*. St. Irenæus calls them *Gnostics*; St. Epiphanius, *Phibionites*; and Theodoret, *Borborites*, on account of the impurities of their life: others call them *Zaccheans*; others *Cod-*

dians, &c. though for what particular reasons, it is not easy to say, nor perhaps would it be worth while to enquire.

FLORIST, a person curious, or skilled in flowers; their kinds, names, characters, culture, &c.

FLORY, **FLOWRY**, **FLEURY**, **FLORETTEE**, **FLEUR-DE-LISSE**, &c. terms in heraldry, used when the out lines of any ordinary are drawn as if trimmed with; or in the form of flowers, as lillies, flower-de-luces, &c.

Thus, he bears a cross *Flory*, &c. See *Tab. Herald.* fig. 26.

FLOTA, or **FLOTTA**, *Fleet*; a name the Spaniards give particularly to the ships which they send annually from Cadix, to the port of Vera-cruz, to fetch thence the merchandizes gathered in Mexico for Spain.

Those sent to fetch the commodities prepared in Peru, are called *Galleons*.

The name **FLOTILLA** is given to a number of ships, which get before the rest in their return, and give information of the departure and cargo of the *Fleta* and galleons.

FLOTAGES, all such things as are floating on the top of the sea, or great rivers; a word chiefly used in the commissions of water-bailiffs.

FLOTSON, **FLOTZAM**, or **FLOATSAM**, a term signifying any goods lost by shipwreck, and swimming on the top of the water; which, with *jetson* and *Lagon*, and *Shares*, are given the lord high admiral, by his letters patent.

Jetson is what is cast out of the ship, being in danger of a wreck, and beaten to the shore by the water; or cast on shore by the seamen. *Lagon*, or *Lagan*, is that which lies in the bottom of the sea. *Shares* are goods due to several persons by proportion.

FLOUNDER, see *FISHING*.

FLOWER, **FLOS**, that part of a plant, which contains the organs of generation; or the parts necessary for the propagation of the kind.

The *Flower* is a natural production, which precedes the fruit, and yields the grain or seed.

The structure of *Flowers* is somewhat various; though the generality, according to Grew, have these three parts in common, viz. the empalement, the foliation, and the attire.

Mr. Ray reckons, that every perfect *Flower* has the petala, stamina, apices, and stylos, or pistil: And such as want any of these parts, he deems imperfect *Flowers*.

In most plants there is a perianthium, calyx, or *Flower* cup, of a stronger consistence than the *Flower* itself, and designed to strengthen and preserve it.

In some *Flowers* the two sexes are confounded, i. e. the male and female parts are found in the same *Flower*: in others, they are separated; and of these again, the female are followed by fruits, and the male *Flowers* not: Whence, *Flowers* become distinguished into male, female, and hermaphrodite.

The generality of *Flowers* are of the hermaphrodite kind: Such, e. gr. are the lilly, tulip, daffodil, rosemary, sage, thyme, geranium, althæa, &c.

The structure of parts is much the same in those where the sexes are divided: The difference between them consists in this, that the stamina and apices, i. e. the male parts, in these, are separated from the pistils; being sometimes on the same stalk, and sometimes on different ones.

Those wherein the stamina are, in regard they bear no fruit, are called male, or barren *Flowers*, and by the botanist, *stamineous Flowers*: Those which contain the pistil, being succeeded by fruit, are called female, or fruitful *Flowers*.

Among the plants which bear both male and female parts on the same plant, but at a distance from each other, are reckoned, the cucumber, melon, gourd, turkey-wheat, turnip, walnut, oak, beech, fir, alder, cyprès, cedar, juniper, mulberry, plantain, &c.

Those, in which the male and female parts of the *Flowers* are bore on different plants, the willow, poplar, hemp, mercury, spinage, nettles, and hops.

As Mr. Ray divides *Flowers* into perfect and imperfect;

The perfect *Flowers* he accounts all such as have the petala, though they should want the stamina; but this is a very erroneous opinion. These he subdivides into simple, which are those not composed of other smaller ones, and which usually have but one single style; and compounded, which consist of many flocculi, all making but one *Flower*.

Simple *Flowers*, are either *monopetalous*, which have the body of the *Flower* all of one entire leaf, though sometimes cut, or divided a little way, into many seeming petala, or leaves; as the borrag, bugloss, &c.—or,

Polypetalous Flowers, those which have distinct petala, and those falling off singly, and not altogether, as the seeming petala of the monopetalous *Flowers* always do.

Both these are farther divided into uniform and difform *Flowers*.

The former have their right and left hand parts, and the forward and backward parts all alike; but the difform have no such regularity; such are in the *Flowers* of sage, dead-nettle, &c.

FLO

Monopetalous difform FLOWERS, are likewise farther divided into *Semi-fistular* FLOWERS, those whose upper part resembles a pipe, cut off obliquely; as in the arifolochia.

Labiata FLOWERS, those either with one lip only, as in the acanthium and scordium; or with two lips, as in the far greater part of the labiate *Flowers*.

In these the upper lip is sometimes turned upwards, and so turns the convex part downwards, as in the chamæcillus, &c. but most usually the upper lip is convex above, and turns the hollow part down to its fellow below, and so represents a kind of helmet, or monk's hood; whence these are frequently called *galeate*, *cucullate*, and *galericulate* *Flowers*.

Such are the *Flowers* of the lamium, and most of the verticillate plants.

Sometimes also the labium is entire, and sometimes jagged or divided.

Corniculate FLOWERS, these are such hollow *Flowers* as have on their hinder part a kind of spur or little horn; as in the linaria, delphinium, &c. and the corniculum, or calcar, is always impervious at the tip or point.

Compound FLOWERS, are, either *discous*, *planifolius*, or *fistular*.

Discous, or *discoïdal* FLOWERS, are those whose flosculi are set together so close, thick, and even, as to make the surface of the *Flower* plain and flat; which therefore, because of its round form, will be like a discus.

This disk is sometimes radiated, when there are a row of petala standing round in the disk, like the points of a star; as in the matricaria, chamæmelum, &c.

And sometimes naked, having no such radiating leaves round the limb of its disk; as in the tanacetum.

Planifolius FLOWERS, are those which are composed of plain *Flowers*, set together in circular rows, round the center, and whose face is usually indented, notched, uneven, and jagged; as the hierachia, sonchis, &c.

Fistular FLOWERS, are those which are compounded of many long, hollow, little *Flowers*, like pipes, all divided into large jags at the ends.

Imperfect FLOWERS are such as want the petala, and are called likewise *staminous*, *apetalous*, and *capillaceous* *Flowers*.

Those which hang pendulous by fine threads, like the july, are by Tournefort called *amentaceous*; we call them *cat-tails*. These are Mr. Ray's principal distinctions of *Flowers*; but other Botanists furnish other divisions and denominations of them.

Campaniform, or *bell-like* FLOWERS, are those in shape of a bell.

Cruciform FLOWERS, or those consisting of four petala, or leaves: The calyx also containing four leaves; and the pistil always producing a fruit. Such are those of the clove-tree, cabbage-tree, &c.

Infundibuliform FLOWERS, are such as resemble the figure of a funnel, *i. e.* are broad, and ample at top, and contracted into a neck at bottom: Such is that of the bear's ear, or auricula.

Cucurbitaceous FLOWERS, are such as resemble the *Flower* of the gourd; or have the same conformation therewith.

Stamineous FLOWERS, are such as have no petala, but consist wholly of stamina or threads, with apices a-top.

The leaves placed around these stamina, are not to be esteemed as petala, but a calyx; in regard they do not fall off, but afterwards become a capsula, or cover, including the seed; which is the office of the calyx alone.

In effect, it is essential to the leaves of *Flowers*, not to serve as a cover to the seeds that succeed them: And this is the only characteristic that distinguishes the leaves, or petala of *Flowers* from their calyx; for, that no particular colour of the leaves, does determine whether the parts in dispute be leaves of the *Flower*, or the calyx of the *Flowers*, appears hence, that there are some leaves of *Flowers*, which are green like the calyx; and some calyces coloured like petala.

Leguminous FLOWERS, are those of leguminous plants. These bear some resemblance to a flying butterfly; for which reason they are also called *papilionaceous* *Flowers*.

Papilionaceous FLOWERS, consist of four or five leaves, whereof the uppermost is called *vexillum*, or standard; and the lowest *carinae*, as resembling the bottom or keel of a boat: Those between the two are called *lateral* leaves, or *aleæ*.

From the bottom of the calyx arises a pistil, which is encompassed with a sheath, or cover, fringed with stamina. This pistil always becomes the fruit, and is usually called the *pod*, in latin, *siliqua*.

Umbelliform FLOWERS, are those with several leaves disposed in manner of a rose; and whose calyx essentially becomes a fruit of two seeds, joined, before they come to maturity; but afterwards easily separated again.

They have this denomination, by reason they are generally sustained by a number of pedicles, which proceeding from the same centre, are branched all around, like the sticks of an umbrella.

Of this kind are the *Flowers* of fennel, angelica, &c.

Viricillate FLOWERS, are those ranged, as it were, in stories, rings, or rays along the stems: Such are those of horehound, clary, &c. See *Supplement*, articles *CAMPANIFORMIS*, &c.

FLOWERS, in gardening, are distinguished into *early*, or *spring*

FLU

Flowers, which flourish in the months of March, April, and May. Of this class are the anemones, daffodils, hyacinths, tulips, juncquils, cowslips, primroses, &c.

Summer FLOWERS, which open in June, July, and August, as pinks, gilly-flowers, lillies, daisies, campanulas, poppies, sun-flowers, &c.

Autumnal, or *late* FLOWERS, denote those of September and October; as the oculus Christi, indian pinks, and roses, pansy, flower-gentle, &c.

Of these *Flowers*, those which subsist all the year, we mean in the stem, or root at least, are called *perennials*.

And those which are to be planted, or sowed a-fresh every year, according to the season, are called *annuals*.

FLOWER, in architecture, according to Vitruvius, is a representation of some imaginary *Flower*, by way of crowning, or finishing, on the top of a dome, &c.

In lieu of this the moderns commonly use a vase, ball, or the like.

FLOWER-DE-LUCE, FLEUR DE LIS, in heraldry, is a bearing antiently of great dignity; being reputed the noblest of all *Flowers*, and as such having been in all ages the charge of the royal escutcheon of the kings of France; though tract of time has made the bearing thereof more vulgar.

In some coats it is bore single; in others triple; in others it is semée, seeded all over the escutcheon.

FLOWER of the capital, is an ornament of sculpture, in form of a rose, in the middle of the sweep of the Corinthian abacus. *Tab. Archit. fig. 26. lit. 4.*

In that of the Composite, it is not a rose, nor any real, but an imaginary kind of *Flower*.

FLOWERS, in chemistry, are the finest, and most subtle parts of dry bodies, raised by fire, into the vessel's head, and aludels; and adhering to them, in form of a fine powder, or dust. Such are the *Flowers* of sulphur, benjamin, &c.

FLOWERS of Sulphur, or Brimstone, are the vapours of melted brimstone conveyed from an iron pot (in which it is kept boiling) through a proper flew, into a close room or oven, where this vapour condenses into *Flowers*.

FLOWER of wheat, Rye, and other pulse. See FARINA.

FLOWERS*, in the animal oeconomy, denote womens monthly purgations, or menses.

* Nicod derives the word in this sense from *fluere*, q. d. *Fluori*: Others will have the name occasioned hence, that women do not conceive, till they have had their *Flowers*; so that these are a sort of forerunners of their fruit.

FLOWERS, in rhetoric, are figures, or ornaments of discourse, by the Latins called *flosculi*. See FIGURE.

FLOWERAGE, a collection of flowers of several kinds set together in hucks, and hung up with strings.

FLOWERED, in the manufactures.—A stuff, or cloth, is said to be *flowered*, *flourished*, *sprigged*, or *figured*, when there are representations of *Flowers*, either natural, or imaginary, wrought thereon.

There are stuffs *flowered* of almost all kinds of matter: *flowers* of gold, silver, silk, wool, thread, cotton, &c. Stuffs and cloths are usually denominated from the ground, whereon the *flowers* are raised.

Thus, there are *flowered* velvets, taffaties, damasks, fattins, mohairs, dimities, &c.

Those *flowered* with gold and silver, are more usually called *brocades*. See BROCADE.

The flowers are usually wrought at the same time with the cloth, or ground. The threads of the warp are raised, and lowered by means of packthreads passed through them in mounting the loom; and the manufacturer shooting his warp, or matter of the flowers, whether gold, silver, silk, or the like, between the threads thus raised, forms the flowers.

It is very curious to see them mount a loom; or, as they call it, *read a design*, to be represented on a stuff: But it is next to impossible to describe it; yet we have endeavoured to give some idea thereof under the article DESIGN.

FLUIDITY, in physics, that state or affection of bodies, which denominates or renders them *fluid*.

Fluidity stands in direct opposition to *firmness*, or *solidity*.

Fluidity is distinguished from *liquidity* or *humidity* in that the idea of the first is absolute, and the property contained in the thing itself; whereas that of the latter is relative, and implies wetting, or adhering; *i. e.* somewhat that gives us the sensation of wetness, or moisture, and which would have no existence, but for our senses.

Thus, melted metals, air, æther, and even smoke, and flame itself, are *fluid* bodies, but not liquid ones; their parts being actually dry, and not leaving any sense of moisture.

The nature, and causes of *Fluidity* have been variously assigned. The Gassendists, and antient Corpuscularians, require only three conditions as necessary thereto, *viz.* a smallness and smoothness of the particles of the body; vacuities interspersed between them; and a spherical figure. Thus the Epicurean poet, Lucretius:

*Ille autem debent ex levibus atque rotundis
Esse magis, fluido quæ corpore liquida constat.*

The

The Cartesians, and after them Dr. Hook, Mr. Boyle, &c. beside the circumstances above-mentioned, require a various, perpetual, intestine motion of the particles of the bodies, as that which principally contributes to *Fluidity*.

Fluidity then, according to these philosophers, consists in this, that the parts of the body being very fine, and small, are so disposed by motion, or figure, as that they can easily slide over one another's surfaces all manner of ways; and that they be in a constant, various, separate agitation to and fro; and that they only touch one another in some few parts of their surfaces. Mr. Boyle, in his *history of Fluidity*, mentions these three as the conditions principally required to *Fluidity*, viz.

1° The minuteness of parts: thus, in effect, we find that fire by dividing metals into fine, small parts, renders them fluid; and that acid menstrua dissolve and render them fluid after the like manner; and that fire turns the hard body of common salt almost wholly into a liquor, by distillation: Not but that the figure of the particles may have a considerable share in *Fluidity*.

Thus mercury, whose parts are doubtless much grosser than those of oil and water, is yet more fluid than either of them: And thus oil by the action of fire, may be converted into a consistent substance, like butter.

2° Store of vacuities interposed between the corpuscles, to give room for the several particles to move among themselves.

3° A motion and agitation of the corpuscles; either from some principle of mobility within themselves, or from some extraneous agent, penetrating and entering the pores, moving variously among them, and communicating to them a part of its motion.

That this last is the qualification chiefly required in *Fluidity* he argues from divers observations and experiments.

Thus, a little dry powder of alabaster, or plaster of Paris finely sifted, being put in a vessel over the fire; it soon begins to boil like water; exhibiting all the motions and phenomena of a boiling liquor. It will tumble variously in great waves like that; will bear stirring with a stick or ladle like that; without resisting; nay, if strongly stirred near the side of the vessel, its waves will apparently dash against them: Yet is it all the while a dry, parched powder.

The like is observed in sand: A dish of which being set on a drumhead, briskly beaten by the sticks, or on the upper stone of a mill, it in all respects emulates the properties of a fluid body.

A heavy body, *e. gr.* will immediately sink in it to the bottom, and a light one emerge to the top. Each grain of sand has a constant vibratory and dancing motion: and if a hole be made in the side of the dish, the sand will spin out like water.

That the parts of fluids are in continual motion, the Cartesians bring divers considerations to prove. As 1° The transmutation of solids into fluids, *e. gr.* ice into water, and vice versa; the chief difference between the body in those two states consisting in this, that the parts being fixed and at rest in the one, resist the touch; whereas in the other, being already in motion, they give way upon the slightest impulse.

2° The effects of fluids, which commonly proceed from motion: Such are the insinuation of fluids among the pores of bodies; the softening and dissolving of hard bodies; the actions of corrosive menstrua, &c. Add, that no solid can be brought to a state of *Fluidity*, without the intervention of some moving, or moveable body, as fire, air, or water. Air, the same gentlemen hold the first spring of these causes of *Fluidity*; it being this that gives motion to fire and water, though itself receives its motion and action from the æther, or subtle medium.

Boerhaave pleads strenuously for fire's being the first mover, and the cause of all *Fluidity* in other bodies, as air, water, &c. Without this, he shews that the atmosphere itself would fix into one solid mass.

Sir I. Newton sets aside this theory of the cause of *Fluidity*, and substitutes a new one, the great principle of attraction.

—The corpuscular system, with all the improvements of Des Cartes, and Mr. Boyle, did not sufficiently account for the primary condition, requisite to constitute a body fluid, viz. the various intestine motion and agitation of its particles. But this motion is naturally enough accounted for, by supposing it a primary law of nature, that, as all the particles of matter attract each other when within a certain distance; so at all greater distances, they fly from, and avoid one another. For then, though their common gravity, together with the pressure of other bodies upon them, may keep them together in a mass; yet their continual endeavour to avoid one another singly, and the adventitious impulses of heat, light, or other external causes, may make the particles of fluids continually move round about one another, and so produce this quality.

There is a difficulty indeed, in accounting, why the particles of fluids always keep at such a distance from one another, a not to come within the sphere of one another's attraction. The fabric and constitution of that fluid body, water, is amazing; that a body so very rare, and which has a vast over-proportion of pores, or interspersed vacuity, to solid matter, should yet be perfectly incompressible by the greatest

force: And yet this fluid is easily reducible into that firm, transparent, friable body, which we call ice; by being only exposed to a certain degree of cold.

One would think, that though the particles of water cannot come near enough to attract each other; yet the intervening frigorific matter doth, by being mingled per minima, strongly attract them; and is itself likewise strongly attracted by them, and so wedges or fixes all the mass into a firm, solid body; which solid body loses its solidity again, when by heat the vinculum is solved, and the frigorific particles are disjoined from those of the water, and are forced to fly out of it: And just thus may the fumes of lead perhaps fix quicksilver.

When a firm solid body, such as a metal, is by heat reduced into a fluid, the particles of fire disjoin and separate its constituent parts, which their mutual attraction caused before to cohere; and keep them at such a distance from one another, as that they are out of the sphere of each other's attraction, as long as that violent motion lasts; and when by their lightness and activity they are flown off, unless they be renewed by a continual supply, the component particles of the metal finally come near enough again to feel one another's attractions.

As, therefore, the cause of cohesion of the parts of solid bodies appears to be their mutual attraction; so the chief cause of *Fluidity* seems to be a contrary motion, impressed on the particles of fluids; by which they avoid, and fly one another, as soon as they come at, and as long as they keep at such a distance from each other.

It is observed also in all fluids, that the direction of their pressure against the vessels which contain them, is in lines perpendicular to the sides of such vessels; which property being the necessary result of the particles of any fluid's being spherical, it shews that the parts of all fluids are so, or of a figure very nearly approaching thereto.

FLUIDS, are bodies, whose particles are but weakly connected; their mutual cohesion being in great measure prevented by some external cause.

In this sense a *Fluid* stands opposed to a *solid*.

—Sir I. Newton defines a *fluid* body, to be that whose parts yield to the smallest force impressed, and by yielding are easily moved among each other.

The cause, therefore, of *Fluidity*, should seem to consist in this, that the parts do not cohere so strongly, as they do in solid or firm bodies; and that their motion is not hindered by any inequality in the surface of the parts; as is the case in powders.

For, that the particles whereof *Fluids* consist, are of the same nature, and have the same properties with the particles of solids, is evident, from the conversion of liquids and solids into each other, *e. gr.* of water into ice, of metals into fluors, &c. Nor can it be reasonably doubted, that the component parts of all bodies are the same, viz. hard, solid, impenetrable, moveable corpuscles.

The Cartesians define a *Fluid* to be a body whose parts are in continual intestine motion; and Dr. Hook, Mr. Boyle, and Boerhaave, though far from Cartesianism, subscribe to the definition: alledging arguments to prove that the parts of *Fluids* are in continual motion; and even that it is this motion, which constitutes *Fluidity*.

The later Newtonians dare not go so far: To say that the parts of a *Fluid* are in continual motion, is more than either our senses, experience, or reason will warrant; and to define a thing from a property that is disputable, is certainly bad philosophy.

Add, that the great argument from geometry, produced in favour of this continual motion, viz. That the resistance of a body moving in a *Fluid*, is less, if the parts of the *Fluid* be agitated by an intestine motion, than if they were at rest, is demonstrated to be false.

We observe therefore, with Dr. Clarke, That if the parts of a body either do not touch each other, or easily slide over one another; and are of such a magnitude, as that they may be easily agitated by heat, and the heat be sufficiently great to agitate them, though it may perhaps be less than suffices to prevent water from freezing; or, even, though the parts be not actually moved; yet, if they be small, smooth, slippery, and of such a figure and magnitude as disposes them to move and give way; that body is *fluid*.

And yet the particles of such *fluid* bodies do, in some measure, cohere; as is evident hence, that mercury, when well purged of air, will be sustained in the barometer, to the height of 60 or 70 inches; that water will ascend in capillary tubes even in vacuo; and that the drops of liquors in vacuo run into a spherical form: as adhering by some mutual cohesion like that between polished marble planes. Add, that these *fluid* bodies, if they consist of particles that are easily entangled within each other, as oil; or if they be capable of being stiffened by cold, and joined by the interposition of little cones, or wedges, as water; they are easily rendered hard: But if their particles be such as can neither be entangled, as air; nor stiffened by cold, as quicksilver; then they never grow hard and fixed.

FLU

FLUIDS are called either *natural*, as water, and mercury; or *animal*, as blood, milk, bile, lymph, urine, &c. or *artificial*, as wines, spirits, oils, &c. See each under its proper article.

The doctrine and laws of *Fluids* are of the greatest extent in philosophy.—The pressure, and gravitation of bodies in *Fluids*, and the action of the *Fluids* immersed in them, make the subject of hydrostatics.

Hydrostatical Laws of FLUIDS.—I. The upper parts of all *Fluids*, as water, &c. do press upon the lower: Or, as some philosophers state it, all *Fluids* do gravitate in proprio loco.

The contrary of this was a principle in the school-philosophy; but the certainty of such pressure is now demonstrated by a thousand experiments: It will be sufficient to instance one or two.

Immerse a tube, open at both ends, and half filled with oil of turpentine, in a vessel of water, the upper end of the tube being stopped with the finger: if now the upper surface of the oil lie as low as that of the water; the oil, upon removing the finger, will not run out at the lower end of the tube; nay, and if the tube be thrust a little lower, the water will rise up in it, and bear the oil above it: But if the upper surface of the oil be considerably higher than that of the water, the oil will drop out of the tube. Whence it follows, that the column of oil in one case presses or gravitates less on the plane imagined to pass under its lower surface, than a column of water; and in the other case, more.

—Or thus; an empty vial, close shut, being immersed in water, and suspended by a horse hair to the beam of a balance, with a weight at the other end exactly counterpoising it: upon unstoppering the vial, and letting it fill with water, it will preponderate, and bear down the end of the balance, without having any communication with the external air.

Which two experiments abundantly prove the proposition, that the upper parts of *Fluids* do really press, or gravitate on the lower.

From this gravity it follows, that the surfaces of stagnant *Fluids* are plain, and parallel to the horizon; or rather, that they are segments of a sphere concentric with the earth.

For, as the particles are supposed to yield to any force impressed, they will be moved by the action of gravity, till such time as none of them can defend any lower. And this situation once attained, the *Fluid* must remain at rest, unless put in motion by some foreign cause; inasmuch as none of the particles can now move without ascending, contrary to their natural tendency.

II. If a body be immersed in a *Fluid*, either wholly, or in part; its lower surface will be pressed upward by the water underneath it.

The truth of this proposition is evident from the experiment above-mentioned; where the oil of turpentine was suspended, nay, and made to mount up in the tube, by the pressure of the water upwards on its lower parts.

The law, or quantity of this pressure is this, that a body immersed in a *Fluid*, loses just so much of the weight it would have in air; as so much of the *Fluid* as is equal to it in bulk, if weighed in the air, would amount to.

This pressure of *Fluids* on the lower parts of an immersed body, is farther confirmed, by attending to the reason why bodies specifically lighter than *Fluids* ascend therein. The effect is owing to this, that there is a greater pressure or weight on every other part of the plane or surface of the *Fluid* imagined to pass under the lower surface of the body, than there is on that whereon the emerging body pushes. Consequently, to produce an equilibrium in the *Fluids*, the parts immediately under the rising body being pressed by the rest every way, do continually force it upwards.

In effect, the emerging body is continually pressed on by two columns of water, one bearing against its upper, and the other against its lower parts: The length of both which columns being to be accounted from the top of the water, that which presses on the lower part, will be the longer, by the thickness of the ascending body, and consequently will over-balance it by the weight of as much water as will fill the space that body takes up.

Hence, 1^o if a body A be specifically lighter than B, an equal portion of the *Fluid* in which it is immersed; it will rise with a force proportionable to the excess of gravity of B above A: And if A be specifically heavier than B, it gravitates and descends with the excess only of its weight above that of B.

III. The pressure of the upper parts of a *Fluid* on the lower, exerts itself every way, and every way equally; laterally, horizontally, and obliquely, as well as perpendicularly.

FLU

For, as the parts of a *Fluid* yield to any impression, and are easily moved: it is impossible any drop should remain in its place: If while it is pressed by the super-incumbent *Fluid*, it be not equally pressed on every side.

The same is confirmed from experiments: for several tubes of divers forms, straight, curved, angular, &c. being immersed in the same *Fluid*, though the apertures, through which the *Fluid* enters, be differently posited to the surface or plane, some being perpendicular, others parallel, and others variously declined; yet will the *Fluid* rise to an equal height in them all.

Hence, 1. all the particles of *Fluids* being thus equally pressed on all sides, it is argued, that they must be at rest, and not in continual motion, as has been usually supposed.

Hence, 2. also a body being immersed in a *Fluid*, sustains a lateral pressure from the *Fluid*; which is also increased as the body is placed deeper beneath the surface of the *Fluid*.

IV. In tubes that have a communication with each other, whatever their magnitude be, whether equal, or unequal; and whatever their form, whether straight, angular, or crooked: still, *Fluids* rise in them to the same height.

V. If a *Fluid* rise to the same altitude in two tubes that communicate with each other, the *Fluid* in one tube is a balance, or equal in weight to that in the other.

If the tubes be of equal diameters, the columns of the *Fluid* having the same base and altitude, are equal, and consequently their gravities equal; so that they press and gravitate against each other with equal force.

This is demonstrated from mechanics. *E. gr.* Let the base of G I, *Tab. Hydrostatics*, fig. 6, be supposed quadruple the base of H K; and let the *Fluid* descend in the greater tube the space of an inch, as from L to O; it will then rise in the other the space of four inches, as from M to N. Wherefore the velocity wherewith the *Fluid* moves in the tube H K, is to that wherewith it moves in G I, as the base of the tube G I to the base of the other, H K. But the altitude of the *Fluid* being supposed the same in both tubes, the quantity of the *Fluid* in the tube G I, will be to that in the other tube H K, as the base of the tube G I to the base of the other H K.

Consequently, the momentum of the *Fluid* in the tube G I, is to that in the tube H K; as the product of the base of the tube G I into the base of the other H K, to the factum of the tube H K into the base of the other G I. Wherefore, the products being equal, the momenta must be equal.

The same is easily demonstrated where one of the tubes is inclined, and the other perpendicular, &c.

Hence in tubes that communicate, the *Fluid* will preponderate in that where its altitude is the greatest.

VI. In communicating tubes, *Fluids* of different specific gravities will equiponderate, if their altitudes be in the ratio of their specific gravities.

Hence we have a way of finding the specific gravities of *Fluids* viz. by pouring one *Fluid* into one of the communicating tubes, as A B (fig. 7.) and another, into the other tube C D; and measuring the altitudes E B and F D, at which they stand when balanced.

For the specific gravity of the *Fluid* in A B, is to that in D C, as D H, to B G.—If the *Fluids* employed in this experiment be apt to mix, it may be proper to fill the horizontal tube B D with mercury, to prevent the mixture.

Hence, since the densities of *Fluids* are as their specific gravities; the densities will likewise be as the altitudes of the *Fluids* D H and B G: so that we have hence likewise a method of determining the densities of *Fluids*. See DENSITY.

VII. The bottoms, and sides of vessels, are pressed in the same manner, and by the same laws as the liquids contained in them.

And hence, as action and re-action are equal; the *Fluids* themselves sustain an equal pressure from the bottoms and sides.—And as the pressure of *Fluids* is equal every way, the bottom and sides are pressed as much as the neighbouring parts of the *Fluids*; and consequently this action increases in proportion to the height of the *Fluids*, and is equal every way at the same depth; as depending altogether on the height, and not at all on the quantity of the *Fluid*.

VIII. In perpendicular vessels of equal bases, the pressure of *Fluids* on the bottoms, is in the ratio of their altitudes.

This is evident, in that the vessels being perpendicular, the bottoms are horizontal: consequently the tendency of *Fluids* by the action of gravity will be in lines perpendicular to the bottom, so that they will press with all their weight; the bottoms therefore are pressed in the ratio of the gravities. But the gravities are as the bulks; and the bulks here are as the altitudes: therefore the pressures on the bottoms are as the altitudes.

IX. In perpendicular vessels of unequal bases, the pressure on the bottoms is in a ratio compounded of the bases, and altitudes.

From the preceding demonstration it appears, that the bottoms are pressed in the ratio of the gravities: and the gravities

vities of *Fluids* are as their bulks; and their bulks in a ratio compounded of the bases and altitudes. Consequently, &c.

X. If an inclined vessel ABCD, fig. 8. have the same base and altitude with a perpendicular one, BEFG; the bottoms of each will be equally pressed.

For in the inclined vessel ABCD, the bottom CD, is pressed in the direction BD. But the force of gravity in the direction BD, is to the absolute gravity, as BE to BD.

Consequently, the bottom CD is pressed in the same manner, as if it had been pressed perpendicularly by the *Fluid* under the altitude BE. Therefore, the bottoms of the perpendicular and inclined vessels are equally pressed.

XI. *Fluids* press upon subject bodies, according to their perpendicular altitude, and not according to their latitude, or breadth.

Or, as others state it, thus: If a vessel be taper, or unequally big at top and bottom; yet the bottom will be pressed after the same manner as if the vessel were cylindrical, and the top and bottom equal.

Or thus: The pressure sustained by the bottom of a vessel, whatever the figure of the vessel be, is ever equal to the weight of a column of the *Fluid*, whose base is the bottom itself, and height, the vertical distance of the upper surface of the water from the bottom.

Or, yet more explicitly, thus: If there be two tubes or vessels, having the same heights, and bases, both filled with water; but one of them made to tapering upwards, that it shall contain but twenty ounces of water; whereas the other widening upwards, holds two hundred ounces: yet the bottoms of the two tubes shall sustain an equal pressure of water, viz. each of them that of the weight of two hundred ounces.

This is a noble paradox in hydrostatics, first discovered by M. Pascal, and which it is well worth the clearing and infilling on. It is found unexceptionably true from abundant experiments; and it may even be demonstrated and accounted for on principles of mechanics.

Suppose, e. g. the bottom of a vessel, CD (fig. 9.) less than its top, AB; since the *Fluid* presses the bottom CD, which we suppose horizontal, in a perpendicular direction, E.C, none but that part within the cylinder E.C.D.F. can press upon it; the natural tendency and pressure of the rest being taken off by the sides.

Again, supposing the bottom CD (fig. 10.) much bigger than the top FG; or even, for the easier demonstration, suppose a tube FE fixed in a cylinder ABCD; and suppose the bottom CD raised to L, that the *Fluid* may be moved through the interval DL; then will it have risen through the altitude GH, which is to DL, as the base CD to that GF. The velocity therefore of the *Fluid* FE, is to its velocity in the vessel AD, as the base CD to the base FG.

Hence, we have the momentum wherewith the *Fluid* in the tubes tends downwards, by multiplying the base of the cylinder CD into its altitude CK.

Consequently, the bottom CD is pressed with the same force; as it would be pressed by the cylinder HC.DI.

To confirm and illustrate this doctrine of the pressure of *Fluids* in the ratio of the base and altitude, provide a metallic vessel, ACDB (fig. 10.) so contrived, as that the bottom CD may be moveable, and to that end fitted in the cavity of the vessel with a rim of wet leather, to slide without letting any water pass. Then, through a hole in the top, AB, apply successively several tubes of equal altitudes, but of different diameters. Lastly, fastening a string to the beam of a balance, and fixing the other end by a little ring K to the moveable bottom; put weights in the other scale, till they be sufficient to raise the bottom CD: then will you not only find, that the same weight is required, what diameter or magnitude soever the tube be of; but even, that the weight which will raise the bottom, when pressed by the smallest tube, will raise it when pressed by the whole cylinder HC.DI.

XII. The most solid and ponderous body, though when near the surface of the water it would sink with great velocity, yet if placed at a greater depth than twenty times its own thickness, will not sink, unless assisted by the weight of the incumbent water.

Thus, immerge the lower end of a slender glass tube in a vessel of mercury: then stopping the upper end with your finger, you will by that means keep about half an inch of that ponderous *Fluid* suspended in the tube. Lastly, keeping the finger thus, immerge the tube in a long glass of water, till the little column of mercury be more than thirteen or fourteen times its length under water; then, removing the finger, you will find that the mercury will be kept suspended in the tube by the pressure of the water upwards: but if you raise the tube a very little above the former station, the mercury will immediately run out; whereas, if before you had removed the finger from the top, you had sunk the pipe so low, as that the mercury were twelve or fourteen inches, &c. below the surface of the water; the

mercury would be violently forced up, and make several ascents and descents in the tube, till it had gained its proper station, according to the laws of specific gravity.

Hence then we have a solution of the phenomenon of two polished marbles, or other planes, adhering so strongly together: in that the atmosphere presses or gravitates with its whole weight on the under surface, and sides of the lower marble; but cannot do so at all on its upper surface, which is closely contiguous to the upper, and suspended marble.

For the laws of the pressure and gravitation in *Fluids* specifically heavier, or lighter than the bodies immersed, see GRAVITY Specific.

For the laws of the resistance of *Fluids*; or the retardation of solid bodies, moving in *Fluids*, see RESISTANCE.

For the ascent of *Fluids* in capillary tubes; or between glass planes, see ASCENT.

The motions of *Fluids*, and particularly water, do also make the subject of hydraulics.

Hydraulic Laws of Fluids. — I. The velocity of a *Fluid*, as water, moved by the pressure of a super-incumbent *Fluid*, as air, is equal at equal depths, and unequal at unequal ones.

For the pressure being equal at equal depths, the velocity arising thence must be so too; and vice versa: yet does not the velocity follow the same proportion as the depth; notwithstanding that the pressure, whence the velocity arises, does increase in the proportion of the depth. But here the quantity of the matter is concerned: and the quantity of motion, which is compounded of the ratio of the velocity and quantity of matter, is increased in equal times as the squares of the velocities.

II. The velocity of a *Fluid* arising from the pressure of a super-incumbent *Fluid*, at any depth, is the same as that which a body would acquire in falling from a height equal to the depth. As is demonstrated both from mechanics and experiments. See DESCENT.

III. If two tubes of equal diameters, full of any *Fluid*, be placed any how, either erect, or inclined; provided they be of the same altitude, they will discharge equal quantities of the *Fluid* in equal times.

That tubes, every way equal, should, under the same circumstances, empty themselves equally, is evident; and that the bottom of a perpendicular tube is pressed with the same force, as that of an inclined one, when their altitudes are equal, has already been shewn. Whence it easily follows, that they must yield equal quantities of water, &c.

IV. If two tubes of equal altitudes, but of unequal apertures, be kept constantly full of water; the quantities of water they yield in the same time, will be as the diameters: and this, whether they be erect, or any way inclined.

Hence, if the apertures be circular, the quantities of water emptied in the same time, ought to be in a duplicate ratio of the diameters.

But this law, Mariotte observes, is not perfectly agreeable to experiment. If one diameter be double the other, the water flowing out of the less, is found more than a fourth of what flows out of the greater. But this may have been owing to some accidental irregularities in making the experiments.

Volfius however ascribes it principally to this, that the column of water directly over the aperture is shorter than that next the sides or parietes of the vessel: for the water, in its efflux, forms a kind of cavity over the aperture; that part immediately over it being evacuated first; and the other water not running fast enough from the sides to supply it. Now, this cavity, or diminution of altitude, being greater in the greater tube, than in the less; hence the pressure or endeavour to pass out, becomes proportionably less in the greater tube, than in the less.

V. If the apertures E and F of two tubes AB and CD (fig. 12. and 13.) be equal; the quantities of water, discharged in the same time, will be as the velocities.

VI. If two tubes have equal apertures E and F, and unequal altitudes AB and CD; the quantity of water discharged from the greater AB, will be to that discharged from CD, in the same time, in a sub-duplicate ratio of the altitudes AB and CD.

Hence, 1^o the altitudes of waters, AB, and CD, discharged through equal apertures E and F, will be in a duplicate ratio of the waters discharged in the same time.—And as the quantities of water are as the velocities; the velocities are likewise in a sub-duplicate ratio of their altitudes.

Hence, 2^o the ratio of the waters discharged by two tubes AB, and CD, together with the altitude of one of them, being given; we have a method of finding the altitude of the other, viz. by finding a fourth proportional to the three given quantities; which proportional, multiplied by itself, gives the altitude of CD, required.

Hence, also, 3^o the ratio of the altitudes of two tubes of equal apertures being given, as also the quantity of water discharged by one of them; we have a method of determining the quantity the other shall discharge in the same time. Thus, to the given altitudes, and the square of the quantity of water discharged at one aperture, find a fourth proportional.

tional. The square root of this will be the quantity of water required.

Suppose, *e. gr.* the heights of the tubes as 9 to 25; and the quantity of water discharged at one of them, three inches: that discharged by the other will be $= \sqrt{(9.25:9)} = \sqrt{25} = 5$.

VII. If the altitudes of two tubes AB and CD be unequal, and the apertures E and F be likewise unequal; the quantities of water discharged in the same time, will be in a ratio compounded of the simple ratio of the apertures; and the subduplicate one of the altitudes.

And hence, if the quantities of water discharged in the same time by two tubes, whose apertures and altitudes are unequal, be equal; the apertures are reciprocally as the roots of the altitudes, and the altitudes in a reciprocal ratio of the squares of the apertures.

VIII. If the altitudes of two tubes be equal, the water will flow out with equal velocity, however unequal the apertures be.

IX. If the altitudes of two tubes, AB and CD, as also their apertures E and F be unequal; the velocities of the waters discharged are in a subduplicate ratio of their altitudes.

And hence, 1^o , as the velocities of waters flowing out at equal apertures, when the altitudes are unequal, are also in a subduplicate ratio of the altitudes, and, as this ratio is equal, if the altitudes be equal; it appears in the general, that the velocities of waters flowing out of tubes, are in a subduplicate ratio of the altitudes.

Hence also, 2^o , the squares of the velocities are as the altitudes.

Mariotte found from repeated experiments, that if a vessel ABCD have a tube EG fitted to it, there will more water be evacuated through the tube, than there could have been in the same time, through the aperture of the vessel E, without the tube: and that the motion of the Fluid is accelerated so much the more, as the tube EG, is the longer.

E. gr. The altitude of a vessel AC, being one foot, that of the tube EG three feet, and the diameter of the aperture three lines; no less than $6\frac{1}{2}$ septiers of water were discharged in the space of one minute; whereas upon taking off the tube, only four septiers were discharged. Again, when the length of the tube EG was six feet, and the diameter of the aperture G, an inch; the whole quantity of water run out in thirty-seven seconds: but cutting off half the tube, the vessel was not evacuated in less than forty-five seconds; and taking it quite away in less than ninety-five seconds.

X. The altitudes and apertures of two cylinders full of water, being the same; one of them will discharge double the quantity of water discharged in the same time by the other; if the first be kept continually full, while the other runs itself empty. For the velocity of the full vessel will be equable; and that of the other will be continually retarded. Now it is demonstrated, that if two bodies be impelled by the same force; and the one proceeds equably, and the second is equally retarded; by that time they have lost all their motion, the one has moved double the space of the other.

XI. If two tubes have the same altitudes, and equal apertures; the times wherein they will empty themselves, will be in the ratio of their bases.

XII. Cylindric, and prismatic vessels, as ABCD (fig. 14.) empty themselves by this law, that the quantities of water discharged in equal times, decrease according to the uneven numbers, 1, 3, 5, 7, 9, &c. taken backwards.

For the velocity of the descending level FG, is continually decreasing in the subduplicate ratio of the decreasing altitudes: but the velocity of a heavy body descending, increases in the subduplicate ratio of the increasing altitudes. The motion therefore of the level FG, in its descent from G to B, is the same as if it were to descend in the inverse ratio from B to G. But if it descend from B to G, the spaces, in equal times, would increase according to the progression of the uneven numbers. Consequently, the altitudes of the level FG, in equal times, would decrease according to the same progression inversely taken.

Hence, therefore, the level of water FG, descends by the same law, as, by an equal force impressed, it would ascend through an altitude equal to FG.

From this principle might many other particular laws of the motion of Fluids be demonstrated, which for brevity sake we here omit.

To divide a cylindrical vessel into parts, which shall be evacuated in certain parts, or divisions of time, see CLEPSYDRA.

XIII. If water descending through a tube HE (fig. 15.) spout up at the aperture G, whose direction is vertical; it will rise to the same altitude GI, at which the level of the water LM, in the vessel ABCD, does stand.

For since the water is driven through the aperture G, by the force of gravity of the column EK, its velocity will be the same as that with which a body by the same force impressed, would rise to the altitude FI. Wherefore, since the direction of the

aperture is vertical, the direction of the water spouting through it, will be so too; consequently, the water must rise to the height of the level of the water LM in the vessel.

Indeed, by the experiment it appears, that the water does not rise quite so high as I: beside, that the aperture G should be smaller, as the height of the level of the water is less; and even smaller, when mercury is to be spouted, than when water. But this is no objection to the truth of the theorem; it only shews, that there are certain external impediments, which diminish the ascent.

Such are the resistance of the air, the friction of the tube, and the gravity of the descending Fluid.

XIV. Water descending through an inclined tube, or a tube bent in any manner, will spout up through a perpendicular aperture to the height at which the level of the water in the vessel stands.

XV. The lengths or distances DE and DF, or IH, and IG (fig. 16.) to which water will spout either through an inclined, or a horizontal aperture D, are in a subduplicate ratio of the altitudes in the vessel or tube AB and AD.

For, since water spouted out through the aperture D, endeavours to proceed in the horizontal line DF; and at the same time, by the power of gravity, tends downwards in lines perpendicular to the same; nor can the one power hinder the other, inasmuch as the directions are not contrary: it follows, that the water by the direction BA will arrive at the line IG, in the same time wherein it would have arrived at it, had there been no horizontal impulse at all. Now the right-lines IH and IG are the spaces which the same water would have described in the mean time by the horizontal impetus; but the spaces IH and IG, inasmuch as the motion is uniform, are as the velocities. Consequently, the velocities are in a subduplicate ratio of the altitudes AB and AD. And therefore the lengths or distances to which the water will spout in apertures either horizontal, or inclined, are in a subduplicate ratio of the altitudes. Hence, as every body, projected either horizontally or obliquely, in an unresisting medium, describes a parabola; water projected either through a vertical or inclined spout, will describe a parabola.

Hence we have a way of making a delightful kind of water arbours, or arches, viz. by placing several inclined tubes in the same right-line.

On these principles are formed various hydraulic engines for the raising, &c. of Fluids, as pumps, siphons, fountains, or jets d'eau, &c. which see described under their proper articles, PUMP, SIPHON, FOUNTAIN, SPIRAL SCREW, &c.

For the laws of the motion of FLUIDS, by their own gravity, along open channels, &c. see RIVER, and WAVE.

For the laws of pressure and motion of air, considered as a FLUID, see AIR and WIND.

FLUMMERY, a wholesome sort of vegetable jelly, made of oatmeal.

The manner of preparing it in the western parts of England, is to take half a peck of wheat bran, which must be soaked in cold water three or four days; then strain out the milky water of it, and boil it to a jelly: afterwards season it with sugar, add some rose and orange flower water, and let it stand till cold, and thickened again; and then eat it with white or rhenish wine, or with cream.

FLUOR, in physics, &c. denotes a fluid; or, more properly, the state of a body, which was before hard and solid, but is now reduced by fusion or fire into a state of fluidity.

Gold and silver will remain a long time in Fluor, kept to them by the intensest heat, without losing any thing of their weight. See GOLD, FIXITY, &c.

FLUOR is also used by the modern mineral writers for such soft, transparent, sparry kinds of mineral concretions, as are frequently found amongst ores, and stones, in mines and quarries.

These are of a stony nature, and resemble gems, but are less hard; and are called *Metallic Fluors* and *Spars*. See Supplement, article SPAR.

FLUOR *Albus*, or *Uterinus*, a kind of flux, incident to women, popularly called the *Whites*.

It consists in an irregular, disorderly discharge of some corrupt humour from the uterus, sometimes white, and pale, like whey; sometimes yellow, green, or blackish. At first it is usually mild, and harmless, but in time it grows hot, sharp, and corrosive, and exoriates all the parts it touches.

It is attended with a pain in the spina dorsa, a swelling of the feet and eyes, weariness, lumbago, a loss of appetite, change of complexion, &c.

It is frequently produced from a too heavy and lasting grief. It must be carefully distinguished from an ulcer in the uterus, and a gonorrhæa, which last it greatly resembles.

It happens to all ages; from girls of three years old; and at all times; before, after, or even along with the menses; and even to women with child.

Etmuller takes it for a gonorrhæa muliebris, analogous to a non-violent gonorrhæa in men, flowing out of the glandulæ of the prostates.

What the coryza is in the nostrils; too much weeping in the eyes; and coughing and hawking in the fauces; that, according to Etmuller, is this *Fluor* in the uterus.

According to Pitcairn, all the difference between the venereal gonorrhæa, and a *Fluor albus*, is that the humour evacuated in the latter is viscid, and in the former quite thin and ferous. The same author adds; that the *Fluor albus* can only be cured by medicines proper for the venereal disease. See Supplement, article FLUOR ALBUS.

FLUTE*, an instrument of musick, the simplest of all those of the wind-kind; played, by blowing in it with the mouth; and the tones or notes formed and changed by stopping or opening holes disposed for that purpose all along it.

* The Latins call it *flûla*, and sometimes *tibia*, pipe; from the former of which, some derive the word *Flute*: Though Borel will have it derived from *flutta*, a lamprey, thus called *a flutendo in fluvio*; in regard the *Flute* is long, like the lamprey, and has holes all along it, like that fish.

The ancient *Pistula* or *Flutes* were made of reeds; afterwards they were of wood; and at length of metal. But how they were blown, whether as our *Flutes*, or hautboys, does not appear.

It is plain, some had holes, which at first were but few; but afterwards were increased to a greater number: and some had none. Some were single pipes, and some a combination of several, particularly Pan's syringes, which consisted of seven reeds, joined together sideways.

These seven reeds had no holes, each giving but one note, in all seven distinct notes; but at what intervals, is not known: Perhaps they were the notes of the natural, or diatonic scale. The German *Flute* is different from the common one: It is not put into the mouth, by the end, as the ordinary ones are; the end is stopped up with a plug, or tampon, but the lower lip is applied to a hole a little way distant from it.

It is made equally big every where, and perforated with six holes, beside that of the mouth.

FLUTE*, or **FLUYT**, is also a kind of long vessel, with flat ribs, or floor timbers; round behind, and swelled in the middle, serving chiefly for the carrying of provisions in fleets or squadrons of ships; though it is also used in merchandise.

* The word *Flat**, taken for a sort of boat; or vessel, is derived, according to Borel, from the ancient *flotte*, a little boat. In the verbal process of the miracles of St. Catherine of Sweden, in the XIIIth century, we read, *Unus equum suum una cum mercibus magni ponderis intravit super instrumentum de lignis fabricatum, vulgariè dictum Fluta*. Upon which the Bollandists observe, that in some copies it is read *flotta*, an instrument called by the Latins *ratia*; and that the word *flutta* or *flotta*, arose from *flotten*, or *volanten*, to float.

FLUTE-GRAFTING, see the article ENGRAFTING.

FLUTES, or **FLUTINGS**, in architecture, are perpendicular channels, or cavities, cut along the shaft of a column or pilaster.—See *Tab. Archit.* fig. 32. lit. *dd*, fig. 28. lit. *uu*.

They are supposed to have been first introduced in imitation of the plaits of womens robes; and are therefore called by the Latins, *Strigæ*, and *rugæ*.

The French call them *Cannelures*, as being excavations; and we, *Flutes*, or *Flutings*, as bearing some resemblance to the musical instrument so called.

They are chiefly affected in the Ionic order, in which they had their first rise; though they are also used in all the richer orders, as the Corinthian and Composite; but rarely in the Doric; and scarce ever in the Tuscan.

Their number is usually 24, though in the Doric it is only 20.

Each *Flute* is hollowed in exactly a quadrant of a circle.

Between the *Flutes* are little spaces that separate them, called by Vitruvius, *striae*, and by us, *lists*; though in the Doric, the *Flutes* are frequently made to join each other, without any intermediate space at all; the list being sharpened off to a thin edge, which forms a part of each *Flute*.

In some buildings we see columns with *Flutes* that go winding round the shaft, spirally; but this is rather looked on as an abuse.

Vignola determines the depth of the *Flutes*, by taking the angle of an equilateral triangle for the centre. Vitruvius describes it from the middle of the square, whose side is the breadth of the *Flute*: Which latter method makes them deep. The *Flutes*, or *strigæ*, are frequently filled up with a prominent, or swelling ornament, sometimes plain, in form of a staff or reed; and sometimes a little carved, or enriched, in imitation of a rope, or otherwise, and therefore called *rudæntures* or *cablings*; and the columns thus enriched, are called *cabled columns*.

This is most frequent in the Corinthian order. The cablings, or fillings up, commence from about one third of the height of the column, reckoning from the base: and are continued

VOL. I.

to the capital: That is, they begin and end with the diminution of the column.

FLUTES, or *Flutings*, are also used in botany, to denote the stems and fruits of certain plants, which have furrows analogous to those of these columns.

FLUX, **FLUXUS**, in medicine, an extraordinary issue, or evacuation of some humour.

Fluxes are various, and variously denominated, according to their seats, or the humours thus voided; as a *Flux* of the belly; uterine *Flux*, hepatic *Flux*, salival *Flux*, &c.

The *Flux* of the belly is of four kinds, which have each their respective denominations, viz. the *lientery*, or *Fluxus lientericus*; the *caliac*, or *Fluxus chylofus*; the *diarrhæa*; and the *dy-sentery*, or *bloody Flux*. See each explained under its proper article, **LIENTERY**, &c.

A wound, or scarification cross the crown of the head is used in Scotland to cure *Fluxes* and dysenteries. *Phil. Transact.* N^o 312.

FLUX of the mouth, or salival *Flux*, see **SALIVATION**.

The *Hepatic FLUX* of the antients, is by several moderns held a mere name, being in reality a hæmorrhoidal *Flux*, out of the hæmorrhoidal veins.

Women are subject to three kinds of *Fluxes* extraordinary: The first, called the *menes* or *menstrual Flux*, as happening every month; sometimes *courses*, as keeping pace with the moon; and sometimes *flowers*. See **MENSES**.

The second is after delivery, called *Lochia*. See **LOCHIA**.

The third is irregular, and præternatural; and for want of a better name, called *Fluor albus*, or the *whites*. See **FLUOR ALBUS**.

FLUX, in hydrography, a regular, periodical motion of the sea, happening twice in twenty-four hours; wherein the water is raised, and driven violently against the shores.

The *Flux* or *Flow*, is one of the motions of the tide; the other, whereby the water sinks and retires, is called the *reflux*, or *ebb*. See **TIDES**.

There is always a kind of rest, or cessation of about half an hour, between the *Flux* and *reflux*; during which time the water is at its greatest height, called *high-water*.

The *Flux* is made by the motion of the water of the sea, from the equator towards the poles; which, in its progress, striking against the coasts in its way, and meeting with opposition from them, swells, and where it can find passage, as in flats, rivers, &c. rises up, and runs into the land.

This motion follows in some measure the course of the moon; as it loses, or comes later every day by about three quarters of an hour; or more precisely, by 48 minutes: and by so much is the motion of the moon slower than that of the sun. It is always highest and greatest in full moons; particularly those of the equinoxes. In some parts, as at Mount St. Michael, it rises eighty or ninety feet; though in the open sea never rises above a foot, or two; and in some places, as about the Morea, there is no *Flux* at all.

It runs up some rivers above a hundred and twenty miles. Up the river Thames it only goes eighty, viz. near to Kingston in Surry.

Above London-bridge the water flows four hours, and ebbs eight; and below the bridge, flows five hours, and ebbs seven.

FLUX-Powders are those prepared to facilitate the fusion of the harder metals; as also to melt ores, in order to discover what proportion of metal they contain.

Powder of antimony is a very good *Flux* powder. By this alone may you readily melt iron or steel in a crucible, with an ordinary charcoal fire. See Supplement, article **FLUXES**.

FLUXION, in medicine, a sudden collection of morbid matter in any part of the body.

Fluxions arise either from the weakness, flaccidity, and inactivity of the part affected, which does not disperse, protrude, or expel the humours naturally received into it: Or from the derivation of some extraordinary quantity of peccant matter from some other part.

This latter is properly called *defluxion*, and by the antients, *attribution*. See **DEFLUXION**.

A *Fluxion*, or *defluxion* on the trachea and lungs, is called a *catarrh*. See **CATARRH**.

FLUXION, in the Newtonian analysis, denotes the velocity with which a flowing quantity is increased by its generative motion.—By which it stands contradistinguished from *fluent* or the *flowing* quantity, which is gradually, and indefinitely increasing; after the manner of a space which a body in motion describes.

Method of FLUXIONS, is the arithmetic and analysis of *Fluxions*, and fluents, or flowing quantities.

Foreigners usually define the method of *Fluxions* the arithmetic, or analysis, of infinitely, or rather indefinitely, small variable quantities; or the method of finding an infinitesimal, or infinitely small quantity, which being taken an infinite number of times, becomes equal to a given quantity.

Sir I. Newton, and after him the English authors, call these infinitely small quantities, *moments*; as considering them as the momentary increments or decrements of variable quantities, *e. gr.* of a line considered as generated by the flux of a point; or of a surface generated by the flux of a line. Accordingly, the variable quantities are called *fluant* or flowing quantities; and the method of finding either the *Fluxion*, or the *fluant*, the method of *Fluxions*.

M. Leibnitz, considers the same infinitely small quantities as the differences, or differentials of two quantities; and calls the method of finding those differences, the *differential calculus*.

Each of these ways of considering and denominating, has its advantages; which the retainers to this or that method strenuously assert.

Flowing quantities, *i. e.* such as in the genesis of figures by local motion, are continually increasing and diminishing, are certainly very properly denominated *fluants*: And as all figures may be conceived as so generated; the infinitely small increments, or decrements of such quantities are very naturally denominated *Fluxions*.

But the difference in the name, there is another in the notation.

Sir I. Newton expresses the *Fluxion* of a quantity, as \dot{x} , by a dot placed over it, as \dot{x} ; and M. Leibnitz expresses his differential of the same x by prefixing a d , as dx ; each of which methods of notation has likewise its advantage.

Setting aside these circumstances, the two methods are the same. The method of *Fluxions* is one of the greatest, most subtil and sublime discoveries of this, or perhaps of any age: It opens a new world to us, and extends our knowledge, as it were, to infinity. It carries us beyond the bounds that seemed to have been prescribed to the human mind; at least infinitely beyond those to which the ancient geometry was confined.

The history of this important discovery, as fresh as it is, is a little dark, and imbroiled. Two of the greatest men of this age do both of them claim the invention, Sir I. Newton, and M. Leibnitz; and nothing can be more glorious for the method itself, than the zeal wherewith the partisans of either side have asserted their title.

To give the reader a just view of this noble dispute, and of the pretensions of each party, we shall lay before him the origins of the discovery, and mark where each claim commenced, and how it was supported.

The first time the method made its appearance in publick, was in 1684; when M. Leibnitz gave the rules thereof in the *Leipfic Acts* of that year; but the demonstrations he kept to himself. The two brothers, the Bernoullis, were presently struck with it; and found out the demonstrations, though very difficult; and practised the calculus with surprising success.

This is all we hear of it, till the year 1687; when Sir I. Newton's admirable *Principia* came forth, which is almost wholly founded on the same calculus.

The common opinion at that time, was, that Sir Isaac, and M. Leibnitz had each invented it about the same time: And what confirmed it, was, that neither of them made any mention of the other; and that, though they agreed in the substance of the thing, yet they differed in their ways of conceiving; called it by different names; and used different characters.

In effect, M. Leibnitz's character was supposed by foreigners to be somewhat more commodious than that of Sir Isaac Newton; accordingly the method soon spreading itself throughout Europe, M. Leibnitz's character went with it; by which means the geometricians were insensibly accustomed to look on him as the sole, or principal inventor.

The two great authors themselves, without any seeming concern, or dispute as to the property of the invention, enjoy'd the glorious prospect of the progresses continually making under their auspices, till the year 1699; when the peace began to be disturbed.

M. Fatio, in a treatise of the line of swiftest descent, having declared that he was obliged to own Sir I. Newton, as the first inventor of the differential calculus, and the first by many years; and that he left the world to judge, whether M. Leibnitz, the second inventor, had taken any thing from him: This precise distinction between first and second inventor, with the suspicion it insinuated, raised a controversy between M. Leibnitz, supported by the editors of the *Leipfic Acts*, and the English geometricians, who declared for Sir Isaac Newton.

Sir Isaac himself never appeared on the scene; his glory was become that of the nation, and his adherents, warm in the cause of their country, needed not him to animate them.

Writings succeeded each other but slowly, on either side; probably on account of the distance of places; but the controversy grew still hotter and hotter: till at length it came to such pass that in the year 1711, M. Leibnitz complained to the Royal Society, that Dr. Keil had accused him of pub-

lishing the method of *Fluxions* invented by Sir I. Newton, under other names, and characters.

He insisted, that no body knew better than Sir Isaac himself, that he had stolen nothing from him; and required that Dr. Keil should publicly disavow the ill construction which might be put on his words.

The society, here appealed to as judge, appointed a committee to examine all the old letters, papers, &c. that had passed among the several mathematicians, relating to the point; and after a strict examen of all the evidences that could be procured, gave in their report, "That it did not appear that M. Leibnitz knew any thing of the differential calculus before a letter wrote him by Sir I. Newton, and sent to him at Paris, in the year 1672; wherein the method of *Fluxions* was sufficiently explained, to let a man of his sagacity into the whole matter; and that Sir I. Newton had even invented his method before the year 1669, and of consequence fifteen years before M. Leibnitz had given any thing on the subject in the *Leipfic Acts*." And thence they concluded that Dr. Keil had not at all injured M. Leibnitz in what he had said.

The society printed this censure of theirs, together with all the pieces and materials relating thereto, under the title of *Commercium epistolicum de analysi promota*, London, 1712. This book was carefully distributed through Europe, to vindicate the title of the English nation to the discovery; for Sir Isaac, as already hinted, never appeared in it: whether it were, that he trusted his honour with his comparitors, who were zealous enough in the cause; or whether it were, that he was even superior to the glory thereof.

M. Leibnitz, and his friends however could not shew the same indifference: He was accused of a theft; and the whole *commercium epistolicum* either expresses it in terms, or insinuates it. — Soon after the publication thereof, a loose sheet was printed, at Paris, in behalf of M. Leibnitz, then at Vienna. It is wrote with a world of zeal and spirit, and maintains boldly that the method of *Fluxions* had not preceded that of *differences*; and even insinuates, that it might have arisen from it. The detail of the proofs on each side would be too long, and could not be understood without a large comment, which must enter into the deepest geometry.

M. Leibnitz had begun to work upon a *commercium epistolicum*, in opposition to that of the Royal Society; but he died before it was completed.

It must be owned that there are strong presumptions in favour of M. Leibnitz; presumptions, we mean, that he was no plagiarist: For that Sir Isaac Newton was the first inventor, is past all dispute; his glory is secure; and the reasonable part, even among the foreigners, allow it; and the question is only, whether M. Leibnitz took it from him, or fell upon the same thing with him: For in his theory of abstract notions, which he dedicated to the royal academy, in 1671. before he had seen any thing of Sir I. Newton's, he already supposed infinitely small quantities, some greater than others; which is one of the great principles of the system.

The doctrine consists of two parts, *viz.* the direct method of *Fluxions*, called also *calculus differentialis*; and the inverse method of *Fluxions*, or *calculus integralis*.

The latter is directly opposite to the former; and is a sequel of it. Both of them are adopted into the new geometry, and make reigning methods therein.

The first descends from finite, to infinite; the latter ascends from infinitely small, to finite; the one de-compounds a magnitude, the other re-establishes it.

The foundation of the direct method of *Fluxions* amounts to this problem: The length of the space described being continually, (that is, at all times) given, to find the velocity at any time proposed.

The foundation of the inverse method of *Fluxions* amounts to this problem: The velocity of the motion being continually given, to find the space described by it at any time proposed.

Direct method of FLUXIONS.—All finite magnitudes are here conceived to be resolved into infinitely small ones; which are the elements, moments, or differences thereof.

The art of finding these infinitely small quantities, and of working on them, and discovering other infinite quantities by their means, makes the direct method of *Fluxions*.

What renders the knowledge of infinitely small quantities of such infinite use and extent, is that they have relations to each other, which the finite magnitudes, whereof they are the infinitesimals, have not.

Thus, *e. gr.* in a curve of any kind whatever, the infinitely small differences of the ordinate and abscissa, have the ratio to each other, not of the ordinate, and abscissa, but of the ordinate and subtangent; and of consequence, the abscissa and ordinate alone being known, give the subtangent unknown; or, which amounts to the same, the tangent itself. See the inverse method of *FLUXIONS*.

The method of notation in *Fluxions*, introduced by the inventor Sir I. Newton, is thus:

The variable, or flowing quantity, to be uniformly augmented, as suppose the abscissa of a curve, he denotes by

by the letters $v x y z$; and their *Fluxions* by the same letters with dots placed over them, thus $\dot{v} \dot{x} \dot{y} \dot{z}$. Again, as the *Fluxions* themselves are also variable quantities, and are continually increasing or decreasing; he considers the velocities with which they increase, or decrease, as the *Fluxions* of the former *Fluxions*, or second *Fluxions*; which are denoted with two dots over them, thus, $\ddot{v} \ddot{x} \ddot{y} \ddot{z}$.

After the same manner one may consider the augmentations, and diminutions of these, as their *Fluxions* also, and thus proceed to the third, fourth, fifth, &c. *Fluxions*, which will be noted thus, $\dot{v} \dot{x} \dot{y} \dot{z} : \ddot{v} \ddot{x} \ddot{y} \ddot{z} : \ddot{\ddot{v}} \ddot{\ddot{x}} \ddot{\ddot{y}} \ddot{\ddot{z}}$ &c.

Lastly, if the flowing quantity be a surd, as $\sqrt{a-bx}$; he notes its *Fluxion* $\dot{\sqrt{a-bx}} : a-bx$: If a fraction $\frac{x}{d-y}$ he notes it, $\dot{\frac{x}{d-y}} : \frac{x}{d-y}$. V. Wallis's *Algebra*, p. 392.

The chief scope and business of *Fluxions* is, from the flowing quantity given, to find the *Fluxion*: for this we shall lay down one general rule, as stated by Dr. Wallis: and afterwards apply and exemplify it in the several cases.

"Multiply each term of the equation separately by the several indices of the powers of all the flowing quantities contained in that term; and in each multiplication, change one root or letter of the power into its proper *Fluxion*: The aggregate of all the products connected together by their proper signs, will be the *Fluxion* of the equation desired."

The application of this rule will be contain'd in the following cases. In the general; To express the *Fluxions* of simple variable quantities as already mentioned, you need only put the letter, or letters, which express them, with a dot over them: thus, the *Fluxion* of x is \dot{x} , and the *Fluxion* of y is \dot{y} , and the *Fluxion* of $x+y+v+z$, is $\dot{x}+\dot{y}+\dot{v}+\dot{z}$, &c.

Note, For the *Fluxion* of permanent quantities, when any such are in the equation, you must imagine 0, or a cypher; for such quantities can have no *Fluxion*, properly speaking, because they are without motion, or invariable.

To find the *Fluxions* of the products of two or more variable or flowing quantities,—multiply the *Fluxion* of each simple quantity by the factors of the products, or the product of all the rest; and connect the last products by their proper signs; then the sum, or aggregate, is the *Fluxion* sought.

Thus, the *Fluxion* of xy , is $x\dot{y}+\dot{x}y$; and the *Fluxion* of xyz , is $xy\dot{z}+x\dot{y}z+\dot{x}yz$; and the *Fluxion* of $xvyz$, is $xvy\dot{z}+xv\dot{y}z+xv\dot{z}y+\dot{x}vyz$; and the *Fluxion* of $a+bx$ by $b-y$ (the common product being $ab+bx-by-xy$), will be $b\dot{x}-y\dot{a}-x\dot{y}-y\dot{x}$.

To find the *Fluxion* of a fraction,—multiply the *Fluxion* of the numerator by the denominator, and after it place (with the sign —) the *Fluxion* of the denominator; this will be the numerator, and the square of the denominator will be the denominator of the fraction expressing the *Fluxion* of the given fraction.

Thus the *Fluxion* of $\frac{x}{y}$ is $\frac{y\dot{x}-x\dot{y}}{y^2}$.

For suppose $\frac{x}{y}=z$, then will $x=yz$; which equal quantities must have equal *Fluxions*; therefore $\dot{x}=\dot{y}z+y\dot{z}$, and $\dot{x}-zy=y\dot{z}$; and dividing all by y , $\frac{\dot{x}-zy}{y}=z$ (because $\frac{\dot{x}}{y}=z$) $\frac{y\dot{x}-x\dot{y}}{y^2}$: Wherefore this last is the *Fluxion* of the fraction $\frac{x}{y}=z$; because z being $\frac{x}{y}$, \dot{z} will be equal to the *Fluxion* of $\frac{x}{y}$.

And the *Fluxion* of $\frac{a}{x}$ will be $-\frac{\dot{a}}{x^2}$; for the permanent quantity a having no *Fluxion*, there can be no product of the *Fluxion* of the numerator into the denominator, as there would have been, had a been x , z , or any other variable quantity.

To find the *Fluxion* of a power,—Multiply the power (first brought one degree lower) by the index of that first power; and the product by the *Fluxion* of the root.

Thus, the *Fluxion* of xx will be $2x\dot{x}$; for $xx=xx$; but the *Fluxion* of $xxz=xx\dot{z}+\dot{xx}z=2x\dot{x}$, &c. and the *Fluxion* of z^3 will be $3z^2\dot{z}$. That of x^8 will be $8x^7\dot{x}$, &c.

Or if m express the index of any power, as suppose x^m ; its

Fluxion will be $m x^{m-1} \dot{x}$, or $m x x^{m-2} \dot{x}$: For x^m brought one degree lower (m being a general index) must be x^{m-1} ; then that x by m , the index, makes $m x^{m-1}$; and this last

by the *Fluxion* of the root, produces $m x^{m-1} \dot{x}$. If the power be produced from a binomial, &c. as suppose

$xx+2xy+y^2$, its *Fluxion* will be $2x\dot{x}+2\dot{x}x+2x\dot{y}+2\dot{x}y$.

If the exponent be negative, as suppose x^{-m} or $x^{-\frac{1}{n}}$, its *Fluxion* will be $-m x^{-m-1} \dot{x}$.

Or, if you would do it by way of fraction, $\frac{-m x^{-m-1} \dot{x}}{x^{\frac{1}{n}}}$

(for the square of x^m is as well x^{2m} as x^{m^2}) or, according to

Sir Isaac Newton's method, which is yet shorter, $\frac{-x^m}{x^{m+1}}$.

If the power be imperfect, i. e. if its exponent be a fraction,

as suppose $\sqrt[n]{x^m}$; or in the other notation $x^{\frac{m}{n}}$, suppose

$x^{\frac{m}{n}}=z$: Then if you raise up each member to the power of n , it will stand thus, $x^m=z^n$; the *Fluxion* of which will

be, by this general rule, $m x^{m-1} \dot{x}=n z^{n-1} \dot{z}$. Where-

fore \dot{z} will be $\frac{m x^{m-1} \dot{x}}{n z^{n-1}}$ (by dividing both parts by

$n z^{n-1}$) and $\frac{m x^{m-1} \dot{x}}{n z^{n-1}}=\frac{m}{n} \frac{x^{m-1} \dot{x}}{z^{n-1}}$; or $\frac{m}{n} x^{\frac{m}{n}-1} \dot{z}$.

putting instead of $n z^{n-1}$, its value x^{m-1} . Hence, to find the *Fluxion* of any kind of power, proceed thus:—Multiply the power given by its index or exponent, and then multiply that product by the *Fluxion* of the root of the power given; and after that, subtract 1, or unity, from the index of the power.

To find the *Fluxions* of surd quantities—Suppose it required to find the *Fluxion* of $\sqrt{2rx-xx}$, or $2rx-xx^{\frac{1}{2}}$. Suppose $2rx-xx^{\frac{1}{2}}=z$; then is $2rx-xx=zz^2$; and consequently $r\dot{x}-x\dot{x}=z\dot{z}$; and, by division,

$\frac{r\dot{x}-x\dot{x}}{z}=z$ (by substitution) $\frac{r\dot{x}-x\dot{x}}{\sqrt{2rx-xx}}=z$ to the *Fluxion* of $\sqrt{2rx-xx}$.

If it be required to find the *Fluxion* of $a y - x x^{\frac{2}{3}}$; for $a y - x x^{\frac{2}{3}}$ put z ; then $a y - x x = z^{\frac{3}{2}}$, and $a \dot{y} - 2 x \dot{x} = \frac{3}{2} z^{\frac{1}{2}} \dot{z}$. And multiplying by 3; $3 a \dot{y} - 6 x \dot{x} = 3 z^{\frac{1}{2}} \dot{z}$; and consequently, $3 a \dot{y} - 6 x \dot{x} = 3 z^{\frac{1}{2}} \dot{z}$ equal (substituting $a y - x x = z^{\frac{3}{2}}$) $3 a^{\frac{2}{3}} \dot{y} - 6 a^{\frac{1}{3}} \dot{x} = 3 z^{\frac{1}{2}} \dot{z}$.

$x^2 y + 3 a x^2 y - 6 a^2 y^2 x x + 12 a y x^2 \dot{x} - 6 x^2 \dot{x} =$ to the *Fluxion* of $a y - x x^{\frac{2}{3}}$.

To find the *Fluxion* of quantities compounded of rational and surd quantities—let it be required to find the *Fluxion* of $b x^2 + c a x + e a^2 \sqrt{xx+a}$. Put $b x^2 + c a x + e a^2 = p$, and $\sqrt{xx+a} = q$. Then the given quantity is $p q$ and the *Fluxion* thereof is

$p \dot{q} + q \dot{p}$. But \dot{q} is $\frac{\dot{x}}{\sqrt{xx+a}}$, and \dot{p} is $2 b x \dot{x} + c a \dot{x}$; therefore in the equation $p \dot{q} + q \dot{p} = z$, if in the place of p, q, \dot{p}, \dot{q} , we restore the quantities they represent,

we shall have $\frac{b x^2 + c a x + e a^2}{\sqrt{xx+a}} + \sqrt{xx+a} (2 b x \dot{x} + c a \dot{x}) = z$. Which being reduced to one denomination, gives $3 b x^3 + 2 a c x^2 + e a^2 x + 2 b a^2 x + c a^3 x = z$ to the *Fluxion* of $\sqrt{xx+a}$ the given quantity.

The method of *FLUXIONS*, or *calculus integralis*, consists in finding finite magnitudes, from the infinitely small parts thereof.

FLU

It proceeds, as already observed, from infinitely small quantities to finite; and recomposes and sums up what the other has resolved. whence it is also called by some the *summatory calculus*. But what that has decomposed, this does not always re-establish; so that the inverse method is limited, and imperfect; at least hitherto. If it were once complete, geometry would be arrived at its last perfection.

To give an idea of its nature and office, take the instance already proposed in the direct method: in that the infinitely small quantities of the ordinates and absciss, being known, give the subtangent required. In this, on the contrary, the subtangent of an unknown curve being had, gives the infinitely small quantities of the absciss and ordinate which produced it, and of consequence the absciss and ordinate themselves; which are finite magnitudes, in whose relation the whole essence of the curve is founded.

But the distinguishing use of this method is in measuring. The base of a parallelogram multiplied by the infinitely small element of its altitude, gives an infinitely small parallelogram; which is the element of the finite parallelogram, and is repeated an infinity of times therein, *i. e.* as many times as there are points in the height of the parallelogram.

To have the finite parallelogram, therefore, by means of its element, the element must be multiplied by the altitude; which is the inverse method of *Fluxions*, re-ascending from the infinitely small quantity to the finite.

Such a circuit of infinitesimals, it is true, would be impertinent in so simple a case; but when we have to do with surfaces terminated by curves, the method then becomes necessary, or at least superior to any other.

Suppose, *e. gr.* in a parabola, the space included between two infinitely near ordinates, an infinitely small portion of the axis, and an infinitely little arch of the curve: it is certain, this infinitely small surface is no parallelogram; since the two parallel ordinates which terminate it on one side, are not equal; and the arch of the curve, opposite to the little portion of the axis, is frequently neither equal nor parallel thereto. And yet this surface, which is no parallelogram, may be considered, in the strictest geometry, as if it really were one, by reason it is infinitely small, and the error, of consequence, infinitely little, *i. e.* none.

So that to measure it, there needs nothing but to multiply an ordinate of the parabola by the infinitely small portion of the axis corresponding thereto. Thus we have the element of the whole parabola; which element being raised by the inverse method to a finite magnitude, is the whole surface of the parabola. This advantage is peculiar to the geometry of infinites, of being able without any error to treat little arches of curves, as if they were right lines; curvilinear spaces, as if rectilinear ones, &c. enables it not only to go with more ease and readiness than the ancient geometry, to the same truths; but to reach a great number of truths which were inaccessible to the other.

Its operations, in effect, are more easy, and its discoveries more extensive; and simplicity and universality are its distinguishing characters.

To find the flowing quantity belonging to any *FLUXION* given. — To have the doctrine of the inverse method correspond and keep pace with that of the direct, we will apply it in the same cases.

In the general: to express the variable quantity of a *Fluxion*, there needs nothing but to write the letters without the dots.

Thus the flowing quantities of $x y z$, are $x y z$.

To find the flowing quantities belonging to the *FLUXION* of the product of two quantities;

Divide each member of the *Fluxion* by the fluxionary quantity or letter; or change the fluxionary letter into the proper flowing quantity of which it is the *Fluxion*: the quotients connected by their proper signs will be the flowing quantities sought.

Only, if the letters be all exactly the same, the flowing quantity will be a simple one, whose parts are not to be connected together by the signs $+$ and $-$.

To find the flowing quantity belonging to the *Fluxion* of any power, either perfect or imperfect. — Take the fluxionary letter or letters out of the equation: then augment the index of the *Fluxion* by 1, or unity: lastly, divide the *Fluxion* by the index of its power so increased by unity.

Thus suppose $3 x x x$ proposed; by taking away x it will be $3 x x$: and by increasing its index by unity, it will be $3 x x$: then dividing it by 3, its now (augmented) index, the quotient will be $x x$, the flowing quantity required.

Again, suppose $\frac{n}{m} x$ a *Fluxion* proposed: by taking away

the fluxionary x , it will be $\frac{n}{m}$

index by unity (*i. e.* by taking away -1) it will be $\frac{n}{m} x$:

FLY

And lastly, by dividing the remaining part of the *Fluxion* by $\frac{n}{m}$, prefixed to, or multiplied into x , the quotient will be

$x^{\frac{n}{m}}$; which is the flowing quantity sought. The uses of the direct method of *Fluxions*, see specified under the articles *MAXIMIS* and *MINIMIS*, and *TANGENTS*. Those of the inverse method, see under *QUADRATURE* of curves; *RECTIFICATION* of curves; and *CUBATURE* of solids.

To *FLY* gross, in falconry, is said of a hawk, when he flies at the great birds, as cranes, geese, herons, &c.

FLY on head, is when the hawk missing her quarry, betakes herself to the next check, as crows, &c. See *HAWK*.

FLYBOAT, a large vessel, with a broad bow, used by merchants in the coasting trade. — Some of them will carry 800 ton of goods.

FLYERS, in architecture, such stairs as go straight, and do not wind round, nor have the steps made tapering; but the fore and back part of each stair and the ends respectively parallel to one another.

So that if one flight do not carry you to your designed height, there is a broad half space; and then you fly again, with steps every where of the same breadth and length as before.

FLYING, the progressive motion of a bird, or other winged animal in the liquid air.

Flying is either natural, or artificial. *Natural FLYING* is that performed by an apparatus or structure of parts concerted for that end by nature herself. Such is that of most birds, and insects; and of some fishes.

In Virginia, and New-England, they have monstrously large flying beetles. *Philosop. Transact.* N^o 127. And in Languedoc, grasshoppers, about an inch long, wherewith the ground, in several parts, in the year 1685, was covered one third of a foot deep. — *Ibid.* N^o 182.

The parts of birds, &c. chiefly concerned in *Flying*, are the wings and tail: by the first, the bird sustains and wafts himself along; and by the second, he is assisted in ascending and descending, to keep his body poised and upright, and to obviate the vacillations thereof.

It is by the largeness and strength of the pectoral muscles, that birds are so well disposed for quick, strong, and continued *Flying*. — These muscles, which in men are scarce a seventieth part of the muscles of the body, in birds, exceed and outweigh all the other muscles taken together: upon which Mr. Willoughby makes this reflection, that if it be possible for man to fly, his wings must be so contrived and adapted, that he may make use of his legs, and not his arms, in managing them.

The *Flying* of birds is thus effected: The bird first bends his legs, and springs with a violent leap from the ground: then opens or expands the jointures of his wings, so as to make a right-line, perpendicular to the sides of his body. Thus, as the wings with the feathers therein, constitute one continued lamina; being now raised a little above the horizon, and vibrating the wings with great force and velocity, perpendicularly against the subject air; the air, though a fluid, resists those succussions, both from its natural inactivity, and from its elasticity, which makes it restore itself after it has been compressed, and re-act as much as it is acted on: by such means is the whole body of the bird protruded. The sagacity of nature is very remarkable in the opening and recovering of the wing for fresh strokes. — To do it directly, and perpendicularly, it must needs have a great resistance to overcome: to avoid which, the bony part, or bend of the wing, into which the feathers are inserted, moves sideways with its sharp end foremost; the feathers following it like a flag.

The resistance the air makes to the withdrawing of the wings, and consequently the progress of the bird will be so much the greater, as the waft, or stroke of the fan of the wing is the longer: but, as the force of the wing is continually diminished by this resistance; when the two forces come to be in equilibrium, the bird will remain suspended in the same place: for the bird only ascends so long as the arch of air, the wing describes, makes a resistance equal to the excess of the specific gravity of the bird above the air. If the air, therefore, be so rare as to give way with the same velocity as it is struck withal, there will be no resistance, and consequently the bird can never mount on such unstable steps.

Mr. Ray, Willoughby, &c. have supposed the tail to do the office of a rudder, in steering and turning the body this way or that; but Borelli has shewn it unfit for any such office. — The *Flying* of a bird, in effect, is quite a different motion from the sailing of a ship: birds do not vibrate their wings towards the tail, as oars are struck towards the stern; but waft them downward: nor does the tail of the bird cut the air at right angles as the rudder does the water; but is disposed horizontally, and preserves the same situation what way soever the bird turns. In effect, as a vessel in the water is turned about on its centre of gravity to the right, by a brisk application of the oars to the

the left; so a bird, in beating the air with its right wing alone, towards its tail, its fore part will be turned to the left: as when in swimming, by only striking out with the right arm and leg, we are driven to the left.

Thus, we see pigeons changing their course to the leftward, labour it with their right wing, keeping the other almost at rest.

Add, that birds with long necks have another way of altering their course: for by only inclining the head and neck towards this or that side, the centre of gravity of the whole being changed, the bird will proceed according to this new direction.

Birds never fly upwards in a perpendicular line, but always in a parabola, the line described by projectiles.—In a direct ascent, the natural and artificial tendency would oppose and destroy each other; so that the progress would be very slow. In a direct descent, they would aid one another, so that the fall would be too precipitate.

Indeed the hawk we frequently find take that advantage in seizing of the partridge: but ordinarily, birds keep their wings expanded, and at rest, to retard their descent; and at the same time stretch out their feet, and legs.

Artificial Flying, is that attempted by men, by the assistance of mechanics.

The *Art of Flying*, is one of the great desiderata of mechanics; it has been attempted in divers ages: the discovery of it might prove of great service, and also of great disservice to mankind.

No body seems to have bid so fair for that invention, as our famous *Hyar Bacon*, who lived upwards of five hundred years ago. He not only affirms the art feasible, but assures us he himself knew how to make an engine, in which a man sitting might be able to carry himself through the air, like a bird: and affirms, that there was another person who had actually tried it with success.

The secret consisted in a couple of large thin hollow copper globes, exhausted of air; which being much lighter than air, would sustain a chair, whereon a person might sit.

Fa Francisco Lana, in his *Prodromus*, proposes the same thing, as his own thought. He computes, that a round vessel of plate brass, fourteen foot in diameter, weighing three ounces the square foot, will only weigh 1848 ounces; whereas a quantity of air of the same bulk, will weigh 2155 $\frac{1}{2}$ ounces: so that the globe will not only be sustained in the air, but will carry with it a weight of 373 $\frac{1}{2}$ ounces; and by increasing the bulk of the globe, without increasing the thickness of the metal, he adds, a vessel might be made to carry a much greater weight.

But the fallacy is obvious: a globe of the dimensions he describes, *Dr. Hook* shews, would not sustain the pressure of the air, but would be crushed inwards. Beside, in whatever ratio the bulk of the globe were increased, in the same must the thickness of the metal be also, and consequently the weight increased: so that there would be no advantage in such augmentation.

The same author describes an engine for *Flying*, invented by the *Sieur Besnier*, a smith of *Sable*, in the county of *Maine*. *V. d. Philosoph. Collect. N.º 1.*

FLYING BRIDGES, in fortification, are those made of two small bridges, laid one upon the other, so that the uppermost, by means of ropes and pulleys, is forced forwards, till the end of it is joined to the place designed.

FLYING CAMP, a small body of an army, consisting of four, five, or six thousand men, and sometimes a greater number, as well foot as horse, which continually keep the field, making divers motions, to prevent the incursions of the enemy, or to frustrate their enterprises; to hinder convoys, to harass the adjacent country, and to be thrown into a besieged place, as occasion shall serve.

FLYING PINION, is a part of a clock, having a fly or fan, whereby to gather air, and so bridle the rapidity of the clock's motion, when the weight descends in the striking part. See **CLOCK**.

FOCAGE, or **FUAGE**, fire-money, hearth-money, or chimney-money. See **FUAGE**.

FOCILE, **FOCIL**, in anatomy, a name the Arabs gave to the two bones of the arm, reaching from the elbow to the wrist.

The biggest, which is what we call the *Cubitus*, and *Ulna*, they call the *greater Focil*, *Focile majus*.

The less, which we call *Radius*, they call *Focile minus*.

The like is observed with regard to the bones of the leg. The biggest of which, by the Latins called *Tibia*, the Arab writers, &c. call the *great Focil*: and the less, or *Fibula*, the *lesser Focil*.

FOCUS, in geometry and the conic sections, is applied to certain points in the parabola, ellipsis, and hyperbola; wherein the rays reflected from all parts of these curves do concur or meet. See **CURVE**.

The *Foci* of an *Ellipsis* are two points, as *Ff*, *Tab. Con. fig. 21.* in the axis *AB*, on which, as centers, the figure is described: **VOL. I.**

or, two points in the longer axis, whence two right-lines being drawn to any point in the circumference, shall be together equal to the axis itself. These are also called *umbilici*.

To find the *Foci* of an ellipsis: from *B* to *L*, let off half the parameter; and in the centre *C* erect a perpendicular *CK*, meeting a semicircle described on *AL*. Then making *CF* = *CK*, the point *F* will be the *Focus*.

If then the axis *AB* be cut in the *Focus F*; the rectangle of the segments of the axis *AF*, *FB*, will be subquadruple of the rectangle of the parameter into the axis; whence the square of the distance of the *Focus* from the centre is equal to the rectangle of half the axis into the difference of the semi-parameter from half the axis. See **ELLIPSIS**.

Focus of the hyperbola, see the article **HYPERBOLA**.

The *Focus* of a parabola is a point in its axis, as *F*, (*Tab. Conics, fig. 18.*) wherein the semi-ordinate *FN*, is equal to the semi-parameter; or, a point in the axis distant from the vertex, by a fourth part of the parameter, or latus rectum.

It is demonstrated in conics, 1º That in a parabola, the distance of the *Focus* from the vertex, *AF*, is to the parameter in a subquadruple ratio.

2º That the square of the semi-ordinate is quadruple of the rectangle of the distance of the *Focus* from the vertex, and the abscissa.

3º That the right-line *FM* drawn from the *Focus F* to the extremities of the semi-ordinate of the parabola, is equal to the aggregate of the abscissa *AP*, and the distance of the *Focus* from the vertex *AF*.

Focus, in optics, is a point wherein several rays concur, and are collected; either after having undergone refraction, or reflection.

It is thus called, by reason the rays being here brought together, and united; their force and effect is increased; so that they become able to burn: accordingly, it is in this point, that bodies are placed to sustain the force of burning-glasses, or mirrors.

It must be observed, that the *Focus* is not, strictly speaking, a point; the rays are not all accurately collected into the same place: *Huygens* demonstrates, that the *Focus* of a lens convex on both sides, is $\frac{1}{2}$ of the thickness of the lens.

Focus, in dioptrics, is the point wherein refracted rays, rendered convergent by refraction, do concur, or meet, and cross the axis.

The same point is also called the *Point of Concurrence*, or *Concurrence*.

Virtual Focus, in dioptrics, is the point from which refracted rays, when by refraction they are rendered divergent, do begin to diverge or recede from each other.

The same point is also called *Punctum dispersus*, or *Point of Divergency*.

The effect of convex glasses, or lenses; is to render the rays, transmitted through them, convergent, and to bring them together into a *Focus*, which will be nearer or further off, as the lens is a portion of a greater or less sphere.

The effect of concave lenses is to render the rays transmitted through them, divergent, or to disperse them from a virtual *Focus*.

For the place, position, distance, &c. of the *Foci* of rays refracted through plain, concave, and convex mediums of divers densities, as air, water, glass, &c. see **REFRACTION**; **LENSES** &c.

The laws of the *Foci* of glasses, and the methods of finding the same, being those of most use, and importance, we shall here subjoin them a part, as delivered and demonstrated by *Mr. Molyneux*, in his *Dioptrica Nova*.

1º Then, the *Focus* of a convex glass, i. e. the point wherein parallel rays transmitted through a convex glass whose surface is the segment of a sphere, do unite, is distant from the pole or vertex of the glass, almost a diameter and half of the convexity.

2º In a plano-convex glass, the *Focus* of parallel rays, or the place where they unite with the axis, is distant from the pole of the glass a diameter of the convexity; provided the segment do not exceed thirty degrees.

The rule or canon in plano-convex glasses, is as 107 : 193 :: so is the radius of the convexity: to the refracted ray taken in its concurrence with the axis; which in glasses of larger spheres, is almost equal to the distance of the *Focus* taken in the axis.

3º In double convex glasses of the same sphere, the *Focus* is distant from the pole of the glass about the radius of the convexity, if the segment be but thirty degrees.

But if the convexities be unequal, or if the two sides be segments of different spheres, then the rule is, As the sum of the radii of both convexities: to the radius of either convexity alone :: so is the double radius of the other convexity: to the distance of the *Focus*.

Here observe, that the rays which fall nearer the axis of any glass, are not united with it so soon as those farther off: nor will the focal distance be so great in a plano-convex glass, when

when the convex side is towards the object, as when the contrary way.

Hence it is truly concluded, that in viewing any object by a plano-convex glass, the convex side should always be turned outward; as also in burning by such a glass.

For the *Virtual Focus* observe, — 1^o, That in concave glasses, when a ray falls from air parallel to the axis, the virtual *Focus*, by its first refraction, becomes at the distance of a diameter and an half of the concavity.

2^o, In plano-concave glasses, when the rays fall parallel to the axis, the virtual *Focus* is distant from the glass the diameter of the concavity.

3^o, in plano-concave glasses; as 107 : 193 :: 50 is the radius of the concavity : to the distance of the virtual *Focus*.

4^o, In double concaves of the same sphere, the virtual *Focus* of parallel rays is at the distance of the radius of the concavity. But whether the concavities be equal or unequal, the virtual *Focus*, or point of divergency of the parallel rays, is determined by this rule;

As the sum of the radii of both concavities : is to the radius of either concavity :: 50 is the double radius of the other concavity : to the distance of the virtual *Focus*.

5^o, In concave glasses, if the point to which the incident ray converges, be distant from the glass farther than the virtual *Focus* of parallel rays, the rule for finding the virtual *Focus* of this ray is this;

As the difference between the distance of this point from the glass, and the distance of the virtual *Focus* from the glass : is to the distance of the virtual *Focus* :: 50 is the distance of this point of convergence from the glass : to the distance of the virtual *Focus* of this converging ray.

6^o, In concave glasses, if the point to which the incident ray converges, be nearer to the glass, than the virtual *Focus* of parallel rays, the rule to find where it crosses the axis, is this;

As the excess of the virtual *Focus*, more than this point of convergence : is to the virtual *Focus* :: 50 the distance of this point of convergence from the glass : is to the distance of the point where this ray crosses the axis.

Rules for finding the Foci of glasses. — To find the *Focus* of a convex spherical glass, being of a small sphere, apply it to the end of a scale of inches, and decimal parts, and expose it before the sun; upon the scale you will have the bright intersection of the rays measured out : or, expose it in the hole of a dark chamber; and where a white paper receives the distinct representation of distinct objects, there is the *Focus* of the glass.

For a glass of a pretty long *Focus*, observe some distant object through it, and recede from the glass till the eye perceives all in confusion, or the object begins to appear inverted; here the eye is in the *Focus*.

For a plano-convex glass; make it reflect the sun against a wall; you will on the wall perceive two sorts of light; one more bright within another more obscure : withdraw the glass from the wall, till the bright image is at its smallest; the glass is then distant from the wall about the fourth part of its focal length.

For a double convex: expose each side to the sun in like manner; and observe both the distances of the glass from the wall. The first distance is about half the radius of the convexity turned from the sun; and the second, about half the radius of the other convexity.

Thus we have the radii of the two convexities; whence the *Focus* is found by this rule;

As the sum of the radii of both convexities : is to the radius of either convexity :: 50 is the double radius of the other convexity : to the distance of the *Focus*.

Focus, in catoptrics, is a point wherein the rays reflected from the surface of a mirror, or speculum, and by reflection rendered convergent, do concur, or meet.

The effect of concave mirrors is to collect the rays falling on the concave surface into a *Focus*.

The effect of convex mirrors is to disperse the rays falling on them, or render them more divergent.

For the laws of the *Foci* of rays refracted from mirrors, or specula, see REFLECTION.

The *Foci* of concave glasses are had by reflection: for as a concave mirror burns at the distance of about half the radius of the concavity; so a concave glass, being supposed a reflecting speculum, unites the rays of the sun at the distance of about half the radius of the concavity.

To find the *Foci* of all glasses geometrically. — Dr. Halley furnishes us a general method for finding the *Foci* of spherical glasses of all kinds, both concave and convex; exposed to any kind of rays, either parallel, converging, or diverging; under the following problem.

To find the *Focus* of any parcel of rays diverging from, or converging to a given point in the axis of a spherical lens, and inclined thereto under the same angle, the ratio of the sines of refraction being given :

Suppose GL (*Tab. Optics*, fig. 38. N^o 2.) a lens; P a point in its surface; V its pole; C the centre of the sphere whereof

it is a segment; O the object, or point in the axis, to or from which the rays do proceed; and OP a given ray : and suppose the ratio of refraction to be as r to s . Then making CR to CO, as s to r for the immersion of a ray; or as r to s for the emerision (i. e. as the sines of the angles in the medium which the ray enters, to the corresponding sines in the medium out of which it comes) and laying CR, from C towards O, the point R will be the same for all the rays of the point O. Lastly, drawing the radius PC, if need be, continued; with the centre R, and distance OP strike a piece of an arch, intersecting PC in Q. The line QR being drawn, shall be parallel to the refracted ray; and PF being made parallel thereto, shall intersect the axis in the point F; the *Focus* sought. Or, make it, as CQ : CP :: CR : CF; then will CF be the distance of the *Focus* from the centre of the sphere.

This author gives a demonstration of the method; and adds various figures, exhibiting the various cases of rays either diverging, or converging, as they enter, or emerge out of the surface either of a convex or concave lens.

From this principle all the rules for the *Foci* of rays parallel to the axis, as likewise for the principal *Focus*, where the rays nearest the axis do unite, are deduced. As,

Hence, 1^o, If OP be equal to CR; the points Q and C are coincident, and the rays OP, after refraction, run on parallel to the axis. 2^o, If the point Q fall on the same side of the axis, as is the point P; then the beams after refraction do tend on, either diverging, or converging, as before: but if Q fall on the other side the axis, the diverging rays are made to converge by a convex, or the converging to diverge by a concave glass.

3^o, If OP do exceed CR, the *Focus* is in all cases on the same side of the glass, as is the centre of the sphere C. But contrariwise, if OP be less than CR, the *Focus* falls on the other side of the glass beyond the vertex V. 4^o, An object may be so placed, that the rays next the axis of a convex glass shall have an imaginary *Focus* transmitting diverging rays, when the more remote parts thereof shall make them converge to a real *Focus*. 5^o, If OV, the distance of the object from the pole or vertex of the glass, be taken instead of OP, then will CQ be the difference of OV and CR; and as that difference is to CR, 50 is the radius CV, to CP, the distance of the principal *Focus* from the centre of the sphere, whereof the glass is a segment. Or else, as CQ : OP or RQ :: PC : to V F, the focal distance from the pole of the glass. Whence follows a general rule for the *Foci* of all glasses; only according to *Corol.*

3. if OV do exceed CR, the *Focus* is on the same side of the glass, as the centre of the sphere: but if CR be greater, then the *Focus* is on the opposite side of the glass: whence it will be determined, whether the *Focus* be real, or imaginary.

What has been said of one surface of the lens, is easily applicable to the other, taking F the *Focus*, for an object.

FODDER, any kind of meat for horses, or other cattle : in some places hay and straw mingled together, is more peculiarly denominated *Fodder*.

In the civil law it is used for a prerogative that the prince has, to be provided of corn, and other meat, for his horses, by the subjects, in his warlike expeditions.

FODINA, a name some authors give to the labyrinth in the bone of the ear. See LABYRINTH.

FÆCES, } See { FÆCAL.
FÆCAL, }
FÆCULÆ, }
FÆCUNDITY, } FÆCUNDITY.

FÆTOR, in medicine, stinking, or foetid effluvia, proceeding from the body, or the parts thereof. See EFFLUVIA.

Fætors arise from stagnant, extravasated, corrupted, or poisoned humours; as also from any thing capable of attenuating and volatilizing the oils and salts; as abstinence, heat, too much motion, acrimony of food, &c.

FÆTOR Narium, stench of the nostrils; a sort of disease arising from a deep ulcer within the nose, yielding a foetid smell.

Its cause, according to Galen, is a sharp humour, falling from the brain upon the mamillary processes.

This is one of the causes for which marriage might formerly be annulled.

FÆTUS, in medicine, denotes the child, while yet contained in the mother's womb; but particularly, after it is perfectly formed; till which time it is more properly called *Embryo*. See EMBRYO.

The manner of the conception, or generation of the *Fætus*, is matter of great controversy. That all the parts of the animal did exist, and that its fluids were in motion, before generation, is generally allowed; but whether the animalcule was lodged in the male, or female, is not yet agreed of.

Many of the moderns will have the ova, or eggs, contained in the ovary of the female; to be the first matter, or flamen of the *Fætus*. These eggs they suppose to contain all the parts of the *Fætus* in little; and that being impregnated with the male seed, the parts thereof become enlarged and displayed : and that from the ovary they are conveyed by the fallopian tubes into the uterus, where they receive their impregnation, accretion, &c.

Others

Others will only have the female ovum to be a proper nidus for the animalcule, which, they contend, is in the male seed. The animalcule getting into an ovum fit to receive it; and this falling through one of the tubæ fallopianæ into the womb, the humors which diffil through the vessels of the womb penetrating the coats of the egg, swell and dilate it, as the juice of the earth does seeds thrown into the ground. Or else the branches of the veins and arteries, whereby the egg was tied in the ovary, being broken, knit with the vessels of the womb.

The first thing that appears of a *Fœtus*, is the placenta, like a little cloud, on one side of the external coat of the egg: about the same time the spine is grown big enough to be visible; and a little after the cerebrum and cerebellum appear like two small bladders: next, the eyes stand prominent in the head: then the *punctum saliens*, or pulsation of the heart is plainly seen. The extremities discover themselves last of all.

The *Fœtus*, when formed, is almost of an oval figure, while it lies in the womb: for its head hangs down; with its chin upon the breast: its back is round; with its arms it embraces its knees, which are drawn up to its belly; and its heels are close to its buttocks: its head upwards, and its face towards its mother's belly. About the ninth month, its head, which was hitherto specifically lighter than any other part, becomes specifically heavier; its bulk bearing a much smaller proportion to its substance than it did.

The consequence of this change is, that it tumbles in the liquor which contains it: its head falls down; its feet get up; and its face turns towards its mother's back. But being now in an irksome posture, though at the same time a favourable one for its exit; the motion it makes for its relief, gives frequent pains to the mother; which causes a contraction of the womb, for the expulsion of the *Fœtus*.

What some anatomists pretend to give further as to the posture of the *Fœtus* in the womb, in the several stages of gestation, is very precarious.

In the first month it is of no moment how it lies in the womb: in the latter months, after the *Fœtus* is grown not only quick, but robust, it frequently changes its posture of itself; as not only the mothers themselves feel, but any other person, by laying the hand on their bellies, frequently may. However, its ordinary posture is supposed to be sitting: as the time of birth draws near, it turns itself, and presents the head to the os uteri; though sometimes it offers the feet first, and sometimes lies a-crois, and offers either a hand, a knee, or the like; these are irregular situations, and without a deal of address in the midwife in turning the *Fœtus*, both the mother and the infant are in danger.

The *Fœtus* is inclosed in two membranes, or coats; the inner, which immediately invests the *Fœtus*, and the liquor wherein it lies, is called the *Amnios*: the outward membrane is called the *Chorion*.

In some animals there is a third membrane, called the *Allantois*, whose place is between the other two; and which serves for the discharge of the urine of the *Fœtus*, brought higher by the urachus.

Dr. Needham seems to have discovered something analogous hereto in the human *Fœtus*, and calls it the *Membrana Urinaria*: But others chuse only to make it a duplicature of the chorion; though the necessity of such third membrane be the same in men, as in cows, sheep, &c. See *ALLANTOIS*.

There are some differences in the structure, mechanism, and proportion of the parts of a *Fœtus*, from those of an adult: and even some additional and extraordinary parts; by which the nutrition of this zoophyte, or plant animal, as it is called, and the circulation of the blood therein, are effected.

The principal variations are about the liver, heart, and lungs. Of these the most considerable are the umbilical vessels, which are two arteries, a vein, and the urachus, arising from the placenta, and conveyed through the navel to the liver of the *Fœtus*, near the navel; all which, after the birth, drying up, become impervious and useless.

In the liver itself there is an extraordinary communication between the porta and cava, called *Canalis Venosus*, which, after the birth, gradually dries up. In the heart, at the mouth of the vena cava, is the foramen ovale, whereby that vein has a communication with the pulmonary vein: there is also a communication between the aorta, and pulmonary artery, by means of the canalis arteriosus, which passes between the two, at about two inches distance from the base of the heart. It is by means of these two canals or passages, that the blood circulates in the *Fœtus* while inclosed in the womb; they serving to convey and pass the blood from the heart into the arteries; and from the veins into the heart again, without its passing through the lungs, which are now useless.

The lungs of a *Fœtus* are of a darker colour, and closer consistence, than after they have been breathed into; as appears

from their swimming in water, after birth, which they will not do before; which difference affords an useful experiment, in case of the suspected murder of children. For if they were still-born, the lungs sink in water; if born alive, they swim.

The two canals above-mentioned serve only to prevent the obstruction the blood would otherwise have within the lungs, before they have been opened. After respiration has opened the lungs, the blood taking its course through them those passages close up.

—The head of the *Fœtus* is much bigger in proportion to the body, than afterwards; the bones and brain are softer, the sutures open, and they leave a great space on the top of the head, covered only with a membrane; and the glands, particularly the thymus and renales, are bigger and softer. For other differences in the proportion, see *EMBRYO*.

Bartholine, in his treatise *de infloritis partus viis*, relates a great many stupendous cases of *Fœtus*'s dead and putrified in the womb; the parts of which have made their way through apertures; one whereof at the navel was some years in coming away: And in the *Philosoph. Transactions* we meet with the like instances; particularly, of one voided piece-meal by the anus, several years after conception.

Authors give accounts of *Fœtus*'s found in the fallopian tubes; and others in the cavity of the belly. M. de S. Maurée, in the *Memoirs of the royal academy of sciences*, relates the history of a *Fœtus* formed in the ovary of the mother; and which at three months from impregnation, bursting the testicle, forced its way through, into the epigastric region.

During the rupture, the mother felt all the preludes of an imminent travel; and having called her chirurgeon, died in his arms, crying, I am delivering, I am delivering!

The story of Margaret countess of Holland, who is said to have been delivered of 364 *Fœtus*'s, all alive, and afterwards baptized, passes for a fable; and yet there is a picture of this notable delivery still preserved in the church of Loosdun, as a monument of the truth thereof. Albertus Magnus gives a like instance of a woman, who brought forth 150 *Fœtus*'s, or embryo's all formed, and as big as the little finger.

FOG, or *Mist*, a meteor, consisting of gross vapours, floating near the surface of the earth.

If the vapours, plentifully raised from the earth, and waters, either by the solar or subterraneous heat, meet, at their first entrance into the atmosphere, with cold enough to condense them considerably; their specific gravity being hereby increased, their ascent will be stopped, and they will either return back in form of a dew, or of drizzling rain; or they will remain suspended for some time, in form of a *Fog*.

Fogs are only low clouds, or clouds in the lowest region of the air, and clouds are no other than *Fogs* raised on high.

Objects viewed through *Fogs*, appear larger, and more remote than through the common air.

The fishing for herring is chiefly practised in foggy weather.

FOGAGE, in the forest law, is rank grass, not eaten in the summer.

FOIBLE, a French term, frequently used also in our language. It literally signifies weak; and in that sense is applied to the body of animals, and the parts thereof: As, *foible reins*, *foible sight*, &c. being derived from the Italian *fiavole*, of the latin *stibilis*, to be lamented, pined.

But it is chiefly used with us substantively, to denote a defect, or flaw in a person, or thing. Thus we say, every person has his *Foible*; and the great secret consists in hiding it artfully: Princes are gained by flattery, that is their *Foible*: The *Foible* of young people is pleasure; the *Foible* of old men is avarice; the *Foible* of the great and learned is vanity; the *Foible* of women and girls, coquetry, or an affectation of having gallants: You should know the fort, and the *Foible* of a man, before you employ him: but we should not let people perceive that we know their *Foible*.

FOIL*, or *FOYLE*, among looking-glass grinders, a sheet of tin, with quicksilver, or the like, laid on the backside of a looking-glass, to make it reflect. See *FOLIATING*.

* The word is formed of the Latin *folium*, leaf.

FOILING, among hunters, the footing, and treading of deer, which remains on the grass, but scarce visible.

FOLDS, in the manufactures. See the articles *CLOTH*, &c.

FOLDS of the drapery, in painting. See *DRAPERY*.

FOLIA, in botany, is used for the leaves of plants and also of flowers; but particularly the former; the leaves of flowers being more properly called *petala*.

FOLIACEUM expansum, in anatomy, is that extreme of the fallopian tube, next the ovary; and which is expanded like the mouth of a trumpet, and invironed with a sort of fringe. See *FALLOPIAN tube*.

FOLIAGE, a cluster or assemblage of flowers, leaves, branches, &c.

FOLIAGE is particularly used for representations of such flowers, leaves, branches, rinds, &c. whether natural, or artificial;

ficial; used as enrichments on capitals, freezes, pediments, &c. See *Tab. Archit.* fig. 30. lit. a a; see also CAPITAL, FREEZE, &c.

FOLIATING of looking-glasses, is the spreading a composition of something which will firmly adhere to the back of the glass, and there reflect the image.

This composition is called the *Foil*, and is usually made with quicksilver, mixed with tin and some other ingredients.

For the method of *Foliating* looking-glasses, see **LOOKING-GLASS**.

In *Philos. Trans.* N^o 245. we have a method of *foliating* globe looking-glasses, communicated by Sir R. Southwell.

The mixture is of quicksilver, and Bismuth, of each three ounces; and tin, and lead, of each half an ounce: To the two last, throw on the marcasite; and afterwards the quicksilver; stir them well together over the fire; but they must be taken off, and be towards cooling, before the quicksilver be put to them.

When you use it, the glass should be well heated, and very dry; but it will do also when it is cold, though best when the glass is heated.

FOLIATION, in botany, &c. is used by Dr. Grew, to express the assemblage of the folia, or petala of a flower. See **PETALA**.

The *Foliation* is the most conspicuous part of flowers; being that collection of fugacious, coloured leaves, which constitute the compass, or body of the flower.

It is of great use in the generation and preservation of the young fruit, or seed: it filtrates a fine juice, to nourish it in the uterus, or pistil.

In some species, as apricocks, cherries, &c. it likewise serves to guard the young tender fruit from the violence of wind, weather, &c. for these being of a very tender, and pulposus body, and coming forth in the colder times of the spring, would be often injured by the extremities of weather, if they were not thus protected, and lodged up within their flowers.

Before the flower opens, the *Foliation* is curiously and artfully folded up in the calyx or perianthium.

Dr. Grew enumerates several varieties of these foldings, viz. the *close Couch*, as in roses; the *concave Couch*, as in the blattaria flore albo; the *single Plait*, as in peas blossoms; the *Couch* and *Plait*, as in marigolds; and the *Roul*, as in the ladies bower.

FOLIO, or rather **FOLIUM**, in books of accounts, &c. signifies *Page*.

Thus *Folio 7*, wrote abridgedly *F^o 7*. denotes the seventh page, &c.

Folio Recto, or *F^o R^o* expresses the first side or page of a leaf.

Folio Verso, or *F^o V^o* the second, or back-side of the leaf.

The word is Italian, and literally signifies *leaf*.

FOLIO, among bookellers. A *Book in Folio*, or simply, a **FOLIO**, is that where the sheet is only folded in two, each leaf making half a sheet.

Beneath the *Folio* are the *Quarto*, *Octavo*, *Duodecimo*, *Sixteen*, *Twenty-four*, &c. See **BOOK**.

FOLIUM Caryophyllum, or clove leaf. See **CLOVES**.

FOLIUM Indicum, or *Indum*, called also *Thamalapathra*, and *Malabathrum*; a leaf brought from the Indies, growing chiefly about Cambaye, produced by a tree not unlike the lemon-tree; used in the composition of Venice treacle. See *Supplement*, article **MALABATHRUM**.

FOLK-LAND, in our antient Saxon customs, denoted *Copyhold Land*. See **COPYHOLD**.

In opposition to these, charter lands were called *Bocklands*. See **BOCK-LAND**.

Fundus sine scripto possessus (says Somner) *censum pensitans annuum, & officiorum servituti obnoxius: Terra popularis*.

FOLKMOTE, **FOLCMOTE**, or **FOLKESMOTE**, among our Saxon ancestors, signified any popular, or public meeting of all the folk, or people of a place, district, or the like; *e. gr.* of all the tenants at a court-leet, or court-baron; or of all the free-men of a county; or all the barons, &c. of a kingdom.

The word, says Stow, is still in use among the Londoners, and signifies, *Celeberr ex omni civitate conventum*, an assembly of all the citizens. Manwood says, it is the court holden in London, wherein all the folk and people of the city did complain of the mayor and aldermen for any misgovernment.

Somner, in his Saxon dictionary, makes *Folcmote* to denote a general assembly of the people, for doing fealty to the king, and considering and ordering matters of the commonwealth *. Whence some date the origin of parliaments.

* *Omnes proceres regni, & milites & liberi homines universi totius regni Britanniae facere debent in pleno Folcmote fidelitatem domino regi, coram episcopis regni.* In leg. Edw. Confess. cap. 33. *Ei auxilium non fit in bustinga, miskeninga, i. e. speaking amifs; neque in Folcmote, neque in aliis placitis infra civitatem.* Charta H. I. pro London. Du Cange.

When such assembly is made in a city, it may be called a *Burgmote*; when in the county, a *Shiregemote*.

* *Cum aliquid vero inopinatum & malum contra regnum vel contra coronam regis emerit, statim debent pulsatis campanis, quod*

Anglice vocatur Moteb, convocare omnes & universos; quod Anglice vocant Folkmote, &c. Leg. Alfred.

FOLLICULUS, among gardeners, the seed-vessel, case, coat, hulk, or cover, wherewith several kinds of seeds and fruits are inclosed.

FOLLICULUS Fellis; see **VESICULA Fellis**.

FOLLY, according to Mr. Locke, consists in the drawing of false conclusions from just principles; by which it is distinguished from madness, which draws just conclusions from false principles.

FOMAHANT, or **FOMALHAUT**, in astronomy, a star of the first magnitude, in the water of the constellation Aquarius.—Its longitude, according to Hevelius, for the year 1700, is 29^o, 37', 48", and latitude southward, 20^o, 59', 46". How it stands in Mr. Flamsteed's catalogue, see in the article **AQUARIUS**.

FOMENTATION, a liquid medicine, applied on any diseased part, to resolve, discuss, soften, assuage, fortify, or constringe the same.

Fomentations are either *simple*, or *compound*.

Compound Fomentations are decoctions of roots, leaves, flowers, and seeds, made in common water, or other proper liquor; to which are sometimes added salts, axungies, oils, &c. To use, or apply them, they dip a hot linen cloth, or flannel, in the liquor, and spread it on the part affected.

There are also *Fomentations* made another way, viz. by boiling certain drugs in linen bags, and then applying them, bags and all, on the part.

There are also a sort of dry *Fomentations*, being bags filled with medicines, but not boiled, only sometimes sprinkled with a little wine or brandy.

Simple Fomentations are those made with lukewarm water, milk, oil, oxycrate, or other the like liquor.

Fomentations are also called *Local Baths*, or partial bathings; because, being applied on a diseased part, they have much the same effect as a bath, or half bath, has on the whole body.

FONT, or *Baptifmal Font*, a stone, or marble vessel, at the lower end of a parish-church, serving to hold the water, to be used in administering the sacrament of baptism.

A *Baptifmal Font* was antiently the character of a parish-church.

Its place, at present, is at the bottom of the church, or in a little chapel within the church. Antiently, it was placed in a little church, distinct from the great one, though near to it, called the *Baptistery*.

It is said to have been a common thing, during the first ages of the church, for the *Baptifmal Fonts* to be filled miraculously, at the time of Easter, which was their great baptizing season. Baronius gives divers instances of these miraculous *Fonts* in the years 417, 554, and 558.

Possessius B. of Lilybæum, who wrote in 443, observes, that in the year 417, under the pontificate of Zozimus, there was an error committed in the time of celebrating Easter; it being held on the 25th of March, in lieu of the 22^d of April, which was the time it was held on at Constantinople. He adds, that God was pleased to shew the error in a very convincing manner, by the *Fonts* of a certain village, which always used to be miraculously filled against Easter; and which, this year, were not full till the 22^d of April. See *Tillemont Hist. Eccl.* t. x. p. 678, and 679. Gregory de Tours, p. 320, 516, 746, 950. 1062.

FONTICULUS*, or **FONTANELLA**, in chirurgery, a general name for issues, fetons, and the like other small artificial discharges. See **ISSUE**.

* The word is a diminutive of *font*, fountain, or spring.

FONTINALIA, or **FONTANALIA**, in antiquity, a religious feast, held among the Romans, in honour of the deities who presided over fountains, or springs.—Varro observes, that it was the custom to visit the wells on those days, and to cast crowns into fountains.—Scaliger in his conjectures on Varro, takes this not to be a feast of fountains in general, as Festus insinuates; but of the Fountain which had a temple at Rome, near the Porta Capena, called also *Porta Fontinalis*: he adds, that it is of this fountain Cicero speaks in his 2^d book *De legib.*—The *Fontinalia* were held on the thirteenth of October.

FOOD, or **ALIMENT**, is whatever matter is taken in at the mouth, digested in the stomach, and other viscera, and converted into the matter of the body, to repair, or supply what is spent, or wanting.

The operations which the *Food* undergoes, before it become a part of our body, are 1^o Mastication; 2^o Deglutition; 3^o Concoction; 4^o Chylification; 5^o Sanguification; 6^o Assimilation.

Food is of two kinds, viz. *Esculents*, or *Meat*; and *Potulents*, or *Drink*.

The first *Foods* of our great forefathers, were water, and the spontaneous productions of the earth; with which also many whole nations sustain themselves to this day.

Tulpius,

Tulpius somewhere notes, that men antiently fed after the same rate as other animals; and lived on hay and corn. That by degrees they came to the humours or juices of certain beasts, as milk; and at length they commenced carnivorous, and devoured the parts of the animals themselves.

The variety of *Foods*, it seems, does not make any difference in the substance, or actions of the bodies sustained thereby; the viscera having a power of altering and assimilating them, however heterogeneous, into one similar substance, like themselves.

The difference in *Foods* consists principally in this, that some are more easily digested and assimilated, than others; and that some afford more nutritious juice, than others: and to this end it is, that the divers kinds of dressing have been invented, viz. to dispose the matter for a more easy and plentiful assimilation.

The best, most simple, and light of digestion, are the *Foods* prepared of frumentaceous, and leguminous seeds; as wheat, rye, barley, oats, and mays, dried, ground, fermented, baked, &c. Peas, beans, vetches, &c. Also green plants, and pot-herbs, as lettuce, beet, parley, &c. Fruits, as apples, pears, berries, plumbs, cherries, &c. And the lean parts of animals, birds, fishes, insects, &c. prepared by boiling, baking, stewing, &c.

And yet for different intentions, different kinds of *Foods* are required: thus hard, dry, thick, heavy, feculent *Foods* are best for those whose viscera are strong, digestion quick, &c. and soft, light, humid, simple *Foods* to such, are pernicious. Again, to the weak, valetudinary, studious, and sedentary, those *Foods* are best, which are either by art, or nature, the nearest to chyle; as milk, broths, &c.

Where the temperature inclines to acidity, there alcalious *Foods* are the most suitable; and acids, where the constitution inclines to be alcaline.

Some will have it that iron, metals, minerals, &c. may by a proper preparation become *Food*; on which account decoctions of gold, chalybeats, &c. are cried up: but it is certain, that no such matters can ever be assimilated, and become part of our body. They may act, indeed, on the blood, and the blood-vessels, by their weight, impetus, &c. and, on that account, may be of use in medicine; but not as *Food*.

A due regulation of the quantity and quality of our *Food*, and a nice adjustment thereof to the convective powers, would be of the utmost consequence to health and long life.

What we expend in motion, exertion, effluvia, &c. is but a determinate quantity; and the supply should only keep pace with the expence. A just proportion of the two would probably preserve us from acute distempers; as it certainly would from chronic ones; most, or all of which proceed from repetition, as appears from their being cured by evacuation.

The qualities of *Foods*, as to easiness, or difficulty of digestion, Dr. Cheyne thinks, may be determined in all cases from these three principles.

1^o, That those substances which consist of the grossest parts, are hardest of digestion; by reason their constituent parts touch in the most points; or have the greatest quantity of contact, upon which their cohesion depends.

2^o, That those substances, whose parts are brought together with greater force, cohere proportionably closer, and are the more difficultly separated.

3^o, That salts are very hard to be digested; because united by plane surfaces, under which they are always comprehended: hence, in the last stages of the circulation, where it is slower, they readily shoot into larger clusters, and so are hard to be driven out of the habit.

From these principles that author infers, that such vegetables and animals, as come soonest to their growth, are easier of digestion, than those long in attaining to maturity: the smallest of their kind, sooner than the larger: those of a dry, fleshy, and fibrous substance, sooner than the oily, fat, and glutinous: those of a white colour, sooner than those of a redder; those of a soft, mild, and sweet, sooner than those of a rich, strong, poignant, aromatic taste: land animals, than sea animals: animals that live on light vegetable *Food*, than those on hard and heavy *Food*: plain dressed *Food*, than what is pickled, salted, baked, smoked, or otherwise high seasoned: and boiled meat sooner than roast, &c.

The same author adds, that abstinence and exercise must concur with the due *Food* for the preservation of health; and that where exercise is wanting, as in studious persons, the defect must be supplied by abstinence.

FOOL, according to Mr. Locke, is one who makes false conclusions from right principles; by which he is distinguished from a madman.

Dr. Willis relates, that upon dissecting a *Fool*, the principal differences found between him and a man of sense, were, that the brain was smaller; and that the cervical plexus, formed of the intercostal nerve, whereby the correspondence between the brain and heart is effected, was less, and sent forth fewer branches to the heart, &c. *Nervor. Descript. & Uf.* c. 26.

FOOT, a part of the body of most animals, whereon they stand, walk, &c.

Animals are distinguished, with respect to the number of *Feet*, into bipedes, *q. d.* two-footed; such are men and birds: quadrupedes *q. d.* four-footed; such are most land animals: and multipedes, *q. d.* many-footed; as insects.

The reptile kind, as serpents, &c. have no *Feet*.

The travellers would persuade us, that the bird of paradise has no *Feet*; that when it sleeps, it hangs by its wings; and, when it feeds, by its bill: but the truth of the matter is, they who catch them, cut the *Feet* off, either that the bird may be thought the more extraordinary; or for fear they should spoil the feathers, which are very beautiful.

Lobsters have twelve *Feet*; spiders, mites, and polypus's, eight; flies, grasshoppers, and butterflies, have six *Feet*.

Galen has several good observations on the wise adjustment of the number of *Feet* in men, and other animals, in his book *De Usu Part. l. iii.*

The fore-*feet* of the mole are admirably formed to dig, and scratch up the earth, and make way for its head, &c. In water fowls, the legs and *Feet* are excellently adapted to their respective occasions and manners of living. In such as are to wade in the rivers, the legs are long, and bare of feathers a good way above the knee; their toes also are broad: and in such as bear the name of *mudsuckers*, two of the toes are somewhat alated, that they may not easily sink in walking upon boggy places.

Others, which are to swim, are whole-footed, *i. e.* have their toes webbed together, as the goose, duck, &c. And it is pretty enough to observe, how artfully these will gather up their toes and *Feet*, when they withdraw their legs, or go to take their stroke in swimming, and again expand, or open the whole *Foot*, when they press upon, or drive themselves forward in the water.

FOOT, in anatomy, the great FOOT, denotes the whole extent from the jointure of the hip to the tip of the toes; as the great hand does the whole from the shoulder to the fingers ends.

The *pes magnus*, or great *Foot*, is divided into the thigh, the leg, and the *Foot* properly so called.

Its bones are the femur, or thigh bone; the tibia and fibula for the leg; and those of the tarsus, metatarsus, and toes.

Its arteries are branches of the crural artery; and its veins terminate in the crural vein. Of these there are five principal ones, viz. the Saphena, great and little Iliadic, the Musculous, Poplitea, and Suralis. See each under its proper article, SAPHENA, &c.

FOOT, properly so called, or the lesser FOOT, denotes only the extremity of the leg; consisting of three parts, viz. the Tarsus, the space from the ankle to the body of the *Foot*, answering to the wrist in the hand: Metatarsus, the body of the *Foot* to the toes: and Digiti, or toes. Each of these parts consists of a great number of bones; as the Calx, Talus, Cuneiformia, and Cuboides. The bottom of all is called the Sole, or Planta pedis. See TALUS, &c.

FOOT, in the Greek and Latin poetry, denotes a metre or measure, composed of a certain number of long and short syllables.

The Spondee, Iambic, Trochee, and Pyrrhic, are dissyllabic *Feet*, *i. e.* they consist of two syllables each. The Dactyl, Anapaest, Molossus, Tribach, Bacchius, Antibacchius, Amphibrachys, and Creticus, are trissyllabic, or consist of three syllables each. The Proceleusmaticus, Choriambus, and Epitrite, are quadrissyllabic, or composed of four syllables. See each under its proper head, SPONDEE, IAMBIC, &c.

There are also other *Feet*, invented by idle grammarians, of five, six, or more syllables, but they are not worth the reciting. Hexameter verses consist of six *Feet*; pentameters, only of five.

Even and odd FOOT, par and impar. In poetry, and particularly in iambic verses, *Feet* are denominated *odd* and *even*, in respect of their situation in the verse. Thus, the first, third, and fifth *Foot* of the verse are uneven; in regard those numbers are not capable of being divided into two equal parts.

In the ancient tragedy, the iambic verses, which prevailed therein, only allowed uneven *Feet* to the spondees; so that the second, the fourth, and sixth *Feet* were to be iambus's, in regard they were even. This regular mixture of spondees in the uneven *Feet*, rendered the verse the more solemn and noble.

The comic poets, the better to disguise their verse, and make it more like prose, took the contrary course; putting spondees, where the tragic poets would only have allowed iambus's.

FOOT is also a long measure, consisting of twelve inches.

The *Foot* long is divided into twelve inches; and the inch into barley corns. See INCH, &c.

Geometricians divide the *Foot* into ten digits; and the digit into ten lines, &c.

The French divide their *Foot*, like us, into twelve inches; and the inch into twelve lines.

FOO

The *Foot* square is the same measure both in length, and breadth, containing 144 square, or superficial inches. The cubic, or solid *Foot* is the same measure in all the three dimensions, containing 1728 cubic inches. The *Foot* is of different lengths, in different countries. The Paris Royal *Foot* exceeds the English by seven lines and a half: the ancient Roman *Foot* of the capital consisted of four palms; equal to eleven inches, and seven tenths English: the Rhinland, or Leyden *Foot*, by which the northern nations go, is to the Roman *Foot*, as 950 to 1000. The proportions of the principal *Feet* of several nations, compared with the English and French, are here subjoined.

The English *Foot* being divided into one thousand parts, or into twelve inches, the other *Feet* will be as follow;

		<i>Th. Pts. F. Inch. Li.</i>
London	— — —	<i>Foot</i> 1000 0 12 0

FOOT-BANK, or **FOOT-STEP**, *Banquette*, in fortification, is a small step of earth, on which the soldiers stand to fire over the parapet.

FOOT of the Forest*, *Pes forestæ*, in our ancient customs, contained 18 inches, or $1\frac{1}{2}$ of the common *Feet*.

* *Notandum est, quod pes forestæ usitatus tempore Ric. Oxfell, in arrantatione vasorum, factus est, signatus & sculptus in pariete cancellæ ecclesiæ de Edwynstone, & in ecclesiâ Beatæ Mariæ de Nottingham: Et dictus pes continet in longitudine octiduum pollices, &c. Ex Regiâ. Abb. de Novo Loco in Com. Nott.*

FOOT GELD was an ancient americiament, for not cutting out the balls of the feet of great dogs in the forest; to prevent their running after the king's deer.

FOOT GUARDS, see the article **GUARDS**.

FOOT HUSKS, among gardeners, are the short heads out of which flowers grow.

FOOT LEVEL, an instrument, which serves to do the office both of a level, a square, and a *Foot* rule.

The *Foot level*, represented *Tab. Surveying*, fig. 22. consists of two branches, about an inch broad; opening and shutting like a two-foot rule.

These branches are hollowed half way up the side of each, to receive a kind of tongue, or thin piece of brass, which is fastened to one of them, by means whereof the branches may be shut close together. The use of this tongue is such, that when the end of it is placed in the branch it is not fastened to, where there is a pin that holds it, the two branches will stand at right angles: to the head of the instrument is likewise added a square piece of brass; by means whereof it does the office of a square.

FOR

At the bottom of the angle of the said piece of brass is a little hole, wherein is fastened a line with a plummet; which falling on a perpendicular line drawn on the tongue, shews whether any thing the instrument is applied to, be level or not.

Lieutenant Colonel of FOOT. See **LIEUTENANT**.

FOOT Pace, *half pace*, or *landing place*, see **STAIR-CASE**.

FOOT Rule, see the article **RULE**.

FORAGE — *Truss of FORAGE*, see the article **TRUSS**.

FORAMEN, in anatomy, a name given to certain holes or perforations in divers parts of the body; as the

FORAMEN Lacrum, see **DURA MATER**.

FORAMEN of the membrana tympani, is a perforation in the membrane of the tympanum, or drum in the ear; which admits of the passage of wind, smoke, &c. from the meatus a palato to the drum.

This passage is very small, and runs obliquely from the tympanum through the upper part of its membrane, near the process of the malleus. The existence of this perforation is more evident, when ulcers affect the palate, by the egress of wind upon the patient's stopping his nose and mouth, and forcing the wind by the ears, than by any anatomical inspection.

FORAMEN Ovale, or **FORAMEN Botalli**, an oval aperture, or passage through the heart of a foetus, which closes up after birth. See *Tab. Anat. Splanch.* fig. 12. lit. g.

It arises above the coronary vein, near the right auricle; and passes directly into the left auricle of the heart.

The *Foramen ovale* is one of the temporary parts of the foetus, wherein it differs from an adult. It serves for the circulating of the blood in the foetus, till such time as the infant breathes, and the lungs are opened.

Its use was first exactly described by Leon. Botallus of Asti in Piedmont, in the year 1562; who tracing the course and passage of the blood, asserted the *Foramen ovale* to be that opening whereby the blood in foetus's was conveyed from the right ventricle to the left.

The modern anatomists stand to the discovery; and the *Foramen ovale* is now generally allowed a part necessary in the system of the circulation of the blood in the foetus.

At the aperture of the *Foramen*, there is a kind of floating membrane, which looks like a valve; but it has nothing of the office thereof: it does not hinder the blood from passing from either auricle to the other. All it serves for, according to Mr. Winslow, is, to close the *Foramen* after the birth.

It has generally been thought, that the *Foramen ovale* may sometimes remain open, even in adults: and in effect, divers authors furnish us with instances thereof.

Dr. Connor assures us, he found it but half closed in a girl of four or five years old; and in another girl, which he opened at Oxford, there was room left to thrust a tent through. *Dissert. Med. Phys. de Stup. Of. Coal.*

The accurate Mr. Cowper adds, that he has often found the *Foramen ovale* open in adults. *Anat. Append.* fig. 3. And the Paris anatomists observe, that in a sea-calf the *Foramen ovale* is always open; by which means it is enabled to stay so long under water.

Somewhat of this, too, is supposed to have been the case in the extraordinary recoveries of divers persons drowned, hanged, &c. See **DROWNING**.

But Mr. Chefelden ventures to set aside all these authorities; and contends, that the *Foramen ovale* is neither open in any adult land animals, nor in amphibious creatures.

When he first applied himself to dissection, he tells us, he had no distrust of the frequent accounts in authors of the *Foramen* being open; but he afterwards found that he himself often mistook the osium of the coronary veins for the *Foramen*; and the like he imagines other authors to have done; who assert, that it is always open in amphibious animals; for that upon a diligent enquiry into these animals, he could never find it open in any of them.

Neither does he think that sufficient to enable those creatures to live under water, as the foetus does in utero; unless the ductus arteriosus were open also. *Chefeld. Ap. Der. Phys. Theol.* 1. iv. c. 7.

FORCE, *vis*, or *power*, in mechanics, philosophy, &c. See **VIS**, and **POWER**.

Accelerating FORCE,	See	ACCELERATION.

FORCE of Wind,		WIND, &c.

FORCE,

FOR

FORCE, in common law, signifies an offence, by which violence is used either to persons, or things.

Force is either *simple*, or *compound*.

Mixed, or *compound Force* is violence committed with some fact, which of itself alone were criminal: as if any man by *Force* enter into another man's possession, and there kill a man, or ravish a woman, &c.

Simple Force is that which has no other crime adjoined to it: as if one, by *Force*, enter into another man's possession, without doing any other unlawful act.

Force is also divided into *true Force*, and *Force after a sort*. There are other branches; as *forcible entries*, *forcible detaining*, or holding; unlawful assembly, routs, riots, rebellions, &c. See **FORCIBLE Entry**, &c.

Fresh Force. See the article **FRESH**.

FORCE, in grammar, and some other arts, is applied to a thing which stands in lieu of, or has the same effect as another.

In our language, the *f* between two vowels has the *Force* or power of a *z*, and is sometimes put for a *z*: as in horison, baptizing, &c.

In Hebrew, the Dagesh; and in Arabic, the Tefdid, have the *Force* of a letter suppressed. An unite before a cypher, has the *Force* of ten.

FORCEPS*, a chirurgeon's instrument, wherewith dead, and corrupt parts are seized, cut, or pulled off, &c. As also foreign bodies extracted out of wounds, &c.

* The word literally denotes a pair of tongs.

They are of divers forms, long, crooked, with teeth; with beaks, half-mooned, &c.

FORCIBLE Entry, a violent, actual entry into houses, or lands, &c. weapon'd; whether violence or hurt be offered any person therein, or not.

FORCIBLE holding, or *detaining*, a with-holding by violence, and with a strong hand, of the possession of land, &c. whereby he who has a lawful right of entry is barred or hindered.

FORDICIDIA*, in antiquity, a religious feast among the Romans, held on the fifteenth of *April*: thus called from the Latin *forda*, a cow big with calf, and *caedo*, I slay, or sacrifice; by reason such cows were herein sacrificed to the goddess *Vellus*, or the earth.

* *Forda*, a cow with calf, is formed, according to Ovid, from *fere*, I bear; or rather, as Scaliger and Salmassius imagine, from the Greek, *φορην*, *φορεω*, the same.

Varro writes, that there were several of these cows sacrificed in the Curia. And Livy, and Halicarnassus relate, that there was one in each Curia; so that there were thirty in all; which is confirmed by Ovid. *Fastor.* l. iv. ver. 631.

The *Fordicidia* were first instituted by Numa, on occasion of a general barrenness among the cattle: Ovid gives a particular description of the ceremony, in the passage above quoted: He adds, that part of these cows were sacrificed in the temple of Jupiter, that is, in the capitol.

FORE-CASTLE of a ship, is that part where the fore-mast stands. See *Tab. Ship.* fig. 2. lit. B C; n. 23.

It is divided from the rest of the floor by a bulk-head; that part of the *Fore-Castle* which is aloft, and not in the hold, is called the *Prova*.

FORECLOSED, in our ancient law books, signifies barred, shut out, or excluded for ever: as, when the equity of redemption on mortgages is barred.

FOREFOOT, in the sea language, is when one vessel sails, or lies across another's way.

As if two ships being under sail, and in ken of one another; one of them lies in a course with her stern so much a-weather of the other, that if both hold on, the windward ship will run a-head of the other. Such ship is said to lie with the other's *forefoot*.

Though as soon as she has passed, they say, she is gone out a-head.

FOREIGN*, something extraneous, or that comes from abroad.

* The word is formed of the latin *foris*; doors; or *foris*, out of doors; or *forum*, market, &c.

Foreign minister, *foreign prince*, *foreign goods*, &c. are those belonging to other nations. See **MINISTER**, &c. *Foreign* to the purpose; signifies a thing remote or impertinent. Matter is *foreign* to the idea of space, i. e. it is not inherent therein, but adventitious thereto.

Foreign plants are particularly called *exotics*.—*Foreign Fossils*, see **FOSSEL**.—*Foreign Motion*, see **MOTION**.—*Foreign Canons*, see **CANON**.

In some universities they give the appellation *foreign doctors*, *doctores forensis*, to such as do not reside in the place, or the university; but take degrees to go and live elsewhere, and in other countries.

In the life of St. Paul, bishop of Verdun, written by an anonymous author, and published from a MS. above four hundred years old, by Bollandus, we meet with *forensis presbyter*, for a priest who lives in another part. The same Bollandus

FOR

notes, that St. Ambrose uses the word *forensis* for exterior. **FOREIGN**, or *FORAINE Traite*, is a duty belonging to the king of France, of one twentieth of the value of all goods, imported or exported out of the kingdom.

FOREIGN, is used in law in several senses, and joined with divers substantives.—Thus,

FOREIGN Answer, is such an answer, as is not triable in the county where it is made.

FOREIGN Attachment, is an attachment of foreigners goods found within a liberty or city, in the hands of a third person, for the satisfaction of some citizen, to whom the foreigner oweth money.

FOREIGN Matter, in law, is matter triable in another county; or matter done in another county.

FOREIGN Opposer, or *Apposer*, is an officer in the exchequer, to whom all sheriffs or bailiffs do repair to be apposed by him of their green wax, after they are apposed of their sums out of the Pipe-office; and who from thence draws down a charge upon one of them to the clerk of the pipe.

His business is, to examine the sheriff's estreats with the record, to ask the sheriff, what he says to every particular sum therein.

FOREIGN Plea, is a refusal of the judge as incompetent, because the matter in hand was not within his precinct.

FOREIGN Service, is such service whereby a mean lord holdeth of another, without the compass of his own fee: or, that which a tenant performeth, either to his own lord, or to the lord paramount out of his own fee.

FOREJUDGED the Court, is when an officer of any court is banished or expelled the same for some offence, or for not appearing to an action by bill filed against him; in which latter case, he is not to be admitted to officiate, till he appear to the bill. Anno 2 Hen. IV. c. 8.

He shall lose his office, and be forejudged the court, &c. *Fore-judicare, interdum est male judicare.* Spel.

FOREJUDGER, in law, signifies a judgment, whereby a man is deprived, or put by the thing in question.

FORE-KNIGHT, in the sea language, a piece of wood, carved in figure of a man's head, and fast bolted to the beams upon the second deck.

FORELAND, or *FORENESS*, in navigation, a point of land jutting out into the sea.

FORELAND, in fortification, is a small space of ground between the wall of a place, and the moat; called also *berme* and *liziere*.

FORELOCKS, in a ship, are little flat wedges, like pieces of iron, used at the ends of bolts, to keep them from flying out of the holes.

FORELOIN, among hunters, is when a hound going before the rest of the cry, meets chace, and goes away with it.

FORELORN Hope, in an army, *Ensans perdu*. See **ENFANS Perdu**.

FORE-MAST of a ship, is a round large piece of timber, seated in her fore-part, on which is born the fore-sail, and fore-top-sail yard. (See *Tab. Ship.* fig. r. n. 8c.)

Its length is usually $\frac{2}{3}$ of the main-mast.

FORENSIC Service, see the article **SERVICE**.

FORENSIS Toga, see the article **TOGA**.

FORE-SAIL, the sail of the fore-mast. See **SAIL**.

FORESCHOKE, *Derelictum*, antiently signified as much as *forfaken* in modern language.

It is especially used in one of our statutes, for land or tenements seized by the lord, for want of services due from the tenant; and so quietly held and possessed beyond the year and day.

As if we should say, that the tenant, who seeing his lands or tenements taken into the lord's hand, and possessed so long, takes not the course appointed by law to recover them; does in due presumption of law disavow or forsake all the right he has to them.—In which case, such lands shall be called *Fore-schoke*, says the stat. 10 Ed. II. c. 1.

FORESKIN, see the article **PREPUCE**.

FOREST*, *Silva*, in geography, a great wood; or, a large extent of ground, covered with trees.

* The word is formed of the Latin *foresta*, which first occurs in the *Capitulare* of Charlemain, and which itself is derived from the German *forst*, signifying the same thing. Spelman derives it from the Latin *foris refect*, by reason *forests* are out of towns. Others derive *Foresta* a *foris*, q. d. *Foresta quod sit tuta statio ferarum*, as being a safe station or abode for wild beasts.

The Caledonian and Hercynian *Forests* are famous in history. The first was a celebrated retreat of the ancient Picts, and Scots: the latter antiently possessed the greatest part of Europe; particularly Germany, Poland, Hungary, &c. In Cæsar's time it extended from the borders of Alsatia and Switzerland to Transylvania; and was computed sixty days journey long, and nine broad: some parts, or cantons thereof are still remaining.—The *Forest* of Dean in Gloucestershire is famous for the iron works therein.

The antients adored *Forests*, and imagined a great part of their gods to reside therein: temples were frequently built in the thickest *Forests*; the gloom and silence whereof naturally inspired sentiments of devotion, and turned mens thoughts within themselves.

For the like reason, the antient Druids made *Forests* the place of their residence, and performed their sacrifices, instructed their youth, and gave laws therein. See DRUIDS.

Forest Trees, see the articles TREE, and TIMBER.

Pruning Forest Trees, see the article PRUNING.

Transplanting of Forest Trees, see TRANSPLANTING.

FOREST, in a law sense, is defined a certain territory of woody grounds and fruitful pastures, privileged for wild beasts, and fowls of *Forest*, chase and warren, to rest and abide in, under the safe protection of the king, for his princely delight; bounded with unremoveable marks, and meers, either known by matter of record, or prescription; replenished with wild beasts of venery, or chase, and with great covers of vert for succour of the said beasts; for preservation and continuance whereof, with the vert and venison, there are certain peculiar laws, privileges, and officers.

The properties and characters of a *Forest*, are, — First, That it cannot be in the hands of any, but the king; because none else hath power to constitute such commissions as are necessary to the being of a *Forest*, beside the king; as, particularly, that of a justice in eyre of the *Forest*.

And yet the abbot of Whitby had a *Forest* by grant of king Henry II. and king John; with all officers incident thereto.

The second character, is the courts belonging thereto, which are, the *Justice-seat*, held every three years; the *Swanimote*, held thrice every year; and the *Attachment*, once every forty days.

The third characteristic is the officers belonging thereto, for preservation of the vert and venison; as the justices of the forest, the warden or keeper, ranger, verderers, foresters, agisters, regarders, bailiffs, beades, &c. See each under its proper article, *JUSTICE of the Forest*, *KEEPER*, &c.

But the most essential mark of a *Forest*, is the Swanimote, which is no less incident thereto, than the court of Pye-powder to a fair. If this fail, it ceases to be a *Forest*, and commences a chase. See SWANIMOTE.

The way of making a *Forest*, is thus: certain commissioners, appointed under the great seal, view the ground intended, and fence it round: this being reported in chancery, the king causes it to be proclaimed throughout the county where the land lies, that it is a *Forest*; and is thenceforth to be governed by the laws of the *Forest*: and prohibits all persons from hunting therein, without his leave.

New Forest in Hampshire, history tells us, was made by the destruction of twenty-two parish churches, and all the villages, manors, chapels, &c. for the space of thirty miles together. Beside *New Forest*, there are now subsisting sixty-eight *Forests* in England; thirteen chaces; and more than seven hundred eighty-one parks.

Our antient Norman kings were the first who inclosed *Forests*, and settled the jurisdiction thereof: their taste ran mightily that way. In the course of a few reigns from the conquest, no less than sixty-eight *Forests* were inclosed; the strictest laws were made to secure them; and the severest penalties inflicted on all trespassers thereon.

William the conqueror decreed, the eyes of any person to be pulled out, who took either a buck, or boar: William Rufus made the stealing of a doe a hanging matter: the taking of a hare was fined at 20 s. and a coney at 10 s.

Eadmer adds, that fifty persons of fortune being apprehended by that last prince, for killing his bucks, were forced to purge themselves by the fire of ordeal, &c.

Henry I. made no distinction between him who killed a man, and him who killed a buck; and punished those who destroyed the game, though not in the *Forest*, either by forfeiture of their goods, or loss of limbs; though Henry II. remitted it for a temporary imprisonment.

Richard I. revived the old discipline of gelding and pulling out the eyes of those convicted of hunting in the *Forest*: but he afterwards relaxed a little, and was contented to make such convicts abjure the realm, or be committed, or pay a fine.

Assize of the FOREST, see the article ASSIZE.

Charter of the FOREST, see CHARTA de Foresta.

Drift of the FOREST, see the article DRIFT.

Foot of the FOREST, see the article FOOT.

Keeper of the FOREST, see the article KEEPER.

Perambulation of the FOREST, see PERAMBULATION.

Reposition of the FOREST, see REPOSITION.

Waste of the FOREST, see the article WASTE.

FOREST Pci, see the article PES.

FOREST is also used adjectively. — The *Forest* cities of the empire are four cities situate in the antient Black *Forest*, or Silva Nigra, a part of the antient Hercynian *Forest*; viz. Rhinfield, Waldhuff, Seckingen, and Lauffembourg. But, now that the bounds of the Black *Forest* are contracted, these cities are out of the limits thereof.

FOREST Law. — The *Forest* laws are peculiar laws, different from the common law of England.

Before the making of *Charia de Foresta*, offences committed therein, were punished at the pleasure of the king, in the severest manner; and even in the charter there were some grievous articles, which the clemency of later princes have since by statute thought fit to alter *per Assisas Forestae*.

Yet to this day, in trespasses relating to the *Forest*, *voluntas reputabitur pro facto*; so that if a man be taken hunting a deer, he may be arrested, as if he had taken a deer. The forester may take, and arrest a man, if he be taken either at dog-draw, stable-stand, back-bear, or bloody-hand; notwithstanding that three of these be only presumptions. See DOG-DRAW, STABLE-STAND, &c.

FORE-STAFF, an instrument used at sea, for taking the altitudes of heavenly bodies.

The *Fore-staff*, called also *Cross-staff*, takes its denomination hence, that the observer, in using it, turns his face towards the object; in contradistinction to the Back-staff, where he turns his back to the object.

The *Fore*, or *Cross-Staff*, represented in *Tab. Navigation*, fig. 14, consists of a fraight square, graduated staff, A B, and four crosses, or vanes, F F, E E, D D, C C, which slide thereon.

The first and shortest of these vanes, F F, is called the *ten Cross*, or *Vane*, and belongs to that side of the instrument, whereon the divisions begin at 3 degrees, and end at 10.

The next longer vane, E E, is called the *thirty Cross*, belonging to that side of the staff, wherein the divisions begin at 10 degrees, and end at 30, called the *thirty Scale*. The next vane, D D, is called the *sixty Cross*, and belongs to the side where the divisions begin at 20 degrees, and end at 60. The last, and longest, C C, called the *ninety Cross*, belongs to the side whereon the divisions begin at 30 degrees, and end at 90.

Use of the FORE-STAFF. — The great use of this instrument, is to take the height of the sun, and stars, or the distance of two stars: and the ten, thirty, sixty, or ninety crosses are to be used according as the altitude is greater, or lesser; that is, if the altitude be less than ten degrees, the ten cross is to be used; if above ten, but lesser than thirty, the thirty cross is to be used, &c.

Note, for altitudes greater than sixty degrees, this instrument is not so convenient as a quadrant, or semi-circle.

To observe an altitude by the FORE-STAFF. — Apply the flat end of the staff to your eye, and look at the upper-end *d* of the cross of the centre of the sun or star, and at the lower end *a* for the horizon. If you see the sky instead of the horizon, slide the cross a little nearer the eye; and if you see the sea, instead of the horizon, slide the cross further from the eye: and thus continue moving, till you see exactly the sun or star's centre by the top of the cross *b*, and the horizon by the bottom thereof, *a*.

Then the degrees and minutes cut by the inner edge *c* of the cross upon the side of the staff, peculiar to the cross you use, is the altitude of the sun or star.

If it be the meridian altitude you want, continue your observation as long as you find the altitude increase; still moving the cross nearer to the eye.

By subtracting the meridian altitude thus found, from ninety degrees, you will have the zenith distance.

To work accurately, an allowance must be made for the height of the eye above the surface of the sea, viz. for one English foot, 1 minute; for five foot, 2½; for ten foot, 3½; for twenty foot, 5; for forty foot, 7, &c.

These minutes subtracted from the altitude observed, and added by the zenith distance observed, give the true altitude, and zenith distance.

To observe the distance of two stars, or the moon's distance from a star, by the FORE-STAFF. — Apply the instrument to the eye; and looking to both ends *a* and *b* of the cross, move it nearer, or farther from the eye, till you see the two stars; the one on the one end, and the other on the other end of the cross. Then the degrees and minutes cut by the cross on the side proper to the vane in use, give the stars distance.

FORESTAGE, FORESTAGIUM, in our antient customs; an obsolete duty, or service, paid by the foresters to the king.

In Britany, Lobineau observes, the office of foresters was held by gentlemen of the first rank, who for their *Forestage* were obliged to furnish the lord, when he kept open house, with cups and spoons.

FORESTAGE also seems to have been used for a duty, payable to the king's foresters. *Et sint quieti de thelonio, & passagio, & de Forestagio*, &c. *Chart. Edw. I.*

It may likewise be taken for a right to use the forest; or a taking of reasonable estovers. See ESTOVER.

FORESTAL*, or **FORSTAL**, in Domesday wrote **FORSTEL**, is an intercepting in the highway; or stopping, or even insulting a passenger therein.

* The word is formed of the Saxon, *fore*, before; and *stel*, station. — In the laws of Hen. I. the sense of the word is thus explained: *Forethal est, si quis ex transverso incurrat, vel in viam expectet, & assidet inimicum suum.*

FORESTALLER, a person who *forstals* the market, or buys up goods upon the road.

FORESTALLING*, the buying, or bargaining for corn, cattle, or other merchandize, by the way, before it reaches the market, or fair, to be sold; or by the way, as it comes beyond the seas, or otherwise, toward any city, port, haven, or creek of this realm, with design to take advantage thereof, and sell it again at a more advanced, and dear rate.

* *Fleta* says, it signifies *obstructionem viæ, vel impedimentum transitus & fugæ avariæ*.

FORESTALLING is particularly used in Crompton, for stopping a deer broken out of the forest, and preventing its returning home again; or, a lying between him and the forest, in the way he is to return.

FORESTER, a sworn officer of the forest, appointed by the king's letters patent, to walk the forest, and watch the vert, and venison; as also to attach and present all trespasses against both, within his bailiwick, or walk, to the forest courts; to be punished according to their offences.

Though the letters patent of a *Forester* be ordinarily only granted, *quam diu bene se gesserit*; yet they are granted to some and their heirs; who are hereby called *Foresters in Fee*.

Sir William Temple relates, that the Franks having subdued all Gaul, their princes reduced Flanders into a kind of government; and gave the quality of *Foresters*, with part of the province, to the bravest of their captains.

This quality of lord *Forester* held till the time of Charlemagne, or, according to others, of Charles the Bald, in whose time Flanders being erected into a county, the title of *Foresters* was changed into that of count.

FORE-TOPE-MAST is half the length of the fore-mast, (See *Tab. Ship* fig. 1. 11. 102.) and the fore-top-gallant-mast half the length of the fore-top-mast.

FORFEITURE*, originally signifies a transgression, or offence against some penal law.

* The word is formed of the base Latin *forisfactura*; whence *forisfactura*, and *forisfactura*, and the French *forfait*. *Forisfactura* comes of *forisfactus*, which, according to *Isidore*, signifies to hurt, or offend, *facere contra rationem*; and which is not improbably derived of *foris*, out, and *factus* to do, q. d. an action out of rule, or contrary to the rules. *Borel* will have *forfait* derived from the using of force or violence: *Lobinna* in his glossary will have *forisfactus* properly signify a mulct, or amend, not a *forfait*; which latter he derives from the base *brion forsed*, a penalty.

But with us, it is now more frequently used for the effect of such transgression, or the losing some right, privilege, estate, honour, office, or effects, in consequence thereof; than for the transgression itself. As, *forfeiture of estates, forfeiture of goods, &c.* A fee becomes vacant by the forfeiture or rebellion of the vassal.

Goods *forfeited*, and goods confiscated, differ: those which have a known owner, who has committed some offence, whereby he loses his goods, are said to be *forfeited*. Those which an offender disavows, as not his own; and which are not claimed by any other, are said to be confiscated. Stat. 25 Edw. III. Add that *forfeiture* or *forfeit*, is more general; and confiscation more particular, being principally used for such as *forfeit* only to the king's exchequer.

Full FORFEITURE, *plena forisfactura*, called also *plena vita*, is a forfeiture of life and member, and all else that a man has.

FORFEITURE of marriage, *Forisfactura maritaggi*, a writ, which formerly lay against him, who, holding by knight's service, and being under age, and unmarried, refused her whom the lord offered him, without his disparagement, and married another.

FORFEX, in surgery, a pair of scissars wherewith things may be cut.

The word is sometimes also used for pincers, nippers, or plyers: and is often confounded with *forceps*. Blanchard, and after him Quincy, describes a *Forfex* as an instrument to draw teeth withal.

FORGE, properly signifies a little furnace, wherein smiths, and other artificers in iron and steel, &c. heat their metals red hot, in order to soften and render them more malleable and manageable on the anvil, &c.

We say a farrier's *Forge*, silversmith's *Forge*, cutler's *Forge*, locksmith's *Forge*, &c.—The *Forge* used by the several operators in iron, is very simple; we shall instance in that of the blacksmith, to which all the rest are reducible.

The hearth, or fire-place, is a mass of brick, about two foot six inches high: the back of the *Forge* is built upright to the ceiling, and is inclosed over the fire-place with a hovel, which leads into a chimney, to carry away the smoke. In the back of the *Forge*, against the fire-place, is a thick iron plate, with a taper pipe fixed therein, about five inches long, called the *tewel*, into which the nose or pipe of the bellows is received: the use of this plate and *tewel* is, to preserve the pipe of the bellows, and the back of the hearth from being burnt. Right before the back, at about two foot distance, is

VOL. I.

the trough, filled with water, to wet the coals with, and thereby increase their force; as also to quench the iron in. Behind the back of the *Forge* is placed the bellows, one of whose boards is fixed so, that it moves not, either upward, or downward; and to the other is fitted a rope, chain, or even a rod; which rising perpendicularly, is fixed to a cross piece, called the *rocker*, which moving on a kind of fulcrum near the middle, serves as a handle.

By drawing down this handle, the moveable board of the bellows rises; and by a considerable weight a-top of its upper side, it sinks down again; and by this alternate agitation performs the necessary motions of a pair of bellows. See *BELLOWS*. Braziers and coppersmiths *Forge* differs but little from that already described; only that it is much less, and that nothing is burnt in it but charcoal; the metals used by these operators not working well with pit-coal.

FORGE is also used for a large furnace, wherein iron ore taken out of the mine, is melted down.

But this is not properly called a *Forge* as a furnace.

FORGE is more properly used for another kind of furnace, wherein the iron ore, melted down and separated in a former furnace, and there cast into sows and pigs, is heated, and fueled over again, and beaten afterwards with large hammers; and thus rendered more soft, pure, ductile, and fit for use.

Of these *Forges* there are two kinds; which the iron successively passes through, before it comes to the smith.

The first is called the *Finary*, where the pigs are worked into gross iron, and prepared for the second, which is called the *Chafery*, where it is further wrought into bars, fit for use.

FORGE Mills, see the article *MILL*.

FORGER of false deeds, signifies either him that fraudulently makes and publishes false writings, to the prejudice of any man's right, or else the writ that lies against him who commits this offence.

Fitz. Nat. Br. fol. 69. b. says, That a writ of deceit lies against him, who commits this offence, and the penalty of it is declared in the stat. 5 Eliz. cap. 14.

FORGING, in the mechanic arts, the act of beating, or hammering iron on an anvil, after having first made it red not in the *Forge*; in order to extend it into various forms, and fashion it into works.

Iron is hammered, and *forged* two ways: either by the force of the hand; in which there are usually several persons employed, one of them turning the iron, and hammering likewise; and the rest only hammering.

Or, it is done by the force of a water-mill; which raises, and works several huge hammers, beyond the force of man, under the strokes whereof the workmen present large lumps, or pieces of iron, which are sustained at one end by the anvils, and at the other by iron chains fastened to the ceiling of the forge.

This last way of *forging* is only used in the largest works, as anchors for ships, &c. which usually weigh several thousand pounds.—For the lighter works, a single man suffices to hold, heat and turn with one hand, while he strikes with the other.—Each purpose the work is designed for, requires its proper heat.—If it be too cold, it will not feel the weight of the hammer, as the smiths call it, (*i. e.* it will not stretch or give way;) and if it be too hot, it will red-sear, *i. e.* it will break or crackle under the hammer.

The several heats the smiths give their iron, are 1° A blood-red heat. 2° A white-flame heat. 3° A sparking, or welding heat.

FORKED Heads, among hunters, those horns of deer which bear two croches on the top; or which have their croches doubled.

FORLET Land, such land in the bishoprick of Hereford, as was granted or leased, *dum episcopus in episcopatu juerit*; that the successor might have it for his present income.

But now that custom is disused, and the same lands are granted, as others, by lease; yet they still retain the name. *Butterfield's Survey*, fol. 56.

FORM, *FORMA*, in physics, denotes the manner of being peculiar to each body; or that which constitutes it such a particular body, and distinguishes it from every other.

The philosophers generally allow two principles of bodies: *Matter*, as the common basis, or substratum of all; and *Form*, as that which specifies and distinguishes each; and which added to a quantity of common matter, determines or denominates it this, or that; wood, or fire, or ashes, &c.

Aristotle calls *Form* *λογος της υλης*, the reason, or manner of the essence, or being of a thing: but as *υλη* denotes substance, as well as essence, a mighty controversy has arose in the schools, in which sense the word is here to be used; and whether *Forms* are to be accounted substantial, or only essential; *i. e.* whether the *Forms* of bodies be real substances, and have an existence distinct from that of matter, or not. It is certain, the most antient philosophers never dreamt of making *Form* a substance. *Parmenides*, and after him *Tellesius* expressly assert, all natural things to consist of one and the

the same kind of substance, and only to differ in accidents. And though Empedocles allowed of a substantial *Form* in mixt bodies, yet he denied it in the elements, and only held an essential one.

Galen allowed of nothing in matter more than the temperature of the primary elements; in which he was seconded by Alex. Aphrodisæus, Philoponus, and others.

Substantial *Forms* seem to have been first broached by the followers of Aristotle, who thought matter, under different modes or modifications, not sufficient to constitute different bodies; but that something substantial was necessary to set them at a greater distance: and thus introduced substantial *Forms*; on the footing of souls, which specify and distinguish animals.

The considerations which the Peripatetics principally insist on, in confirmation of this doctrine are: 1^o That without substantial *Forms*, all natural things would be of the same species, nature, and essence; which is supposed an absurdity.

2^o That every thing has its peculiar power, motion, and operation; as the magnet, *e. gr.* has that of attracting iron; but that this power does not flow from the matter of the body, which is only passive; nor from the accidents: and therefore that it must arise from a substantial *Form*.

3^o That without substantial *Forms* there would be no generation; for a production of accidents is only an alteration.

4^o That without such *Form*, the nature of a man and of a lion would not differ.

What contributed much to their error, was the circumstances of life and death: for, observing, that as soon as the soul was departed out of a man, all motion, respiration, nutrition, &c. immediately ceased; they concluded that all those functions depended on the soul; and consequently that the soul was the *Form* of the animal body, or that which constituted it such: that the soul was a substance, independent of matter, no body doubted; and hence the *Forms* of other bodies were concluded equally substantial.

But to this it is answered, that though the soul be that by which a man is man; and consequently is the *Form* of the human body, as human: yet it does not follow, that it is properly the *Form* of this body of ours, as it is a body; nor of the several parts thereof, considered as distinct from each other.

For those several parts have their proper *Forms* so closely connected with their matter, that it remains inseparable therefrom, long after the soul has quitted the body: thus, flesh has the *Form* of flesh; bone of bone, &c. long after the soul is removed, as well as before.

The truth is, the body does not become incapable of performing its accustomed functions, by reason the soul has deserted it; but the soul takes its leave, by reason the body is not in a condition to perform its functions.

The ancient and modern corpuscular philosophers therefore, with the Cartesians, exclude the notion of substantial *Forms*; and shew by many arguments, that the *Form* is only the modus or manner of the body it is inherent in.

And as there are only three primary modes of matter, *viz.* figure, rest, and motion; with two others arising therefrom, *viz.* magnitude, and situation: the *Forms* of all bodies they hold to consist therein; and suppose the variations these modes are capable of, sufficient to present all the variety observable in bodies. See *MODES*.

Many varieties we actually see result from changes in these modes; which may very well pass for differences of *Form*: thus an awl only differs from a needle in magnitude; a globe from a cube in figure: and transparent glass being pulverized, will reflect the light, and appear white; and yet all the alteration consists in the order and arrangement of the parts: when wheat is ground into flour, all the change consists in a separation of the contiguous parts; and when the flour is baked into bread, what is it but the same particles associated again, in another manner? By agitating water, a froth is formed; if the agitation be increased, the particles will exhale, and form clouds; which being congregated again, return in dew, snow, hail, or rain: and the same water, by the accession of cold, might have been formed into ice. So many different bodies, endued with different qualities, and which the Peripatetics themselves allow specifically different, arise from one and the same body by mere motion, and rest!

The philosophy of substantial *Forms*, its rise, use, and extent, are set in an excellent light by Fa. Malebranche.

The way of thinking, that first introduced it, is this: every thing I perceive in tasting, feeling, and handling this honey, and salt, is in the honey, and salt: but it is certain, that the things I perceive in the honey, *e. gr.* the colour, taste, &c. differ essentially from those I perceive in the salt; consequently, there is an essential difference between the two.

Hence it follows, that they are grossly deceived, who take all the differences between those bodies to consist in the different configurations of the component parts; since the different figure is not at all essential to the different bodies: for change the figure of the parts of the honey how you will; and even give them those of the parts of salt; yet it is honey still.

There must therefore be some substance added to the com-

mon matter of all bodies, to make them essentially different. And thus are substantial *Forms* hooked in; those fertile substances, which perform every thing that we see in all nature.

Since then in every natural body there are two substances; the one common to honey, salt, and all other bodies; and the other, that which makes the honey, honey; the salt, salt; and all other bodies what they are: it follows, that the first, *viz.* Matter, having no contrary, but being indifferent to all *Forms*, must remain without force, and action; as having no occasion to defend itself.

But for the others, *viz.* the substantial forms, there is a necessity of their being accompanied and invested with faculties and qualities for their defence, and subsistence. These must be always on their guard, for fear of being surprized: they are in possession of a thing, which they are to hold against numerous pretenders; and therefore they must be continually at work, to fortify themselves, and extend their dominion over the neighbouring matters, and push their conquests as far as they can: were they to remain unactive, and unprepared, other *Forms* would lay hold of them, and banish and destroy them for ever. To guard against this, they keep constant watch; and entertain mortal enmities and antipathies against those other *Forms*, which only wait to destroy them.

If now it happen, that one *Form* seize the matter, or receptacle of another; that the *Form* of a carcass, for instance, seize the body of a dog: it is not enough, that this new *Form* annihilate the former; but its hatred must be further gratified with the destruction of all the qualities, that took its enemy's parts.

The hair of the carcass, then, must be turned white, by a creation of a new colour: its blood must become red, but of such a red, as is not to be suspected in the interest of the enemy; and the whole body to be invested with qualities, truly to their new master, whom they are to defend with all the power the qualities of a carcass can have; till such time as being overpowered, this *Form* gives way too, in its turn, to the *Form* of maggots, worms, &c.

But, as nothing can be in perpetual war; but every thing has its place of rest; it follows, that even the fire must likewise have its centre, whither its natural levity always prompts it, that it may remain at rest, cease to burn, and even quit its heat, which it only maintains here below for its defence.

These may serve as a taste of the consequences, drawn from that important principle, substantial *Forms*; which is infinitely fertile, and furnishes every philosopher with all sorts of solutions, according to his ability, address, inclination, &c.

Forms are usually distinguished into essential and accidental.

Essential FORMS. Though the five modes above-mentioned, generally taken, be adventitious; yet, to this, or that body, *e. gr.* to fire, or water, they are essential: thus, it is accidental to iron, to have this, or that magnitude, figure, or situation; since it might exist in different ones; yet, to a knife, or hammer, the figure, magnitude, and position of parts, which constitute it a hammer, or knife, are essential; and they cannot exist, or be conceived without them.

Hence it is inferred, that though there be no substantial, there are essential *Forms*, whereby the several species of bodies become each what they are, and are distinguished from all others.

Accidental FORMS, are those really inherent in bodies; but in such manner, as that the body may exist in all its perfection, without them.—Such is whiteness in a wall; heat in water; a figure of a man in wax, &c.

Metaphysical FORM is nothing else but specific difference; as metaphysical matter is nothing else but the genus.—Thus, rational, is the metaphysical *Form* of man.

Forms, again, are distinguished into simple, and compound.

Simple FORMS are those of simple bodies, *i. e.* of such as have but few properties.

Compound FORMS are those of more compound bodies; or of such as have more properties.

Thus, *e. gr.* if the *Form* of a hard body be compared with the *Form* of wood; the former may be accounted simple, and the latter complex; inasmuch as a hard body, considered only as hard, has fewer properties than wood.—Absolutely speaking, however, simple *Forms* are those of the elements; and compound, those of mixt bodies.

Lastly, some distinguish *Forms* into natural, and artificial.

Natural FORMS, are those inherent in bodies without any thing contributed thereto on the part of man. Such is the *Form* of marble.

Artificial FORMS, are those arising from human industry: such is that of a statue.—But this distinction is useless; and does not imply any intrinsic difference in the *Forms* themselves.

Form of Corporeity, according to Avicenna, and the Scotists, is that which constitutes body in the general effe of body.

That there is such a thing, they prove thus: the human body is a natural body, which cannot be placed in the effe of body, but by the *Form* of corporeity: For it is either so placed by this, or by the rational soul; not by the soul, since that is spiritual; therefore by the *Form* of corporeity. And the same may be understood of other bodies: but the later philosophers set this aside as a chimæra.

Syllogistic FORM, is a just disposition, both of the terms, in respect of predicate, and subject; and of the propositions, in respect of quantity, and quality.

By just disposition we mean such an one, wherein the conclusion follows duly and legitimately from the two premises; there being no *Form* where there is no conclusion. See **SYLLOGISM**. The disposition of the several terms, being, as it were, so many steps or degrees of a *syllogistic Form*; is called the *figure of the syllogism*.

The disposition of the premises alone, being as it were another degree, is called the *mode of the syllogism*.

FORM, in theology, denotes one of the essential parts of the sacraments; being that which gives them their sacramental nature and efficacy.

The *Form* consists in certain words, which the priest pronounces in administering them.---In some of the Romish sacraments the *Form* is deprecativ; in ours it is absolute, or indicative.

The fathers and ancient divines held, that the sacraments consisted of things, and words, *rebus & verbis*. William of Auxerre was the first, who, about the beginning of the 13th century, introduced the terms, *matter* and *form*, in lieu thereof.

FORM is also used, in a moral sense, for a manner of being, or doing a thing according to rules.

This republic has frequently changed its *Form* of government; that is, its constitution. Pardons generally express a remission, or abolition of a crime, in what *Form* or mannersoever it were committed. He was admitted doctor in *Form*; put your argument in *Form*.

FORM, in law, is applied to certain established rules to be observed in process or judiciary proceedings.

In which sense the word stands opposed to the ground or matter in dispute.

It is a maxim in law, that the *Form* leads, or sways the matter: the very contrary maxim should be true.

CONTRA FORMAM *seppamenti*, } See the article **CONTRA**.

CONTRA FORMAM *collationis*, }

Modo & FORMA. see the article **FORMA**.

FORM*, in joinery, &c. is applied to the long seats or benches in the choirs of churches, for the priests, canons, prebends, religious, &c. to sit on.

* Du Cange takes the name to be derived from hence, that the backs of these seats were anciently enriched with figures of painting and sculpture, called in Latin, *forma & typi*.---In the life of St. William of Rochford we meet with *Forma*, as signifying a seat for an ecclesiastic, or religious, in a choir; and in that of St. Lupicin, we have *formula* in the same sense. In the rule of the nuns of St. Caesarea, the nun who presides over the choir is called *primiceria*, *vel formaria*.

FORM also denotes the external appearance or surface of a body; or the disposition of its parts, as to length, breadth, and thickness.

In which sense it coincides with figure.

FORM is also used in the mechanic arts, for a kind of mould, whereon a thing is fashioned, or wrought.

Such are the hatters *Form*, the paper-makers *Form*, &c.

Hatters FORM, is a large block, or piece of wood of a cylindrical figure; the top thereof being rounded, and the bottom quite flat.

Its use is, to mould or fashion the crown of the hat, after the matter thereof has been beaten and felled.

To *form* a hat, it is necessary the wool, hair, &c. be very hot, just reeking out of the copper.

Paper-makers FORM is the frame or mould wherein the sheets are fashioned. See **PAPER**.

Printers FORM is an assemblage of letters, words, and lines, ranged in order, and disposed into pages, by the compositor; from which, by means of ink, and a press, the printed sheets are drawn.

Every *Form* is inclosed in an iron chafe, wherein it is firmly locked by a number of pieces of wood; some long and narrow, and others in *form* of wedges.

There are two *Forms* required for every sheet; one for each side; and each *Form* consists of more or fewer pages, according to the volume of the book.

FORM, in hunting, denotes the feat of a hare; or the place and time when and where the quarts.

FORMA Pauperis, or in **FORMA Pauperis**, is when any person has cause of suit, but is so poor that he cannot dispense the usual charges of suing at law, or in equity.

In this case, upon his making oath that he is not worth 5 l. his debts being paid, and bringing a certificate from some lawyer, that he has just cause of suit, the judge admits him to sue in *Forma pauperis*, that is, without paying fees to the counsellor, attorney, or clerk. This custom has its beginning from stat. 11 H. VII. c. 12.

FORMAL, something that regards the *Form*; or that gives the manner, or *Form*.

The *formal* cause, joining itself to the material, produces the body, or compound.

The schoolmen also apply the word to anything which has

a kind of *Form*, either essential, or accidental; at least, in our conception.

Thus, we frequently hear the philosophers talk of the *formal* object of knowledge; and of the *formal* reason of any thing; *formal* unity, &c.

FORMAL Cause is defined by certain philosophers, to be something implanted in one parcel of matter, whereby it is distinguished from all other matter.

For matter is supposed common to all bodies; consequently, that they are distinguishable from one another does not arise from their matter, but from the *Form* which is peculiar to each: hence what is produced by such cause, is said to be *formed*.

Hence it follows, that the casualty of matter, and form, is not the same; or that the component power, and the actual composition are different. Contrary to the opinion of the generality of schoolmen, who maintaining *Form* to be a substance co-existent with matter, make it a real component part; as much as matter itself.

FORMAL Circle, see the article **CIRCLE**.

FORMAL Notion, see the article **NOTION**.

FORMAL is also used in a moral sense, importing positive, express, and precise.

Thus we say, a *formal* agreement, a *formal* text, *formal* answer, &c.---*Formal* evidence. See **EVIDENCE**

FORMALITER, **FORMALLY**, is variously used in the schools.

Sometimes it is understood of the subject, when a predicate is therein on account of some form: thus, white *formally* taken, diffuses light; *q. d.* the form inherent in this subject, *viz.* whiteness, is the cause why the subject diffuses the light.

FORMALLY has also place in suppositions; a word being *formally* supposed, when it is taken for the thing it was intended to signify: as, *man is an animal*.

FORMALLY is also used in the same sense with *adequately*, and totally: thus, a syllogism *formally*, *i. e.* adequately taken, requires three propositions.

Sometimes it is also used for *quidditatively*: thus, *man formally* taken, is a reasonable animal.

FORMALLY is also used for *really*: in opposition to objectively: thus, a thing is said to be *formally* such, when it is such in the proper notion of the thing spoke of.

FORMALLY, again, is used in speaking of the manner wherein a thing is contained in another; in opposition to *virtually*, and *eminently*. See **VIRTUALLY**, and **EMINENTLY**.

FORMALITY, the quality of a *Form*, or *Formula*: or that which constitutes and denominates them such.

FORMALITY, as defined in the schools, is any manner, wherein a thing is conceived: or, a manner in any object, importing a relation to the understanding, whereby it may be distinguished from another object.

Thus, animality and rationality are *Formalities*.---The Scotists make great use of *Formalities*; in opposition to the virtualities of the Thomists.

The Scotists hold, that the metaphysical degrees in man are so many *Formalities*, really distinct from each other; as *man*, *living*, *animal*, &c. And the same they hold of the attributes of God: the Thomists, on the contrary, contend, that they are really and intrinsically the same.

FORMALITIES, in matters of law, are frequently used for the formula's themselves; or the rules prescribed for judiciary proceedings.---In contracts of strict law, all the *Formalities* must be strictly observed: an omission of the least *Formality* may ruin the whole convention.

The term is also used for a certain order, or decorum, to be observed.

The composition of *Formalities*, decencies, and circumspctions, may form a political pedant; but not an ambassador, who must be a gallant man. Wicquefort.

FORMATION, in philosophy, &c. the act of forming, fashioning, or producing a thing.

The *Formation* of the chick in the egg is admirably explained by Malpighi, in an express treatise, *De Formatione pulli in ovo*.

The *Formation* of the fetus, the embryo, in the womb, is a process of which we have but very dark conceptions.

The *Formation* of metals is effected in the earth, of fumes, or vapours raised by the subterraneous fire, and fixed or condensed as they arrive toward the surface of the earth.

FORMATION of stones, see the article **STONES**.

FORMATION of the tails of comets, see **COMETS**.

FORMATRIX, or **FORMATRICE**. The ancient philosophers admitted a *Virtus*, or *Facultas Formatrix*, whereby all things had their forms given them.

FORMATUM Punctum, see the article **PUNCTUM**.

FORME, or **FORMY**, in heraldry. A *Crofs FORME*, or *Formy*, is a cross narrow in the centre, and broad at the ex-

trores; so called by Leigh and Morgan; though most other authors call it *Pate*.

FORMED, or **FIGURED Stones**, among naturalists, are such bodies, as being either pure stone, flint, or spar, are found in the earth, so *formed*, as that they bear a near resemblance to the external figure of muscles, cockles, oysters, or other shells, or to plants, or animals.

Authors have been greatly divided as to their origin: the several opinions see under the articles **FOSSIL**, **SHELL**, &c.

FORMED Bachelor, see the article **BACHELOR**.

FORMED, in heraldry, &c. the same with *seated*.

FORMEDON, in law, a writ which lies for him who has right to lands, or tenements, by virtue of any entail, arising from the statute of Westm. 2. c. 1.

There are three kinds, viz. *Forma Donationis*, or *Formedon in the Descender*; *Formedon in the Reverter*; and *Formedon in the Remainder*.

FORMEDON in the Descender, lies for the recovery of lands, &c. given to one and the heirs of his body; or to a man and his wife, and the heirs of their two bodies; or to a man, and his wife, being cousin to the donor, in frank marriage, and afterwards alienated by the donee.

After his decease, his heir shall have this writ against the tenant or alienee.

Fitz. Nat. Br. fol. 211, &c. makes three sorts of *Formedon* in the descender: the first is that now expressed: the second, for the heir of a coparcener that aliens, and dies; the third he calls, *Infimus tenuit*; which lies for a coparcener, or heir in gavel-kind, before partition, against him to whom the other coparcener or heir has alienated, and is dead.

FORMEDON in the Remainder, lies where a man gives land in tail, the remainder to another in tail; and afterwards the former tenant in tail dies without issue, and a stranger abates: then he in remainder shall have this writ.

FORMEDON in the Reverter, lies for the donor, or his heirs (whose land is entailed to certain persons, and their issue, with condition, for want of such issue to revert to the donor, and his heirs) against him to whom the donee alienates after the issue extinct, to which it was entailed.

FORMICA*, in medicine, a species of tumid, callous wart, of a blackish colour, and broad base; which appears like the stings of ants.

* And hence the name *Formica*, which literally denotes an ant: for the like reason it is denominated by the Greeks, *μυρμικα*.

FORMING, is used for the act of giving being, or birth to any thing: thus, God is said to have *formed* man after his own image. Every thing generated is *formed* of something corrupted.

The word is also simply used for giving the figure to any thing. The potter *forms* his vessels as he pleases. Geometry teaches how to *form* all kinds of figures.

It is used also, for the producing of a thing: thus, thunder is *formed* of exhalations: the lineaments of the face began to be *formed*.

FORMING of a Siege, is the making lines of circumvallation, to fortify the camp, and disposing things for the attack of a place in *form*.

They also say, to *form* a squadron, or battalion; meaning, to range the soldiers in form of a squadron, &c.

The term is also used in speaking of a body of forces; which being out of any order of squadrons, battalions, &c. do halt, range themselves in order, and put themselves in a condition for the attack. — As soon as the enemy observed this motion, they began to *form* themselves.

Angle FORMING the Flank, see the article **ANGLE**.

FORMING, is also used in grammar, in speaking of certain tenses of verbs, which are made from others, by a change of certain letters.

The present tense is *formed* from the infinitive. Compound and derivative words also; and even all that have any etymology, are said to be *formed*.

FORMULA, a rule, or model; or certain terms prescribed, and decreed by authority, for the form and manner of an act, instrument, proceeding, or the like.

The Roman law was full of *Formula*'s: divorces, adoptions, stipulations, &c. were performed by certain *Formula*'s, or in certain terms. — Cneius Flavius published a collection of the *Formula*'s of his time; which were well received. — The least slip or failure in any of the terms of these *Formula*'s, rendered the whole transaction null. — The *Formula*'s of Marculphus, with M. Bignon's comment, are in great esteem.

FORMULA, in church history, and theology, denotes a formulary, or profession of faith.

The council of Seleucia was dissolved by Leonas, the emperor's commissary, as not able to bring them to sign the *Formula*.

FORMULA, in medicine, denotes a little form, or prescription; such as physicians direct in extemporaneous practice: in distinction from the greater forms, which are the official medicines. See **PRESCRIPTION**.

FORMULARY, a writing, containing the form, or formula

of an oath, declaration, attestation, or abjuration, &c. to be made on certain occasions.

There are also *Formularies* of devotion, of prayers, &c. liturgies are *Formularies* of the public service in most churches.

FORNACALIA, or **FORNICALIA**, a feast held among the ancient Romans, in honour of the goddess Fornax or Fornix.

It was solemnized with sacrifices, performed before the mouth of an oven, wherein they dried their corn, baked their bread, &c.

The *Fornacalia* were moveable: the grand curio proclaimed the time of celebration every year on the twelfth of the calends of March.

They were first instituted by Numa; and the Quirinalia were instituted for the sake of such as had not kept the *Fornacalia*. See **QUIRINALIA**.

FORNICATION, *Whoredom*; the act, or crime of incontinency between single persons; for if either of the parties be married, it becomes adultery.

St. Thomas labours much to prove simple *Fornication*, contrary to the law of nature.

By the ancient law of England, the first offence herein was punished with three months imprisonment: the second was made felony, by an act in the time of the late usurpation. At present, doing public penance is the chief punishment.

FORNICATION is sometimes used as a general term, including all kinds of offences against chastity.

Its species are, 1^o *Simple Fornication*, which is that committed with a prostitute. 2^o *Stuprum*, that committed with persons of reputation and sobriety. 3^o That committed with relations, called *Incest*. 4^o That committed with married persons, *Adultery*. 5^o That committed with persons consecrated to God, *Sacrilege*. 6^o That committed between persons of the same sex, *Sodomy*. 7^o That committed by persons on themselves, *Manusupration*. And 8^o That committed with beasts, *Bestiality*.

FORNIX, in anatomy, the extremity of the corpus callosum, next the cerebellum; which is separated or divaricated into two legs, forming a kind of arch, or *Fornix*. See **CORPUS CALLOSUM**.

FORPRISE, in law, an exception, or reservation. — In which sense the word is used in the statute of Exon, 14 Edw. I.

We still use it in conveyances and leases, wherein excepted and *forprised* are synonymous terms.

FORPRISE * is also used for an exaction. — In which sense it amounts to the same with *forecapium*.

* *Totum pratum, &c. sine quacunque Forpripa in excambium pro place dedit.*

FORAGE*, provision for cattle, of hay, oats, and straw; particularly in war.

* Skinner derives the word from *foras agere*, by reason they go abroad to seek *Forrage*: Others from *Far*, which antiently signified any kind of corn, or grains: Menage, from *Foderagium*, or *Fodrum*, or *Fodrum*, which the Romans used in the same sense: Cujas and Du Cange, derive it from the German *Futter*, horse-meat: Vossius, from the German *foden*, or *voeden*, to feed: Nicod, from *Farrago*; which literally signifies what we call *Forrage*; and figuratively, a mixture of divers kinds of things. Hicks derives it from the Saxon *Fodre*, or the English *Fodder*, or the base Latin, *Fodrum*. See **FODDER**.

In marching, encamping, &c. care must be taken, that the cavalry may find *Forrage*. To go to *forrage*: They were sent *a-forraging*.

A ration of *Forrage* is the portion of hay, straw, and oats, allowed each horseman, for the subsistence of his horse one day: which is twelve pounds of hay, as much straw, and three pecks of oats.

FORSTAL, } See { **FORESTAL**.

FORSTALLING, } See { **FORESTALLING**.

FORT, a little castle, or fortress; or a place of small extent, fortified by art, or nature, or both.

A *Fort* is a work encompassed round with a moat, rampart, and parapet; to secure some high ground, or passage of a river; to make good an advantageous post; to fortify the lines and quarters of a siege, &c.

Field Fort, see the article **FORTIN**.

Paine Fort, & *dure*. See the article **PAINE**.

Royal Fort, is a *Fort* whose line of defence is at least twenty-six fathoms long.

Star Fort, is a scone, or redoubt, constituted by re-entering and salient angles; having commonly from five to eight points; and the sides flanking each other.

FORTERESSE, or **FORTRESSE**, a general name for all fortified places; whether so made by nature, or art.

Such are fortified towns, castles, citadels, forts, towers, redoubts, sconces, &c.

FORTIFICATION, called also *military architecture*, is the art of fortifying, or strengthening a place; by making works around the same, to render it capable of being defended by a small force, against the attacks of a more numerous enemy.

TAB. FORTIFICATION

Some authors go back to the beginning of the world, for the author and origin of military architecture. According to them, God himself was the first engineer; and paradise, or the garden of Eden, was the first fortress. Cain improved on the hint, in building the first city, Gen. iv. 17. After him came Nimrod, Gen. x. 10. Then Semiramis, as Polyzenus relates, *Stratagem*. l. viii. c. 27. The Canaanites, Numb. xiii. 19. Deut. i. 28. David, 2 Sam. v. 9. Solomon, 2 Chron. iii. 5. Rehoboam his son, 2 Chron. viii. 5. and the other kings of Judah and Israel; and at length the Greeks and Romans. Vitruvius, l. x. cap. ult. and l. i. c. 5.

Such is the series of those who fortified places; to which might be added Pharaoh, the persecutor of the Israelites, who built the cities of Pithom and Raames, Exod. i. 11. But how ancient soever the surrounding of cities with walls, towers, &c. may be, the name *Fortification*, and the art now understood thereby, are of no very old standing.

These have had their rise since the invention of cannons; the terrible effects whereof rendered it necessary to change the structure of the ancient walls, and to add so many things thereto, that those changes were thought enough to constitute a new art, which was called *Fortification*, by reason of the strength it afforded those in cities, to defend them against an enemy.

The first authors who have wrote of *Fortification*, considered as a particular formed art, are Ramelli, and Cataneo, Italians. After them Errard, engineer to Henry the great of France; Stevinus, engineer to the prince of Orange; Marolois, the chevalier de Ville, Lorini, Coehorn, the count de Pagan, and the marshall de Vauban: which last two noble authors have contributed greatly to the perfection of the art.

From the idea and office of *Fortification*, some general fundamental rules or axioms may be drawn: as,

1^o, That the manner of fortifying should be accommodated to that of attacking: so that no one manner can be assured all ways to hold, unless it be assured the manner of besieging be incapable of being altered; and that to judge of the perfection of a *Fortification*, the method of besieging at the time when it was built must be considered.

2^o, All the parts of a *Fortification* should be able to resist the most forcible machines used in besieging.

3^o, A *Fortification* should be so contrived, as that it may be defended with as few men as possible, which consideration, when well attended to, saves a vast deal of expence.

4^o, That the defendants may be in the better condition, they must not be exposed to the enemy's guns and mortars; but the aggressors must be exposed to theirs.

Hence, 5^o, All the parts of a *Fortification* should be so disposed, that they may defend each other; in order to this, every part there is to be flanked, i. e. capable of being seen and defended from some other; so that there be no place where an enemy can lodge himself, either unseen, or under shelter.

6^o, All the campaign around must lie open to the defendants; so that no hills or eminence must be allowed, behind which the enemy might shelter himself from the guns of the *Fortification*; or from which he might annoy them with his own.

The fortress, then, is to command all the place round about; consequently the out-works must all be lower than the body of the place.

7^o, No line of defence is to be above point blank musket shot, which is about one hundred and twenty fathom.

8^o, The acuter the angle at the centre, the stronger is the place; as consisting of the more sides, and consequently more defensible.

Such are the general laws and views of *Fortification*: the particular ones, respecting each several work or member thereof, will be delivered under their proper articles. See BASTION and FORTIFIED place.

FORTIFICATION is also used for the place fortified; or the several works raised to defend and flank it, and keep off the enemy.

All *Fortifications* consist of lines and angles, which have various names, according to their various offices.

The principal angles are those of the centre, the flanking angle, flanked angle, angle of the epaule, &c.

The principal lines are those of *circumvallation*, of *contravallation*, of the capital, &c. See each in its place.

Fortifications are divided into *regular*, and *irregular*; and again into *durable* and *temporary*.

Regular FORTIFICATION, is that wherein the bastions are all equal; or that which is built in a regular polygon, the sides and angles whereof are generally about a musket shot from each other.

In a regular *Fortification*, the parts being all equal, have the advantage of being equally defensible; so that there are no weak places.

Irregular FORTIFICATION, is that wherein the bastions are unequal, and unlike; or the sides and angles not all equal, and equidistant.

In an irregular *Fortification*, the defence and strength being unequal; there is a necessity for reducing the irregular figure, as near as may be, to a regular one.

And, as the irregularity of a figure depends on the quantity of angles and sides; the irregularity of a *Fortification* arises either from the angles being too small, or the sides being too long, or too short.

Consequently, an irregular figure being proposed to be fortified; all the angles, with the quantity of the sides, must be found, to be able to judge how it is to be fortified.

Durable FORTIFICATION, is that built with design to remain a standing shelter for ages. Such are the usual *Fortifications* of cities, frontier places, &c.

Temporary FORTIFICATION, is that erected on some emergent occasion, and only for a little time.

Such are field works, cast up for the seizing and maintaining a post, or passage; those about camps, &c. as circumvallations, contravallations, redoubts, trenches, batteries, &c.

The methods of fortifying, that have been invented, are various; and new methods continue still to be proposed. The principal, and those which chiefly obtain through Europe, are those of Coehorn, Pagan, Vauban, and Scheiter, from which all the rest are easily conceived.

FORTIFICATION, according to the Dutch method, is that, which making the flank perpendicular to the curtain, makes the flank the subsuple of the face, and subtriple of the curtain; and the angle of the bastion, equal, either to two thirds of the angle of the polygon; or to half thereof, with the addition of fifteen or twenty degrees, to make it equal to a right angle.

Freitach determines the quantity of the flank in a square to be six; in a pentagon, seven; in a hexagon, eight; in a heptagon, nine; in an enneagon, ten; in a decagon, eleven; and in all other figures, twelve Rhinland perches: consequently, the face twenty-four, and the curtain thirty-six perches.

To draw the profile of a *Fortification* after the Dutch manner; draw the inner polygon GH, *Tab. Fortification*, fig. 6. into five equal parts: the demi-gorge AH is to contain one of them; and the capital HC, two. Then divide the curtain EA into four parts; and make the flank AB one.

This is Freitach's method: but the French make both the demi-gorge, and flank, a sixth part of the polygon; and in squares, and pentagons, setting aside the second flanks, they describe a semicircle upon BS, that the angle of the bastion C may be a right angle.

The Italians giving the same dimensions to the gorge and flank, make the secondary flank half the curtain, in polygons exceeding a hexagon, and a third of the curtain in the rest.

Lastly, the Spaniards giving the same dimensions to the flanks, omit the secondary flanks.

But flanks perpendicular to the curtain with secondary flanks, are in dispute, on account of the obliquity of the defence; so that the Dutch method of fortifying, with the other ancient ones, founded on the same principles, are now out of doors.

FORTIFICATION, according to the count de Pagan's method; supposes in the larger *Fortifications*, the external polygon AB, fig. 7. to be one hundred, and the iace AG, thirty perches; in the smaller, the first eighty, and the second twenty-five; and in the middle size, the first ninety, and the second twenty-seven and a half: the perpendicular CD, fifteen, and the flanks GF and HE perpendicular to the lines of defence AF and BE, covered with an orillon, and threefold, to which add a ravelin and counter-guard, to serve for out-works.

This method was received with great applause, and must be allowed greatly preferable to the Dutch method.

But it has its defects; for besides that the fortifying of places by it, is very expensive; its triple flanks are too close, so as to lie exposed to the violence of the bombs; the orillon is so large as to prejudice the length of the flanks; and the outer rampart of the bastion is too big.

FORTIFICATION according to Monsr. Blondel's method, has a great affinity with that of the count de Pagan, only that the quantity of the lines and angles are differently determined. See *Tab. Fortification*, fig. 12.

Thus, a right angle being subtracted from the angle of the polygon, and to a third part of the remainder, fifteen added; the sum gives the diminished angle. In the greater *Fortification*, the outer polygon is one hundred, in the smaller eighty-five. The external polygon being divided into ten parts, seven of them give the lines of defence; and the faces are half those of the tenaille.

This method is very well calculated for the purposes of architecture; only, being somewhat expensive, it is but little used.

FORTIFICATION, according to Monsr. Vauban's method, supposes the outer polygon in the larger *Fortifications* to be one hundred; in smaller, eighty; and in the middle size, ninety: the faces are made $\frac{2}{3}$ of the same; the perpendicular, in a square, in a pentagon $\frac{1}{3}$, in the other polygons $\frac{1}{4}$ of the same. The complement of the face to the line of defence, he makes equal to the distance of the epaule; he uses re-entering and crooked flanks; and places a low tenaille before the curtain; and the Dutch ravelin with lunettes. See *Tab. Fortification*, fig. 13.

This method of *fortifying* pleases most people; both as it increases the strength, without much expence; and as it is perfectly well accommodated to the principles of military architecture, above laid down.

Yet it seems defective in this, that the faces are too much exposed to the view of the enemy; and that the lunettes are a little too long to be defended.

Monf. Vauban's newer method of FORTIFYING, is that which builds large bastions before small ones, and covers the curtain with a double ravelin; drawing a low tenaille before the same curtain. See *Tab. Fortification*, fig. 14.

Detached bastions are perfectly suitable to what we have delivered in the former method; excepting that the flanks are rectilinear, and destitute of an orillon.

FORTIFICATION according to the method of Schreier, supposes the external polygon, in the larger *Fortifications* to be one hundred perches; in the lesser eighty; in the middle size ninety: the flanks perpendicular to the lines of defence; and the lines of defence in the greater *Fortifications* seventy perches, in the lesser sixty, and the middle size sixty-five.

It detaches bastions from the curtain, and forms a kind of inner recess behind the curtain; it assumes the angle of the bastion, in a square, to be sixty-four degrees; to this adding eight, the product is the angle in a pentagon; to which adding six degrees, the sum is the angle of the bastion in a hexagon; and adding five to this, the sum is the same angle in a heptagon.

FORTIFIED Place, a Fortrefs, or Fortification, i. e. a place well flanked, and sheltered with works. — See *Tab. Fortification*, fig. 20.

Places fortified after the modern way, consist chiefly of bastions, and curtains, and sometimes of demi-bastions; according to the situation of the ground; of cavaliers, ramparts, fausse-brayes, ditches, countercarps, covert ways, half moons, ravelins, hornworks, crownworks, outworks, esplanades, redents, and tenailles. See each under its proper article, *BASTION*, &c.

There are other moveable and additional parts; as bermes, parapets, banquettes, embrasures, cordons, boyaux, moulinsets, chevaux de frise, chaussetrappes, galleries, mantelets, batteries, saps, mines, blinds, gabions, and palisades. See each in its place, *BERME*, *PARAPET*, &c.

Several of these works, again, consist of divers parts, which have different denominations; thus a bastion consists of faces, flanks, casemates, orillons, gorge, &c. which see.

FORTIN, or FORTLET, a diminutive of the word *Fort*, importing a little *Fort*, or scone, called also *Field Fort*, built in haste, for the defence of a pass, or post; but particularly to defend a camp, in the time of a siege; where the principal quarters are usually joined, or made to communicate with each other by lines defended by *Fortins* and redoubts.

Fortins being very small, their flanked angles are generally one hundred and twenty fathom distant from each other; but their figure and extent is various, according to the place and occasion; some having whole bastions, and others only half bastions.

Star FORTIN, is that whose sides flank each other, &c. See *Star FORT*.

FORTIORI. *A multo FORTIORI*, see *MULTO*.

FORTIS Aqua, see the article *AQUA*.

FORTUNA Equestris, see the article *EQUESTRIS*.

FORTUNA, in our antient law books, is the same with what we call *Treasure-Trove*.

Thesaurum ducente Fortunâ invenire inquirendum est per 12 juratores pro rege, &c. quod fideliter præsentabunt, &c. annes Fortunas, abjuraciones, appella, &c.

Some pretend it also signifies *Fortuito occisos*; but this seems to be very fanciful.

FORTUNATE Islands, in the antient geography, an appellation which has given the critics and antiquaries a world of perplexity; being the name of a place famous for golden apples which grew therein: or, as Varro says, for sheep, with golden fleeces.

The antients describe them as situate without the straits of Gibraltar, in the Atlantic ocean. — The common opinion of the moderns takes them for the Canary Islands; this is grounded principally on the situation and temperature of those islands, which renders the use of clothes there unnecessary; and from the abundance of oranges, lemons, grapes, and other delicious fruit growing therein.

Ol. Rudbeck has found a very different place for them. That learned author, who makes his native country, Sweden, the scene of all that is great and extraordinary in antient tradition and fable; will have the *Fortunate islands* to be Sweden; and the delicious fruits, talked of by the antients, his imagination suggests, were nothing but the virtue, and good manners, which antiently flourished in that cold hyperborean nation.

FORTUNE, see the articles *PROVIDENCE*, *FATE*, &c.

FORTUNE, *τυχη*, is a name unknown in the earlier ages; and does not occur either in Homer or Hesiod; as not being invented in their time.

In after days, it was introduced as a machine; and made to serve divers purposes in natural philosophy, and theology.

Men observing a world of evils and disorders to fall out; and not daring directly to complain of providence; and being willing withal to excuse themselves from being the occasions of their own misfortunes, had recourse to the notion of *Fortune*, against whom they might vent their resentments with impunity.

Plutarch, in an express treatise of the *Fortune* of the Romans, accounts for the practise of the antient poets, who seem to make Jupiter the author of all the evils of life. Mankind, he observes, before the name of *Fortune* had got into the world, perceiving a certain arbitrary cause, disposing of things in an irresistible manner, called it *god*; but the same cause being often observed to act at random, and without any rule or order at all, the supreme being came to be divested of the attribute; and *Fortune*, or destiny, acknowledged in his stead.

It is not easy to unravel, what the antients meant by the name *Fortune*. — The Romans understood by it, I know not what principle of fortuity, whereby things came to pass, without being necessitated thereto: but what, and whence that principle is, they do not seem to have ever precisely thought; whence their philosophers are often intimating, that men only framed the phantom *Fortune*, to hide their ignorance; and that they call *Fortune* whatever befalls a man without his knowing why. Hence Juvenal affirms, it was men who made a deity of *Fortune*:

Nullum mumen adest, si sit prudentia; sed te Nos facimus, Fortuna, deam, cælogue locamus.

According to the opinion of the heathens, therefore, *Fortune*, at bottom, was only the arrival of things in a sudden and unexpected manner, without any apparent cause, or reason. So that the philosophical sense of the word coincides with what is vulgarly called *chance*.

But in religion it had a further force; altars and temples in great numbers were consecrated to this *Fortune*, as a deity. — This intimates that the heathens had personified, and even deified their chance; and conceived her as a sort of goddess, who disposed of the fate of men at her pleasure. Hence that invocation of Horace, *O diva, gratum quæ regis Antium*; in the 35th ode of the first book, where he recommends Augustus, then preparing for a visit to Britain, to her protection. From these different sentiments it may be inferred, that the antients at one time took *Fortune* for a peremptory cause, bent upon doing good to some, and persecuting others: and sometimes for a blind, inconstant cause, without any view or determination at all.

If then the word *Fortune* had no certain idea in the mouth of those who erected altars to her: much less can it be ascertained what it denotes in the mind of those who now use the word in their writings.

They who would substitute the name *providence* in lieu of that of *Fortune*, cannot give any tolerable sense to half the phrases wherein the word occurs.

To these, e. g. we must always distrust *Fortune*, but especially when the seems to flatter us most: the contempt of riches, in the philosophers, is a secret desire of revenging their merit against the injustice of *Fortune*, by a contempt of those very benefits she deprives them of: *Fortune* is so blind, that amidst a crowd, wherein there is but one wife man, we must not imagine she will trace him out, to accumulate him with her favours.

On these, and the like occasions, the word *providence* cannot be substituted in lieu of *Fortune*: the idea answering to the expression, is pagan, as well as the expression itself. Add, that it is a fault, even in point of accuracy, to use a term that signifies nothing; as much as it is in point of religion, to ascribe *Fortune* with providence, in the direction of the universe.

Horace paints the goddess, preceded by Necessity, holding nails and wedges in her hands, with a cramp-iron, and melted lead to fasten it; rarely accompanied with Fidelity, unless when she abandons a family; for in that case Fidelity never fails to depart with her, as well as friends.

The painters represent her in a woman's habit with a bandage before her eyes, to shew that she acts without discernment: and standing on a wheel, to express her instability. The Romans, says Lactantius, represented her with a cornucopia, and the helm of a ship, to shew that she distributes riches, and directs the affairs of the world. In effect, it is with such characters, that we see her represented on so many medals, with the inscriptions, *FORTVNA AVG. FORTVNA REDVX. FORTVNAE AVG. or REDVCIS, &c.* Sometimes she is seen pointing at a globe before her feet, with a sceptre in one hand, and holding the cornucopia in the other.

The Romans had a virile, as well as a muliebric *Fortune*, for the objects of their adoration: the *Fortuna virilis* was honoured by the men, and the *Fortuna muliebris*, by the women.

On the reverse of a medal of Commodus, we have a representation of *Fortune*, under the quality, or surname of *Manens*, i. e. stable, permanent; holding a horse by the reins. On the Greek medals we meet with *ΑΓΑΘΗ or ΚΑΛΗ ΤΥΧΗ*, good *Fortune*. Constantine gave the epithet *anthousia*, i. e. flourishing, to the *Fortune* of his new city Constantinople.

Part of FORTUNE, see the article *PART*.

FORTY Days, see **QUADRAGESIMA** and **LENT**.

Prayers of FORTY Hours, see **PRAYERS**.

FORUM, in antiquity, is used in divers acceptations: sometimes for a place of traffic; answering to our market-place; in which sense it has usually some adjective added to it, as *forum boarium*, the beast market; *forum piscarium*, the fish market; *clitorium forum*, the herb market, &c.

FORUM, again, is used for any place, where the governor of a province convenes his people, to give judgment, according to course of law.

Whence a man is said *Forum agere*, when he keeps the assizes; *Forum indicere*, when he appoints the place where they are to be kept, &c.

FORUM was also a publick standing place in the city of Rome, where causes were judicially tried, and orations delivered to the people.

Of these *Forums* there were several; at first only three, viz. *Romanum*, *Julianum*, and *Augustum*; but that number was afterwards increased to six, by the addition of the *Transitorium*, called also *Palladium*; the *Trojanum*, and *Salustii Forum*.

The first, and most eminent of these, was the *Forum Romanum*, called also *Forum Vetus*; and absolutely, *Forum*, or the *Forum*.

In this was an apartment, called the *Rostra*, where the lawyers pleaded; the officers harangued; funeral orations were delivered, &c. See **ROSTRA**.

In the same *Forum* was the *Comitium*, or hall of justice, with the sanctuary of Saturn, the temple of Castor, &c.

FORUM is also used among casuists, &c. for *jurisdiction*. Thus, they say in *Foro legis*, or the outer *Forum*, i. e. in the eye of the law, or the common course of justice: in *Foro Conscientiae*, or the inner *Forum*, i. e. in the eye of God, or a man's own conscience.

There are a great many things not condemned in *Foro Legis*, which yet are criminal in *Foro Conscientiae*.

FOSS, or **FOSSÉ** in fortification, &c. a ditch, or moat. See **DITCH**.

* The word is French, formed of the Latin participle *fossus*, of the verb *fodio*, I dig.

Advance FOSSE, see the article **ADVANCE**.

Van FOSSE, see the article **VAN**.

Foss, **FOSSA**, in anatomy, a kind of cavity in a bone, with a large aperture, but no exit, or perforation.

When the aperture is very narrow, it is called a *Sinus*.

In the cranium there are six internal, and fourteen external *Fossæ*. The cavity of the orbit, which contains the eye, is a *Foss*.

Foss is particularly used for the cavity, or denture in the back part of the neck.

FOSSA Magna, or *Navicularis*, is an oblong cavity, forming the inside of the pendulum muliebri, and which presents itself upon opening the labia; and in the middle whereof are the carunculae myrtiliformes.—See *Tab. Anat. (Splanchn.) fig. 9. lit. c.*

FOSSE, in our ancient customs, was a ditch, full of water, where women committing felony, were drowned; as men were hanged. *Nam & ipsi in omnibus tenementis suis omnem ab antiqua lege habere justitiam, videlicet ferrum, fossam, furcas, & similia.* In another sense it is taken for a grave, as appears by these old verses;

*Hic jacet in fossa Bedæ venerabilis ossa,
Hic est fossatus, qui bis erat hic cathedratus.*

Foss-Way, was antiently one of the four great Roman highways of England; so called, according to Camden, because it was ditched on both sides, which was the Roman method of making highways.

FOSSARI, in antiquity, a kind of officers in the eastern church, whose business was to enter the dead.

Cicconius relates, that Constantine created nine hundred and fifty *Fossaries*, whom he took out of the divers colleges or companies of tradesmen: he adds, that they were exempted from taxes, services, onerary offices, &c.

Fa. Goar, in his notes on the Greek *Euchologion*, insinuates, that the *Fossarii* were established in the times of the apostles; and that the young men, who carried off the body of Ananias, and those persons full of the fear of God, who interred St. Stephen, were of the number.

St. Jerom assures us, that the rank of *Fossarius* held the first place among the clerks: but he is to be understood of those clerks only, who had the direction and intendance of the interment of the devout.

FOSFIL, in natural history, is used, in a general sense, for any thing dug up, or found under ground.—Such are all minerals, metals, rock salts, &c.

The chemists divide all bodies into three classes, or kingdoms; viz. *Fossil*, or *Mineral*; *Vegetable*; and *Animal*.

Fossils may be distinguished into, 1^o Such as are *Natives* of the earth; and, 2^o Such as are *adventitious*, and reposit therein by any extraordinary means; as earthquakes, deluges, &c.

Native FOSSILS, or **FOSSILS** properly so called, are sensible bodies generated, and growing in the earth; whose constituent parts are so simple, and homogeneous, that there is no apparent distinction of vessels, and juices; nor any difference between the part, and the whole.

Native Fossils are either *simple*, or *compound*.

Simple FOSSILS are those, whose parts, however divided, are all of the same nature, i. e. of the same gravity, magnitude, figure, hardness, and mobility.

Such is quicksilver, which, however divided, is always found the same.

Compound FOSSILS are those which may be divided into different, or dissimilar parts.

As antimony, which may be resolved by fire into sulphur, and a metalline part.

The *simple Fossils* are all metals, salts, stones, both vulgar and precious, and earths.

The *compound Fossils* are all sulphurs, all semimetals, or what we properly call minerals; and all bodies combined out of any two, or more of the preceding, either simple, or compound *Fossils*.

Adventitious, or **Foreign FOSSILS**, include the subterraneous exuviae of sea and land animals, and even vegetables; as shells, bones, teeth, leaves, stalks, &c. which are found buried in great abundance, in divers parts of the earth.

These extraneous *Fossils* have employed the curiosity of several of our latest naturalists, who have each their several system to account for the surprising appearances of petrified sea fishes, in places far remote from the sea, and on the tops of mountains; shells in the middle of quarries of stones; and of elephants teeth, and bones of divers animals, peculiar to the southern climates; and plants only growing in the east, found fossil in our northern and western parts.

Some will have these shells, &c. to be real stones, and stone plants, formed after the usual manner of other figured stones: of which opinion is our learned Dr. Lister.

That author, though he allows of petrified shells on the sea shores, will by no means agree, that there are any such petrifications in the midland countries. The shell-like stones, found in our quarries, he contends, are *Lapides sui generis*; and never were any part of an animal.

His reasons are, that their matter, and texture, is perfectly the same with that of the rock, or quarry, where they are taken; as iron-stone shells are all iron-stone; spar, or crystalline, all spar, &c. Add, that the quarries of different stone yield different sorts of these shells; and that there are no animals in nature, which yield any thing exactly like many of them.

But to this erroneous doctrine it is to be answered, 1^o That these shells found under ground, are often perfectly conformable to those in the sea in figure, substance, magnitude, &c. 2^o The substance of these *Fossils* often also differs essentially from the common substance of stones. It is true, we frequently find them covered, or impregnated with a mineral, or stoney matter, which has gradually insinuated itself into the pores; but it is in many cases easy to distinguish that matter from the substance of the shell.

The more judicious opinion is, that these *fossil* shells, with all other foreign bodies, found within the earth, as bones, trees, plants, &c. were buried therein at the time of the universal deluge; and that having been penetrated either by the bituminous matter, abounding chiefly in watery places, or by the salts of the earth; they have been preserved entire, and sometimes petrified.

Others think, that those shells, found at the tops of the highest mountains, could never have been carried thither by the waters, even of the deluge; inasmuch as most of these aquatic animals, by reason of the weight of their shells, always remain at the bottom of the water, and never move but close along the ground.

They imagine, that a year's continuance of the waters of the deluge, intermixed with the salt waters of the sea, upon the surface of the earth, might well give occasion to the production of shells of divers kinds in different climates; and that the universal saltness of the water was the real cause of their resemblance with the sea shells. As the lakes formed daily by the retention of rain, or spring, water, produce different kinds.

Others think, that the waters of the sea, and the rivers, with those which fell from heaven, turned the whole surface of the earth upside down; after the same manner as the waters of the Loire, and other rivers, which roll in a sandy bottom, overturn all their sands, and even the earth itself, in their swellings and inundations: and that in this general subversion, the shells came to be interred here, fishes there, trees there, &c. See the *Journ. des Savans*, 1715. p. 19. and *Mem. de Trev.* 1713.

But no body has set this system in a better light, than Dr. Woodward, in his *Nat. history of the Earth*. That author maintains, the whole mass of earth, with every thing belonging thereto, to have been so broke, and dissolved, at the time of the deluge, that a new earth was then formed in the bosom of the water, consisting of different strata, or beds of terrestrial

terrestrial matter, ranged over each other usually, according to the order of their specific gravities. By this means, plants, animals, and especially fishes, and shells, not yet dissolved among the rest, remained mixed and blended among the mineral and fossil matters; which preserved them, or at least assumed and retained their figures and impressions, either indentedly, or in relieve.

Camerarius attacks this opinion of Dr. Woodward, and goes yet higher, and advances many new notions. He supposes, 1° That the greatest part of the shells now dug from under ground, had been placed there before the deluge, that is, at the time of the creation, when God separated the earth from the waters. 2° That, without having recourse to the dissolution of the earth by the waters, one might suppose most of them to have slipped in at the chinks and crevices naturally happening after the waters were retired, and the earth sufficiently drained. 3° That particular inundations might have swept most of these shells into the places where we now find them. 4° That the sea may have wrought, or cast up most of these shells through subterraneous spiracles and canals. 5° That God has created divers stony and metalline bodies, perfectly like the vegetables and animals, which we see on earth, and in the sea.

To all these suppositions, Dr. Woodward answers, 1° That it is no ways probable, God should create such a number of shell-fish of the same species at once; and that purely with a design to destroy them all again so soon after: that among the fossil shells of the same species it is easy to distinguish those of different ages: that some appear precisely such as we now find them in the spring, the season when the deluge began: that it is not only shells, we find under ground, but also bones of quadrupeds, plants, and trees of extraordinary sizes, and which are not of the number of aquatics: and lastly, that the waters were separated from the earth on the third day; and that none of these things were created, till afterwards. 2° That, on the second supposition, these shells would be disposed perpendicularly, and not horizontally, as they are always found: that we should sometimes find them in the clefts of the earth, where in fact there are none but what are broke. 3° That we have no acquaintance with any of these pretended inundations: that they could never have brought shells, stags horns, and elephants teeth from America, and the East-Indies, to England, and other parts of Europe; nor the fruits, pines, and beeches, frequently found far greater than any of our growth. Add, that these particular inundations must have risen to the tops of the highest mountains, and of consequence they must have been general. 4° On the fourth supposition it must be held, that God did not only create all these several bodies in the entrails of the earth; but their several parts, and the separate pieces and fragments of those parts; a piece of a shell, for instance; one side of a shell, which consists of two; a shell void of the fish it should contain; beads of corn, without the grain; pieces of cedar bark, without the wood; pieces of bullocks hides without flesh and bones; human skins without bodies; a bone without the rest of the skeleton; a tooth without the jaw, &c. Add, that the fossil shells have not only external, but essential resemblances to sea shells; both, *e. gr.* yielding, by analysis, a quantity of sea salt: That among the fossil teeth of fishes, we meet with some apparently worn: and lastly, that the shell fish called *Purple*, has a long sharp tongue, by means whereof it pierces other shells, and picks the fish out of them; and that in digging under ground we actually meet with divers of these shells thus pierced. Can such minute thorough-paced resemblances be the accidental effect of a *lusus naturæ*?

This is the substance of what has hitherto been advanced on the point; wherein it is evident that Dr. Woodward has greatly the better of the argument.

Fossil SALT, see the article **SALT**.

Fossil WOOD, see the article **WOOD**.

FOSTERLEAN *, antiently signified nuptial gifts: much the same with what we now call *jointure*.

* The word is originally Saxon, and signifies *ciborum exhibitio*, that is, a stipend which the wife has for her maintenance. *Poeta sciendum est cui Fosterlean pertineat, vadit hoc Brigdonia, & placent amici sui.*

FOTUS, in medicine, the same as *fomentation*. See **FOMENTATION**.

FOVEA cordis, the pit of the heart, or rather of the stomach; called also *Scrobiculus Cordis*.

FOUGADE *, or **FOUGASSE**, in the art of war: a little mine, in manner of a well, seldom exceeding ten foot in width, and twelve in depth; dug under some work, or post that is like to be lost; and charged with barrels, or sacks of gunpowder, covered with earth.—It is set on fire like other mines, with a faucible.

* The word is French: M. Huet derives it from *foeate*, or *focis*, fire.

FOUL, in the sea language, is used when a ship has been long untrimmed, so that grass, weeds, periwinkles, barnacles, or the like, stick or grow to her sides under water. In this state, she is said to be *foul*.

Again, a rope is said to be *foul*, when it is either tangled in itself,

or hindered by another, so that it cannot run, or be haled.

A ship is said to make *foul water*, when being under sail, she comes into such shoal, or low water, that though her keel do not touch the ground, yet she comes so near it, that the motion of the water under her raises the mud from the bottom, and so *fouls* the water.

FOUNDATION, that part of a building which is under ground: or, that mass of stone, &c. which supports a building; or upon which the walls of the superstructure are raised: or, it is the coffer, or bed, dug below the level of the ground, to raise a building upon.

The *Foundation* either takes up the whole area and extent of the building, as when there are to be vaults, cellars, or the like: or it is drawn in cuts, or trenches, as when only walls are to be raised.

The *Foundation* is properly so much of the masonry, as reaches as high as the surface of the ground; and this is always to be proportioned to the load, or weight of the building which it is to bear.

Sometimes it is massive, and continued under the whole building; as in the antique arches, and aqueducts, and some amphitheatres: more usually it is only in spaces, or intervals; either to avoid expence, or because the vacuities are at too great a distance, in which latter case they make use of insulated pillars, bound together by arches.

That we may found our habitation firmly, says Sir H. Wotton, we must first examine the bed of earth, upon which we are to build; and then the under-ceilings, or substruction, as the antients called it. For the former, we have the general precept in Vitruvius, *Substructionis Foundationes fodiuntur, si quant inveniri ad solidum & in solido*: by which he recommends not only a diligent, but even jealous examination of what the soil will bear; advising us not to rest upon any appearing solidity, unless the whole mould through which we cut, have likewise been solid.

But how deep we should go in this search, he has no where determined, as perhaps depending more on discretion, than regularity, according to the weight of the work: yet Palladio has ventured to reduce it to a rule; allowing for the cavatione, *i. e.* the hollowing or under-digging, a sixth part of the height of the whole fabrick, unless there be cellars under ground, in which case he would have it somewhat lower.

Sir H. Wotton's *Elem. of Architecture*.

The *Foundations* of buildings are either *natural* or *artificial*.

—*Natural*, as when we build on a rock, or a very solid earth; in which case we need not seek for any further strengthening.

—*Artificial*, where the ground is sandy, or marshy, or has lately been dug. In the former case, the architect must adjust the depth of the *Foundation* by the height, weight, &c. of the building: a sixth part of the whole height is looked on as a medium; and as to thickness, double that of the width of the wall, is a good rule.

Where the natural *Foundation* may not be trusted, they either fortify the ground by pallifying it, *i. e.* driving it full of piles, (see **PALLIFICATION**): Or else they lay large wooden planks at the bottom of the trenches dug for the *Foundation*.

In some places they found the piers of bridges, and other buildings near the water, on sacks of wool, laid like mattresses; which being well pressed, and greasy, will never give way, nor rot in water.

FOUNDATION, is also used figuratively for the establishment of a city, empire, or the like.

The Romans reckoned their years from the *Foundation* of Rome, *ab urbe condita*; which we sometimes express by *ab U. C.* Chronologers make 779 years from the Israelites passing out of Egypt, to the *Foundation* of Rome.

FOUNDATION also denotes a donation, or legacy, either in money, or lands, for the maintenance and support of some community, hospital, school, lecture, or other work of piety.

Among the order of Augustines, there is a *Foundation* for the marrying of poor maids; and another for the furnishing of trusses to poor people who have ruptures, or hernias.

FOUNDER, he who lays a foundation, or who founds and endows a church, school, religious house, or other work of charity and piety.

The *Founders* of churches may preserve to themselves the right of patronage, or presentation to the living.

FOUNDER *, is also an artist that melts, or casts metals into various forms, for divers uses; as guns, bells, statues, bombs, types or printing characters; and other small works, as candlesticks, buckles, &c.

* The word in this sense is formed of the French *fondre*, to melt, or fuse.—In the Roman law they are called *Statuarii*.

From the different productions, or works of the *Founders*, they are differently denominated, as *Founders of small Works*; *Bell Founders*; *Gun Founders*; *Letter Founders*; *Figure Casters*, &c. What belongs to each, see under **FOUNDERY**.

FOUNDER'S FURNACE, see the article **FURNACE**.

Moulds of Founders, see the article **MOULDS**.

FOUNDER'S Press, see the article **PRESS**.

FOUNDER, in the sea language. A ship is said to founder at sea, when by an extraordinary leak, or a great sea breaking

in upon her, she is so filled with water, that she cannot be freed of it; nor is able to swim under it, but sinks with the weight thereof.

FOUNDERING, in the manage, a disorder in horses, whereof there are two kinds, *viz.* in the feet, and in the chest.

FOUNDERING in the feet, arises from hard riding, sore labour, great heats, sudden colds, &c. which inflame the blood, and, as the farriers express it, melt the grease, and make it descend downward to the feet, and there settle; which causes such a numbness, and pricking in the hoof, that the horse has no sense or feeling in it, being hardly able to stand; or when he does, shaking and trembling, as if he had an ague.

A horse may likewise be *foundered* by wearing freight shoes, and by travelling upon hard ground.

It may be known when he is *foundered* on his forefeet, and not his hindfeet, by his treading firmly only on his hindfeet, and sparing the other; or his going crouching and crippling on his buttocks.

Sometimes, though rarely, he is *foundered* on his hindfeet, and not his fore; which is known by his seeming weak behind, and resting as much as possible on the forefeet.

The general methods of curing this distemper, are first by paring all the horse's soles so thin that the quick may be seen; then bleeding him well at the toes; stopping the vein with tallow and rosin; and then having tacked hollow shoes on his feet, stopping them with bran, tar, and tallow, as boiling hot as may be; which is to be renewed once in two days, for a week together; after which he is to have good exercise.

Or, after he is pared thin, and let blood at the toes, his feet are to be stopped with cows dung, kitchen see, tar, and foot boiled together, and poured boiling hot into them.

FOUNDERING, in the chest or body, usually befalls a horse by eating too much provender suddenly, when too hot; as also by drinking too much upon travelling, when he is hot, and riding him after it.

The effect of which, is, that his body is oppressed with ill humours, which take away his strength, and put him in such condition that he can neither go, nor bow his joints; and being once laid, he cannot rise again, &c. his legs swell; and soon after begin to peel: he has a dry cough, which makes his eyes water; and his nose runs with white phlegmatic matter.

FOUNDERY, or FOUNDRY, the art of melting and casting all sorts of metals; particularly brass, iron, bell-metal, &c.

The word is also used for a place, or work-house, furnished with furnaces, or forges for this purpose.

FOUNDERY of small works, or the manner of casting in sand.—

The sand used by the *Founders*, in casting of brass, &c. is yellowish, and pretty soft; but after it has been used, it becomes quite black, by reason of the charcoal dust used in the moulds. Every time they would use this sand, they work and tow it several times over in a board about a foot square, placed over a kind of trunk, or box, into which it may fall from off the board. This treading is performed with a roller, or cylinder, about two foot long, and two inches in diameter; and a kind of knife, made of the blade of a sword: with these two instruments they alternatively roll and cut the sand, and at length turn it down into the box underneath.

Then, taking a wooden board, or table, of a length and breadth proportional to the quantity of things to be cast; round this they put a frame, or ledge, and thus make a sort of mould. This mould they fill with the sand before prepared, and moderately moistened. Which done, they take wooden, or metal-line models, or patterns of the things intended to be cast; apply them on the mould, and press them down into the sand, so as to leave their form indented. Along the middle of the mould is laid half a little cylinder of brass, which is to be the master jet, or canal for running the metal; being so disposed as to touch the ledge at one side, and only to reach to the last pattern on the other. From this are placed several lesser jets, or branches, reaching to each pattern, whereby the metal is conveyed through the whole frame.

This first frame being thus finished, they turn it upside down, to take out the patterns, from the sand: in order to which they first loosen them a little all round, with a small cutting instrument.

After the same manner they proceed to work the counter part, or other half of the mould, with the same patterns, in a frame exactly like the former; excepting that it has pins, which entering holes corresponding thereto in the other, make, when the two are joined together, the two cavities of the pattern fall exactly on each other.

The frame being thus moulded, is carried to the founder, or melter, who after enlarging the principal jet, or canal of the counter part, with a kind of knife, and adding the cross jets, or canals to the several patterns in both, and sprinkling them over with mill dust, sets them to dry in an oven.

When both parts of the mould are sufficiently dried, they join them together, by means of the pins; and to prevent their starting or slipping aside by the force of the metal, which is to come in flaming hot through a hole contrived at the master jet, they lock them in a kind of press, either

VOL. I.

with screws; or, if the mould be too big for this, with wedges.

The moulds thus put in press, are ranged near the furnace, to be in readiness, to receive the metal as it comes out of the crucible.

While the moulds are thus preparing, the metal is put in fusion in an earthen crucible, about ten inches high, and four in diameter.

The furnace wherein the fusion is made, is much like the smith's forge; having, like that, a chimney, to carry off the smoke; a pair of bellows, to blow up the fire; and a hearth, where the fire is made, and the crucible placed. It is the use of this hearth, that chiefly distinguishes the furnace from the forge.

In the middle thereof is a square cavity, ten or twelve inches wide, which goes to the very bottom. It is divided into two, by an iron grate: the upper partition serves to hold the crucible and the fuel; and the lower to receive the ashes.

When the fuel, which is to be, of dry wood, is pretty well lighted, they put the crucible full of metal in the middle, and cover it with an earthen lid: and to increase the force of the fire, besides blowing it up with the bellows, they lay a tile over part of the aperture or cavity of the furnace.

The metal first put in being brought to a fusion, they fill the crucible with pieces of brass, beaten in a mortar. To put them in, they make use of a kind of iron ladle, with a long spout at the end thereof, formed into a kind of hollow cylinder, out of which the piece is dropped.

Nothing now remains, but for the founder to take the crucible out of the fire, and carry it in a pair of iron tongs (whose feet are bent, the better to embrace the top of the crucible) to the mould: into which he pours the melted metal, through the hole answering to the master-jet of each mould.

Thus he goes successively from one to another, till his crucible is emptied, or there is not matter enough left for another mould.

Then, casting cold water on the moulds, they take the frames out of the presses, and the castworks out of the sand, which afterwards they work again for another casting. Lastly, they cut off the jets, or casts, and sell, or deliver the work to those who bespoke it, without any further repairing.

FOUNDERY of statues, great guns, and bells.—The art of casting statues in brass, is very ancient; inasmuch that its origin was too remote and obscure, even for the research of Pliny, an author admirably skilled at discovering the inventors of other arts.

All we can learn for certain, is, that it was practised in all its perfection first among the Greeks, and afterwards among the Romans: and that the number of their statues consecrated to the gods and hero's, surpassed all belief. See **STATUE**.

The single cities of Athens, Delphos, Rhodes, &c. had each three thousand statues; and Marcus Scaurus, alone, though only ædile, adorned the Circus with no less than three thousand statues of brass, for the time of the Cirenian games.

This taste for statues was finally carried to such a pitch, that it became a proverb, that in Rome the people of brass were not less numerous than the Roman people.

Among us, the casting of statues was but little known, or practised before the seventeenth century.

As to the casting of guns, it is quite modern; and it were perhaps to be wished, we were as ignorant of it as the antients.

—All authors agree, that the first cannon were cast in the fourteenth century; though some fix the event to the year 1338; and others to 1380.

The casting of bells is of a middle standing, between the other two.—The use of bells is certainly very antient in the western church; and the same were likewise once used in the church of the east. But at present F. Vanleb assures us, in his second account of Egypt, he had found but one bell in all the eastern church, and that in a monastery in the upper Egypt.

The matter of these large works is rarely any simple metal, but commonly a mixture of several, as brass, bell-metal, &c. We shall here give the process in the *Foundry* of each.

Method of casting Statues, or Figures.—There are three things chiefly required in casting of statues, busts, basso-relievo's, vases, and other works of sculpture; *viz.* the mould, the wax, and shell or coat.

The inner mould, or core (thus called from *caur*, as being in the heart, or middle of the statue) is a rude, lumpy figure, a little resembling the statue intended. It is raised on an iron grate, strong enough to sustain it, and is strengthened within-side by several bars or ribs of iron.

It may be made indifferently of two sorts of matter, at the discretion of the workmen, *viz.* Potters clay mixed up with horse-dung and hair; or of plaster of Paris, mixed with fine brick-dust.

The use of the core in statues is to lessen the weight, and save metal. In bells it takes up all the inside, and preserves the space vacant where the clapper is hung. In great guns it forms the whole chace, from the mouth to the breech: and in mortars, the chace, and chamber.

The wax is a representation of the intended statue in wax. If

it be a piece of sculpture, the wax must be all of the sculptor's own hand, who usually fashions it on the core itself. Though it may be wrought a-part in cavities moulded, or formed on a model, and afterwards disposed and arranged on the ribs of iron over the grate, as before; filling the vacant space in the middle with liquid plaster, and brick dust; by which means the inner mould, or core is formed in proportion as the sculptor carries on the wax.

When the wax (which is to be of the intended thickness of the metal) is finished, they fit little waxen tubes perpendicularly to it, from top to bottom; to serve both as jets for the conveyance of the metal to all parts of the work, and as vent holes, to give passage to the air, which would otherwise occasion great disorder, when the hot metal came to encompass it. By the weight of the wax used herein, is that of the metal adjusted; ten pounds of this last being the proportion to one pound of the former.

The work brought thus far, wants nothing but to be covered with its shell; which is a kind of coat, or crust laid over the wax; and which being of a soft matter, and even at first liquid, easily takes and preserves the impression of every part thereof, which it afterwards communicates to the metal, upon its taking the place of the wax between the shell and the core.

The matter of this outer mould, or shell, is varied according as different layers, or strata are applied. The first is a composition of clay and old crucibles well ground and sifted, and mixed up with water, to the consistence of a colour fit for painting. Accordingly, they apply it with a pencil, laying it seven or eight times over; letting it dry betwixt whiles. For the second impression they add horse's dung, and natural earth to the former composition. The third impression is only horse's dung and earth. Lastly, the shell is finished by lying on several more impressions of this last matter made very thick with the hand.

The shell thus finished is secured and strengthened by several bands or girts of iron wound around it at half a foot's distance from one another, and fastened at bottom to the grate under the statue, and at the top to a circle of iron, where they all terminate.

Here it must be observed, that if the statue be so big, that it would not be easy to move the moulds when thus provided, it must be wrought on the spot where it is to be cast.

This is performed two ways: in the first, a square hole is dug under ground, much bigger than the mould to be made therein; and its sides lined with walls of freestone or brick. At the bottom is made a hole of the same materials with a kind of furnace, having its aperture outwards. In this is a fire to be lighted, to dry the mould, and afterwards to melt the wax. Over this furnace is placed the grate; and on this the mould, &c. framed as above explained. Lastly, at one of the edges of the square pit is made another large furnace to melt the metal, as hereafter mentioned.

In the other way, it is sufficient to work the mould above ground; but with the same precaution of a furnace, and grate underneath. When finished, four walls are to be run up around it; and by the side thereof a massive made for a melting furnace.—For the rest, the method is the same in both.

The mould being finished and inclosed between four walls, whether under ground, or above it; a moderate fire is lighted in the furnace under it; and the hole covered with planks, that the wax may melt gently down, and run out at pipes contrived for the purpose at the foot of the mould, which are afterwards very exactly closed with earth, as soon as all the wax is carried off.

This done, the hole is filled up with bricks thrown in at random, and the fire in the furnace is augmented, till such time as both the bricks and the mould become red-hot; which ordinarily happens in twenty-four hours. Then, the fire being extinguished, and every thing cold again, they take out the bricks, and fill up their place with earth, moistened, and a little beaten, to the top of the mould, in order to make it the more firm and steady.

Things being in this condition, there remains nothing but to melt the metal, and run it into the mould. This is the office of the furnace above; which is made in manner of an oven, with three apertures; one to put in the wood, another for a vent, and a third to run the metal out at. From this last aperture, which is kept very close all the time the metal is in fusion, a little tube or canal is laid, whereby the molten metal is conveyed into a large earthen basin over the mould, into the bottom of which all the big branches of the jets, or casts, which are to carry the metal into all the parts of the mould, are inserted.

It must be added, that these jets are all terminated, or stopped with a kind of plugs, which are kept close, that upon opening the furnace, the bras, which gushes out like a torrent of fire, may not enter any of them, till the basin be full enough of matter to run into them all at once: upon which occasion they pull out the plugs, which are long iron rods, with a head at one end capable of filling the whole diameter of each tube. The hole of the furnace is opened

with a long piece of iron, fitted at the end of each pole; and the mould is then filled in an instant.

The work is now finished; at least so much as belongs to the casting; the rest being the sculptor's or carver's business; who, taking the figure out of the mould and earth, it is encompassed withal, saws off the jets wherewith it appears covered over, and repairs it with instruments proper to his art, as chisels, gravers, puncheons, &c.

The manner of casting bells. What has been hitherto shewn of the casting of statues, holds, in proportion, of the casting of bells: all that there is particular in these latter, is as follows.

First, then, the metal is different; there being no tin in the metal of statues, but no less than a fifth part of tin in that of bells. Secondly, the dimensions of the core, and the wax of bells, especially if it be a ring of several bells that is to be cast, are not left to chance, or the caprice of the workman; but must be measured on a kind of scale, or diapason, which gives the height, aperture, and thickness necessary for the several tones required.

It need not be added, that it is on the wax, that the several mouldings, and other ornaments and inscriptions to be represented in relief on the outside of the bell, are formed.

The clapper, or tongue, is not properly a part of the bell, but is furnished from other hands. In Europe, it is usually of iron, with a large lump at the extreme, and is suspended in the middle of the bell. In China it is only a huge wooden mallet, struck by force of arm against the bell: whence they can have but little of that consonance so much admired in some of our rings of bells. The Chinese have an extraordinary way of increasing the found of their bells, viz. by leaving a hole under the cannon; which our bell-founders would reckon a defect.

The proportions of our bells differ very much from those of the Chinese. In ours, the modern proportions are, to make the diameter fifteen times the thickness of the brim, and the height twelve times.

Manner of casting great guns, or pieces of artillery. The casting of cannons, mortars, and other pieces of artillery, is performed like that of statues and bells; especially as to what regards the mould, wax, shell, turnaces, &c.

As to the metal, it is somewhat different from both; as having a mixture of tin, which is not in that of statues; and only having half the quantity of tin that is in bells, i.e. at the rate of ten pound of tin, to an hundred of copper. A cannon is always shaped a little conical, being thickest of metal at the breech, where the greatest effort of the gunpowder is made, and diminishing thence to the muzzle: so that if the mouth be two inches thick of metal, the breech is six.

Its length is measured in calibers, i.e. in diameters of the muzzle. Six inches at the muzzle require twenty calibers, or ten feet in length: there is always about a sixth of an inch allowed play for the ball.

Letter Foundry, or the manner of casting printing letters. The invention of printing letters we shall speak of under the articles PRINTING, and LETTER.

Their difference, kind, &c. has already been explained under the articles CHARACTER, &c.

The two things principally to be regarded in the casting of letters, are the matter, and the matrices.

The matter is a compound metal; partly brass or copper, and partly lead, mixed in a certain proportion, which every letter-founder regulates at his own discretion, and to which he frequently adds a certain quantity of some other metal or mineral, as his experience directs him, to render his composition the harder.

The most usual proportion of the two metals, is a hundred pound of lead to twenty or twenty-five pound of brass. Some (though not the best founders) use iron, instead of brass; in the proportion of a hundred pound of lead, to thirty or thirty-five of iron.

These metals are melted separately in large crucibles; the brass, or iron with antimony, and the lead by itself. When in fusion they are mixed together: this fusion and mixture are the most laborious parts of the letter-founder's art.

The matrices of the letters are pieces of copper, whereon the impression of the intended character has been cut, or struck in creux, by means of puncheons, &c. graven in relief.

Each letter has its proper matrix; and there are particular ones for points, virgula's, figures, rules, head-pieces, and other ornaments of printing: excepting the quadrats, which being only of lead, and not intended to leave any impression, are cast without matrices, and only in moulds: and each matrix has its puncheon made of steel, or iron, well tempered.

The matrices being struck, and touched up, or repaired, where needful, are put each at the end of an iron mould, inclosed between two thin pieces of board, two or three inches square; the two upper angles being cut off, so as to compose an irregular hexagon.

The

The principal parts of these moulds, which, as already mentioned, are hid between the slips of wood; are, 1^o, Two steel plates, with each its screw, to keep them fast, at a distance from the boards. 2^o, Two called *long pieces*. 3^o, A piece called the *blank*, which is what properly forms the body of the character, at the extremity whereof the matrice is put. 4^o, A jet, or cast; which is a sort of little funnel to receive and convey the melted matter to the matrice. 5^o, A register, serving to rejoin the two parts of the mould, after they have been opened to take out the letter when cast.

On the outside of the moulds are three other pieces, *viz.* the bow, at bottom; and two hooks a-top. The bow is a thick steel wire, two or three lines in diameter, and eight or ten inches long, bent in manner of a bow, or arch; whereof the lower piece of wood is as it were the chord, or string. One end is fastened to the board, and the other, which is left at liberty, serves, by its spring, or elasticity, to press and retain the matrice of the character against the extremity of the blank, where the melted matter running in, makes the impression.

The hooks a-top of the mould are also of wire, about the same size with the bow, and about an inch and a half long; being fastened, one of them to one board, and the other to the other. Their use is, to open the mould, and to take out the character, when cast, so as the workman may not be incommoded with the heat.

Every thing belonging to the mould being thus disposed, they begin to prepare the matter. — The furnace, whereon the bafon is placed for the metal to be melted in, is made of the same matter as crucibles. It is usually eighteen or twenty inches high, and ten or twelve in diameter. An iron grate horizontally placed, divides it into two: the lower part serves to hold the ashes, and is furnished with the hole to let in the air. The wood is put in the upper part, through an aperture made over the grate. An earthen pipe serves to carry off the smoke out at a window, near which the furnace is ordinarily placed. And lastly, a stone, or wooden stool, serves to support the furnace, and raise it to a proper height for the workman to work standing.

Over the furnace is placed the melting bafon, or copper. It is about nine inches in diameter, and takes up the whole aperture a-top; being even luted to it all round, with potters earth. Its matter is a kind of pot metal; and that it may be fit for melting both hard and soft metals, it is divided into two equal parts by a perpendicular partition.

In this bafon they melt only the matter already prepared; that is, the mixture or composition made in the crucibles above-mentioned. A little iron ladle serves to scum of the scoriae or impurities from the surface of the melted metal: and these scoriae are not all lost, but serve to melt over again.

Two workmen are usually employed at each furnace. Each of them has his part of the bafon to empty; and they have a table or bench in common, where they lay the characters as fast as they are cast.

To run the metal into the mould, the founder holds it in his left hand; and in his right has a little iron ladle with a wooden handle, containing just enough for one letter.

Having now filled this ladle with liquid metal, he pours it into the jet, or funnel, whose aperture is in the middle of the two hooks of the mould; and thrusting his hand briskly forward wherewith he holds the mould, he makes the metal run into the matrix of the character; which without such motion might grow cold before it arrived there.

He then unbends the bow, opens the mould, and with one of the hooks takes out the character; and, without loss of time, shuts it again, replaces the matrice, and casts a new letter. It is incredible with what expedition and address all this is done. The letter being cast, they view it, before they break off the jet, to see whether it be perfect; otherwise to throw it among the refuse of the fount.

If it be found complete, the jet or tail is broke off; the superfluous metal, occasioned by the mould's not being exactly closed, is taken off with a knife; and the long tailed letters, as *f* and *g* hollowed at bottom, to give room for the massive of the other letters to be placed underneath.

With the same knife they scrape the letter, to smoothe its two broadest sides, or faces, and fit them to be rubbed on the stone. They take care only to rub those sides; for fear of damaging a notch on one of the other sides, which is to distinguish the sides to the compositor, when he sets his forms.

The stone they grind them on, is a sort of hard, coarse-grained free stone, placed horizontally; before which the workman sits. To save his fingers from the friction, he has a kind of finger-stalls, made of some old piece of leather; with which he covers the two fingers next the thumb: with these he works each side of the letter backwards and forwards: to shift sides, he makes use of the thumb, but without discontinuing the motion; so that the by-stander would easily be deceived, and be ready to swear they had all the while rubbed on the same side.

The letters thus ground, are placed on the compository to be scraped and brought to the proper thickness on the two other sides, *viz.* that of the notch, and its opposite. This they sometimes call *compositing*.

The compository is a wooden ruler, with a little ledge at bottom, against which the letters are ranged. On the same instrument the quadrats, rules, borders, &c. are also adjusted. When the letters are composited, they remain to be justified, both as to thickness and height. In order to this, they use a little copper plate, which is their level.

The justification, as to thickness, is made on a piece of marble; and that for the height on an iron compository. The justification of the height is guided by the *m* of some body of characters already justified.

Letters are said to be of their just height, when the part of the plate, or level, bears equally on the standard *m* placed on its foot, in the little compository, and the face of two letters newly cast placed aside of it, to be justified: as to the thickness, the justification is performed by laying the standard letter flat on the little marble, and two new letters aside of it; and thus levelling the three with the plate.

All that then remains, is to dress the letters, *i. e.* to cut the foot, or rather hollow it, and make that sort of groove which every letter has at bottom, precisely opposite to the eye or upper part, or face of the letter.

In order to this, they turn a long line of them upside down in the justificator; which is an instrument of polished iron or steel, consisting of two long pieces joined together by screws. Between these two, they enclose as many letters as they will hold, all placed against each other in the same situation, as when composed for books; excepting that the face in the former case is downwards, and the foot a top. When the justificator is full of letters, they set it on the table of the cutter, between two cheeks of wood; which pressing it very tight, enable the workman to run his plane along the side of the line thus inverted.

This plane consists of three parts; two steel, and the third wood. Of the steel ones, that at bottom consists of two moveable steel plates, which may be drawn closer, or set further off, at pleasure, by means of two screws. Within the interval between the two, they pass the feet of the row of letters; and thus is the plane kept from deviating.

The second part of the plane, answering to the bit of steel in the common planes, consists of two branches, and two screws, which serve to raise or let down the steel, as the groove is to be cut deeper or shallower. The position of this piece of steel, which is four or five inches long, is almost perpendicular.

The last part of the plane, which is wood, serves to join the other two. Its form is that of an arch: one end of it is fastened to the posterior extreme of the plates, and the other to the branches which carry the bit of steel: so that the three parts together make a kind of triangle, voided in the middle.

The cutter is a steel instrument, with a wooden handle, made in manner of a chisel; serving to pare off the rough wire edge of the letters when they are dressed.

When the letters have passed all these operations, they are fit for the printer's use.

The perfection of letters thus cast, &c. consists in their being all severally square and straight, on every side; and all, generally of the same height, and evenly lined, without sloping one way or other; neither too big in the foot, nor the head; well grooved so as the two extremes of the foot contain half the body of the letter; and well ground, barbed, and scraped; with a sensible notch, &c.

FOUNT, or FONT, among printers, &c. a set or quantity of characters, or letters of each kind; cast by a letter-founder, and sorted.

We say, a founder has cast a *Fount* of pica, of english, of pearl, &c. meaning, he has cast a set of characters of these kinds.

A complete *Fount* does not only include the running letter; but also majuscules, or large, and small capitals, single letters, double letters, points, comma's, lines, borders, head-pieces, tail-pieces, and numeral characters.

The letter-founders have a kind of list or tariff, whereby they regulate their *Founts*. The occasion thereof is, that some letters being in much more use, and oftener repeated than others, their cells, or cases, should be better filled and stored than those of the letters which do not return so frequently.

Thus the *o* and *i*, for instance, are always in greater quantity than the *k* or *z*.

This difference will be best perceived from a proportional comparison of those letters with themselves, or some others.

Suppose a *Fount* of a hundred thousand characters, which is a common *Fount*; here the *a* should have five thousand; the *c* three thousand; the *e* eleven thousand; the *f* six thousand; the *m* three thousand; the *k* only thirty; and the *x* and *z* not many more. But this is only to be understood of the letters of the lower-case; those of the upper having other proportions, which it would be here too long to insist on. See **LETTER and CHARACTER**.

FOUNTAIN, FONS, in philosophy, a spring, or source of water, rising out of the ground.

For the phenomena, theory, origin, &c. of springs or *Fountains*, see **SPRING**.

Among the antients, the *Fountains*, or sources of rivers, were held sacred, and even worshipped as a kind of divinities.

Seneca

Seneca observes as much, in his forty-first epistle: and Cicero, l. iii. *de Nat. Deor.* c. 20, mentions, that the Roman priests and augurs used in their prayers and invocations to call on the names of the Tyber, and other rivers, brooks, and springs about Rome. And the seventh inscription in p. 94. of Gruter has, *FONTI DIVINO ET GENIO NUMINIS FONTIS*.

It was a point of religion, not to disturb or muddy these waters in washing or bathing—Tacitus gives an instance hereof in Nero, *Annal.* l. xiv. c. 22. And Struvius, *Antiq. Rem. Syntag.* c. i. p. 167.

FOUNTAIN, or *artificial FOUNTAIN*, in hydraulicks, a machine, or contrivance, whereby water is violently spouted, or darted up; called also a *Jet d'Eau*. See *Jet d'Eau*, *FLUID*, &c.

There are divers kinds of artificial *Fountains*; some founded on the spring, or elasticity of the air; and others on the pressure or weight of the water, &c.

The structure of each hereof, being pretty, and curious, and affording a good illustration of the doctrine of hydraulicks and pneumatics, shall be here explained.

Construction of an artificial FOUNTAIN, playing by the spring or elasticity of the air.—A vessel, proper for a reservoir, as A B, *Tab. Hydraulicks*, fig. 17, is provided of metal, glass, or the like; ending in a small neck *c*, a-top. Through this neck a tube is put, *c a*, traversing the middle of the vessel, till its lower orifice, *d*, nearly, but not absolutely, reach the bottom of the vessel; the vessel being first half filled with water. The neck is so contrived, as that a syringe, or condensing pipe may be forced upon the tube; by means whereof, a large quantity of air may be intruded through the tube into the water; out of which it will disengage itself, and emerge into the vacant part of the vessel, and lie over the surface of the water, C D.

Now, the water here contained, being thus pressed by the air, which is, *c. gr.* twice as dense as the external air; and the elastic force of air being equal to its gravitating force, the effect will be the same as if the weight of the column of air, over the surface of the water, were double that of the column pressing in the tube; so that the water must, of necessity, spout up, through the tube, with a force equal to the excess of pressure of the included, above that of the external air.

Construction of an artificial FOUNTAIN, playing by the pressure of the water.—Having the convenience of a fund, or reservoir of water, in a place considerably higher than that where the *Fountain* is to be (whether that fund have been placed there by nature; or whether it have been raised for the purpose, by a proper engine, as a pump, siphon, spiral screw, or the like) from the reservoir lay vertical tubes for the water to descend through; and to these vertical tubes, fit other horizontal ones, under ground, to carry the water to the place where the *Fountain* is to play. Lastly, from these horizontal tubes erect other vertical ones, by way of adjutages, jets, or spouts; their altitude being much less than that of the tubes whereby the water was carried to the horizontal ones.

Then will the water, by the pressure of the superincumbent column, be spouted up at these jets; and that to the height or level of the water in the reservoir; and this, howsoever any of the tubes be bent or incurved.—The demonstration hereof, see under *FLUIDS*.

Thus may water be spouted to any given height at pleasure: and the tubes may be so proportioned as to yield any given quantity of water, in a given time; or several tubes of the same *Fountain* may be made to yield water in any given ratio: or, lastly, different tubes may project the water to different altitudes. Rules for all which, the reader will find among the laws of *FLUIDS*.

These aerial, or aquatic *Fountains*, may be applied in various manners; so as to exhibit various appearances: and from these alone, arise the greatest part of our artificial water-works. An instance or two, will not be disagreeable.

A FOUNTAIN spouting the water in various directions.—Suppose the vertical tube, or spout in which the water rises, to be A B (*Tab. Hydraulicks*, fig. 18.) into this, fit several other tubes; some horizontal, others oblique; some inclining, others reclining, as O P, M N, F L, &c.

Then, as all water retains the direction of the aperture through which it is spouted: that, issuing through A, will rise perpendicularly; and that through L, H, N, P, E, will describe arches of different magnitudes, and tending different ways.

Or thus: Suppose the vertical tube A B, fig. 19. through which the water rises, to be stopped a-top, as in A; and instead of pipes, or jets, let it be only perforated with little holes all round, or only round half its surface. Then will the water spin forth in all directions, through the little apertures, and to a distance proportional to the height of the fall of the water.

And hence, if the tube A B be supposed the height of a man, and be furnished with an epistomium, or cock at C;

upon opening the cock, the spectators, dreaming of no such matter, will be covered with a shower.

It must be here observed, that the diameters of the apertures, by which the water is emitted, must be considerably less than those of the tubes in which the water is brought; lest the resistance of the air, and other impediments, specified under *FLUID*, break the force of the water.

A FOUNTAIN playing by the draught of the breath.—Suppose A B, fig. 20. a glass or metalline sphere; wherein is fitted a tube, C D, having a little orifice in C, and reaching almost to D, the bottom of the sphere. If now the air be sucked out of the tube C D, and the orifice C be immediately immersed under cold water; the water will ascend through the tube into the sphere.

Thus proceeding, by repeated exsuctions, till the vessel be above half full of water; and then applying the mouth to C, and blowing air into the tube; upon removing the mouth, the water will spout forth.

Or, if the sphere be put in hot water; the air being thereby rarified, will make the water spout as before.

This kind of *Fountain* is called *Pila Heronis*, or *Hero's ball*, from the name of its inventor.

A FOUNTAIN, the stream whereof raises, and plays a brass ball.—Provide a hollow brass ball A, fig. 21. made of a thin plate, that its weight may not be too great for the force of the water. Let the tube B C, through which the water rises, be exactly perpendicular to the horizon.

Then, the ball being laid in the bottom of the cup, or basin B; will be taken up in the stream, and sustained at a considerable height, as A; alternately vibrating, or playing up and down.

Hence, as the figure of the ball contributes nothing to its reciprocal rise, and fall: any other body, not too heavy, may be substituted in lieu thereof; *c. gr.* a bird with its wings stretched forth.

But, note, that as it is necessary the ball, when on the descent, should keep the same precise perpendicular, wherein it rose (since otherwise it would miss the stream, and fall down right) such a *Fountain* can only be played in a place free from wind.

A FOUNTAIN, which spouts water in form of a shower.—To the tube wherein the water is to rise, fit a spherical, or lenticular head, A B, fig. 22. made of a plate of metal, and perforated a-top, with a great number of little holes.

The water rising with vehemence towards A B, will be there divided into innumerable little threads, and afterwards broke, and dispersed into the finest drops.

A FOUNTAIN which spreads the water in form of a table-cloth.—To the tube A B, fig. 23. solder two spherical segments C and D, almost touching each other; with a screw E, to contract, or amplify the interstice or chink at pleasure.

Others chuse to make a smooth, even cleft, in a spherical, or lenticular head fitted upon the tube.

The water spouting through this chink, or cleft, will expand itself in manner of a cloth.

FOUNTAINS wherein the water spouts out of the figures of men and other animals.—Since water may be derived or conveyed by tubes in any situation, and always retains the direction of the aperture; all here required, is to inclose tubes within the figures of men, or other animals, having their orifices in those parts whence the water is intended to spout forth.

From the principles hitherto laid down, it will be very easy to deduce whatever relates to the furniture of *Fountains*, and the various forms water may be put into by their means; all depending on the magnitude, figure, and direction of the adjutages, or apertures.

A FOUNTAIN which when it has done spouting, may be turned like an hour-glass.—Provide two vessels L M, and N O, fig. 24. to be so much the bigger as the *Fountain* is to play the longer; and placed at so much the greater distance from each other, P N, as the water is desired to spout the higher. Let B A C be a crooked tube, furnished in C with a cock; and F E D another bent tube, furnished with a cock in D. In I and K are to be other lesser tubes, open at both ends, and reaching near to the bottoms of the vessels N O, and L M: to which the tubes Q R, and S T are likewise to reach.

If, now, the vessel L M be filled with water; it will descend through the tube B A, and upon opening the cock C, will spout up near to the height of K: and, after its fall again, will sink through the little tube I, into the vessel N O, and expel the air through the tube Q O. At length, when all the water is emptied out of the vessel L M; by turning the machine upside down, the vessel N O will be the reservoir, and make the water spout up through the cock D.

Hence if the vessels L M, and N O contain just as much water as will be spouted up in an hour's time; we shall have a spouting clepsydra, or water clock, which may be graduated or divided into quarters, minutes, &c. as shewn under the article *CLEPSYDRA*.

A FOUNTAIN that begins to play upon the lighting of candles, and ceases as they go out.—Provide two cylindrical vessels,

A B,

A B, and C D, *fig. 25.* connect them by tubes, open at both ends, K L, B F, &c. so that the air may descend out of the higher into the lower. To the tubes folder candlesticks, H, &c. and to the hollow cover of the lower vessel, C F, fit a little tube, or jet F E, furnished with a cock G, and reaching almost to the bottom of the vessels. In G let there be an aperture, furnished with a screw, whereby water may be poured into C D.

Then, upon lighting the candles H, &c. the air in the contiguous tubes becoming rarified thereby; the water will begin to spout through E F.

By the same contrivance may a statue be made to shed tears upon the presence of the sun, or on the lighting of a candle, &c. All here required being only to lay tubes from the cavity wherein the air is rarified, to some other cavities plac'd near the eyes, and full of water.

FOUNTAIN, with regard to architecture, is an assemblage of masonry, sculpture, &c. either for the decoration, or convenience of a city, garden, or the like.

Fountains acquire various denominations, according to their form, and situation; as,

Arched FOUNTAIN, that whose bason and jet are placed perpendicularly under the arch. — Such are the *Fountains* of the Colonnade, and the triumphal water-arch at Versailles.

Bason FOUNTAIN, is that with only a simple bason, of any figure whatever; in the middle whereof is a jet, or spout, or perhaps a statue; or even a group of figures. — As the *Fountain* in the court of Buckingham house.

Covered FOUNTAIN, a kind of pavillion, built of stone; either insulate, and square; or round; or multilateral; or backed: and that, either with a projection, or indenture; inclosing a reservoir, and spouting or darting forth the water thereof through one or more cocks; in the middle of a street, square, garden, court, or the like. Such is that in Lincoln's-Inn new square, London.

Cup FOUNTAIN, is that which, beside a bason, has likewise a cup of one single piece of stone, or marble, supported on a shaft or pedestal, and receiving a jet, or spout rising out of the middle thereof.

As the *Fountain* in the court of the Vatican; the cup whereof is of granite, and antique; being brought from the baths of Titus at Rome.

Marine FOUNTAIN, that composed of aquatic figures, as sea divinities, naiads, tritons, rivers, dolphins, and other fishes, and shells. Such is the *Fountain* of the palace Paestrina at Rome; where a shell supported by four dolphins, serves as a cup, and supports a triton, that spouts water out of his concha marina.

Naval FOUNTAIN, is that made in form of a vessel. Such is that of the place d'Espagne at Paris, representing a bark: That at Monte-Cavallo, representing a galley; or that before the vineyard Mattei at Rome, resembling a boat.

Open FOUNTAIN, is any spouting *Fountain* with a bason, cup, and other ornaments; all open: as is frequent in our gardens, and in the vineyards at Rome.

Pyramidal FOUNTAIN, that formed of several basons, or cups, ranged in stories over each other, and diminishing all the way; being supported by a hollow stem, or shaft. — As the *Fountain* of Monte-Dragone at Fieschi.

Or else supported by figures, fishes, or consoles; the water whereof in its fall makes nets in divers stories, and represents a kind of water-pyramid. — As that at the head of the cascades at Versailles.

Rustic FOUNTAIN, is that formed, or enriched with rock-work, shell-work, petrifications, &c.

Satyrical FOUNTAIN, is a kind of rustic *Fountain*, in manner of a grotto; adorned with termini, mascarons, fauns, sylfens, bacchantes, and other satyrical figures, serving for ornaments as well as jets d'eau.

Spouting FOUNTAIN, or *jet d'eau*, is any *Fountain* whose water is darted forth impetuously through one, or more jets, or adjustments, and returns in form of rains, nets, folds, or the like.

Spout FOUNTAIN, a kind of plain spout, or stream of water, issuing out of a stone, or hole in a wall, without any decoration. — Such is the *Fountain* of Trevi at Rome.

Statuary FOUNTAIN, that which being open and insulated, or even backed, is adorned with one or more statues, by way of finishing, or crownin. — As the *Fountain* of Latona at Versailles; and that of the shepherd at Caprioli.

There are also statues, which spout forth water at some of their parts: or at sea shells, vases, urns, and other attributes of the sea.

Symbolical FOUNTAIN, that where the principal ornaments are the attributes, arms, or cognizances of the person who erected it. — Such are the *Fountain* of St. Peter in Montorio, resembling a castle flanked with towers, and donjons, representing the arms of Castile; and some other *Fountains* at Rome; among which are the flower-de-lis, and the dove, the bearings of the family of pope Innocent X.

FOUNTAIN-PEN, is a sort of pen, contrived to contain a great quantity of ink, and let it flow by gentle degrees; so as to supply the writer a long time, without a necessity of taking fresh ink.

The *Fountain-pen*, represented *Tab. Miscellany, fig. 5.* consists of divers pieces, F, G, H, of brass, silver, &c. whereof the middle piece F carries the pen, which is screwed into the inside of a little pipe; which again is soldered to another pipe of the same bigness, as the lid G; in which lid is soldered a male screw, for screwing on the cover; as also for stopping a little hole at the place, and hindering the ink from passing through it. At the other end of the piece F is a little pipe, on the outside whereof the top cover H may be screwed. In the cover there is a port-crajon, to be screwed into the last mentioned pipe, in order to stop the end of the pipe, into which the ink is to be poured by a funnel.

To use the pen, the cover G must be taken off, and the pen a little shaken, to make the ink run more freely.

FOUR, *Cal de four*, see the article *CUL*.

FOURCHEL, or **FOURCHY**, in heraldry. — A cross *Fourche* is that forked at the ends.

Upton rather than to the points; whereas the true cross *Fourche*, i.e. forked, has its forks composed of straight lines, and blunt ends. — *Tab. Herald fig. 27.*

FOURCHER, an ancient law term, signifying a putting off, prolonging, or delaying an action.

As by stammering we draw out our speech, not delivering that we have to say, in ordinary time; so by *fourching* we prolong a suit, that might be ended in a shorter space.

In Stat. *Westm.* i. cap. 42. we have these words: "coparceners and joint tenants shall no more *fourch*, but only shall have one *essoin*," &c. and anno 6 Edw. I. cap. 10. it is used in the same sense; "the defendants shall be put to answer without *fourching*," &c. In the Latin it is called *furcare*, and is used where a man and his wife do *essoin* severally. *Caveat vir & mulier implacitati, quod semper in *essoin* alterius alter compareat, quamdiu furcare possint; & cum ultra non possint, concurrant coram *essoin* in suis locis: alter autem earum tantum unum *essoin* de malo levis habere possit.* Hengham mag. cap. 9.

FOURCHETTE, *Fer de FOURCHETTE*, see the article *FER*.

FOURTH, in musick, one of the harmonic intervals; or concords.

The *Fourth*, is the fourth in order of the concords. It consists in the mixture of two sounds, which are in the ratio of 4 to 3; i.e. of sounds produced by chords, whose lengths are to each other as 4:3.

It is called *Fourth*, because containing *four* terms, or sounds between its extremes; and three degrees: or, as being the *fourth* in the order of the natural scale from the fundamental.

The ancients call the *Fourth*, *Diatesaron*, and speak of it as the first and principal of all concords; and yet the moderns find it one of the most imperfect. It is so very barren, and jejune, that it affords nothing good, either by multiplication; or division.

The *redundant FOURTH* is a discord composed of the ratios of 27 to 20; and of 4 to 5.

Arches of the FOURTH Point, see the article *ARCH*.

FOURTH RATE, see the article *RATE*.

FOUTGELD, or **FOOTGELD**, see **FOOTGELD**.

FOWL, in its general sense is of equal import with bird.

See **BIRD**.

FOWL, is in a more peculiar manner understood of poultry, or the larger sort of birds both domestic and wild, either bred up, or hunted, for the table.

Such are turkeys, geese, cocks, hens, and ducks, both wild and tame; pheasants, partridges, pigeons, snipes, &c.

Tame FOWL, are a necessary part of the stock of a country farm; and yield considerable service and profit by their eggs, brood, feathers, dung, &c.

They may be kept at a very easy expence near any highway side; as being able to shift for themselves during the greatest part of the year, by their feeding on insects, worms, snails, and almost any thing eatable.

The oldest hens are always the best for sitting; and the youngest for laying; but no sort will be good for either, if kept too fat.

The best age to set a hen for chickens, is from two years old to five; and the most proper month to set them in, is February; though it may be done to good purpose any time between that and Michaelmas. One cock will serve ten hens: a hen sits but twenty days, whereas geese, ducks, and turkeys, sit thirty.

Buckwheat, or French wheat, or hempseed, it is said, make them lay faster than any other food; and the same buckwheat, either whole, or ground, and made into a paste, fats them again; though the common food for that purpose is barley-meal, or wheat-flower, soaked in milk, or water, made into a paste, and crammed down their throats twice a day, till they will hold no more. A goose will scarce sit on any but her own eggs: a hen will sit indifferently on all.

The lightest coloured geese are the best; and those that begin to lay the soonest; as they have a chance of hatching twice in one year. They begin to lay in the spring; and lay twelve or sixteen eggs. Green geese are begun to be fattened at a month old; and will be fat in a month more. Old geese are chiefly

chiefly fattened at six months old, in, or after the harvest. A wild goose, if red footed, and hairy, is old; but if white footed, and not hairy, she is young.

When the eggs are set under a hen, or other *Fowl*, it is advisable to mark the upper sides thereof; and when she goes to feed, to note whether she minds to turn them upside down, or not; that if she neglect that office, it may be done for her.

FOWLING, the act, or art of catching birds with nets; birdlime, decoys, and other devices; as also of breeding up the same.

FOWLING is also used for the pursuing, and taking of birds with hawks, falcons, and other birds of prey; more properly called *Falconry* and *Hawking*.

FOWLING-PIECE, a portable fire-arm for the shooting of birds.

Of *Fowling-pieces*, those are reputed the best, which have the longest barrel, *sc.* from 5 to 6; with an indifferent bore, under thearquebus; though different regulations they should be of different sorts, and sizes. But in all, it is essential the barrel be well polished and smooth within; and the bore all of one gage, from one end to another; which may be proved by thrusting in a piece of wood, cut exactly to the bore of the muzzle, down to the touch-hole.

FOX HUNTING, see the article *FOX HUNTING*.

FRACTION, in arithmetic, a part, or division of an unite, or integer: or, a number which stands to an unite in the relation of a part to its whole.

The word literally imports a broken number.

Fractions are usually divided into *decimal*, *sexagesimal*, and *vulgar*.

For *decimal*, and *sexagesimal Fractions*, see *DECIMAL*, and *SEXAGESIMAL Fractions*.

Vulgar Fractions, called also simply, *Fractions*, are always expressed by two numbers, the one wrote over the other, with a line between them.

The lower, called the *denominator of the Fraction*, denotes the unite, or whole, that is divided into parts; and the upper, called the *numerator of the Fraction*, expresses the parts given in the present case.

Thus, two third parts of a line, or other thing, are wrote $\frac{2}{3}$; where the denominator 3 shews, that the whole line is supposed to be divided into three equal parts; and the numerator 2 indicates or assigns two of such parts.

Again, twenty-nine sixtieths is wrote $\frac{29}{60}$; where the numerator 29 expresses 29 parts of an integer divided into 60; and the denominator 60 gives the denomination to these parts, which are called *sixtieths*.

The real design of adding the denominator, is to shew what aliquot part the broken number has in common with unity. In all *Fractions*, as the numerator is to the denominator; so is the *Fraction* itself, to the whole whereof it is a *Fraction*.

Thus, supposing $\frac{3}{4}$ of a pound equal to 15 s. it is evident, that 3 : 4 :: 15 : 20. Whence it follows, 1^o That there may be infinite *Fractions* of the same value, one with another; inasmuch as there may be infinite numbers found, which shall have the ratio of 3 : 4.

Fractions are either *proper*, or *improper*.

Proper FRACTION is that where the numerator is less than the denominator; and consequently the *Fraction* less than the whole, or integer; as $\frac{3}{4}$.

Improper FRACTION is, where the numerator is either equal to, or bigger than the denominator; and, of course the *Fraction* equal to, or greater than the whole, or integer, as $\frac{4}{3}$; or $\frac{5}{2}$, or $\frac{7}{2}$.

Fractions, again, are either *simple* or *compound*.

Simple FRACTIONS are such, as consist of only one numerator, and one denominator; as $\frac{1}{2}$, or $\frac{3}{4}$, &c.

Compound FRACTIONS, called also *Fractions of Fractions*, are such as consist of several numerators, and denominators; as $\frac{1}{2}$ of $\frac{3}{4}$, or $\frac{1}{2}$, &c.

Of *Fractions*, those are equal to each other, whose numerators have the same ratio to their denominators.—Those are greater, whose numerators have a greater ratio; and those less, which have less: thus, $\frac{1}{2} = \frac{2}{4}$; $\frac{1}{3} = \frac{2}{6}$; $\frac{1}{4} = \frac{2}{8}$; and $\frac{1}{5}$ is greater than $\frac{1}{6}$; and $\frac{1}{6}$ is less than $\frac{1}{7}$.

Hence if both the numerator, and denominator of a *Fraction*, as $\frac{2}{3}$, be multiplied, or divided by the same number, as 2; the facta in the former case, $\frac{4}{6}$, and the quotients in the latter, $\frac{1}{3}$, will constitute *Fractions*, equal to the first *Fraction* given.

The arithmetic of *Fractions* consists in the *reduction*, *addition*, *subtraction*, and *multiplication* thereof.

Reduction of FRACTIONS.—1^o To reduce a given whole number into a *Fraction* of any given denominator.—Multiply the given integer, by the given denominator: the factum will be the numerator. Thus we shall find $3 = \frac{3 \times 4}{4}$; and $5 = \frac{5 \times 3}{3}$; and $7 = \frac{7 \times 2}{2}$, &c.

If no denominator be given, the number is reduced to a *Fraction*, by writing 1 underneath it, as a denominator. Thus $1 = \frac{1}{1}$, $2 = \frac{2}{1}$.

2^o To reduce a given *Fraction* to its lowest terms, i. e. to find a *Fraction*, equivalent to a given *Fraction*, ($\frac{2}{3}$), but expressed in less numbers—divide both the numerator 2, and denominator 4 by some one number, that will divide them both without any remainder, as here by 2. The quotients 1 and 2 make a new *Fraction* $\frac{1}{2}$, equal to $\frac{2}{4}$. And if the division be performed with the greatest number that will divide them both; the *Fraction* is reduced to its lowest terms.

To find the greatest common divisor of two quantities.—Divide the greater by the less: then divide the divisor of the division by the remainder thereof: again, divide the divisor of the second division by the remainder of the second; and so on, till there remain nothing. The last divisor is the greatest common measure of the given numbers.

If it happen that unity is the only common measure of the numerator and denominator; then is the *Fraction* incapable of being reduced any lower.

3^o To reduce two, or more *Fractions* to the same denomination; i. e. to find *Fractions* equal to the given ones, and with the same denominator.—If only two *Fractions* be given, multiply the numerator, and denominator of each, by the denominator of the other: the products given are the new *Fractions* required. Thus $\frac{1}{2}$ and $\frac{2}{3}$ make $\frac{3}{6}$ and $\frac{4}{6}$. If more than two be given, multiply both the numerator and denominator of each into the product of the denominators of the rest. Thus $\frac{1}{2}$, $\frac{2}{3}$, $\frac{3}{4}$ = $\frac{6}{24}$, $\frac{16}{24}$, $\frac{9}{24}$.

4^o To find the value of a *Fraction* in the known parts of its integer. Suppose, *sc.* gr. it were required to know what is $\frac{3}{4}$ of a pound; multiply the numerator 3 by 20, the number of known parts in a pound, and divide the product by the denominator 4; the quotient gives 15 s. Then multiply the remainder 4 by 12, the number of known parts in the next inferior denomination; and dividing the product by 4, as before, the quotient is 3 d. So that $\frac{3}{4}$ of a pound = 15 s. 3 d.

5^o To reduce a mixed number, as $4\frac{1}{2}$ into an improper *Fraction* of the same value.—Multiply the integer, 4, by 12, the denominator of the *Fraction*; and to the product 48 add the numerator; the sum 59 set over the former denominator, $\frac{1}{2}$, constitutes the *Fraction* required.

6^o To reduce an improper *Fraction* into its equivalent mixed number. Suppose the given *Fraction* $\frac{19}{4}$; divide the numerator by the denominator; the quotient $4\frac{3}{4}$ is the number sought.

7^o To reduce a compound *Fraction* into a simple one. Multiply all the numerators into each other for a new numerator; and all the denominators for a new denominator. Thus $\frac{1}{2}$ of $\frac{2}{3}$ of $\frac{3}{4}$ reduced, will be $\frac{1}{4}$.

Addition of vulgar Fractions. 1^o If the given *Fractions* have different denominators, reduce them to the same. Then, add the numerators together, and under the sum write the common denominator. Thus, *sc.* gr. $\frac{1}{2} + \frac{1}{3} = \frac{3}{6} + \frac{2}{6} = \frac{5}{6}$. And $\frac{1}{2} + \frac{1}{3} + \frac{1}{4} = \frac{6}{12} + \frac{4}{12} + \frac{3}{12} = \frac{13}{12} = 1\frac{1}{12}$.

2^o If compound *Fractions* are given to be added; they must first be reduced to simple ones: and if the *Fractions* be of different denominations, as $\frac{1}{2}$ of a pound, and $\frac{1}{3}$ of a shilling, they must first be reduced to *Fractions* of the same denomination of pounds.

3^o To add mixed numbers: the integers are first to be added; then the fractional parts: and if their sum be a proper *Fraction*, only annex it to the sum of the integers. If it be an improper *Fraction*, reduce it to a mixed number, adding the integral part thereof to the sum of the integers, and the fractional part after it. Thus, $5\frac{3}{4} + 4\frac{1}{4} = 10$.

Subtraction of Fractions. 1^o If they have the same common denominator, subtract the lesser numerator from the greater, and set the remainder over the common denominator. Thus from $\frac{7}{8}$ take $\frac{1}{8}$, and there remains $\frac{6}{8}$.

2^o If they have not a common denominator, they must be reduced to *Fractions* of the same value, having a common denominator, and then, as in the first rule. Thus, $\frac{1}{2} - \frac{1}{3} = \frac{3}{6} - \frac{2}{6} = \frac{1}{6}$.

3^o To subtract a whole number from a mixed number; or one mixed number from another. Reduce the whole, or mixed numbers to improper *Fractions*, and then proceed as in the first and second rule.

Multiplication of Fractions. 1^o If the *Fractions* proposed be both simple, multiply the numerators one by another for a new numerator, and the denominators for a new denominator. Thus $\frac{1}{2}$ into $\frac{2}{3}$ produces $\frac{2}{6}$.

2^o If one of them be a mixed, or whole number, it must be reduced to an improper *Fraction*; and then proceed as in the last rule. Thus $\frac{1}{2}$ into $5\frac{1}{2}$, gives $\frac{1}{2}$ into $\frac{11}{2}$; and $\frac{1}{2}$ into $\frac{11}{2}$ = $\frac{11}{4}$.

In multiplication of *Fractions*, observe that the product is less in value, than either the multiplicand, or multiplier, because in all multiplications, as unity is to the multiplicand, so is the multiplier, to the product: or, as unity is to either factor, so is the other factor, to the product. But unity is bigger than either factor, if the *Fractions* be proper; and therefore either of them must be greater than the product.

Thus in the whole numbers, if 5 be multiplied by 8, it will be as 1 : 5 :: 8 : 40; or 1 : 8 :: 5 : 40. Wherefore in

Fractions also, as $\frac{1}{2} : \frac{2}{3} : \frac{3}{4} : \frac{4}{5}$; or as $\frac{1}{2} : \frac{2}{3} : \frac{3}{4} : \frac{4}{5}$. But 1 is greater than either $\frac{2}{3}$ or $\frac{3}{4}$: wherefore either of them must be bigger than $\frac{1}{2}$.

Division of FRACTIONS.— 1^o , If the *Fractions* proposed be both simple, multiply the denominator of the numerator of the dividend; the product is the numerator of the quotient. Then multiply the numerator of the divisor, by the denominator of the dividend, the product is the denominator of the quotient.—Thus $\frac{1}{2} \div \frac{3}{4} = \frac{1 \times 4}{2 \times 3} = \frac{4}{6} = \frac{2}{3}$.
 2^o , If either dividend, divisor, or both, be whole or mixed numbers, reduce them to improper *Fractions*: and if they be compound *Fractions*, reduce them to simple ones: and proceed as in the first rule.

In divisions of *Fractions*, observe that the quotient is always greater than the dividend; because in all division, as the divisor is to the unity, so is the dividend to the quotient; as if 3 divide 12, it will be, as 3 : 1 : 12 : 4. Now 3 is greater than 1; wherefore 12 must be greater than 4: but in *Fractions*, as $\frac{2}{3} : 1 : \frac{3}{4}$; where, $\frac{2}{3}$ is less than 1; wherefore $\frac{3}{4}$ must also be less than $\frac{2}{3}$.

FRACTIONS in species, or algebraic quantities.— 1^o , To reduce *Fractions in species to their least terms.*—The numerators and denominators are to be divided by the greatest common divisor, as in numbers.

Thus the *Fraction* $\frac{a a c}{b c}$ is reduced to a more simple one

$\frac{a a}{b}$ by dividing both $a a c$, and $b c$ by c : and $\frac{203}{667}$ is re-

duced to a more simple one $\frac{7}{23}$ by dividing both 203 and

667 by 29; and $\frac{203 a a c}{667 b c}$ is reduced to $\frac{7 a a}{23 b}$ by dividing by

$6 a^3 - 9 a c c$ becomes $\frac{2 a a - 3 c c}{2 a + c}$ by divid-

ing by 3 a. And $\frac{6 a a + 3 a c}{a^3 - a a b + a b b - b^3}$ becomes $\frac{a a + b b}{a a - a b}$

by dividing by $a - b$.
 2^o , To reduce *Fractions in species to a common denominator.*—

The terms of each are to be multiplied by the denominator of the other.

Thus, having $\frac{a}{b}$ and $\frac{c}{d}$, multiply the terms of one

$\frac{a}{b}$ by d , and also the terms of the other $\frac{c}{d}$ by b , and they

will become $\frac{a d}{b d}$ and $\frac{b c}{b d}$, whereof the common denomina-

tor is $b d$. And thus a and $\frac{a b}{c}$, or $\frac{a}{c}$ and $\frac{a b}{c}$ become $\frac{a c}{c}$

and $\frac{a b}{c}$.

But where the denominators have a common divisor, it is sufficient to multiply them alternately by the quotients.

Thus the *Fraction* $\frac{a^3}{b c}$ and $\frac{a^3}{b d}$ are reduced to these $\frac{a^3 d}{b c d}$

and $\frac{a^3 c}{b c d}$ by multiplying alternately by the quotients c and d ,

arising by the division of the denominators by the common divisor b .

Addition and subtraction of Fraction in species.—The process is in all respects the same in species as in numbers. *E. gr.*

Suppose it be required to add the *Fractions* $\frac{a}{b}$ and $\frac{c}{d}$. These,

when reduced to the same denomination, will be $\frac{a d}{b d}$ and $\frac{b c}{b d}$

consequently their sum is $\frac{a d + b c}{b d}$.

So, if the *Fraction* $\frac{a}{b}$ were to be subtracted from $\frac{c}{d}$:

having reduced them, they will be $\frac{a d}{b d}$ and $\frac{b c}{b d}$, as before.

Their difference, therefore, is $\frac{b c - a d}{b d}$.

Multiplication and division of Fractions in species.—Here too,

the process is perfectly the same as in vulgar arithmetic. Thus, *e. gr.* suppose the factors, or *Fractions*, to be multiplied;

$\frac{a}{b}$ and $\frac{c}{d}$: the product will be, $\frac{a c}{b d}$.

Or suppose the *Fractions* required to be divided, $\frac{a c}{b d}$ and

$\frac{a}{b}$; the quotient will be $\frac{a c b}{b d a} = \frac{a b c}{a b d} = \frac{c}{d}$.

Hence, as $a = \frac{a}{1}$: the product of a into $\frac{c}{d}$, that is, of an

integral quantity into a *Fraction*, $\frac{c}{d} \times a = \frac{a c}{d}$. Whence it

appears, that the numerator of the *Fraction* is to be multiplied by the integer.

Hence also the quotient of $\frac{c}{d}$ by a , that is of the broken

quantity, divided by the whole one, $\frac{c}{d} \div a = \frac{c}{d a}$.

Beside the common notion of a *Fraction*, there is another necessary to be understood. Thus,

Suppose $\frac{3}{4}$ of 20 s: or a pound sterling, were the *Fraction*: this *Fraction* instead of three quarters of one pound, may be considered as a fourth part of three pounds; that is, by taking as many of the integers, as the numerator expresses (*viz.* 3.) and dividing them by 4, the denominator; for then the quotient of the same value will arise for $\frac{3}{4}$ 60 s. 15 s. This shews the reason of that manner of expression used by geometers and

algebraists, who read $\frac{a}{b}$, thus, a divided by b .

Logarithm of a FRACTION, see LOGARITHM.
Summing of infinite FRACTIONS, see CALCULUS, and FLUXIONS.

FRACTURE, in medicine and chirurgery, a breach, or rupture of a bone; or a solution of continuity in a bone, when it is crushed, or broken, by some external cause.

In *Fractures*, the bone is either broken breadth-wise, that is, transversely; or length-wise, which last is more properly called a *Fissure*.

Transverse *Fractures* are more easy to discover, but more difficult to cure than longitudinal ones. A *Fracture* in the middle of a bone is less dangerous than one towards the articulation.

When the *Fracture* is attended with a wound, contusion, &c. or when the bone is shattered into several pieces, it is highly dangerous. A *Fracture* of the femur in adults is rarely, if ever so well cured, but there still remains a lameness. *Fractures* of the lesser bones are usually cured in seven or fourteen days; those of the greater, in twenty or forty days.

In the cure of *Fractures*, the chirurgeon has two things to attend to: first, to restore the fractured bone into its natural situation; and then to keep it tight with ferule, or splinters, and bandages: in which case, nature takes on herself the office of healing and conglutinating it, by forming a callus thereon.

If there be an inflammation, it must be cured before any thing be attempted about the *Fracture*. If the bone happen to be broke again, it never breaks in the callus, but at a distance from it.

After setting, or replacing the *fractured* bone, bleeding is required, to prevent any lodgment of blood on the part aggrieved, by the violence upon the fibres.

A *Fracture* of the cranium is usually certain death, without trepanning.

Capillary FRACTURE, see the article CAPILLARY.

FRÆNUM, or **FRENUM**, *Bridle*, in anatomy, a name given to divers ligaments, from their office in retaining, and curbing the motions of the parts they are fitted to.

FRÆNUM Linguae, or *Bridle of the Tongue*, is a membranous ligament, which ties the tongue to the os hyoides, larynx, fauces, and lower part of the mouth.

In some subjects the *Frænum* runs the whole length of the tongue, to the very tip; in which cases, if it were not cut, it would take away all possibility of speech.

FRÆNUM of the Penis, is a slender ligament, whereby the prepuce is tied to the lower part of the glans.

Nature varies in the make of this part; it being so short in some, that unless divided, it would not admit of perfect erection. There is also a kind of little *Frænum*, fastened to the lower part of the clitoris. See CLITORIS.

FRAIGHT*, or **FREIGHT**, in navigation and commerce, the hire of a ship, or of a part of it; for the conveyance and carriage of goods, from one part, or place, to another; or the sum agreed on between the owner and the merchant, for the hire, and use of a vessel.

* The word is formed of the French *Fret*, signifying the same thing; or from *Fret*, of *Fretum*, an arm of the sea; though others chuse to derive it from the German *Fracht*, or the Flemish *Fracht* signifying carriage.

The *Fraight* of a vessel is usually agreed on either at the rate of so much for the voyage, or by the month, or per tun.

Fraighting, or letting out of vessels on *Fraight*, or hire, is one of the principal articles in the trade of the Hollanders: they are the carriers of all the nations of Europe, and their purveyors; notwithstanding that their country produces nothing at all, and that they are forced to have every thing necessary for the building of a vessel from other countries.

The principal laws and rules relating to *fraighting* are: that if a whole vessel be hired, and the merchant, or person who hires it, do not give it its full load, or burthen; the master of the vessel cannot without his consent take in any other goods, without accounting to him for *Fraight*.

That, though the merchant do not load the full quantity of goods agreed on in the charter-party; yet he shall pay the whole *Fraight*; and if he load more, he shall pay for the excess.

That the master may let a-shore such goods as he finds in his vessel, which were not notified to him; or take them at a higher rate than was agreed on for the rest.

That, if a ship be stopped or detained in its course, either through the master's, or the merchant's default; the delinquent shall be accountable to the other.

That, if the master be obliged to refit his vessel during the voyage, the merchant shall wait; or else pay the whole *Fraight*: if the vessel could not be refitted, the master is obliged to hire another immediately; otherwise only to be paid his *Fraight* in proportion to the part of the voyage performed; though, in case the merchant prove that the vessel at the time it set sail, was not capable of the voyage, the master must lose his *Fraight*, and account for damages to the merchant.

That *Fraight* shall be paid for merchandizes which the master was obliged to sell for victuals, or refitting, or other necessary occasions; paying for the goods at the rate the rest were sold at, where they were landed.

That in case of a prohibition of commerce with the country whither the vessel is bound, so that it is obliged to be brought back again; the master shall only be paid *Fraight* for going.

And if a ship be stopped or detained in its voyage, by an embargo by order of the prince, there shall neither be any *Fraight* paid for the time of the detention, in case it be hired per month: nor shall the *Fraight* be increased, if hired for the voyage; but the pay, and the victuals of the sailors, during the detention, shall be deemed average.

That the master shall take no *Fraight* for any goods lost by shipwreck, plundered by pirates, or taken by the enemy, unless the ship and goods be redeemed; in which case he shall be paid his *Fraight* to the place where he was taken; upon contributing to the redemption.

That the master shall be paid his *Fraight* for the goods saved from shipwreck; and in case he cannot get a vessel to carry them unto the place where they were bound, that he shall be paid in proportion to the part of the voyage already gone.

That the master may not detain any merchandize in his vessel, in default of payment of *Fraight*; though he may order them to be seized any time, or any where afterwards. That if merchandizes in casks, as wines, oils, &c. have so run out in carriage, that the vessels are left empty; or almost empty; the merchant may relinquish them, and the master be obliged to take them for their *Fraight*; though this does not hold of any other goods damaged, or diminished of themselves, or through accidents.

FRAIGHT is also used for the burthen, or lading of a ship; or the cargo of goods, &c. which she has on board.

FRAIGHT is also a duty of fifty sols per tun, paid to the crown of France by the captains and masters of all foreign vessels at their entrance into and going out of the ports and havens of that kingdom. And note, that all vessels not built in France, however they may belong to the subjects of France, are reputed foreigners, and subject to this impost; unless it be made appear, that two thirds of the ship's crew are French.

By the 11th article of the treaty of commerce concluded at Utrecht between England and France, this duty of 50 sols per tun was to have been remitted the English; and at the same time the duty of 5 s. sterling to have been suppressed in favour of the French: but the execution of that article, as well as the tariff settled between the two nations, has been suspended.

The Dutch however and the Hans towns are exempted from the duty of *Fraight*.

FRAIL, a basket of rushes, or the like matter, wherein to pack up figs, raisins, &c.

FRAIL also denotes a certain quantity of raisins, about seventy-five pounds.

FRAISE, in fortification, a kind of defence, consisting of pointed stakes, driven parallel to the horizon, into the retrenchments of a camp, a half-moon, or the like, to fend off and prevent any approach, or scalade.

Fraises differ from palisades chiefly in this, that the latter stand perpendicular to the horizon: and the former jet out parallel to the horizon, at least nearly so; being usually made a little sloping, or with the points hanging down.

Fraises are chiefly used in retrenchments, and other works thrown up of earth: sometimes they are found under the parapet of a rampart; serving instead of the cordon of stone used in stone works.

He fortified all the weak places of his camp with *Fraises* and palisades.—All the outworks of the place were *fraised* and palisaded.

FRAISING of a battalion, is the lining it all around with pikes; in case of being charged by a body of horse.

FRAME, in joinery, &c. a kind of case, wherein a thing is set, or inclosed, or even supported; as a window *Frame*, a *Frame* of a picture, of a table, &c.

FRAME, is also a machine, used in divers arts. The printer's *Frame* is more usually called a *chase*.

The founder's *Frame* is a kind of ledge, inclosing a board; which being filled with wetted sand, serves as a mould to cast their work in. See **FOUNDERY**.

FRAME is more particularly used for a sort of loom, whereon artizans stretch their linens, silks, stuffs, &c. to be embroidered, quilted, or the like.

FRAME, among painters, &c. is a kind of chaffy, or square, composed of four long pieces, or slips of wood, joined together; the intermediate space whereof is divided by little strings or threads into a great number of little squares, like the meshes of a net; and for that reason sometimes called *reticula*.

Its use is in reducing of figures from great to small; or augmenting their size from small to great.

FRAME Lavo, see the article **LAW**.

FRAMING of a house, all the timber-work therein; viz. the carcase, flooring, partitioning, roofing, cicling, beams, shclering, &c.

FRAMPOLE Fence, a privilege enjoyed by the tenants of the manor of Writtle in Essex; whereby they are entitled to the wood growing on the fence; and as many trees or poles as they can reach from the top of the ditch with the helve of an ax; toward the repair of their fences.

The late chief justice Brampton, whilst steward of this court, acknowledged he could not find out the reason, why these fences were called *frampole*.—It may come from the Saxon *framful*, profitable; or may be a corruption of *franc-pole*, because the poles are free for the tenant to take.

FRANC, see the article **FRANK**.

FRANCHISE, a privilege, or exemption from ordinary jurisdiction.

FRANCHISE is also used for an asylum, or sanctuary, where people are secure of their persons, &c.

Churches and monasteries in Spain are *franchises* for criminals; so were they antiently in England; till they were abused to such a degree, that there was a necessity for abolishing the custom.

One of the most remarkable capitulars made by Charlemain in his palace of Heristal, in 779, was that relating to the *franchises* of churches.—The right of *franchise* was held so sacred, that even the less religious kings observed it to a degree of scrupulousness: but to such excess in time was it carried, that Charlemain resolved to bring it down. Accordingly he forbade any provision being carried to criminals retired into churches for refuge.

FRANCHISE is also used for an immunity from the ordinary tributes and taxes.

This is either real, or personal; that is, either belonging immediately to the person; or accruing on account of this or that place, or office of immunity. See **IMMUNITY**.

FRANCHISE of quarters, is a certain space, or district at Rome, wherein are the houses of the ambassadors of the princes of Europe; and where such as retire, cannot be arrested, or seized by the sberri, or sberjeant, not prosecuted at law.

The people of Rome took on this as an old usurpation, and a scandalous privilege, which ambassadors, out of a jealousy of their power, carried to a great length in the 15th century, by enlarging immensely the dependances of their palaces or houses, within which the right of *franchise* was antiently confined. Several of the popes, Julius III. Pius XIV. Gregory XIII. and Sixtus V. published bulls and ordinances against this abuse; which had refused so considerable a part of the city from their authority, and rendered it a retreat for the most abandoned persons.

At length Innocent XI. expressly refused to receive any more ambassadors but such as would make a formal renunciation of the *franchise of quarters*.

FRANCHISE royal, is a place where the king's writ runs not; as at Chester, and Durham: and antiently at Tyndal and Easinghamshire in Northumberland.

FRANCHISING, see **ENFRANCHISEMENT**, and **MANUMISSION**.

FRANCIGENA, or **FRENCHMAN**, in our antient customs, was a general appellation of all foreigners, i. e. all persons who could not prove themselves Englishmen.

FRANGIPANE, an exquisite kind of perfume; frequently given to the leather whereof gloves, purses, bags, &c. are made.

It takes its name from a Roman nobleman, of the antient family of Frangipani; who was the inventor thereof.

There is also a kind of perfumed liquor of the same denomination, said to have been invented by a grandson of Mutio Frangipani; and also a perfumed kind of *ros solis*, called by the same name.

FRANK, or **FRANC**, a term literally signifying free, open, exempt from public impositions and charges: as *Frank confession*, *Frank fair*, *Frank letter*, &c.

The term *Frank* is much used in our antient customs and tenures; where it receives various particular modifications and meanings, according to the words it is combined with, as

FRANK Allu, or *Allodium*, is a land, tenement, or demesne, that is not held of any superior lord.

FRANK Alms, or *Free Alms*, is a tenure of lands or tenements bestowed on God; that is, given to such people as devote themselves to the service of God, in pure and perpetual alms.

Whence, the feoffers, or givers cannot demand any terrestrial service, so long as the lands remain in the hands of the feoffees.

Briton mentions another kind of this land given in alms, but not free alms; the tenants being tied in certain services to the feoffor.

FRANK Bank, see the article *FREE Bench*.

FRANK Chace, denotes liberty of free chace, in a circuit adjoining to a forest, on account of which, men, though they have land of their own within that compass, are forbidden to cut down wood, without the view of the forester; though it be their own demesne. See *CHACE*.

FRANK Fee, *Feudum francum*, as defined by Brooke, is that which is in the hands of the king, or lord of a manor; being antient demesne of the crown.

FRANK Fee, *Feudum liberum*, according to some, denotes that for which no service is performed to any lord.

According to Fachin, l. vii. c. 39. lands held in *Frank Fee* were exempted from all services, except homage.

In contradistinction to that in the tenants hands, which is only antient demesne.

In the reg. of writs, *Frank Fee* is said to be that which a man holds at common law to him and his heirs; and not by such service as is required in antient demesne, according to the custom of the manor.

It is added, that the land in the hands of king Edward the Confessor, at the making of domesday book, is antient demesne; and all the rest, *Frank Fee*. On which footing, all the lands in the realm are either antient demesne, or *Frank Fee*.

Others define *Frank Fee* to be a tenure in fee simple, of lands pleadable at common law; and not in antient demesne.

FRANK Farm, *frama libera*, is lands or tenements, wherein the nature of the fee is changed, by seoffment, from knight's service, to a certain yearly service; and whence neither homage, wardship, marriage, nor relief may be demanded: nor any other service, not contained in the seoffment. See *Fee Farm*.

FRANK Fold, is where the lord hath the benefit of folding his tenant's sheep, within his manor; for the manuring of his land.

FRANK Language, or *Lingua FRANCA*, is a kind of jargon, spoke on the Mediterranean, and particularly throughout the coasts and ports of the Levant; composed of Italian, Spanish, French, vulgar Greek, and other languages.

The *Lingua Franca* is the trading language; and is thus called from the *Franks*, a common appellation given in the Levant to all the European merchants and traders, who come thither to traffick.

In this language, if it may be so called, nothing but the infinitive mood of each verb is used; this serving for all the tenses and moods of the conjugation: and yet this lame, mutilated diction, this barbarous medley, is learnt and understood by the merchants and mariners of all nations who repair thither.

FRANK Law, *Lex libera*, is the benefit of the free, and common law of the land.

He that for any offence, as conspiracy, &c. loseth his *Frank Law*, incurs these inconveniencies. 1^o That he may not be impanelled on any jury or affize; or otherwise used as an evidence, or witness to the truth. 2^o That if he have any thing to do in the king's court, he must not approach it in person, but appoint his attorney. 3^o That his lands, goods, and chattels, be seized into the king's hands; and his lands be effreighted, his trees rooted up, and his body committed to custody.

FRANK Marriage, *Liberum Maritadium*, is a tenure in tail special, whereby lands or tenements are held to a person and his wife, and the heirs of their bodies, on condition of doing fealty to the donor from the fourth degree.

This tenure arises from those words in the gift: *Sciant, &c. me T. B. de O. dedisse ac concessisse, & presenti charta mea confirmasse A. B. filio meo, & Marie uxori ejus, filie C. D.*

Vol. I.

in liberum maritadium unum messuagium, &c.

Fleta gives this reason, why the heirs do no service, till the fourth degree: *ne donatores vel eorum heredes per homagii receptionem a reversione repellantur*: and why in the fourth descent they shall do service to the donor, *quia in quarto gradu vehementer presumitur quod terra est pro defectu heredum donatorum reversione*.

Frank Marriage, is more clearly expressed by Bracton, to be that where the donor intends that the land thus bestowed, shall remain quiet, and free from all secular service that might be affected to the fee; so that he who gave it, shall claim no manner of service from it, until the third heir, and the fourth descent, or degree; reckoning the donee in the first degree, his heir in the second, the heir of him in the third, and his, again, in the fourth; but afterwards the same land to become subject to all the former services; as being then supposed to revert to the lord for want of heirs.

The lands otherwise given in marriage, *viz. servitio obligata*, were with a reservation of the services due to the lord, which the donee and his heirs were bound to perform for ever: only, homage was not to commence till the fourth degree; when both service and homage were to be enjoined for ever.

FRANK Pledge, signifies a pledge, or surety for the behaviour of a free man; called also *Friburgh*.

The antient custom of England, for preservation of the public peace, was, that every free-born man, at fourteen years of age (religious persons, clerks, knights, and their eldest sons excepted) should find surety for his truth towards the king and his subjects, or else to be kept up in prison.

Accordingly, a number of neighbours became interchangeably bound for each other, to see each man of their pledge forthcoming at all times; or to answer for the offence committed by any one gone away: so that whenever one offended, it was presently enquired in what *Pledge* he was; and then those of the *Pledge* either brought him forth within one and thirty days to his answer; or they satisfied for his offence.

This custom was called *Frank Pledge*; and the circuit it extended to, *Decenna*, by reason it usually consisted of ten households; and every person thus bound for himself and neighbours, was called a *Decennier*.

In observance of this custom, the sheriffs at every county court did from time to time take the oaths of young persons, as they arrived at the age of fourteen; and see they were settled in one *Decenna*, or *Doxein*, or another. Whereupon this branch of the sheriff's office and authority was called *Visus Franci Plagi*, i. e. *View of Frank Pledge*.

* *Omnis homo, sive liber, sive servus, aut est, vel debet esse in Franco Plegio, aut de aliquo, manupellus, nisi sit aliquis itinerans de loco in locum, qui non plus se tenet ad unum quam ad alium, vel qui habet quod sufficiat pro Franco Plegio, sicut dignitatem, vel ordinem, vel liberum tenementum, vel in civitate rem immobilem, &c.* Bracton, l. iii. Tracl. de Corona, c. 20.

FRANK Service, see the article *SERVICE*.

FRANK Tenement, see *TENEMENT*, and *FREEHOLD*.

FRANK, or **FRANC**, also denotes an antient coin, struck, and current in France; thus called from its impression, which represented a Frenchman, sometimes on horseback, and sometimes on foot.

The *Frank* was either of gold, or silver: the first was worth somewhat more than the *ecu d'or*, or gold crown. See *CROWN*. The second was a third of the first: but these coins have been long disused.

The term *Frank*, however, is still retained, as the name of a money of account. In this sense it is equivalent to a *livre*, or 20 *sols*, or a third of a French crown.

Thus they say indifferently, a hundred *Franks*, or a hundred *livres*.

FRANKINCENSE*, or simply *INCENSE*, an odorous aromatic gum, or resin, antiently burnt in temples, as a perfume, and now used in pharmacy, as an agglutinant and strengthener.

* The word is formed from the Latin *incensum*, burnt; as alluding to its antient use in temples.

Frankincense distils from incisions made in a tree, called *Arbor Thurifera*, during the heats of summer. — But for all the great use of this gum, both in the antient religion, and the modern medicine; the tree that produces it, or even the place where the tree grows, is but little known.

The most common opinion has always been, that it was brought from Arabia Felix, and was found near the city of Saba; whence its epithet *Sabeum*: and yet the name *Olibanum*, which it sometimes also bears, seems to intimate, that there are of these thuriferous, or incense-bearing trees in the Holy Land near mount Lebanon. And travellers are positive, that there are others in the East Indies.

Nor are we less at a loss as to the form or kind of the tree from which it flows. Pliny contents himself to say that it at first resembles the pear tree; then the mastic tree; then the laurel; but that in reality it is a kind of turpentine tree.

Frankincense is usually divided into *male* and *female*.

The best *Male Incense*, thus *Masculum*, called also *Olibanum*, is in fair, white bits, or tears, a little yellowish, of a bitter disagreeable taste; and when chewed, it promotes the flux of saliva. It is called *Male*, in respect of its tears, which are larger than those of the common, or female.

That brought from the Indies, is not near so good as that from Arabia, or mount Lebanon; it is sometimes called *Incense of Mocha*; though it be not brought from that city.

It is often in a mass, but sometimes in loose drops or tears; somewhat reddish, and bitter to the taste. Some sell this for the true bellium.

Male incense, or *Olibanum*, is an ingredient in divers galenic and chemical preparations: it warms, dries, and binds; and is used not only in divers diseases of the head and breast; but in vomitings, diarrheas, and dysenteries. Externally it is applied to strengthen the brain, and heal wounds. Some use it to alluage the tooth-ach; but it is apt to spoil the good teeth.

For *Female Incense*, or *Frankincense*, authors describe it to be softer, and more resinous, but of lesser virtue than the former.

Bark of Incense, *Cortex Thuris*, is the bark of the tree whence the *Incense* flows, which has the same qualities with the *Incense* itself.

There is another bark brought from the Indies, called also *Bark of Incense*, and sometimes *Jews Incense*, in regard the Jews make frequent use thereof in their perfumes; this is the *Cortex Eleutherie*.

Manna of Incense, is the flower or farina of *Incense*, occasioned by the friction of the grains against each other in the sacks wherein they carry it.

There is also a foot of *Incense*, which is a preparation of it; burnt like resin to make lamp-black.

Frankincense was formerly burnt in the temples of all religions, to do honour to the divinities that were there adored. Many of the primitive christians were put to death, because they would not offer *Incense* to idols.

In the Romish church they still retain the use of *Incense* in many of their ceremonies, particularly at solemn funerals, bestowing it on such persons as they would honour, as on prelates, &c. and sometimes also on the people. See *Supplement, article THUS*.

FRANKS, FRANCES, FRANKIS, or FRANQUIS, a name which the Turks, Arabs, Greeks, &c. give to all the people of the western parts of Europe.

The appellation is commonly supposed to have had its rise in Asia, at the time of the Croisades; when the French made the most considerable figure among the Croisades: from which time the Turks, Saracens, Greeks, Abyssinians, &c. used it as a common term for all the Christians of Europe; and called Europe itself, *Frankistan*.

The Arabs and Mahometans, says Mons. d'Herbelot, apply the term *Franki* not only to the French (to whom the name originally belonged) but also to the Latins and Europeans in general.

Frank, or *Franc*, primarily denotes a *Frenchman*; and, by extension, an European, or rather a Latin, by reason, says the same author, the French distinguished themselves above the other nations, engaged in the holy war.

But Fa. Goar, in his notes on Codinus, cap. v. n. 43. furnishes another origin of the appellation *Franks*, of greater antiquity than the former. — He observes, that the Greeks at first confined the name to the *Franci*, i. e. the German nations, who had settled themselves in France or Gaul: but afterwards they gave the same name to the Apulians and Calabrians, after they had been conquered by the Normans; and at length the name was further extended to all the Latins.

In this sense is the word used by divers Greek writers; as Comnenus, &c. who, to distinguish the French, call them the *western Franks*.

Du Cange adds, that about the time of Charlemaign, they distinguished eastern France; western France; Latin, or Roman France; and German France, which was the ancient France, afterwards called *Francia*.

FRATERNITY, *Brotherhood*; the relation, or union of brothers, friends, partners, associates, &c.

FRATERNITY, in a civil sense, is used for a gild, association, or society of persons, united into a body, for some common interest, or advantage.

For the origin, use, &c. of *Fraternities*, see **GILD**.

FRATERNITY, in a religious sense, is a society of persons, meeting together to perform some exercises of devotion, or divine worship.

In the Romish church, such *Fraternities* are very numerous and considerable; being most of them established by royal patents: as the *Fraternity of the Scapulary*; of St. Francis's cord. The bishop may hinder the establishment of any such *Fraternity* in his diocese.

At Rome there is a *Fraternity* called the *Archi-Fraternity*, or *Grand Fraternity*, under the title of *Our Lady of the Suffrages*, established in favour of the souls in purgatory; approved and confirmed by a bull of pope Clement VIII. in 1584.

There are nine different sorts of *Fraternities*, or confraternities

in France, viz. 1^o Of Devotion. 2^o Of Charity, or Mercy. 3^o Of Penitents, under divers names. 4^o Of Pilgrimages. 5^o Of Merchants, to procure the divine favour on their endeavours. 6^o Of Officers of Justice. 7^o Of the Sufferings of Christ. 8^o Of Arts and Trades of divers kinds. And 9^o Of Factions.

Fraternities, in Latin called *Sodalitates*, derive their origin from the heathens; as is shewn by Polydore Virgil, in his book *de Inventoribus rerum*. But the good use made of them by the Christians, has effectually purged them of any impurities, derived from so ill a source.

Numa Pompilius is said to have established *Fraternities* of all arts and trades in ancient Rome; and to have prescribed the sacrifices each profession was to perform to the patrons or tutelary gods he had assigned them.

FRATERNITY of the holy Trinity, see **TRINITY**.

FRATERNITY is also a title, or quality, which kings and emperors gave to each other; so also do bishops and monks. We meet with it frequently in authors under the eastern empire; both Greek and Latin; the Greek term is ἀδελφότης, *Fraternitas*.

FRATERNITY of Arms, was an alliance, or association in arms, antiently concluded between two knights, who thereby agreed to go together, share their fortune, and mutually assist each other against all the world.

Bertrand du Guesclin, and Oliver Clifton swore a *Fraternity* of arms in the year 1579, laying their hands on the gospels.

Hist. de Bret. T. i. p. 395.

FRATICELLI*, a sect of heretics, who rose in the marquisate of Ancona, about the year 1294.

* The word is an Italian diminutive, signifying *fratriculi*, or little brothers; and was here used by reason they were most of them apostate monks, whom the Italians call *Frattelli*, or *Fraticelli*.

The founders were P. Maurato, and P. de Fossombroni; who having obtained of pope Celestin V. a permission to live in solitude, after the manner of hermits, and to observe the rule of St. Francis in all its rigor; several idle vagabond monks joined them; who living after their own fancies, and making all perfection to consist in poverty, were soon condemned by pope Boniface VIII. and the inquisitors ordered to proceed against them as heretics. Upon this, retiring into Sicily; Peter John Oliva de Serignan had no sooner published his comment on the Apocalypse, than they adopted his errors.

They held the Romish church to be Babylon; and proposed to establish another far more perfect one; they maintained that the rule of St. Francis was the evangelical rule observed by Jesus Christ and his Apostles.

Some say they even elected a pope of their new church: at least they appointed a general, with superiors: and built monasteries, &c. Beside the opinions of Oliva, they held that the sacraments of the church were invalid; by reason those who administered them, had no longer any power or jurisdiction.

They were condemned a-fresh by pope John XXII. but several of them returning into Germany, were sheltered by the duke of Bavaria.

The *Fraticelli* had divers other denominations: they were called *Frattelli*, according to some, by reason they lived in community, in imitation of the primitive Christians; *Dulcini*, from one of their doctors; and *Bischofs*, for what reason we do not know.

FRATRIAGE, FRATRIAGIUM, or FRERAGE, the partition among brothers, or coheirs, coming to the same inheritance or succession.

FRATRIAGE is more particularly used for that part of the inheritance, which comes to the youngest brothers.

Whatever the cadets, or younger brothers, possess of the father's estate, they possess *ratione Fratriagii*, and they are to do homage to the elder brother for it; in regard he is to do homage for the whole to the superior lord.

FRATRES Aruales, see the article **ARVALES**.

FRATRES Conjurati, in our antient law books, &c. denote sworn brothers, or companions.

Sometimes they are also so called who were sworn to defend the king against his enemies, *Leg. W. I. cap. 59. Præcipimus ut omnes liberi homines sint Fratres conjurati ad memoriam nostram & regnum nostrum contra inimicos pro posse suo defendendum.*

FRATRICIDE, the crime of murdering one's brother. See **PARRICIDE**.

Cain committed the first *Fratricide*: and the empire of Rome began with a *Fratricide*.

FRAUD, FRAUS, a secret, under-hand deceit, or injury, done to any one.

To export, or import goods by *Fraud*, or fraudulently, is to do it by indirect ways; in order to avoid the paying of duty, &c. if they be permitted goods; or if they be contraband goods, to avoid the penalties adjudged by the laws.

FRAZY, literally signifies to fret; as cloth or stuff does by rubbing, or over-much wearing.

Among hunters a deer is said to *fray his head*, when he rubs it against a tree, to cause the skins of his new horns to come off.

FRECKLES,

F R E

FRECKLES, small, dusky spots, sprinkled on the skin of the face, or hands; particularly in persons of the fairest skins, and during the hot seasons, after being exposed to the sun, and air. They are supposed to be formed of fuliginous vapours, stopped and coagulated in the skin. Vide Turner's discourse of the skin, p. 256.

They are called in Latin, *Lentiginæ*, from their resemblance in size and colour to a lentil: by the French they are called *Rouffeurs*, and *byan de Judas*; by the Italians *Rossore*, and *Lentigine*.

Freckles seem to be only the earthy, oily, and saline part of the sweat, retained in the plexus, or masses of the skin. While the aqueous liquor, which was their vehicle, is evaporated by the heat of the body, these grosser parts are gradually accumulated, till the masses are full.

Some parts of this sweat are continually oozing through the cuticle; and being of a viscid nature, they retain the dirt, dust, &c. that flies about the face. This viscid matter on the surface of the *Freckles*, will stick there, notwithstanding any repeated wipings, which rather condense and press it into the cavities thereof, than clear it off.

They are found more about the nose, than any where else; by reason the skin is more stretched there, and consequently the pores more patent, to receive the dust, &c.

It follows, that there can scarce be any such thing as an adequate remedy, or preventive of *Freckles*. Temporary ones there may be, which shall draw out and dissipate what matter is already gathered: but the spaces will fill up again in time.

Bullock's gall, mixed with alum; and after the alum has precipitated, exposed three or four months to the sun in a close phial, Monf. Homberg shews, is one of the best remedies known for *Freckles*. It acts as a lixivium; and enters the pores, and dilutes and dissolves the coagulum of the *Freckles*. *Mem. de l'Acad. Royal. des Scien. An. 1709, p. 472, &c.*

FREE, a term variously used; but generally in opposition to constrained, confined, or necessitated. See **FRANK**.

Thus, a man is said to be *free*, who is out of prison: and a bird is *free*, when let out of the cage: *free* from pain, i. e. void of pain: we say, a *free* air: a *free* passage, &c.

FREE, in speaking of things endowed with understanding, has a more peculiar relation to the will, and implies its being at full liberty.

The Stoics maintain, that their sage or wise men alone are *free*.

FREE is also used in opposition to slave.

The moment a slave sets foot on English ground, he becomes *free*. The finest legacy the antient Romans could leave their slaves, was their *freedom*.

FREE Agents, see the article **AGENTS**.

FREE Bench, or *Franc Banc*, signifies that estate in copyhold lands, which the wife hath after the decease of her husband, for her dower, according to the custom of the manor.

Fitzherbert calls *Free Bench* a custom, whereby, in certain cities, the wife shall have her husband's whole lands, &c. for her dower.

Thus, at Orleton, in the county of Hereford, the relict of a copyhold tenant is admitted to her *Free Bench*, i. e. to all her husband's copyhold land, during her life, at the next court after her husband's death.

In the Manors of East, and West Emborne, in Berks, if a customary tenant die, the widow shall have her *Free Bench* in all his copyhold lands, only *dum sola & casta fuerit*; if the commit incontinency, she forfeits her estate: but if the will come into court, riding backwards on a black ram, with his tail in her hand, rehearsing a certain form of words, the steward is bound by the custom to restore her to her *Free Bench*.

The like customs hold also in the manor of Chadleworth, in Berks, that of Tor, in Devonshire; and in some others parts of the West.

FREE Bord*, *Franc Bord*. --- In some places three feet, in others more, and in others less, is claimed by way of *Free Bord*, beyond or without the fence.

* *Et totum boscum, quod vocatur Brendewode, cum Franc Bordo curram pedum, & dimid. per circuitum illius bosci.* Mon. Ang. 2^d Part, fol. 241.

FREE Chapel, is a chapel founded by the king, and by him exempted from the jurisdiction of the ordinary. See **CHAPEL**.

A subject may also be licensed by the king to build such a chapel; and by his charter may exempt it from the visitation of the bishop, &c.

FREE, or *imperial cities* in Germany, are those not subject to any particular prince; but governed, like republics, by their own magistrates.

There were *free cities, libera civitates*, even under the antient Roman empire: such were those to whom the emperor, by the advice, or consent, of the senate, gave the privilege of appointing their own magistrates, and governing themselves by their own laws. See **CITY**.

FREE Fair, see the article **FAIR**.

FREE 1^o, see the article **FREE**.

F R E

FREE Mason, see the article **MASON**.

FREE Port, see the article **PORT**.

FREE State, is a republic, governed by magistrates, elected by the free suffrages of the inhabitants.

FREE Stone, a whitish stone, dug up in many parts of England, that works like alabaster; but is more hard and durable; being of excellent use in building, &c.

It is a kind of the greet stone, but finer fanded, and a smoother stone; and is called *Free Stone* from its being of such a constitution as to be cut freely in any direction.

FREE Stool, see the article **FRIDSTOLL**.

FREE Thinker, see the article **DEIST**.

FREE Warren, the power of granting, or denying license to any one to hunt in such and such ground.

FREE Will, see the article **WILL**.

FREEBOOTER, or **FLIBUSTER**, a name given to the pirates, who scour the American seas; particularly such as make war against the Spaniards.

The French call them *Flibusters*; deducing the word from the English *flibote*, or *flybote*; by reason the first adventurers of this kind were the people of S. Domingo, who made their excursions with flybotes, which they had taken from the English. See **BUCCANEER**.

FREEDOM, the quality, or state of being *free*. See **FREE**.

FREEDOM of a City, Town, &c. denotes a right, or capacity of exercising a certain trade, or employment, in that city, or town corporate; and of being elected to the dignities and offices thereof. It is procured regularly, by serving an apprenticeship; but sometimes purchased with money; and sometimes conferred as a favour or compliment.

FREEDOM of the will, a state, or faculty of the mind, wherein all the motions of our will are in our own power; and we are enabled to determine on this, or that; to do good, or evil, without any force, or constraint from any external cause whatever. See **LIBERTY**.

FREEDOM of Conscience, see **LIBERTY** and **TOLERATION**.

The schoolmen distinguish two kinds of this *Freedom*. --- viz.

FREEDOM of Contradiction, whereby we are at our choice to will, or nill; to love, or not love, &c.

Thus, if I give my friend a power to take my horse; that friend has *Freedom* of contradiction, with respect to the horse; since it is in his own power, either to use him, or let him alone.

FREEDOM of Contrariety, or of *Contraries*, is that whereby we are at our choice to do good, or evil; to be virtuous or vicious.

Thus, if I offer my friend a horse, or a lion; and give him his option of the two, he is said to have a *liberty of contrariety*, over the horse and lion.

But the logicians charge this as a faulty, or unartful division; in regard one member of the division is contained in the other, as a species in the genus: for whatever is free, in respect of contradiction, is also free in respect of contrariety; though not vice versa: for if it be free for my friend to take the horse, or the lion; it is also free for him, to let them both alone: but he may be free to take one of them, without a *Freedom* of chusing which to take.

Yet is the distinction of some use; as it intimates that the will is not always possessed of both kinds of *Freedom*; and that the matter, or subject of the two is different.

The will, though free, has not a liberty of contrariety: thus, any evident truth being proposed to the mind, e. gr. that the whole is greater than a part, we have a power of not assenting thereto, by diverting our attention to something else: but we have not a power of dissenting from that proposition, and judging that the whole is not greater than the part.

Hence, moralists commonly hold, that with respect to the supreme good, mankind has a liberty of contradiction; inasmuch as he may abstain from the love, or pursuit thereof: but he has not a liberty of contrariety, whereby to hate goodness.

Add, that though the human mind may have a *Freedom* of contradiction, with respect to all objects, even the supreme good itself; yet the *Freedom* of contrariety is restrained to certain particulars, which either are, or appear to be good: the will having such a natural propensity to good, that it cannot desire evil, but under the notion and appearance of good.

FREEDOM of thinking, see the article **DEISM**.

FREEHOLD, **FRANK TENEMENT**, *Libertum Tenementum*, is land, or tenement, which a man holds in fee simple, fee tail, or for term of life.

Freehold is of two kinds, in deed, and in law.

The first is the real possession of land, or tenement in fee, fee tail, or for life: the other is the right a man has to such land or tenement before his entry or seizure.

FREEHOLD is likewise extended to such offices as a man holds in fee, or for life. See **FREE**.

FREEHOLD is also sometimes taken in opposition to *Villénage*. See **VILLENAGE**.

Lambard observes, that land, in the Saxons time, was distinguished into *bockland*, i. e. holden by book, or writing; and *folk-land*, held without writing.

The former, he says, was held on far better condition, and by the better sort of tenants; as noblemen and gentlemen; being such as we now call *Freehold*: the latter was mostly in possession of peasants; being the same with what we now call *at the will of the lord*.

In the antient laws of Scotland, *Freeholders* are called *milites*, knights.—In *reg. judicial*, it is expressed, that he who holds land upon an execution of a statute merchant, until he hath satisfied the debt, *tenet ut liberum tenementum sibi et assignatis suis*; and the fame of a tenant per elegit: the meaning of which seems to be, not that such tenants are *Freeholders*; but as *Freeholders* for the time till they have received profits to the value of their debt.

FREEZE, or **FRIZE**, in architecture, that part of the entablature of columns, between the architrave and cornice.—See *Tab. Archit.* fig. 24, 26, 28, 30, 32, 49. lit. e. and 26. lit. u. The *Freeze* is properly a large, flat face, or member separating the architrave from the cornice.

The antients called it *Zophorus*, *Zwofogos*, by reason it was usually enriched with figures of animals; and our denomination *Freeze* has a like origin, being formed of the latin *phrygis*, an embroiderer, because it is commonly adorned with sculptures in basso relievo, imitating embroidery.

The *Freeze* is supposed to be intended to represent the heads of the transverse beams that sustain the roof or covering.

In the tuscany order it is quite plain: in the doric, enriched with triglyphs: in the ionic, it is sometimes made arched, or swelling, in which case it is called by Vitruvius, *pulvinatus*, q. d. bolstered: in the corinthian, and composite, it is frequently joined to the architrave, by a little sweep; and sometimes to the cornice. And in these richer orders it is usually adorned with sculpture, figures, compartments, histories, foliages, festoons, &c.

As to the height of the *Freeze*, it is in general much the same with that at the architrave.—The tuscany *Freeze*, Vitruvius makes 30 minutes; Vignola 35; Palladio, who makes it swelling, gives it but 26; and Scamozzi 42. The doric, in Vitruvius and Vignola, is 30 or 40 minutes; in Palladio, &c.

45. The ionic, Vitruvius makes flat, adorned with acanthus leaves, lions, &c. and makes it 30 minutes high: Vignola, who also makes it flat, gives it 45 minutes; and Palladio, who makes it convex, or swelling, 27 minutes; and Scamozzi 28. The corinthian, Vitruvius enriches with acanthus leaves, human figures, &c. and makes its height 37 minutes, Vignola 45; Palladio 28; and Scamozzi 31½. Lastly, the composite, which in Vitruvius is set with cartouches, and carved between them, is 52½ minutes; Vignola, who makes it like Vitruvius, only gives it 45 minutes; Palladio, who makes it swelling, only 30; and Scamozzi, 32.

From the variety of enrichments practised on the *Freezes*, they become variously denominated, as

Convex, or *pulvinated FREEZES*, are those whose profile is a curve; the best proportion whereof, is, when drawn on the base of an equilateral triangle.

In some the swelling is only at the top, as in a console: in others at bottom, as in a baluster.

Flourished FREEZES are those enriched with rinds or imaginary foliages; as the corinthian *Freeze* of the frontispiece of Nero: or with natural leaves, either in clusters, or garlands: or continued, as in the ionic of the gallery of Apollo in the Louvre.

Historical FREEZES are those adorned with bas-relievo's, representing histories, sacrifices, &c. as that of the arch of Titus at Rome.

Marine FREEZES, are those representing sea-horses, tritons, and other attributes of the sea; or shells, baths, grotto's, &c.

Rustic FREEZES, are those whose courses are rusticated, or imbossed; as the tuscany *Freeze* of Palladio.

Symbolical FREEZES, are those adorned with the attributes of religion; as the corinthian of the temple behind the capitol at Rome, whereon are represented the instruments and apparatus of sacrifice.

Freeze of the capitol, see *HYPOTRACHELIUM*.

Freeze, in commerce, a kind of cloth, or stuff; see *FRIZE*.

FREEZING, *Congelation*, in physiology, the fixing of a fluid, or depriving it of its natural mobility, by the action of cold: or it is the act of converting a fluid substance into a firm, coherent, rigid one, called *Ice*.

The Cartesians define *Freezing* by the quietude, or resting of a fluid body, hardened by cold; which follows naturally enough from their notion of fluidity, where the parts are supposed to be in a continual motion.

In effect, one may pretty safely say, with some of those philosophers, that water only *freezes*, because its parts lose their natural motion, and adhere close to each other.

The principal phenomena of *FREEZING* are, 1° That water, and all fluids, oil alone excepted, dilate in *freezing*, i. e. take up more space, and are specifically lighter than before.

That the bulk, or dimensions of water is increased by *freezing*,

is matter of abundant experiment; and here it may be proper to observe the process of nature in this alteration.

A glass vessel, then, BD (*Tab. Pneumat.* fig. 26.) full of water to D, being immersed in a vessel of water, mixed with salt, RSTV, the water presently rises from E to F; which seems owing to the sudden contraction of the vessel hastily plunged into so cold a medium. Soon after, from the point F it continually descends, condensing; till it arrives at the point G; where, for some time, it seems to remain at rest. But it soon recovers itself, and begins to expand; rising from G to H; and from thence, soon after, by one violent leap, mounts to I. And here the water in B is immediately seen all thick, and cloudy; and in the very instant of this leap, is converted into ice. Add, that while the ice is growing harder, and some of the water near the neck of the vessel B is *freezing*, the flux of water is continued above I, towards D, and at length runs out of the vessel.

2° That they lose not only of their specific, but also of their absolute gravity, by *freezing*; so that when thawed again, they are found considerably lighter than they were before.

3° That *frozen* water is not quite so transparent, as when liquid; and that bodies do not perforce so freely through it.

4° That water, when *freezes*, evaporates almost as much as when fluid.

5° That water does not *freeze* in vacuo; but necessarily requires the presence and contiguity of the air.

6° That water which has been boiled, does not *freeze* quite so readily as that which has not.

7° That the water being covered over with a surface of oil of olives, does not *freeze* so readily as without it; and that oil absolutely preserves it under a strong frost, when olive oil would not.

8° That spirit of wine, nut oil, and oil of turpentine, do not *freeze* at all.

9° That the surface of the water, in *freezing*, appears all wrinkled; the rugae, or wrinkles, being sometimes in parallel lines, and sometimes like rays, proceeding from a centre to the circumference.

The Theories of *FREEZING*, or the method of accounting for these phenomena, are very numerous.—The great principles different authors have gone upon, are either, that some foreign matter is introduced within the pores of the fluid, by whose means it is fixed, its bulk encreased, &c.

Or, that some matter naturally contained in the fluid, is now expelled; by the absence whereof the body becomes fixed, &c.

Or, that there is some alteration produced in the texture or form, either of the particles of the fluid itself, or of something contained within it.

To some one of these principles all the systems of *freezing* are reducible.

The Cartesians, who ascribe all to the quietude of the parts of the fluid, before in motion, account for *Freezing* from the recess of the æthereal matter out of the pores of the water. The activity of that æther, or subtle matter, they hold to be that which gave the particles of the fluid their motion: consequently, upon the absence of this matter, the fluidity must cease.

Though others of the same sect ascribe *Freezing* to a diminution of the usual force and efficacy of the æthereal matter, occasioned by an alteration in the temperature of the air, whereby it is incapacitated for agitating the parts of the fluid as usual.

The Gassendists, and other corpuscularians, with more probability ascribe the *Freezing* of water to the ingress of multitudes of cold or frigorific particles, which entering the liquor in swarms, and dispersing themselves every way through it, do crowd into the minutest pores of the water, and hinder the wonted agitation of its parts; wedging it up, as it were, into the hard and consistent body of ice. And hence its increase of dimensions, coldness, &c.

This intromission of a foreign frigorific matter, they suppose essential to congelation; as that which characterises and distinguishes it from coagulation; the latter being effected indifferently by a hot, or cold mixture; but the former only by a cold one.

Of what kind those frigorific particles are, or how they produce their effect, is matter of debate; and has given occasion to various systems.

Hobbes will have them to be common air, which intruding into the water in congelation, entangles itself with the particles of the fluid, prevents their motion, and produces those numerous bubbles observed in ice; thus expanding its bulk, and rendering it specifically lighter: but this opinion is overturned by Mr. Boyle, who shews that water will freeze in vessels hermetically sealed, and into which the air can have no ingress; and yet the bubbles will be as numerous herein, as in that froze in the open air. Add, that oil is condensed, in *freezing*: consequently, the air cannot there be the cause.

Others, and those the greatest number, will have the *freezing* matter to be a salt; arguing, that an excess of cold will render water torpid: but can never congeal it, without salt. They are saline particles, say they, and those dissolved and mixed in a due proportion, that are the chief cause of *Freezing*: congelation bearing a near relation to crystallization.

This salt, they suppose of the nitrous kind; and to be furnished by the air, which is generally allowed to abound in nitre. See AIR, and NITRE.

How the particles of nitre may prevent the fluidity of water, is pretty easily accounted for: these particles are supposed to be so many rigid, pointed spicula, which are easily driven into the stamina, or globules of the water; and thus becoming variously mingled and entangled therewith, by degrees inflexible and destroy the motion thereof.

The reason this effect only arises in severe winter weather, is, that it is then only that the retarding action of the nitrous spicula is more than equal to the power or principle whereby the fluid is otherwise kept in motion, or disposed for motion.

This opinion is supported by the known experiment of artificial Freezing.—A quantity of common salt or saltpetre being mixed with snow, or ice pulverised; and the mixture dissolved by the fire: upon immersing a tube full of water in the solution; the water, or at least that part of it next the mixture, presently freezes, even in warm air. Whence it is imagined, that the spicula of the salt, by the gravity of the mixture, and of the incumbent air, are driven through the pores of the glass, and mixed with the water: for that it is the salt has the effect, is supposed evident; inasmuch as we know assuredly that the particles of water cannot find their way through the pores of glass. In these artificial Freezings, whatever part the mixture is applied in, there is presently produced a skin, or lamina of ice; whether at top, or bottom, or on the sides: by reason there is always a flock of saline corpuscles, sufficient to overpower the corpuscles of fire: but natural congelations are confined to the top of the water, where the salt most abounds.

Against this system the author of the *Nouvelle conjecture pour expliquer la nature de la glace*, objects, that it does not appear, that nitre always enters the composition of ice; but that if it did, it would come short of accounting for some of the principal effects. For how, for instance, should the particles of nitre, by entering the pores of water, and fixing the parts, oblige the water to dilate, and render it specifically lighter? Naturally they should augment its weight. This difficulty, with some others, shew the necessity of a new theory. That author, therefore, advances the following one, which seems to solve the phenomena in a more easy and simple manner; as not depending on the precarious admission or extrusion of any heterogeneous matter.

Water, then, freezes in the winter only, because its parts being then more closely joined together, mutually embarrass one another, and lose all the motion they had: and the cause of this closer union of the water, is the air; or more expressly, an alteration in the spring and force of the air.

That there are an infinite number of particles of gross air, interperfed among the globules of water, is abundantly evident from experiment: and that each particle of air has the virtue of a spring, is confessed: now this author argues, that the small springs of gross air mixed with the water, have more force in cold winter weather, and unbend themselves more, than at other times. Hence, those springs thus unbending themselves on one side, and the external air continuing to press the surface of the water on the other; the particles of water thus constringed and locked up together, must lose their motion and fluidity, and form a hard consistent body: till a relaxation of the spring of the air, from an increase of heat, reduce the particles to their old dimensions, and leave room for the globules to flow again.

But this system has its foible: even the principle on which it stands, may be demonstrated to be false. The spring, or elasticity of the air is not increased by cold; but diminished. Air expands itself by heat, and condenses by cold: and it is demonstrated in pneumatics, that the elastic force of expanded air, is to that of the same air condensed; as its bulk when rarified, to its bulk condensed.

It is scarce worth mentioning, that some authors have advanced, to account for the increase of bulk and diminution of specific gravity of frozen water, that the aqueous particles, in their natural state, were nearly cubes, and so filled that space without the interposition of many pores: but that by congelation they are changed from cubes to spheres; whence a necessity of a deal of empty space between them. Cubic particles are certainly much less proper to constitute a fluid, than spherical ones: and spherical particles less disposed to form a fixt, than cubic ones.—Thus much the nature of fluidity and firmness easily suggests. After all, for a consistent theory of Freezing, we must recur either to the frigorific matter of the corporealians; considered under the light and advantages of the Newtonian philosophy: or to the æthereal matter of the Cartesians, under the improvements of Monf. Gauteron, in the *Memoires de l'Academie Royale des Sciences*, an. 1709.

Each of which we shall here subjoin; and leave the reader to make his choice.—For the first: a number of cold, saline corpuscles being introduced into the interstices, between the globules of water; may be so near each other, as to be within the spheres of one another's attractions; the consequence of which must be, that they will cohere into one solid, or firm body: till heat afterwards, separating them, and putting them in-

to various motions, breaks this union, and separates the particles so far from one another, that they get out of the distance of the attracting force, and into the verge of the repelling force; and then the water re-assumes its fluid form.

For, that cold and Freezing do arise from some substance of a saline nature, floating in the air, seems probable hence, that all salts, and more eminently some particular ones, when mixed with snow, or ice, do prodigiously increase the force and effects of cold: add, that all saline bodies do produce a stiffness and rigidity in the parts of those bodies into which they enter.

Microscopical observations upon salts manifest, that the figures of some salts, before they shoot into masses, are thin, double, wedge-like particles, which have abundance of surface with respect to their solidity (the reason why they swim in water, when once raised in it, though specifically heavier.) These small points of the salt getting into the pores of the water, whereby also they are in some measure suspended in the winter time (when the heat of the sun is not strong enough to dissolve the salts into a fluid, to break their points, or to keep them in perpetual motion) being less disturbed, and more at liberty to approach one another; and by shooting into crystals of the form above-mentioned, do, by their extremities, insinuate themselves into the minutest pores of water, and by that means freeze it into a solid form.

Further, there are many little volumes, or particles of air, included at several distances both in the pores of the watry particles, and in the interstices left by the spherical figures. By the insinuation of the saline crystals, the volumes of air are driven out of the watry particles; and many of them uniting, form larger volumes, which thereby have a greater force to expand themselves, than when dispersed; and so both enlarge the dimensions, and lessen the specific gravity of the water, thus congealed into ice.

Hence also we may conceive, how water, impregnated with salts, sulphurs, or earths, which are not easily dissolvable, may form itself into metals, minerals, bitumens, and other fossils; the parts of these mixtures becoming a cement to the particles of water, or getting into their pores, change them into these different substances.

For the second: as an ethereal matter or medium is generally allowed the cause of the motion of fluids; and as the air itself has all its motion from the same principle; it follows, that all fluids must remain in a state of rest, or fixity, when this matter loses of its necessary force. Of consequence, the air being less warmed in the winter time, from the obliquity of the rays of the sun; is denser, and more fixed in winter, than any other season of the year.

But further, from divers experiments we have learned, that the air contains a salt, supposed to be of the nature of nitre. This granted, and the density of the air allowed, it follows, that the molecules of this nitre must likewise be brought nearer together, and thickened by the condensation of the air: as, on the contrary, a rarefaction of the air, and an augmentation of its fluidity, must divide and separate them.

If now the same thing happen to all liquors that have imbibed or dissolved any salt; if the warmth of the liquid keep the salt exactly divided; and if the coolness of a cellar, or of ice give occasion to the molecules of the dissolved salt to approach, run into each other, and shoot into crystals: why should the air, which is allowed a fluid, be exempt from the general law of fluids?

It is true, the nitre or the air being grosser in cold weather, than hot, must have less velocity: but still, the product of its augmented mass, into the velocity remaining, will give it a greater momentum, or quantity of motion. Nor is any thing further required to make this salt act with greater force against the parts of fluids: and, probably, this is the cause of the great evaporation in frosty weather.

This aerial nitre must promote the concretion of liquids: for it is not the air, nor yet the nitre it contains, that gives the motion to fluids: it is the ethereal medium. From a diminution of the force of that, therefore, arises a diminution of the motion of the rest. Now the ethereal matter being weak enough of itself in the winter time, must lose still more of its force by its action against air condensed and loaded with large molecules of salt. It must, therefore, lose of its force in cold weather, and become less disposed to maintain the motion of fluids. In a word, the air, during frost, may be esteemed like the ice impregnated with salt, wherewith we ice our liquors in summer time. Those liquors, in all probability, freeze, from a diminution of the motion of the ethereal medium, by its acting against the ice and salt together: and the air, for all its scorching heat, is not able to prevent its concretion.

FREEZING Mixture, a preparation for the artificial congelation of water, and other liquors.

All kinds of salts, whether alcalizate, or acid; and even all spirits, as those of wines, &c. as also sugars, and saccharum Saturni, mixed with snow, are capable of freezing most fluids; and the same effect is produced in a very great degree by a mixture of oil of vitriol, or spirit of nitre with snow: Thus Mr Boyle.

Monf. Homberg obferves the fame of equal quantities of corrofive fublimate, and fal armoniac, with four times the quantity of diftilled vinegar.

FREEZING *Rain, or Raining Ice*, a very uncommon kind of flower, which fell in the weft of England, in December, anno 1672; whereof we have divers accounts in the *Philofophical Tranfactions*.

This rain, as foon as it touched any thing above ground, as a bough, or the like, immediately fettled into ice; and by multiplying and enlarging the icicles, it broke all down with its weight. The rain that fell on the fnow, immediately froze into ice, without finking in the fnow at all.

It made an incredible destruction of trees, beyond any thing in all hiftory: "had it concluded with fome gult of wind," fays a gentleman on the fpot, "it might have been of terrible confequence."

"The fprig of an afh-tree, of juft three quarters of a pound, being weighed, the ice thereon weighed fixteen pound.—"Some were frighted with the noife in the air; till they difcerned it was the clatter of icy boughs dafhed againft each other." Dr. Beale obferves, that there was no confiderable froft obferved on the ground during the whole; whence he concludes, that a froft may be very fierce and dangerous on the tops of fome hills, while in other places it keeps at two, three, or four foot diftance above the ground, rivers, lakes, &c. And may wander about very furious in fome places, and remifs in others, not far off. This froft was followed by glowing heats, and a wonderful forwardnefs of flowers and fruits.

FREEZING, in commerce and manufactures; fee **FRISING**.

FREEZELAND, **FRIEZELAND**, or **FRIZELAND**, *Horfe*, in war, the fame with *Cheval de Frife*. See *CHEVAL de Frife*.

FREGIT *Claufum*, fee the article **CLAUSUM**.

FREIGHT, fee the article **FRAIGHT**.

FRENCH, **FRANCOIS**, abfolutely ufed, fignifies the language of the people of France.

The *French*, as it now ftands, is no original, or mother-language; but a medley of feveral: there is fcarce any language, but it has borrowed words, or perhaps phrafes, from.

The languages that prevail moft, and that are, as it were, the bafis thereof, are 1^o The Celtic; whether that were a particular language itfelf, or whether it were only a dialect of the Gothic, as fpoke in the weft, and north. 2^o The Latin, which the Romans carried with them into the Gauls, when they made the conqueft thereof. And 3^o the Teutonic, or that dialect of the Teutonic fpoke by the Franks, when they paffed the Rhine, and eftablifhed themfelves in the Gauls.

Of thefe three languages, in the fpace of about thirteen hundred years, was the prefent *French* formed; fuch as it is now found.

Its progrefs was very flow; and both the Italian and Spanifh were regular languages long before the *French*.

Paftquier obferves, it was under Philip de Valois, that the *French* tongue firft began to be polifhed: and that in the register of the chamber of accounts of that time, there is a purity feen almoft equal to that of the prefent age.

However, the *French* was ftill a very imperfect language, till the reign of Francis I. The cuftom of fpeaking Latin at the bar, and of writing the public afts and inftruments of the courts of juftice in that language, had made them overlook the *French* their own language. Add, that the preceding ages had been remarkable for their ignorance, which was owing in good meafure to the long and calamitous wars, which France had been engaged in: whence, the *French* nobleffe deemed it a kind of merit, not to know any thing; and the generals regarded little, whether or no they wrote and talked politely, provided they could but fight well.

But Francis I. who was the reftorer of learning, and the father of the learned, changed the face of things; and after his time Henry Stevens printed his book *De la Precellence du Langage François*.

The change was become very confpicious at the end of the 16th century; and under Henry IV. Amyot, Coeffeteau, and Malherbe contributed towards bringing it to its perfection: which the cardinal de Richelieu completed, by the eftablifhment of the *French* Academy; an afsembly, wherein the moft diftinguifhed perfons of the church, the fword, and the gown have been members.

Nor did the long reign of Louis XIV. contribute a little to the improvement of the language. The perfonal qualities of that prince, and his tafte for the polite arts, and that of the princes of the blood, rendered his court the politest in Europe. Wit and magnificence feemed to vie; and his generals might have difputed with the Greeks, Romans, &c. the glory of writing well, if they could not that of fighting.

From court, the elegance, and purity of the language foon fpread itfelf into the provinces; and now there is fcarce any body there but writes and fpeaks good *French*.

One of the characters of the *French* language is to be natural and eafy. The words are ranged in it much in the fame order as the ideas in our minds; in which it differs exceedingly from the Greek and Latin, where the inverfion of the natural order of words is reputed a beauty.—Indeed the Hebrew furpaffes

even the *French* in this point; but then it comes fhort of it in copioufnefs and variety.

It muft be added, however, that as to the analogy of grammar, and the fimplicity wherewith the moods of verbs are formed; the Englifh has the advantage, not only over the *French*, but over all the known languages in the world: but then the turns, the expreffions, and the idioms of the Englifh are fometimes fo quaint, and extraordinary, that it lofes a good deal of the advantage which its grammatical fimplicity gives it over the reft.

The *French* has but few compound words; wherein it differs widely from the Greek, High Dutch, and Englifh. This the *French* authors own a great difadvantage in their language; the Greek and Dutch deriving a great part of their force and energy from the compofition of words; and frequently expreffing that in one founding word, which the *French* cannot exprefs but by a periphrasis. The diminutives in the *French* are as few as the compounds; the greateft part of thofe remaining in ufe having loft their diminutive fignification. But what diftinguifhes the *French* moft, is its juftnefs, purity, accuracy, and flexibility.

French is the moft univerfal and extenfive language in Europe. The policy of ftates and courts has rendered it neceffary for the minifters of princes, and their officers, &c. And the tafte of arts and fciences has had the fame effect with regard to the learned.

In Germany, and elfewhere, the princeffes and perfons of diftinction value themfelves on underftanding *French*: and in feveral courts of Europe, *French* is almoft as much known as the language of the country: though the court of Vienna is an exception from this rule. *French* is there very little ufed: The emperor Leopold could not bear to hear it fpoke in his court: the Latin and Italian are there cultivated inftead of it. This extenfive ufe of the *French* language is no modern advantage: William the conqueror gave laws to England in the *French* language; and the ancient cuftoms of moft of the provinces of the Netherlands are wrote in the fame.

Laftly, the *French* is the fame language every where; and not only in all the provinces of France, but in all the places where it is fpoke, out of France.

The feveral nations who fpeak Slavonic, do not fo much fpeak the fame language, as different dialects of the fame language. In feveral parts of Europe there are as many different languages, as there are ftates; and in Italy there are reckoned no fewer than ten or twelve dialects, fome of which differ as much from the common Italian as from the *French*, or Spanifh. In Holland, the feamen of Rotterdam, and the banks of the Meufe, do not underftand thofe of Amfterdam, and the cofts of the Zuyder Zee. They who underftand Caftilian, will not underftand the language of Catalonia and Cerdania. The High Dutch is not the fame in Sweden, as in Jutland: in the Low Countries, as at Lubbeck. Bohemia, Hungary, Croatia, &c. are countries belonging to the emperor; yet they have a language different from that fpoke at Vienna. The king of Sweden, when he fpeaks the language of his country, will not be underftood by his fubjects in Pomerania, Lapland, &c. And the like may be obferved of the king of Denmark, with regard to his fubjects of Norway, and Iceland: whereas, at Quebec, the Louifania, Martinico, St. Domingo, Pondicheri, &c. they fpeak the fame language as at Paris, and throughout the reft of France.

For a critical acquaintance with what regards the *French* tongue, fee the *Remarques* of M. Vaugelas; and the *Observations* M. Corneille has made on thofe remarks: the *Remarques* of Fa. Bouhours; and the *Doubts* of a Bas-Breton Gentleman, by the fame father: the *Conversations* of Arifte and Eugene: the *Observations* of M. Menage, and his *Etymologies*; with thofe of M. Huet: Fa. Buffier's *French* grammar; and that of the Abbe Regnier. Add, the two difcourfes of the Abbe de Dangeau; one on the vowels, and the other on the confonants, and many later works.

FRENCH Bread, a fort of bread valued for its lightnefs and delicacy.

It is prepared by taking half a bufhel of fine flower to ten eggs, and a pound and half of frefh butter; and into that putting as much yelt with a manchet.—Then, tempering the whole mafs with new milk pretty hot, let it remain half an hour to rife. Which done, make it into loaves or rolls, and wafh it over with an egg, beaten with milk. The oven is not to be too hot. See **BAKING**.

FRENZY, and **FRENETIC**, see **PHRENZY**, and **PHRENETIC**.

FRESCO, a kind of painting performed on fresh plaister, or on a wall laid with mortar not yet dry; and with water colours.

This sort of painting has a great advantage; by its incorporating with the mortar, and drying along with it, it is rendered extremely durable: and never falls or falls, but along with it. The Italians, from whom we borrow the term, call it *Fresco*: Vitruvius, lib. vii. c. 4. calls it *Udo Tattorio*.

Painting in *Fresco* is very ancient; having been practised in the earliest ages of Greece and Rome.—It is chiefly performed on walls and vaults newly plastered with lime and sand: but the plaister is only to be laid, in proportion as the painting goes on; no more being to be done at once, than the painter can dispatch in a day, while it dries.

Before he begins to paint, a cartoon or design is usually made on paper, to be calked, and transferred to the wall, about half an hour after the plaister is applied.

The antients painted on stucco; and we may remark in Vitruvius, what infinite care they took in making the incrustation or plastering of their buildings to render them beautiful and lasting: though the modern painters find a plaister made of lime and sand preferable thereto; both as it does not dry so hastily; and as being a little brownish, it is fitter to lay colours on, than a ground so white as stucco.

In this kind of painting, all the compound and artificial colours, and almost all the minerals are set aside; and scarce any thing is used but earths; which are capable of preserving their colour, defending it from the burning of the lime, and resisting its salt, which Vitruvius calls its bitterness.

For the work to come out in all its beauty, the colours must be laid on quick, while the plaister is yet moist: nor should they ever be retouched, dry, with colours mixed up with the white of an egg, or size, or gum, as some workmen do; by reason such colours grow blackish: nor do any preserve themselves, but only such as were laid on hastily at first.

The colours used, are white made of lime slacked long before, and white marble dust; oker, both red, and yellow; verditer; lapis lazuli; smalt; black chalk, &c. All which are are only ground, and worked up with water; and most of them grow brighter and brighter, as the *Fresco* dries.

FRESH Fine, is that which was levied within a year past. Westm. 2. c. 45. See **FINE**.

FRESH Force, *Friska Fortia*, in law, denotes a force done within forty days.

If a man be disseised of lands or tenements, within any city or borough; or dejected from them after the death of his ancestors, to whom he is heir; or after the death of his tenant for life, or in tail; he may, within forty days after his title accrued, have his remedy by an assize, or bill of *Fresh Force*.

FRESH Shot, in the sea phrase, signifies the falling down of any great river, into the sea; by means whereof the sea bath *fresh* water a good way from the mouth of the river.—As this is more or less, they call it a *great*, or *small fresh* shot.

FRESH Spell, in the sea language, a fresh gang, to relieve the rowers in the longboat.

FRESH Suite, *recens insecutio*, is such a present and active prosecution of an offender, where a robbery is committed, as never ceases from the time of the offence committed, or discovered, till he be apprehended.

The benefit of such pursuit of a felon, is, that the party pursuing shall have his goods restored to him; whereas otherwise they are the king's.

Fresh Suit is either within the view, or without. Manwood says, that upon *fresh Suit* within the view, trespassers in the forest may be attached by the officers pursuing them, though without the limits of the forest.—*Fresh Suit* may continue for seven years.

FRESH Water, is that not tintured or impregnated with salt, or saline particles, enough to be discoverable by the sense. Such generally is that of springs, rains, wells, lakes, &c.

Dr. Lister is of opinion, that the natural and original state of water is to be salt: the *Freshness* he supposes to be accidental, and to be owing to the vapours of plants, and the breath of animals therein; and to the exhalations raised by the sun.

Others will have all water originally *fresh*; and take its saltness to be accidental: to account for which a great number of hypotheses have been framed.

The saltness of water is a foreign, and in most cases a hurtful quality. It renders it not only nauseous to the taste, but greatly prejudicial to the body: and it is generally agreed, that those waters, *cæteris paribus*, are best, not only for drinking, but also for economical uses, as washing, boiling, and brewing, which are the freest from saltness.

Hence, various methods have been contrived for examining the *Freshness* of waters; and of dulcifying or making salt water *fresh*.

Mr. Boyle gives us a method of examining the *Freshness* of

water, by means of a precipitate, which casts down any saline particles before floating therein.

Into one thousand grains of distilled water he puts one grain of salt; and into the solution lets fall a few drops of a strong well filtrated solution of well refined silver, dissolved in clear aqua fortis; upon which there immediately appears a whitish cloud, which, though but slowly, descends to the bottom, and there settles in a white precipitate, in which is the saline matter of the fluid.

This method, if it were required, would examine water to a greater nicety, than that here specified. It has discovered salt in water, where there was but one grain of salt in two thousand, nay in three thousand times the weight of water.

The experiment was tried before the Royal Society, in 1692, by Sir Hans Sloan; where it was likewise found that a drop of two, even of spirit of salt, mixed with common water, would be discovered by the same method.

Dr. Hook, in the same year, read a lecture before the Royal Society, on a method of his own, for discovering the smallest quantity of salt contained in water, on a principle of hydrostatics.

The operation was performed by means of a large poise of glass, of the shape of a bolt head; the ball thereof was three inches in diameter, and the neck $\frac{1}{4}$ of an inch. This being so poised, with red lead put in it, as to make it very little heavier than *fresh* water; and then suspended by the small stem, which was graduated, to the end of a nice beam of a balance; and the degree or division of the neck, contiguous to the surface of the water, noted: upon infusing a quantity of salt, only equal to the two thousandth part of the weight of the water, the neck of the poise sunk near half an inch lower in the water.

The dulcifying, or making of salt water *fresh*, is a secret, that has been long sought with great attention.—Dr. Lister takes the most easy, safe, and natural way of procuring *fresh* water from the sea, to be by putting sea plants, as *alga marina*, or common sea weed into a quantity of the water, in a glass body, with a head, beak, and receiver: from which a *fresh*, sweet, and potable liquor will continually distil.

Mount. Houston has also at length declared his secret of making sea water *fresh*.—It consists, first, in a precipitation, made with oil of tartar, which he can prepare at a small expence. Next he distils the sea water, with a furnace contrived to take up little room, and which, with a very little fire, will distil twenty-four French quarts of water in a day. For the cooling thereof, instead of making the worm pass through a vessel full of water, he makes it pass through a hole made on purpose out of the ship and enter it again at another; so that the sea water does the office of a refrigeratory. To the two preceding operations he joins filtration, which is performed by a peculiar kind of earth, mixed and stirred with the distilled water; and at length suffered to settle. This filtration, he says, finally leaves it perfectly salubrious. *Phil. Trans.* N^o 67.

FRET, or **FRETT**, in architecture, a kind of knot, or ornament, consisting of two lists, or fillers variously interlaced, or woven; and running at parallel distances, equal to their breadth. See *Tab. Archit.* fig. 55.

A necessary condition of these *Frets* is, that every return, and intersection be at right angles. This is so indispensable, that they have no beauty without it; but become perfectly gothic.

Sometimes the *Fret* consists but of a single fillet; which, if well managed, may be made to fill its space exceedingly well.

The antients made great use of these *Frets*: the places they were chiefly applied on, were even, flat members, or parts of building; as the faces of the corona, and eaves of cornices; under the roofs, soffits, &c. on the plinths of bases, &c.

The appellation was occasioned hence, that the French word *Frette* literally signified the timber-work of a roof, which consists chiefly, of beams, rafters, &c. laid a-cross each other, and as it were, *fretted*.

FRET*, or **FRETTE**, in heraldry, is a bearing consisting of six bars, crossed, and interlaced, *fret-wife*: as, in *Tab. Herald.* fig. 39.

* Guillin derives the word from the French *retti*, net: but the reader will easily furnish himself a wish better etymology from the word *Fret*, in architecture.

He bears diamond a *Fret* topaz: the coat armor formerly of the lord Malrevers, and now quartered by the duke of Norfolk. When it consists of more than six pieces, the number must be specified.

Some call this the *true Lovers Knot*, others, *Harrington's Knot*, because it is their arms, and *Nodo firmo* the motto. Gibbon is for calling it *Heraldorum nodus amatorius*.

FRETTY, or **FRETTE**, in heraldry, is where there are divers bars laid a-cross each other.

Fretty is of six, eight, or more pieces. Azure, *Fretty* of eight pieces, or: the coat of the lord Willoughby.

Columbiere observes, that *Fretty* absolutely used, without any addition, is supposed to be of six pieces; that is, so many bars

bars or pieces crossing each other: which, therefore, need not be expressed; but if there be more, as much must be mentioned. And yet Guillim has azure, *Pretty* of fix, argent: the coat of the antient lords Elthingham of Suffex.

FRET-WORK, an enrichment of *Frets*; or a place adorned with something in manner thereof. See **FRET**.

Fret-work is sometimes used among us, to fill up, and enrich flat, empty spaces; but it is principally practised in roofs, which are *fretted* over with plaster work.

The Italians also apply it to the mantlings of chimneys with great figures: a cheap piece of magnificence, and as durable almost within doors, as harder matters in the weather.

FRIABLE, is applied to bodies, to denote them tender and brittle; easily crumbled, or reduced to powder between the fingers; their force of cohesion being such as easily exposes them to such solution. Such are pumice, and all calcined stones, burnt slum, &c.

Friability is supposed to arise hence, that the body consists wholly of dry parts, irregularly combined, and which are readily separated, as having nothing unctuous, or glutinous to bind them together.

FRIAR, or **FRIER**, by the Latins called *Frater*, the Italians *Fray*, and the French *Frere*, that is, *Brother*, is a term common to the monks of all orders; founded on this, that there is a kind of fraternity, or brotherhood presumed between the several religious persons of the same convent, or monastery.

The kinds of *Friars* are very numerous, Augustin *Friars*; Dominican, or Black, or Preaching *Friars*; Franciscan, or Grey, or Minor, or Begging *Friars*; and Carmelites, or White *Friars*.

FRIAR, in a more peculiar sense, is restrained to such monks, as are not priests; for those in orders are usually dignified with the appellation of *Father*. See **FATHER**.

FRIARS, or **FRIERS** *Observant*, *Frates Observantes*, were a branch of the Franciscans, thus called, because not combined together in any cloister, convent or corporation, as the conventuals are; but only agreed among themselves to observe the rules of their order, and that more strictly than the conventuals did; from whom they separated themselves out of a singularity of zeal; living in certain places of their own choosing.

FRIARY of the holy Trinity, see the article **TRINITY**.

FRIBURGH *, **FRIBURGH**, or **FRIETHEBORG**, among our Anglo-Saxon ancestors, denoted the same as Frankpledge did after the time of the conquest.

* *Præterea est quædam summa & maxima securitas, per quam omnes statu firmissimo sustentantur, viz. ut unusquisque stabilitus sit sub jurisdictionis securitate, quam Angli vocant Froborghes: soli tamen Eboracenses dicunt eandem Tiennannatle, quod sonant latine decem hominum numerum. LL. Edv. II. ap. Lamb.*

Every man in this kingdom was antiently associated in some decennary, or company of ten families, who were pledged or bound for each other, to keep the peace, and observe the law. See **TITHING**.—If any offence was done by one, the other nine were to answer it: that is, if the criminal fled from justice, they had thirty days allowed to apprehend him: if he was not taken in that time, he who was the *Friburgh*, i. e. the principal pledge of the ten, should take two of his own number, and the chief pledges of three neighbourin-*Friburghs*, with two others out of each of the said *Friburghs*; who were to purge themselves and their *Friburgh* of the forfeiture and flight of the criminal. If they could not do this, the principal pledge, with the other eight, were to make satisfaction.

Great men were not combined in any ordinary decenna, or dozen; as being deemed a sufficient assurance for themselves and their mental servants.

FRICASSEE *, a dish, or mess, hastily dressed in a frying-pan, and seasoned with butter, oil, or the like.

* The word is French, formed of the Latin *Frisatura*, frying. Others will have *Fricassee* formed in imitation of the noise made by butter, or other fat, when melted in the pan.

We say, a *Fricassee* of pullers, of rabbits, of trench, of tripe, of frogs, of eggs, of peas, &c.

FRICTION, the act of rubbing, or grating the surface of one body against that of another, called also *Attrition*. The phenomena arising upon the *Friktion* of divers bodies under different circumstances, are very numerous, and considerable.

Mr. Hawksbee gives us a number of experiments of this kind: particularly of the attrition, or *Friktion* of glass, under various circumstances; the result of which was, that it yielded light, and became electrical.

All bodies by *Friktion* are brought to conceive heat; many of them to emit light; particularly a cat's back, sugar, beaten sulphur, mercury, sea water, gold, copper, &c. But a bove all, diamonds, which when briskly rubbed against glass, gold, or the like, yield a light, equal to that of a live coal, when blown by the bellows.

FRICTION, in mechanics, denotes the resistance a moving body meets withal from the surface whereon it moves.

Friktion, arises from the roughness or asperity of the surface of the body moved on, and that of the body moving. For such surfaces conflicting alternately of eminences, and cavities; either the eminences of the one must be raised over those of the other; or they must be both broke and wore off: but neither can happen without motion; nor can motion be produced without a force impressed. Hence, the force applied to move the body, is either wholly, or partly spent on this effect; and consequently there arises a resistance, or *Friktion*: which will be greater, *cæteris paribus*, as the eminences are the greater, and the substance the harder. And as the body, by continual *Friktion*, grows more and more polite, the *Friktion* diminishes.

Hence it follows that the surfaces of the parts of machines that touch each other, should be as smooth and polished as possible. But, as no body can be so much polished, as quite to take away all inequality; witness those numerous ridges discovered by the microscope on the smoothest surfaces: hence arises the necessity of anointing the parts that touch, with oil, or some other fatty matter.

Laws of FRICTION. 1^o As the weight of a body moving on another, is increased, so is the *Friktion*.

This we see experimentally in a balance; which when only charged with a small weight, easily turns; but with a greater, a greater force is required.

Hence, if the line of direction of a moving body be oblique to the surface moved on; the *Friktion* is the greater: this having the same effect as an increase of weight.

And hence, again, as a perpendicular stroke, or impression is to an oblique one; as the whole sine, to the sine of the angle of incidence; and the sine of a greater angle is greater, and that of a lesser less, the *Friktion* is the greater, as the line of direction approaches nearer to a perpendicular.

This is easily observable, and especially in the teeth of wheels, which are frequently broke on this very account. The *Friktion*, therefore, is taken away, if the line of direction of the moving body be parallel to the surface.

2^o The *Friktion* is less in a body that rolls, than it would be were the same body to slide, as is easily demonstrated.

For suppose a dented ruler, AB, *Tab. Mechanicks*, fig. 38. and suppose a wheel DE to move along it, with its teeth perpendicular to the circumference; if now the body were to slide, the tooth F, when it touched the ruler, would describe a right line on the surface thereof: and, as the tooth of the ruler, H, resists the same; it could not proceed without removing, or breaking either the tooth H, or that F. And the same will hold in the sliding of any rough surface upon another; where all the *Friktion* will take place, that can any way arise from the roughness of the surface. But if the wheel ED roll along the ruler, then the tooth H will no longer resist its motion, only as it is to be hoisted out of the cavity F over the eminence of the tooth H: and the same holds in the rubbing of any rough body over the surface of another.

Hence, in machines, left the *Friktion* should employ a great part of the power; care is to be taken, that no part of the machine slide along another, if it can be avoided: but rather that they roll, or turn upon each other. With this view it may be proper to lay the axes of cylinders, not, as is usually done, in a groove, or concave matrix; but between little wheels, ABCD, fig. 39. moveable on their respective axes. This was long ago recommended by P. Calaneo; and experience confirms, that we save a deal of power by it. Hence also it is that a pulley moveable on its axis resists less than if it were fixed. And the same may be observed of the wheels of coaches, and other carriages.

From these principles, with a little further help from the higher geometry, Olaus Roemer determined the figure of the teeth of wheels, that should make the least resistance possible; and which should be epicycloidal. And the same was afterwards demonstrated by De la Hire; though, which is much to be lamented, the thing is not yet taken into practice.

Hence, in sawing-mills, the sides of the wooden rectangle the saws are fitted into, should be furnished with rotulae, or little wheels; which would greatly lessen the *Friktion*; and the like in other cases.

Calculation of the quantity of FRICTION. The *Friktion* is a point of the utmost importance in machines; and by all means to be considered, in calculating the force thereof: yet it is generally overlooked in such calculations: but this is principally, by reason its precise value is not known.

It is not yet reduced to certain, and infallible rules: the common method is, barely to compute the advantage, which a moving power has from the machine; either on account of its distance from a fixed point; or of the direction in which it acts. And in all the demonstrations it is supposed that the surfaces of bodies are perfectly smooth and polished. Indeed the engineers expect, that in the practice they should lose part of the advantage of their force, by the *Friktion*: but how much, it is supposed, nothing but the practice can determine. M. Amontons, indeed, has made an attempt to settle,

by experiment, a foundation for a precise calculation of the quantity of *Friction*; and M. Parent has confirmed it from reasoning, and geometry: but their theory, however warranted, is not generally and fully received.

M. Amontons' principle is, that the *Friction* of two bodies depends on the weight, or force wherewith they bear on each other; and only encreases as the bodies are more strongly pressed, or applied against each other; or are charged with a greater weight: and that it is a vulgar error, that the quantity of *Friction* has any dependence on the bigness of the surfaces rubbed against each other: or that the *Friction* increases as the surfaces do.

Upon the first proposal of this paradox, M. de la Hire had recourse to experiments, which succeeded much in favour of the new system. He laid several pieces of rough wood, on a rough table: their sizes were unequal; but he laid weights on them, so as to render them all equally heavy. And he found, that the same precise force, or weight, applied to them by a little pulley, was required to put each in motion, notwithstanding all the inequality of the surfaces. The experiment succeeded in the same manner in pieces of marble, laid on a marble table.

Upon this M. de la Hire betook himself to the rationale of the thing; and has given us a physical solution of the effect: and M. Amontons has settled a calculus of the value of *Friction*, and the loss sustained thereby in machines, on the footing of the new principle.

In wood, iron, lead, and brass, which are the principal materials used in machines, he finds the resistance caused by *Friction*, to be nearly the same, when those materials are anointed with oil, or other fatty matter: and this resistance, independent of the quantity of surface, he makes to be nearly equal to a third part of the force wherewith the bodies are pressed against each other.

Beside the pressure, the magnitude whereof determines that of the *Friction*; there is another circumstance to be considered, viz. the velocity. The *Friction* is the greater, and the more difficult to surmount, as the parts are rubbed against each other with the greater swiftness: so that this velocity must be compared with that of the power necessary to move the machine, and overcome the *Friction*. If the velocity of the power be double that of the parts rubbed; it acquires, by that means, an advantage that makes it double; or, which amounts to the same, it diminishes the contrary force of *Friction* by one half; and reduces it to a sixth part of the weight or pressure. But this velocity M. Amontons only considers as a circumstance that augments or diminishes the effect of the pressure, i. e. the difficulty of the motion: so that the *Friction* still follows the proportion of the weight. Only, we are hereby directed to dispose the parts of machines that rub against each other, in such manner as that they may have the least velocity possible: and thus the diameter of the axis of a wheel should be as small as possible with regard to that of the wheel; in that the lesser the axis, the slower will be the motion of the surfaces rubbing against each other: since the velocity of a circular motion always goes diminishing from the circumference to the centre. And for the same reason the teeth of dented wheels should be as small and thin as possible: for a tooth catching on a notch, &c. rubs one of its sides against a surface equal to its own; and is to disengage itself in a certain time by passing over a space equal to the surface; consequently, the lesser the surface, the less space it has to move; the smallness of the surface diminishing the resistance of the *Friction*; not as it is a less surface that rubs, but as there is a less space to move.

But notwithstanding all the confirmations and illustrations of this theory of *Friction*; the public, or even the academy itself where it was proposed, could not be brought fully to acquiesce in it. It is granted, that the pressure has a great effect; and is, in many cases, the only thing to be considered in *Frictions*: but it will be hard to persuade us absolutely to exclude the consideration of the surface. In effect, the contrary seems capable of a metaphysical demonstration.

If two bodies, with plain surfaces, supposed infinitely hard, and polished, be moved along each other; the *Friction* will be none; or infinitely small: but if, in lieu of such supposition, which has no place in nature, we suppose two bodies with rough, uneven surfaces; the difficulty of moving one of them on the other, must either arise from this, that the first is to be raised, in order to disengage the parts caught or locked in the second; or that the parts must be broken and worn off; or both. In the first case, the difficulty of raising one of the bodies, makes that of the motion; and of consequence the *Friction* arises wholly from the weight, or pressure; and the surface has nothing to do in it.

In the second case, the magnitude of the surface would be all; were it possible this second case could be absolutely abstracted from the first; i. e. could the parts of one body be rubbed and worn against those of the other, without raising one of them; it being visible that a greater number of parts to be broken would make a greater resistance, than a less. But as in practice we never rub, or grind, without raising the body; the resistance arising from the greatness of the surface in the second case,

is always combined with that from the pressure: whereas in the former case, that arising from the pressure may be alone, and uncompounded.

Add, that what is wore off a body, is ordinarily very little; with regard to the great number of times the body must have been raised during the *Friction*, and all the little heights added together, which the body must have been raised to.

Hence, as the resistance from pressure may be single; and as the same always accompanies that arising from the magnitude of the surfaces; and is usually much the more considerable of the two, when it does accompany it: for these reasons, in most of the experiments that are made, it is the only one perceived, and the only one that needs to be considered.

But then, as it is possible, in certain cases, for the pressure to be very slender; and the number of parts to be rubbed very great: it must be owned, there are cases wherein the *Friction* follows very sensibly the proportion of the surfaces.

For the *Friction* of the parts of fluids; see RESISTANCE, and RETARDATION of Fluids.

Friction, in medicine, and chirurgery, denotes the act of rubbing a diseased part with oils, unguents, or other matters, in order to ease, relieve, and cure it.

Frictions are much used of late in venereal cases. They prefer the applying of mercury externally, by way of *Friction*, to that of giving it internally, to raise a salivation.

There are also *Frictions* with the flesh-brush, a linen cloth, or the hand only: for the effect of which last, see STROAKING.

Frictions of any kind, are a sort of exercise, which contributes greatly to health; as they excite and stir up the natural warmth, divert fluxions, promote perspiration, open the pores of the skin, and carry off stagnant humours.

The flesh-brush, Dr. Cheyne observes, is an exercise extremely useful for promoting a full and free perspiration and circulation. Every body knows the effect of currying horses; that it makes them sleek, gay, lively, and active; so as even to be judged equivalent to half the feeding.

This it can no otherwise effect, but by assisting nature to throw off the recrements of the juices, which stop the free circulation; and by constant *Frictions*, irritation, and stimulation, to call the blood and spirits to the parts most distant from the seat of heat, and motion, and so plump up the superficial muscles. And the same effects it would have in other creatures, and man himself, if managed in the same manner, and with the same care and regularity.

Persons, therefore, of weak nerves, and sedentary lives would do well to supply the want of other exercise, with spending half an hour, morning and night, in currying and rubbing their whole body, especially their limbs, with a flesh-brush.

Friction, or rather *Frixion*, in chemistry, is the same with what in cookery we call *Frying*, viz. the coction of certain matters in a pan, with the addition of some unctuous thing, as oil, fat, &c.

The *Frixion* of medicines is performed over a slow, moderate fire; and that of foods over a quick one.

FRIESTOLL*, or FRITHSTOW, in our ancient writers, signifies a seat, chair, or place of peace, where criminals might find safety, and protection.

* In the charter of immunities confirmed to the church of St. Peter in York, ann. 5 H. VII. it is explained by *Cathedra quietudinis & pacis*.—*Quod si aliquis vesano spiritu agitatus diabolico ausu quemquam capere presumpserit in cathedra lapidea iuxta altare, quod Angli vocant Friesland, i. e. cathedra quietudinis vel pacis; huius tam flagitiosi sacrilegii emendatio sub nullo iudicio erit, sub nullo pecunie numero claudatur, sed apud Anglos Boteler, hoc est, sine emenda, vocabatur.* Monast. t. 2. p. 135.

Of these there were many in England; but the most famous was at Beverly, which had this inscription, *Hec sedes lapidea Friestoll dicitur, i. e. Pacis Cathedra, ad quem reus fugiendo perveniret, omnimodam habet securitatem.* Camden.

FRIENDLESS Man, was the old Saxon name for him whom we call an Outlaw.

The reason is, because he was, upon his exclusion from the king's peace and protection, denied all help of friends after certain days: *Nam fors fecit amicos.*

FRIERS *Alii*, see the article ALIEN.

FRIEZE, FRIZE, or FREEZE, in architecture, a member, or division of the entablature of columns, by the antients called *Zophoros*. See FREEZE.

FRIGATOON, a Venetian vessel, commonly used in the Adriatic, built with a square stern, and without any fore-mast, having only a main-mast, mizen-mast, and bow-sprit.

FRIGID, FRIGIDUS, cold, is variously used.—A *frigid* style, is a low, jejune manner of diction, wanting force, warmth of imagination, figures of speech, &c.

FRIGID Zone, or Frozen Zone, in geography. See ZONE.

FRIGIDITY, is also used in the same sense with impotency, see IMPOTENCE.

FRIGORIFIC, in physics, something that occasions cold.

Some philosophers, particularly Gassendus, and other corpuscularians, denying cold to be a mere privation or absence of heat, contend that there are actual *frigorific* corpules, or particles

FRI

particles as well as fiery ones: whence proceed cold and heat. But later philosophers allow of no other *frigorific* particles, beside those nitrous salts, which float in the air in cold weather, and occasion freezing.

FRIPPERY, a French term, sometimes used in our language; properly importing the trade, or traffic of old, second-hand clothes, and goods.

The word is also used for the place where such sort of commerce is carried on, and even for the commodities themselves. The company of *Frippiers*, or *Frippeurs*, at Paris, are a regular corporation, of an ancient standing, and make a considerable figure among the communautés of that city.

FRISELAND Horfe, *Cheval de FRISE*, see **CHEVAL**.

FRIT, or **FRITT**, in the glass manufacture, is the matter or ingredients whereof glass is to be made; when they have been calcined, or baked in a furnace.

A salt drawn from the ashes of the plant kali, or from fern, or other plants mixed with sand, or flints, and baked together, make an opaque mass, called by glass-men *Frit*; probably from the Italian *frittare*, to fry; or by reason the *Frit*, when melted, runs into lumps like fritters, called by the Italians, *Frittelli*.

Frit, by the antients, was called *Hammonitrum*, or *Ammonitrum*, of *αμμων*, sand, and *νιτρον*, nitre: under which name it is described by Pliny thus: Fine sand from the Volturnian sea, mixed with three times the quantity of nitre, and melted, makes a mass called *Ammonitrum*; which being re-baked, makes pure glass. *Hist. Nat. l. xxxvi. c. 26.*

Frit, Neri observes, is only the calx of the materials which make glass; which, though they might be melted, and glass be made without thus calcining them, yet would it take up much more time. This calcining, or making of *Frit*, serves to mix and incorporate the materials together, and to evaporate all the superfluous humidity. The *Frit* once made, is readily tuled and turned into glass.

There are three kinds of *Frits*: the first, crystal *Frit*, or that for crystal metal, made with salt of pulverine and sand.

The second, and ordinary *Frit*, is made of the bare ashes of pulverine, or barilla, without extracting the salt from them. This makes the ordinary white, or crystal metal.

The third, is *Frit* for green glasses, made of common ashes, without any preparation. This last *Frit* will require ten or twelve hours baking.

The materials in each, are to be finely powdered, washed, and sieved; then equally mixed; and frequently stirred together in the melting pot. For the rest, see **GLASS**, and **CRYSTAL**.

FRITHBURGH, see the article **FRIBURGH**.

FRITHGILD, was antiently the same with what we now call a *Guild*, or a *Fraternity*, or *Company*. See **GILD**.

FRIXION, see the article **FRICTION**.

FRIZE, or **FRIEZE**, in architecture, a part of the entablature of columns, more usually wrote, and pronounced *Freeze*. See **FREEZE**.

FRIZE, or **FREEZE**, in commerce, a kind of woollen cloth, or stuff for winter wear, being *friezed* or napt on one side; whence, in all probability, it derives its name.

Of *Friezes*, some are crossed, others not crossed. The former are chiefly of English manufacture: the latter of Irish.

FRIZING of cloth, a term in the woollen manufactory, applied to the forming of the nap of a cloth, or stuff into a number of little hard burrs, or prominences, covering almost the whole ground thereof.

Some cloths are only *friezed* on the back-side; as black cloths: others on the right side, as coloured and mixed cloths, rareens, bays, frizes, &c.

Friezing may be performed two ways: one with the hand, *i. e.* by means of two workmen, who conduct a kind of plank, that serves as a *friezing* instrument.

The other way is by a mill, worked either by water, or a horse; or sometimes by men. This latter is esteemed the better way of *friezing*; by reason the motion being uniform, and regular, the little knobs of the *friezing* are formed more equably, and regularly.

The structure of this useful machine is as follows.

The three principal parts are, the *Frizer*, or *crisper*; the *friezing* table; and the *drawer*, or beam.—The two first are two equal planks or boards, each about ten feet long, and fifteen inches broad; differing only in this, that the *friezing* table is lined, or covered with a kind of coarse woollen stuff, of a rough, sturdy nap, and that the *Frizer* is incrustated with a kind of cement, composed of glue, gum arabic, and yellow sand, with a little aqua vitae, or urine. The beam, or *drawer*, thus called by reason it draws the stuff from between the *frizer* and *friezing* table, is a wooden roller, beset all over with little, fine, short points or ends of wire, like those of cards, used in carding of wool.

The disposition and use of the machine is thus: the table stands immovable, and bears, or sustains, the cloth to be *friezed*, which is laid with that side uppermost, on which the nap is to be raised. Over the table is placed the *frizer*, at such distance from it as to give room for the stuff to be passed between them: so that the *frizer*, having a very slow femicircular motion, meeting the long hairs or nap of the

FRO

cloth, twists and rolls them into little knobs, or burrs; while, at the same time, the *drawer*, which is continually turning, draws away the stuff from under the *frizer*, and winds it over its own points.

All that the workman has to do while the machine is going, is to stretch the stuff on the table, as fast as the *drawer* takes it off; and from time to time, to take off the stuff from the points of the *drawer*.

It has already been observed, that the *friezing* table is lined with stuff of a short, stiff, stubby nap; the use whereof is to detain the cloth between the table, and *frizer*, long enough for the grain to be formed; that the *drawer* may not take it away too readily; which must otherwise be the case, inasmuch as it is not held by any thing at the other end.

It were needless to say any thing particular of the manner of *friezing* stuffs with the hand; it being the aim of the workmen to imitate as near as they can, with their wooden instrument, the flow, equable, and circular motion of this machine. It needs only be added, that their *frizer* is but about two feet long, and one broad; and that to form the nap more easily, they moisten the surface of the stuff lightly with water, mingled with whites of eggs, or honey.

FRONT*, the forehead; or that part of the face above the eyebrows.

* The word is formed of the Latin *Front*, and that from the Greek *φρον*, to think, perceive; of *φρον*, *mens*, the mind, thought. Martinius, to make out this etymology, observes, that from the forehead of a person we perceive what he is, what he is capable of, and what he thinks of. Du Laurens chuses to derive it from *ferre*, by reason it bears the marks of what we have in our head.

FRONT is also used where several persons, or things, are ranged side by side, and shew their *Front*, or fore-parts.

Those troops ranged in form of battle made a large *Front*: the three legions were here disposed in two lines, as Cæsar used to do, when with a few forces he had occasion to extend his *Front*. The *Front* of the army consisted of so many battalions, and so many squadrons.

The military evolutions teach how to make a *Front* of any side, *i. e.* how to present the face, and arms to the enemy, what side soever he attack on. They attacked the enemy in *Front*, and in flank.

FRONT, in architecture, denotes the principal face, or side of a building: or that presented to the chief aspect, or view.

The palace consists of a large pile in *Front*, flanked with two wings.

FRONT, in perspective, a projection, or representation of the face or fore-part of an object, or of that part directly opposite to the eye; called also, and more usually, *Orthography*. See **ORTHOGRAPHY**.

Line of the FRONT, see the article **LINE**.

FRONT Scale, see the article **SCALE**.

FRONTAL, in architecture, a little fronton, or pediment, sometimes placed over a small door, or window.

FRONTAL, **FRONTLET**, or *Brow-band*, is also used in speaking of the Jewish ceremonies.

This *Frontal* consists of four several pieces of vellum, on each whereof is wrote some text of Scripture. They are all laid on a piece of a black calves leather, with thongs to tie by. The Jews apply the leather with the vellum on their foreheads, in the lynchage, and tie it round the head with the thongs.

FRONTALE *Os*, in anatomy, see *Os FRONTALIS*.

FRONTALE, or **FRONTAL**, in medicine, an external form of remedy applied on the forehead, and temples, with a bandage; for the cure of the head-ach, megrim, vapours, defluxions on the eyes, &c.

Frontals are composed of roses, elder flowers, betony, marjoram, lavender, camphire, &c. wrapped in a linen cloth, and applied over the forehead and temples.

There are also *Frontals* in manner of liniments, made of unguentum populeum, and extract of opium; or of pastes, powders, seeds, &c.

In *Frontals* applied to ease the violence of the head-ach in the height of fevers, they frequently mix the kernels of cherries.

FRONTALLES, in anatomy, two muscles, one on each side the forehead; commonly supposed to spring from the skull, but now known to arise from the occipital muscles; or rather, it appears that the *Frontales* and occipitales are only one continued digastric muscle, on each side, moving the scalp and skin of the forehead and eyebrows.—See *Tab. Anat. (Myol.) fig. 1 p. 1.*

The *Frontales* begin to be thus denominated after they have begun to pass the coronal suture, with fibres passing obliquely to the eyebrows, where they terminate, and in the lower part of the skin or the forehead.

They have each two appendages; the superior, or external, is commonly fixed to the bone of the nose; the lower is fixed to the *os frontis*, and is by Volcherus Cöster made a distinct muscle, and called *Corrugator*, from its use in drawing the eyebrows to each other, and wrinkling the forehead.

FRONTATED,

FRONTATED, a term used by botanists, to express that the petalum or leaf of a flower grows broader and broader; and at last, perhaps, terminates in a right line.—In opposition to *cuspidated*, which expresses that the leaves terminate in a point.

FRONTIER *, the border, confine, or extreme of a kingdom, or province; which the enemies find in front, when they would enter the same. Thus we say, a *Frontier* town, *Frontier* province, &c. *Frontiers* were anciently called *Marches*.

* The word is derived from the French *Frontiere*, and that of the Latin *Frontaria*, as being a kind of front opposed to the enemy. Skinner derives *Frontier* from *Front*; inasmuch as the *Frontier* is the exterior, and most advanced part of a state, as the front is that of the face of a man.

FRONTIS *O*, in anatomy, the bone of the forehead. See *Tab. Anat. (Osteol.)* fig. 1. lit. a.

The *O* *Frontis* is a bone of the cranium, in form almost round: it joins the bones of the finciput and temples by the coronal suture, and the bones of the upper jaw by the transverse suture, and the osphenoides, by the sphenoidal suture.

It forms the upper part of the orbits, and has four apophyses, which are at the four angles of the two orbits.

It has two holes above the orbits, through which pass the vein, artery, and some twigs of the first branch of the fifth pair of nerves. It has also one in each orbit, a little above the os planum, through which a twig of the ophthalmic branch of the fifth pair of nerves passes to the nose.

It has two sinuses above the eyebrows, between its two tables; they are lined with a thin membrane, in which there are several blood vessels and glands, which separate a mucous serosity, which falls into nostrils.

The inside of this bone has several inequalities, made by the vessels of the dura mater. It has two large dimples made by the anterior lobes of the brain. Above the crista galli, it has a small blind hole, into which the end of the sinus longitudinalis is inserted.

FRONTISPIECE *, in architecture, the portail, or principal face of a fine building.

* The word is formed of the Latin *Frontispicium*, q. d. *Frontis hominis inspectio*.

The *Frontispiece* of the Louvre is the finest piece of architecture in France.

Hence also, by a figure, we say the *Frontispiece* of a book, meaning an ornament with an engraven title on the first page.

FRONTLET, see the article *FRONTAL*.

FRONTON, in architecture, an ornament, among us more usually called *Pediment*. See *PEDIMENT*.

FROST, an excessive cold state of the weather, whereby the motion and fluidity of liquors is suspended: or, it is that state of the air, &c. whereby fluids are converted into ice.

Metals contract, or are shortened in *Frost*. Monf. Auzout, found by experience, that an iron tube twelve foot long lost two lines of its length, upon being exposed to the air, in a frosty night. But this we suppose wholly the effect of the cold.

Frost does not contract fluids, as was formerly imagined: on the contrary, it swells or dilates them by nearly a tenth of their bulk.

Scheffer assures us, that in Sweden the *Frost* pierces into the earth two cubits, or Swedish ell; and turns what moisture is found therein, into a whitish substance, like ice. He adds, the standing waters freeze to a greater depth; even to three ells, or more: but those that have a current, less; and rapid waters, and bubbling springs, never freeze even there.

Mr. Boyle gives us several experiments of vessels made of metals, exceeding thick and strong; which being filled with water, close stopped, and exposed to the cold, in which the water, in freezing, coming to be expanded, and not finding either room, or vent, burst the vessels.

A strong barrel of a gun, with water in it, close stopped and frozen, was rent the whole length: and a small brass vessel, five inches deep, and two in diameter, filled with water, &c. lift up its lid, which was pressed with a weight of fifty-six pounds.

Olearius assures us, that in the city of Moscow he observed the earth to be cleft by the *Frost* many yards in length, and a foot broad. Sheffer mentions sudden cracks or rifts in the ice of the lakes of Sweden, nine or ten foot deep, and many leagues long; and adds, that the rupture is made with a noise not less terrible than if many guns were discharged together. By such means the fishes are furnished with air; so that they are rarely found dead.

In the great *Frost* of 1683, oaks, ashes, walnut-trees, &c. Mr. Bobart tells us, were miserably split, and cleft, so that one might see through them; and this frequently with terrible noises, like the explosion of fire arms. The clefts were not only in the bodies, but continued to the larger boughs, roots, &c. See an inquiry into the circumstances and causes thereof, in the *Philos. Transact.* N^o 165.

The natural histories of *Frosts* furnish very extraordinary effects thereof. The trees are frequently scorched and burnt up as with the most excessive heat; of which there are divers instances in so warm a climate as that of Provence. See *Mezeray, Hist. de France*, An. 1570.

The year 1708, was remarkable throughout the greatest part of Europe for a severe *Frost*. Mr. Derham says, it was the greatest in degree, if not the most universal, in the memory of man. It extended throughout England, France, Germany, Denmark, Italy, &c. but it was scarce felt in Scotland or Ireland. All the orange trees, and olives in Italy, Provence, &c. and all the walnut trees throughout France, with an infinity of other trees, perished by this *Frost*. They had a kind of gangrene grew on them; which Monf. Gaucheron takes to have been the effect of a corrosive salt, corrupting and destroying their texture. He adds, there is so much resemblance between the gangrene befalling plants through *Frost*, and that which the parts of animals are liable to, that they must have some analogous cause. Corrosive humours burn the parts of animals; and the aerial nitre condensed, has the same effect on the parts of plants: *Penetrabile Frigus adurit. Memoires de l'Academie Royale des Sciences*, An. 1709.

In Germany the fresh water fish were every where killed; and a vast destruction befel the smaller birds. The spittle was no sooner out of a man's mouth than it was froze. The Lusatian letters add, that many cows were froze to death in their stalls; and many travellers on the road were some quite froze to death, others lost their hands, feet, noses, and ears.

G. Remus, the author of an academical exercise on this subject, published at Hall in Saxony, entitled, *Consideratio physico-mathematica hyemis proxime præterlapsæ*, gives instances from the news-papers, of two gentlemen and a smith in England; and above sixty men, and many cattle near Paris; and the like at Venice; and eighty French soldiers near Namur; all killed on the road with cold. On the coasts of Italy many of the mariners aboard the English men of war died of the cold; and several lost part of their fingers and toes.

In England, the greatest sufferers in the animal kingdom, Mr. Derham observes, were birds and insects; particularly larks and robin-red-breasts: much the greatest part of which perished. But the vegetables were far the greater sufferers. Few of the tender sorts escaped: Bay, Hollies, Rosemary, Cypress, Alaterni, Phillyrea's, Arbuti, Laurustines, and even Furze, with most of the frutescent Herbs, as Lavenders, Abrotonums, Rue, Thyme, &c. Mr. Bobart informs us, were generally destroyed. The same writer adds, that the sap of the finer wall-fruits was so congealed, and disordered, that it stagnated in the limbs and branches, and produced disorders like to chilblains in human bodies, which in many parts of trees would turn to mortifications: and that the very buds of the finer trees, both the leaf buds, and blossom buds, were quite killed and dried into a farinaceous matter.

In Switzerland, Scheuchzer relates, that not only the Walnut trees and Vines, but even the Beech, Larix, &c. were destroyed. And yet in some parts of those cantons, he adds, there never was a milder winter season known.

Mr. Derham relates it as a common observation, that vegetables suffered more in this winter from the sun, than the *Frost*; in that the sun-shine melting the snow, and opening the ground, left them more exposed to the rigours of the ensuing night. And at a meeting of the Royal Society, it was observed, that the calamities which befel trees, arose not purely from their being frozen; but principally from the winds shaking and rocking them, when they were so; which rent and parted their fibres. *Philosop. Transact.* N^o 324.

Hoar Frost, or *White Frost*, *Pruina*, is the dew frozen or congealed early in cold mornings; chiefly in autumn.

Hoar Frost, Mr. Regis observes, consists of an assemblage of little parcels of ice crystals; which are of various figures, according to the different disposition of the vapours, when met and condensed by the cold.

Dew, is in all appearance the matter of *Hoar Frost*: though many of the Cartesians will have it formed of a cloud, and either congealed in the cloud, and so let fall; or ready to be congealed as soon as it arrives at the earth.

FROTH, a white, light substance, formed on the surface of fluids, by vehement agitation.

Froth consists wholly of little spherules, or globules; and accordingly, may be defined an assemblage of aqueo-aereal bubbles.

FROZEN, or *FRIGID Zone*, see the article *ZONE*.

FROZEN Ocean, see the article *OCEAN*.

FROZEN Waters, see the article *WATERS*.

FRUGIVOROUS Birds, are such as feed on fruits, either wholly or in part.

The *Frugivorous*, according to Mr. Willoughby, are a species of terrestrial birds, some of which have crooked bills and claws; yet are of gentler nature, and not rapacious. Such are the

partot kind, which though sometimes carnivorous, yet feed likewise on fruit.

FRUIT, in its general sense, includes whatever the earth produces, for the nourishment and support of men, and other animals; as herbs, grain, pulse, hay, corn, flax, and every thing, expressed by the Latins under the name *Fruges*.

The devotion and solemnity of rogation week, were instituted to procure a blessing on the *Fruits* of the earth.

In the civil law, they distinguish three kinds of *Fruits*.

Natural FRUITS, which the earth produces spontaneously and without any culture; as those of trees.

FRUITS of industry, which, though natural, require some culture to perfect them. — And

Civil FRUITS, which are only *Fruits* in the eye of law; as rent, salaries, wages, &c.

In the canon law, *Fruits* include every thing whereof the revenue of a benefice consists; as glebe-land, tithes, rents, offerings, mills, &c.

FRUIT, in natural history, denotes the last production of a tree, or plant; for the propagation, or multiplication of its kind: In which sense *Fruit* includes all kinds of seeds, with their furniture, &c.

FRUIT, in botany, is properly that part of a plant wherein the seed is contained; called by the Latins *Fructus*, and by the Greeks *καρπος*.

Fruits are sometimes dry, and sometimes soft, and fleshy.

FRUIT also implies an assemblage of seeds, in a head; as in a ranunculus, &c. and in the general, all kinds of seeds or grains, whether naked, or inclosed in a cover, capula, or pod; and whether bony, fleshy, skinny, membranous, or the like. The *Fruit* is the product, or result of the flower; or that for whose production, nutrition, &c. the flower is intended.

The structure and parts of different *Fruits* are somewhat different; but in all the species, the essential parts of the *Fruit* appear to be only continuations, or expansions of those observed in the other parts of the tree.

Dr. Beal suggests some very good reasons for a direct communication of the remotest parts of the tree and the *Fruit*; so that the same fibres or stamina, which constitute the root, trunk, and boughs are extended into the very fruit.

Thus, cutting open an apple transversely, it will be found to consist of four parts, viz. 1° A skin, or cortex, which is only a production of the skin, or outer bark of the tree. 2° A parenchyma, or pulp; which is an expansion, and intumescence of the inner bark of the tree. 3° Fibres or ramifications of the woody part of the tree, dispersed throughout the parenchyma.

Of these last, authors generally reckon fifteen principal branches; ten whereof penetrate the parenchyma, and incline to the basis of the flower; the other five ascend more perpendicularly from the pedicle, or stalk, and meet with the former at the base of the flower: to these branches are fastened the capulae, or coats of the kernels.

These branches being at first extended through the parenchyma to the flower, furnish the necessary matter for the vegetation thereof; but, the *Fruit* increasing, it intercepts the aliment, and thus the flower is starved, and falls off.

4° The core, which is the produce of the pith or medulla of the plant, indurated and strengthened by twigs of the wood and fibres, inoculated therewith. It serves to furnish a cell, or lodge for the kernels; filtrates the juice of the parenchyma, and conveys it thus prepared to the kernel.

In a pear we distinguish five parts, viz. the skin, parenchyma, ramification, stone, and acetarium.

The three first parts are common to the apple. The stone, observed chiefly in choak pears, is a congeries of hard corpuscles, dispersed throughout the whole parenchyma, but in the greatest plenty, and closest together, about the centre or acetarium. It is formed of the harder or calculeous parts of the nutritious juice of the parenchyma, extravasated in masses.

The acetarium, is a substance of a tart, acid taste, of a globular figure, inclosed in an assemblage of several of the stony parts above-mentioned.

In the plum, cherry, &c. there are four parts, viz. a coat, parenchyma, ramification, and stone, or nucleus. The stone consists of two very different parts; the inner, called the kernel, is soft, tender, and light; being derived from the pith or medulla of the tree by seminal branches, which penetrate the base of the stone: the external or harder part, called the shell, is a concretion of the stony, or calculeous parts of the nutritious juice; like the stone in pears, and like that, it contains a soft, parenchymous matter within it.

The nut, analogous to which is the acorn, consists of a shell, cortex, and medulla. The shell consists of a coat and parenchyma, derived from the bark and wood of the tree. The cortex consists of an inner, and outer part: the first is a duplication of the inner tunic of the shell; the second is a mossy substance, derived from the same source as the parenchyma of the shell. But whether the medulla or pulp of the kernel arise from the pith of the tree, or the cortical part of the fruit, is not yet agreed.

Lastly, berries, as grapes, &c. besides the three general parts viz. coat, parenchyma, and ramification, contain grains of a stony nature, which do the office of seeds.

As to the use of *Fruits*, beside the pleasure and advantage they afford men, &c. they are of service in guarding, preserving, and feeding the feed inclosed; in filtrating the coarser, more earthy and stony parts of the nutritious juice of the plant, and retaining them to themselves; and sending none to the feed but the purest, most elaborated and spirituous parts for the support and growth of the tender delicate embryo, or plantule contained therein.

So that the *Fruit* does the same office to the feed that the leaves of the flower do to the *Fruit*.

FRUIT, in gardening, denotes the production of a *Fruit-tree*; as the Apple, Pear, Plum, Peach, Apricot, Cherry, Grape, Currant, Orange, Fig, Almond, &c.

Fruits are distinguished by gardeners into *Stone Fruit*, and *Kernel Fruit*; *Summer Fruit*, and *Winter Fruit*; *Wall Fruit*, and *Dwarf Fruit*, &c.

Monf. Quintinie observes, that cold, heavy, moist lands produce the fairest and largest *Fruit*; but the hotter, drier, and lighter, the more delicious and rich tasted.

Fruits, with regard to commerce, are distinguished into recent or fresh; and dry.

Recent FRUITS are those sold just as they are gathered from the tree, without any further preparation. — As are most of the productions of our gardens and orchards, sold by the fruiters.

Dry FRUITS are those dried in the sun or by fire, with other ingredients, sometimes added to them, to make them keep; imported chiefly from beyond sea, and sold by the grocers.

Such are raisins, currants, figs, capers, olives, cloves, nutmegs, pepper, and other spices: which see under their respective articles.

Under the denomination of *dry Fruits* are also frequently inclosed apples, pears, almonds, filberds, &c.

Polyphyrenous FRUITS, see the article **POLYPHYRENOUS**.

Fruits current for coins, see the article **COIN**.

First Fruits, see the article **FIRST FRUIT**.

FRUIT-TREES are distinguished like the *Fruits* they bear, into wall *Fruit-trees*, standard *Fruit-trees*, &c.

With regard to *Fruit-Trees*, Monf. Quintinie observes, 1° That the cutting and trimming of young trees hinders them from quick bearing; though it contributes both to the beauty of the tree, and to the richness and flavour of the *Fruit*.

2° That *kernel-fruit-trees* come later to bear than *stone-fruit-trees*; the time required by the first before they arrive at a fit age for bearing, being, one with another, about four or five years: but that when they do begin, they bear in greater plenty than *stone Fruit*.

3° That *stone-fruits*, figs and grapes, commonly bear considerably in three or four years; and bear full crops the fifth and sixth years: and hold it for many years, if well ordered.

4° That *Fruits* in the same neighbourhood will ripen a fortnight sooner in some grounds, than in others of a different temperature.

5° That in the same country, hot or cold summers set considerably forwards, or put backwards the same *Fruit*.

6° That the *Fruits* of wall trees generally ripen before those on standards; and those on standards before those on dwarfs.

7° That the *Fruits* of wall trees planted in the south and east quarters commonly ripen about the same time; only those in the south rather earlier than those in the east: those in the west are later by eight or ten days, and those in the north by fifteen or twenty.

For the planting, pruning, engraving, &c. of *Fruit-trees*, see **PLANTING**, **TRANSPLANTING**, **PRUNING**, and **ENGRAFTING**. See also **ORCHARD**, **GARDEN**, and **NURSERY**.

Monf. de Reffons, in the *Memoires de l'Academie Royale des Sciences*, An. 1716. gives us a method of grafting *stone Fruit-Trees*, without losing of time; so that a tree which bore forty *Fruit* the preceding year, shall bear the choicest *Fruit* the year following.

It frequently happens, that persons are deceived in their *Fruit* trees; especially those bought of the nursery men: and it is a melancholy thing, after having waited three years for *Fruit*, to find it naught at last; and to be obliged to graft the tree again, and wait four years more, for the second hopes. In effect, in the common methods of grafting, they know nothing better than to cut off the head of a tree, and make it put forth new wood, to graft in: this necessarily makes a long delay; which Monf. Reffons shews how to abridge.

Upon considering the union of the sap in grafts, that author was led to think, that all the office the bark has in grafting, is to receive the scutcheon; so that if the bark be not quite hard, dry, and inflexible, and incapable of yielding without cracking

cracking, or bursting; it should seem indifferent, whether one grafted on new wood, or old: the sap passing equally into both. Which reasoning had the good fortune to be verified by a number of experiments made with that view.

We are at liberty, then, to graft almost at any age, and in any wood. Accordingly, a peach tree of a worse kind or quality, may be grafted from another of the best, in autumn, in the height of its *Fruit* and sap, without cutting off any branches; the graft soon comes to the tree by the union of the saps, without shooting at all: so that cutting off the branches above the grafts the spring following; the same graft inserted the preceding autumn will shoot vigorously; and being on a wood of the same kind, the *Fruit* thenceforth produced will be much the larger and finer. But this is not the great point: for the tree thus engrafted will not bear till the third year; and we want *Fruit* the first.

In order to this, it is to be observed, that there are three kinds of branches: wood-branches, growing immediately from the stem or stock of the tree: *Fruit* branches: and branches half of the wood, half of the *Fruit* kind, being such as arising from the largest wood branches, preserve the character thereof, but which, in two years time, will produce *Fruit* branches. Now, it is these intermediate kind of branches, that we are to chuse for scutcheons or grafts. They are easily known by being bigger than the *Fruit* branches, and less than the wood branches: they have each of them, two, three, four, or even five leaves to each eye; and the eyes are farther distant from each other than those of the *Fruit* branches, but closer than those of the wood branches. It must be added, that the eyes on such branch are three; one intended for a wood branch, being situated between the two leaves, and advancing further than the other two, which are intended for *Fruit*, and are placed without-side the leaves.

It is these last that are the precise subjects to be chosen for the grafting withal. Twelve of these scutcheons, more, or less, according to the strength of the tree to be grafted on, being duly applied; we may depend on a crop of good *Fruit*, the very next year, on the same tree which the last year produced the worst.

FRUITERY, a place for the laying up and keeping of *Fruit*.

See **FRUIT**, and **GRANARY**.

The *Fruiter* should be inaccessible to any thing of moisture, or even frost.

FRUITFULNESS, the quality of bearing plenty of fruit; called also *Fertility*, and *Fecundity*. See **FECUNDITY**.

FRUMENTACEOUS Plants*, are those which produce geniculated or knotted stalks, with reed-like leaves; and whose feed growing in spikes or jubæ is useful to make pulstage, or bread.

* The word is formed from *Frumentum*, a general name comprehending all sorts of corn, or grain, for bread. Hence the Italians, who follow the Latins, use *Grano* and *Frumento*, for the same.

Wheat, barley, rye, millet, &c. are *frumentaceous* plants.

Some authors use *frumentaceous* in a narrower sense; restraining it to plants which bear a conformity to wheat; either in respect of their fruits, leaves, ears, or the like.

But this seems founded on a mistaken notion of *Frumentum*, as if it denoted only wheat; which is rather the sense of the word, *triticeum*.

FRUMENTARII, in antiquity, a kind of soldiers, or archers, under the western empire.

St. Cyprian relates, in one of his letters, that some of these *Frumentarii* were sent to take him.

The first time we read of *Frumentarii*, as officers, is in the time of the emperor Adrian. Spartan, in his life of that prince, assures us, that he made use of them to inform himself of what passed.

Before, the name *Frumentarius* was only given to the corn merchants, or measurers of corn.

These *Frumentarii* did not make any particular corps, distinct from the other forces; but there were a certain number of them in each legion; as, among us, there are a certain number of grenadiers in each battalion. Accordingly, in ancient inscriptions, we meet with *Frumentarii* of this or that legion.

It is supposed they were originally a number of young persons, disposed by Augustus throughout the provinces, particularly on all the grand roads, to advertise the emperor with all expedition, of every thing that happened.

In order to this, they had a kind of intendants of all the carriages; and on this account came to be employed for the conveyance of corn, *Frumentum*, to the armies: whence their appellation.

Afterwards, they were incorporated into the troops themselves; where they still retained their antient name.

Their principal office was the giving of intelligence; in which they agreed with those called *Curioli*, with whom they were frequently joined.

FRUMENTY, popularly **FURMETY**, a kind of pottage, the basis whereof is wheat, boiled up with milk, sugar, and sometimes spice.

Vol. I.

Pliny tells us, that in his time they mixed chalk among it. Galen describes it as a very nutritious food made of corn, or pulse, boiled with water, wine, and oil.

The Latins called it *Alica*, which Festus derives *ab alendo*; as being very nourishing. But then it must be observed, they made it of any kind of corn.

Ours being restrained to wheat, we have given its denomination accordingly, from *Frumentum*. — An emulsion, wherein wheat was an ingredient, would be a kind of *Frumenty*.

FRUSTUM, in mathematics, a piece cut off, or separated from a body.

FRUSTUM of a pyramid, or cone, is a part, or piece thereof, cut off, usually, by a plane parallel to the base.

All round, and square timber that goes tapering, may be conceived as the *Frustum* of a cone, or pyramid; to find the quantity whereof, take the following theorem; which in the main is Mr. Oughtred's. Given, B (*Tab. Survey*, fig. 5. N^o 2.) the side of the greater base, *b* the lesser base's side, *A* the height of the *Frustum*: though, below, we suppose *B* and *b* to represent the areas of the two bases. Whole height $a + A = H$.

First, to find *a*, say, as $B - b : b :: A : \frac{bA}{B-b}$, or $\frac{bA}{x}$.

Now $BH = 3$ times the whole pyramid, because any prism is three times a pyramid of the same base, and height with it, by 7 and 10 Euclid, and $bA = 3$ times the upper pyramid.

$B A - b a$

Wherefore $\frac{3}{B A - b a}$ equal to the *Frustum* of the pyramid required; which theorem in words is this.

Multiply the lower base by the whole height; and from the product subtract the upper base multiplied by the height of the top-piece wanting; and then one third of the remainder shall give the *Frustum*.

And the same way you may proceed for the *Frustum* of a cone; only it will be more difficult to find the circular bases.

FRUTEX, *Shrub*; a vegetable of a genus between a tree and an herb; being low, but of a woody substance, and yielding woody branches.

FRUITICOSE *Stalks* of plants, are those of a hard, woody substance.

FRYTH, or **FRITH**, is explained by Sir Edward Coke, as a plain between two woods; or a lawn.

Camden uses it for an arm of the sea; or a strait between two lands; from *Frætum*. — Maketh his issue into the estuary, or *Frith* of Thames.

Smith, in his *England's Improvement*, makes *Frith* signify all hedge-wood, except thorns.

How to reconcile these different sentiments, we know not: but we are sure the Saxon word *Frith*, signifies *Peace*; and that *Fryth*, in our records, is often used for a wood: *Leistor tu tibi Oedipus esto*.

FUAGE, or **FOCAGE**, a tax, or imposition, laid on hearths, or chimneys, *i. e.* on fire-places, or families; called also *Hearth-silver*, and *Chimney-money*.

Edward the black prince, having Acquitain granted him, laid an imposition of *fuage*, or *foage*, upon the subjects of that dukedom, *viz.* one shilling for every fire-place. After his example, Charles V. of France laid a tax of a franc for each fire-place, for one year only. His successor, Charles VI. augmented it under the same name. Charles VII. rendered it perpetual, and called it *taille*.

By an ordonnance of Humbert II. dauphin of Viennois, the imposition of *Fouage*, or *Fouage*, was then laid per feu, *i. e.* per fire, or family, *feu per lares focum habentes*. In Latin it was called *Focagium*, *q. d. pro singulis facis*. — Sometimes it was also called *Fournage*, on account of the oven, or furnace: in Greek *καπnikov*, or *καπνῶ*, *fumus*, smoke. — In Will. Tyr. *De bello sacro*, it is called *Foagium*: for it was also imposed by the kings of Jerusalem. The counts, and other lords, likewise imposed it on the feudatories, or vassals. Zonaras assures us, that the general Nicephorus first established it among the Greeks.

FUCUS is used for a paint, or composition applied on the face, to beautify it, and heighten the complexion.

Old women make use of *Fucus**, and pomatums, to appear young. The *Fucus* made with cerus, is corrosive and pernicious to the skin.

The chemists abuse the ladies in selling them oil of bricks, as an excellent *Fucus*. Pliny says, that the *Fucus* of the Roman dames was a kind of white earth, or chalk, brought from Chio and Samos, dissolved in water.

The *Fucus Solimanni* is a composition of prepared sublimate, in great repute among the Spaniards of Peru.

FUEL, or **FEWEL**, the pabulum of fire; see **FEWEL**, and **FIRE**.

FUGA Vacui, in the antient school philosophy, a supposed aversion in nature to a vacuum.

FUG

The *Fuga vacui* was a very fertile, and extensive principle; and solved abundance of difficulties with a great deal of ease. Suppose, *e. gr.* a syringe; immerse one extreme of it in water; and draw up the embolus, or sucker; then hear how the antients will reason upon it. They first laid it down for granted, that there can be no vacuum; then arguing, that there must be a vacuum, unless the water should follow the embolus; they conclude, that the higher the embolus is drawn, the higher shall the water ascend; and this *Fuga vacui* is to keep out a vacuum.

In after-times, the matter was stated in other terms, and the water was said to rise, *metu vacui*, for fear of the vacuum, which must otherwise ensue. And at length, as if this were not enough, instead of *fuga* and *metu*, they substituted the word *horror*; and affirmed, that the water rose out of nature's *abhorrence* of a vacuum. This was just as good sense, as if a person being asked, how coals were brought to London? should answer, that it was done *fuga*, or *metu*, or *horrore frigoris*; for fear of cold! Which is giving the final cause, when the efficient one was required.

Most of the phenomena, which the antients ascribed to the *Fuga vacui*, the moderns have demonstrated to arise from the gravity and pressure of the air. This is the case in the ascent of water in syringes, pumps, &c.

FUGALIA, in antiquity, a feast celebrated among the Romans; supposed by some to be the same with the *Regifugium*, held on the 24th of February, in memory of the expulsion of the kings, and the abolishing of the monarchical government. Struvius, *Antiq. Roman. Syntag.* c. 9. distinguishes the *Fugalia* from the *Regifuge*: and even doubts, whether the *regifugium* were thus called on account of the expulsion of the kings; or by reason the rex sacrorum, after the sacrifice was ended, fled hastily out of the forum, and comitia.

Be this as it will, the only antient author of note, that makes express mention of the *Fugalia*, is St. Augustin, *de civitat. Dei*, lib. ii. c. 6. And his commentator Vives shews a great inclination to correct the reading of the word, were it not, that St. Augustin adds, that the feast was a true *Fugalia*; all decency and modesty being banished therefrom.

That learned person conjectures, that the *Fugalia* were the same thing with the *Poplifugia*, or the feast of *Fugia*, the goddess of joy, occasioned by the rout of an enemy; which was the reason why the people abandoned themselves to riot and debauchery: and that the feast was first instituted on occasion of the victory gained over the Ficulneates, Fidenates, and neighbouring nations, upon their attempt to take possession of Rome, the day after the people had withdrawn from it. As related by Varro, l. v. *de Ling. Lat.*

But according to Varro, the *Poplifugia*, which fell in the month of June, were held in the memory of the flight, or retreat of the people, in a sedition raised among them: it is true, he adds, that the day followed soon after the retreat of the Gauls, and the time when the neighbouring nations conspired against them: but this does not appear to have any relation to the *Poplifugia*, being only meant to mark the æra, or time when the sedition and flight of the Roman people happened.

After all, though the *Poplifugia* might have been originally established in commemoration of the flight of the people, and not that of the enemies; this does not hinder, but the *Fugalia* of St. Augustin may probably be the *Poplifugia* of Varro; according to the conjecture of Vives.

FUGITIVE, *Refugee*; a person obliged to fly his country, or remove from a place where he had some abode or establishment; on account of his crimes, debts, or on other occasions.

A person who has broke open, or escaped out of prison, is obliged to be a *Fugitive*. Cain became a *Fugitive*, after the murder of his brother.

Among the learned, *fugitive* pieces denote those little compositions which are printed on loose sheets, or half sheets; thus called, because easily lost, and soon forgot.

In the Roman law, a *fugitive* slave was such a one as was apt to run away from his master. And in selling a slave, the master was obliged to declare, whether or no he were *fugitive*.

The term is also applied to deserters in an army; or those who fly from the combat.

FUGITIVES Goods, *Bona Fugitivorum*, the proper goods of him that flies upon felony; which after the flight lawfully found on record, do belong to the king, or lord of the manor.

FUGUE, in music, is when the different parts of a musical composition follow each other; each repeating what the first had performed.

There are three kinds of *Fugues*: the *single Fugue*, *double Fugue*, and *Counterfugue*.

Single, or *simple FUGUE*, is some point consisting of 4, 5, 6 or any other number of notes, begun by one single part, and then seconded by a third, fourth, fifth, and sixth part, if the composition consists of so many, repeating the same, or such like notes; so that the several parts follow, or come in, one after another in the same manner, the leading parts still flying before those which follow.

FUL

Double FUGUE, is when two or more different points move together in a *Fugue*, and are alternately interchanged by several parts.

For the *Counter FUGUE*, see *COUNTER Fugue*.

The Italians say, a *Fugue*, or *flight of Rooms*, or *Chambers*, meaning a series, or range of rooms, the doors whereof answer in a right line behind each other; so as they may be all seen at once, from one extreme to the other.

FULCRUM, *Prop.* in mechanics; see *LEVER*.

FULIGINOUS*, an epithet applied to a thick smoke, or vapour, replete with soot, or other crass matter. See *SMOKE*.

* The word is formed from the Latin *fuligo*, soot; and is rarely used but when joined with vapour.

In the first fusion of lead, there exhales a great deal of *fuliginous* vapour; which retained and collected, makes what we call *Litharge*.

Lampblack is what is gathered from the fuliginous vapours of pines, and other resinous woods, when burnt.

Some physicians talk of *fuliginous* vapours emitted from the spleen to the brain; which they will have to be the cause of the hypochondriac and hysterical disorders; thence called the *Vapours* and by some the *Splen*.

FULL, is variously used, in opposition to empty, narrow, confined, &c.

The Cartesians hold, that the universe is *full*, *i. e.* that every part or point has matter in it.

When the body is *full* of humours, it should be purged. See *PLENTITUDE*, and *PLETHORA*.

An ambassador has *full* power given him to act, transact, &c.

—The army was in *full* march, *i. e.* the whole army was in march, with all the forces it consisted of.

A man is said to bear the arms of a family, *full*, *i. e.* without any difference or diminution.

FULL Forfeiture, see the article *FORFEITURE*.

FULL Arms, see the article *ARMS*.

FULL Moon, *plenilunium*, that phase of the moon, when her whole disk, or face is illuminated; which is in the time of her opposition to the sun.

Eclipses of the moon always happen at the time of *full Moon*.

FULLER*, a workman employed in the manufactories, to full, mill, or scour cloths, rateens, serges, and other woollen stuffs, by means of a mill, to render them thicker, and more compact and durable.

* The word is formed of the Latin *fullo*, which signifies the same thing.

The *Fullers* among the Romans, washed, scoured, and fitted up cloaths; and their office was judged of that importance, that there were formal laws prescribed them for the manner of performing it. Such was the *Lex Metalla de Fullonibus*. See also Pliny, l. vii. c. 56. Ulpian, leg. 12. ff. *de Furtis*, l. xiii. § 6. *Locati*, l. xii. § 6. ff. *&c.*

FULLERS Earth, a fatty fossil earth, soft and brittle; of great use in the woollen manufacture.

It serves to scour cloths, stuffs, &c. and imbibe all the grease and oil necessarily used in the preparing, dressing, &c. of the *Wool*.

Fullers Earth is dug in great plenty out of certain pits near Brick-hill, in Staffordshire; also near Ryegate, in Surry; near Maidstone, in Kent; near Nutley and Petworth, in Sussex; and near Wooburn, in Bedfordshire.

It is absolutely necessary to the well dressing of cloth; and hence foreigners, though they can procure wool to be clandestinely exported out of the kingdom, can never reach to the perfection of the English cloths, &c. without *Fullers earth*.

For this reason it is made a contraband commodity; and the export made equally criminal with that of exporting wool.

Abroad they make great use of urine, in lieu of *Fullers earth*. This earth abounds much in the vegetative salt, which promotes the growth of plants; and is therefore reckoned by Sir H. Plat, and others, a great improver of land. When mixed with vinegar, it disperses pimples and pustules; checks inflammations, and cures burns. See *Supplement*, article *CIMOLIA*.

FULLERS Weed, *Thistle*, or *Teazle*. See *TEAZLE*.

FULLERY, a workhouse, or place where cloths, &c. are *fulled*, or scoured.

The term is principally understood of the fulling-mill.

Thus, when they say, carry that cloth, serge, or the like, to the *Fullery*, they mean it is to be sent to the mill, to be scoured and full.

FULLING, the art, or act of cleansing, scouring, and pressing cloths, stuffs, and stockings, to render them stronger, closer, and firmer: called also *Milling*.

Pliny, lib. vii. cap. 56. assures us, that one Nicias, the son of Hermias, was the first inventor of the art of *Fulling*: and it appears by an inscription, quoted by Sir G. Wheeler, in his travels through Greece, that this same Nicias was a governor in Greece in the time of the Romans.

The *Fulling* of cloths and other stuffs, is performed by a kind of water mill; thence called a *Fulling*, or *Scouring Mill*.

These mills, excepting in what relates to the mill-stones and hopper, are much the same with corn-mills. And there are even some, which serve indifferently for both purposes; corn being ground, and cloths fulled by the motion of the same wheel.

Hence, in some places, particularly France, the fullers are called *Millers*; as grinding corn, and milling stuffs at the same time.

The principal parts of the *Fulling-mill*, are, the wheel, with its trundle; which gives motion to the tree, or spindle, whose teeth communicate it to the peffles, or stampers, which are hereby raised, and fallen alternately according as its teeth catch on, or quit a kind of latch in the middle of each peffle. The peffles and troughs are of wood; each trough having at least two, sometimes three peffles, at the discretion of the master, and according to the force of the stream of water.

In these troughs are laid the cloths, stuffs, &c. intended to be *fulled*: then, letting the current of water fall on the wheel, the peffles are successively let fall thereon, and by their weight and velocity they stamp, and press the stuffs very strongly, which by this means become thickened, and condensed.

In the course of the operation, they sometimes make use of urine, sometimes of fullers earth, and sometimes of soap.

To prepare the stuffs to receive the first impressions of the peffle, they are usually laid in urine; then in fullers earth, and water; and lastly in soap, dissolved in hot water.

Soap alone would do very well; but this is expensive; though fullers earth, in the way of our dressing, is superior thereto; but then it must be first well cleared of all stones and grittiness, which are apt to make holes in the stuff.

As to urine, it is certainly prejudicial, and ought to be entirely discarded; not so much on account of its ill smell, as of its sharpness, and saltness; which is apt to render the stuffs dry, and harsh.

The true method of *Fulling* with soap, is delivered by Mons. Colinet, in an authentic memoir on that subject, supported by experiments made by order of the marquis de Louvois, then super-intendant of the arts and manufactories of France. The substance of which we shall here subjoin.

Method of FULLING cloths, and woollen stuffs, with soap.—

A coloured cloth, of about forty-five ells, is to be laid in the usual manner, in the trough of a *Fulling-mill*; without first soaking it in water, as is commonly practised in many places.

To *full* this trough of cloth, fifteen pounds of soap are required; one half of which is to be dissolved in two pails of river or spring water, made as hot as the hand can well bear it. This solution is to be poured by little and little upon the cloth, in proportion as it is laid in the trough: and thus it is to be *fulled* for at least two hours; after which it is to be taken out, and stretched.

This done, the cloth is immediately returned into the same trough; without any new soap; and there *fulled* two hours more. Then taking it out, they wring it well, to express all the grease and filth.

After the second *Fulling*, the remainder of the soap is melted, as the former, and cast at four different times, on the cloth; remembering to take out the cloth every two hours, to stretch it, and undo the plaits and wrinkles which it has acquired in the trough. When they perceive it sufficiently *fulled*, and brought to the quality and thickness required, they scour it out for the last time in hot water, keeping it in the trough till it be quite clean.

As to white cloths; in regard these *full* more easily, and in less time, than coloured ones, a third part of the soap may be spared.

FULLING of Stockings, Caps, &c. may be performed somewhat differently; *viz.* either with the feet, or the hands; on a kind of rack, or wooden machine, either armed with teeth of the same matter, or else with hofes or bullocks teeth.

The ingredients made use of herein, are urine, green soap, white soap, and fullers earth. But the urine also is reckoned prejudicial here.

Note, woven stockings, &c. should be *fulled* with soap alone: for those that are knit, fullers earth may be used with the soap.

Indeed, it is frequent to *full* these kinds of works with the mill, after the usual manner of cloths, &c. But that is too coarse and violent a manner, and is apt to damage the work, unless it be very strong.

FULLONUM *Carduus*, see the article **CARDUUS**.

FULMINANT, **FULMINANS**, or **FULMINATING**, an epithet applied to something that thunders, or makes a noise like that of thunder.

We say, *Jupiter Fulminant*, *Aurum Fulminans*, *Pulvis Fulminans*, &c.

Aurum FULMINANS, see the article **AURUM**.

Pulvis FULMINANS, is a composition of three parts of nitre, two parts of salt of tartar, and one of sulphur.

Both the *Aurum* and *Pulvis Fulminans* produce their effect principally downwards: in which they differ from gunpowder, which acts *in orbem*; but principally upwards. If they be laid in brass ladles, and so set on fire; after fulmination, the ladles will be often found perforated.

FULMINATING Legion, see the article **THUNDERING Legion**.

FULMINATION, in the Romish canon law, a sentence of a bishop, official, or other ecclesiastic appointed by the pope; whereby it is decreed, that some bull sent from the pope, shall be executed.

Fulmination is the same thing with the verification, or recognition of a letter, or instrument of a prince in a lay court.

FULMINATION is also used for the denunciation, or execution of a sentence of anathema, made in public, with due solemnity.

In *fulminating anathema's*, the bishop who pronounces sentence, is to be clothed in his episcopalia. See **ANATHEMA**.

FULMINATION, or **FULGURATION**, in chemistry, a vehement noise, or shock made by divers preparations; as *Aurum fulminans*, &c. when set on fire.

FUMIGATION, in medicine, and chemistry, is understood of things taken in the way of fume, or smoke; or that are turned into smoke, or steam.

A northern physician has an express treatise to justify the use of *fumigations* in many cases.

It is dangerous taking mercury by *Fumigation*. This *Fumigation* is a kind of potential calcination; the vapour of mercury laid on the fire, corroding and reducing into a calx the little laminæ of metals suspended over it.

FUMIGATION is also used for the act of making a suspended body receive the fumes, or steams of one or more other bodies; in order to calcine it, to correct it, or impart to it some new quality.

Cerufs is made by the *Fumigation*, or vapour of vinegar, gnawing and corroding plates of lead.

FUNAMBULUS, among the Romans, was what we call a *Rope-dancer*, and the Greeks, *Schaenobates*. See **ROPE-DANCER**. The term is also used for such as letting themselves down by a rope, or cord; make their escape out of a city, or place besieged: as is observed by Du Cange.

Julius Capitolinus, and Horace, make mention of *Funambuli*: Acron on Horace, assures us, that it was the orator Messala, who first introduced the word *Funambulus*, in lieu of *Schaenobates*, used by the Greeks. For the Greeks seem to have had of these rope-dancers from the first institution of their scenic games, which are said to have been invented about the time of Icarus, father of Erigone; or of Dionysius, surnamed *Lilæ Pater*, whom Thebes first introduced into Athens.

At Rome, the *Funambuli* first appeared under the consulate of Sulpicius Peticus, and Licinius Stolo, who were the first introducers of the scenic representations. It is added, that they were first exhibited in the island of the Tyber: and that the censors Messala and Cassius afterwards promoted them to the theatre.

In the *floralia*, or *Judi florales*, held under Galba, there were *funambulatory* elephants, as we are informed by Suetonius. Nero also shewed the like, in honour of his mother Agrippina. Vopiscus relates the same of the time of Carinus and Numerianus.

There was a *Funambulus*, it seems, who performed at the time when the Hecyra of Terence was acted; and the poet complains, that the spectacle prevented the people from attending to his comedy. *Ita populus studio stupidus in funambulo amicum occupat.*

FUNCTION, the act of doing something for which the agent was appointed, or which he was obliged to.

Thus we say, the stomach performs its *Function*; i. e. digests well; the fumes of wine disturb the brain in the performance of its *Functions*.

Physicians divide the *Functions* of the human body into *vital*, *natural*, and *animal*.

Vital FUNCTIONS are those necessary to life; and without which it cannot subsist: as, the actions of the heart, brain, lungs, &c.

Natural FUNCTIONS, are those which change the food, &c. so as to assimilate it to our own nature: such are the actions of the viscera, and the vessels which receive, retain, secrete, &c. the humors.

Animal FUNCTIONS, are those without which we cannot perceive, will, remember, &c. Such are feeling, seeing, imagining, judging, passions, voluntary motion, &c.

FUNCTION, is also used figuratively in speaking of the offices, duties, or occupations a person is engaged in.

He acquitted himself of all the *Functions* of the magistracy with applause. The actions of an ambassador must be distinguished from his *Functions*; the one regards his character, the other his person.

FUND, *FUNDUS*, a Latin term, used for the bottom of certain things; and particularly of certain parts of the body.

FUND of the eye, *FUNDUS Oculi*, is that part possessed by the choroides and retina.

The images of objects are represented in an inverted situation, in the *Fund* of the eye. See **VISION**.

FUNDUS Uteri, or bottom of the womb, is the body or principal part thereof: so called in contradistinction to the cervix, or neck; the osculum, or mouth; and the vagina, or sheath. — See *Tab. Anat. (Splan.)* fig. g. lit. a. fig. 11. lit. d.

FUNDUS Vesicæ, or bottom of the bladder, is the cavity thereof, wherein the urine is contained. In men it is placed over the rectum; and in women over the matrix.

FUND of the gall bladder, the stomach, &c. See *GALL Bladder*, *STOMACH*, &c.

FUNDUS Plantæ, is that part of a plant, where the stalk just meets, and joins the root.

FUNDUS Cæli, is the point opposite to the point of culmination; or the point of the ecliptic, wherein it is intersected by the meridian, beneath the horizon.

FUND, in commerce, is used for the capital, or stock of a merchant, company, or corporation; or the sum of money they put into trade.

In this sense we say absolutely, the *Funds*, the *Public Fund*, meaning the stock of the great companies, or corporations, as the Bank, South-Sea, East-India, &c.

FUNDAMENT, the anus, or aperture, through which an animal voids his excrements.

FUNDAMENTAL, something that serves as a base, rest, support, or foundation for any thing.

The Apostles creed contains the *fundamental* points of religion.

The Salic law is the *fundamental* law of the polity of France.

FUNDAMENTAL, in music, denotes the principal note of a song, or composition, to which all the rest are in some measure adapted, and by which they are swayed; called also the *key* of the song. See **KEY**.

FUNERAL*, the ceremonies performed at an interment; or the last offices paid the deceased.

* The word is formed of the Latin *Funus*; and that of *Funalia*, by reason of the torches (which were *Funes, cere circumdati*) used in the *Funerals* of the Romans: though others derive *Funus* from the Greek, *φύος*, death or slaughter.

The *Funeral* rites among the ancient Romans were very numerous. — The deceased was kept seven days; and every day washed with hot water, and sometimes with oil, that, in case he were only in a slumber, he might thus be waked; and every now and then his friends meeting, made a horrible outcry or shout, with the same view; which last action they called *Conclamatio*.

The third conclamation was on the seventh day; when, if no signs of life appeared, the defunct was dressed and embalmed by the pollinctores; placed in a bed near the door, with his face and heels toward the street; and the outside of the gate, if the deceased were of condition, was garnished with cypress boughs.

In the course of these seven days, an altar was raised near his bed-side, called *Acræ*; on which his friends every day offered incense; and the Libitinarii provided things for the *Funeral*.

On the seventh day a crier was sent about the city to invite the people to the solemnization of the *Funeral* in these words, *Exequias L. Tit. L. filii, quibus est commodum ire, jam tempus est. Ollus ex ædibus offertur*.

The people being assembled, the last conclamation ended, and the bed was covered with purple; a trumpeter marched forth, followed by old women, called *Præfæcæ*, singing songs in praise of the deceased; and lastly, the bed followed, bore by the next relations. And if the person were of quality and office, the waxen images of all his predecessors were carried before him on poles.

The bed was followed by his children, kindred, &c. *attrati*, or in mourning: from which act of following the corps, these *Funeral* rites were called *Exequiæ*.

The body thus brought to the rostra, the next of kin *laudabat defunctum pro rostris*, made a *Funeral* oration in his praise and that of his ancestors.

This done, the body was carried to the *Pyra*, or *Funeral* pile, and there burnt: his friends first cutting off a finger, to be buried with a second solemnity.

The body consumed, the ashes were gathered; and the priest sprinkling the company thrice with clean water, the eldest of the *Præfæcæ* crying aloud, *Iliet*, dismissed the people, who took their leave of the deceased in this form, *Vale, Vale, Vale: nos te ordine qua natura permisit, sequemur*.

The ashes, inclosed in an urn, were laid in the sepulchre, or tomb.

The first Romans did not burn their dead, but interred them, as we do. Pliny, lib. vii. c. 54. assures us, that the custom of burning was not introduced till after they had learnt, that their enemies dug up, and exposed the bodies of their soldiers buried in remote countries. And yet Plutarch, in his life of Numa, observes, that Numa was buried; as having expressly forbid them by his testament to burn him: this shews that the Romans had practiced burning before him.

This custom of burning the dead, is religiously observed by the Greeks and Romans, was held in abhorrence by several other nations.

Herodotus relates, that the Persians detested it; as holding fire to be a god. The Egyptians declined to burn their dead; as taking fire for an inanimate beast; and judging it impious to commit the bodies of the deceased to be devoured by beasts. The custom of burning among the Romans ceased under the empire of the Antonines.

FUNERAL Column, a column crowned with an urn, wherein the ashes of some deceased person are supposed to be inclosed; the flut, or shaft, being beset with tears, or flames; the symbols of grief, and of immortality.

FUNERAL Games, *Ludi funebres*, were a part of the ceremony of the ancient *Funerals*.

They consisted chiefly in processions, and sometimes in mortal combats of gladiators around the *funeral* pile.

The custom was very ancient; though it had not always been the same. At first, they cut the throats of a number of captives before the pyra, as victims to appease the manes of the deceased. This Achilles does in Homer, *Iliad*, *Φ*, at the *Funeral* of Patroclus: and *Aeneas*, in Virgil, *l. ix.* at that of Pallas, son of Evander. Cæsar, in his *Commentaries*, *l. vii.* relates, that the Gauls also did the like.

But at length it appeared barbarous, thus to butcher men; and therefore to save the horror of the spectacle, yet without the dead's losing any thing thereby; they made the poor captives fight and kill one another, only saving some few of such as came off victors.

This custom was borrowed of the Greeks by the Romans; among whom the cruel diversion was called *Munus*.

The first who introduced it at Rome, was Junius Brutus, at the obsequies of his father; or, according to others, Ap. Claudius, and M. Fulvius, during their consulate.

The like horrible combats were also occasionally exhibited by the magistrates; and sometimes they were added to the theatrical pieces.

The emperor Claudius decreed, that whereas these accursed games were till then frequent and arbitrary; it should be the practice for the future, only to perform them regularly every year, at the expence of the state; and that the *Ædiles* should have the care and direction thereof. But he conceived a horror for them himself; and soon after abolished them: though it was still allowed particular persons to have them, provided they were worth forty thousand sesterces per annum. — They were not finally abolished before Theodoric king of the Goths, at the end of the fifth century.

FUNERAL Honours, see the article **HONOURS**.

FUNERAL Oration, or *Sermon*, a discourse pronounced in praise of a person deceased, at the ceremony of his *Funeral*.

The custom of making *funeral* orations is very antient. The Romans had it of a long standing; and it was always one of the nearest relations that made the harangue. Augustus did the office to his grandmother Julia, when only twelve years of age. Suet. Aug. c. 8. And we have divers parallel instances.

The custom seems to have begun with the republic; at least, the first *funeral* oration we read of, was that of Brutus, who expelled the kings, and was the first consul; who having been killed in a battle against the Hetrurians, was *laudatus pro rostris*, praised in the forum by Valerius Publicola his colleague.

Indeed, some authors will have the practice more antient. They maintain it to have been in use among the Greeks; and that Solon, who, according to Aulus Gellius, gave laws to the Athenians, in the time when the elder Tarquin reigned at Rome, was the first author thereof: something like which, it seems, the orator Anaximenes has left in writing. See Polydore Vergil de Invent. Rer. *l. iii. c. 10*.

FUNGUS, in natural history; see **MUSHROOM**.

FUNGUS, in medicine, a fleshy tumor, or excrescence, very spongy, soft, and pale; arising on the membranes, tendons, and other nervous parts, in consequence of ulcers, wounds, contusions, and strains.

Fungus's are frequently formed on the meninges, or membranes of the brain, in wounds of the head when not well covered, or defended from the external air: they are also frequent about the joints; which last grow very intensely. But where the skin is open, finding more room, they grow to a prodigious degree in a very little time, assuming the form of a mushroom, or *Fungus*.

There are also *Fungus*'s of the anus, and uterus. They are

FUR

all supposed to proceed from a retention and depravation of the nutritious juice.

The *Fungus* is a general kind of excrescence, whereof there are divers particular species; as the *Ficus*, the *Sarcoma*, *Condyloma*, &c.

FUNGUS FLESH, is a spongy excrescence, or (as we popularly call it) *proud flesh*, frequently growing on the lips of wounds, ulcers, &c.

The *Sarcocele* is the effect of a sort of *fungous* flesh.
